GLOBE ENCYCLOPÆDIA

OF

UNIVERSAL INFORMATION.

EDITED BY

JOHN M. ROSS, LL.D.

SENIOR MASTER OF ENGLISH LANGUAGE AND LITERATURE, HIGH SCHOOL OF EDINBURGH.

VOL. VI.

SHEN—ZYMO.

A. FULLARTON & CO.

LONDON, EDINBURGH, & DUBLIN.

1881.

NOTE BY THE EDITOR.

ON the publication of the Sixth and concluding Volume of the 'Globe Encyclopædia,' the Editor may perhaps be permitted to say a parting word. Begun at the close of 1874, the preparation of the work has thus occupied a period of four years and a half. Considering its size and character, the opinion may be ventured that time has not been wasted in putting it before the public in a complete form. It may even be asserted, without fear of challenge, that no English Encyclopædia professing the same fresh, thorough, and independent treatment of topics has ever been executed with equal rapidity. The scale on which the 'Globe' was planned has been carefully adhered to throughout, and the Editor has been fortunate enough to finish the work in the exact limits originally indicated. In other and more important points it is hoped that the promises made in the Preface to Volume I. have been honourably kept. The generous reception accorded to the 'Globe' on its first appearance by the press of Great Britain and the United States made it a real pleasure to the Editor and his staff, not merely to maintain but to improve the quality of the Encyclopædia as it proceeded; and the character of the criticism upon the successive volumes seems to show that they have succeeded in their effort.

It may here be proper to state that the articles in the various departments of the Encyclopædia have been contributed by writers familiar with the latest results of learned research, scientific investigation, and literary culture. The most superficial examination of the contents will disclose to competent judges unmistakeable evidence of adequate knowledge. No trouble or expense has been spared to make the 'Globe' in this respect unrivalled among works of its kind. Articles have been sent to the remotest parts of the Empire for revision, when recent information was not to be had at home; and experts in other countries have given the benefit of their help.

The Editor cannot conclude without the most grateful acknowledgment of the services rendered by his staff of assistants, to whose cordial co-operation the Encyclopædia is largely indebted for what merit it may possess.

J. M. ROSS.

LIST OF CONTRIBUTORS TO THE ILLUSTRATED 'GLOBE ENCYCLOPÆDIA.'

STAFF.

ROSS, JOHN MERRY, LL.D., UNIVERSITY OF GLASGOW—*Editor.*

MACDONALD, ANDREW, University of Edinburgh.
GROOME, FRANCIS HINDES, late Postmaster of Merton College, Oxford.
KNOTT, CARGILL, G., B.Sc., University of Edinburgh.
DAVIDSON, ALEXANDER, M.A., University of Edinburgh.
} *Assistant-Editors.*
DAVIDSON, THOMAS, M.A., University of Edinburgh.
GREIG, CHARLES E., M.A., University of Edinburgh.
PHILIP, ALEXANDER, M.A., University of Edinburgh.

ADDIS, REVEREND FATHER, Brompton Oratory.
ARCHER, WILLIAM, London.
BROWN, ALEXANDER, of Alexander Henry & Co.'s, gunmakers, Edinburgh.
BROWN, Rev. JAMES, D.D., Paisley.
BROWN, ROBERT, M.D., London, author of 'The Races of Mankind,' &c., &c.
BRYCE, JAMES, M.A., LL.D., late Mathematical Master, High School of Glasgow.
BURN, ROBERT SCOTT, author of numerous works on Agriculture.
CHRISTIE, JAMES, M.D., Glasgow, author of 'Cholera Epidemics in E. Africa,' &c.
CLARK, J. T., Keeper of the Advocates' Library, Edinburgh.
CLARK, WALTER, Museum of Science and Art, Edinburgh.
CLERK, Rev. ARCHIBALD, D.D., editor and translator of 'Ossian.'
COTTON, JAMES S., M.A., formerly Fellow of Queen's College, Oxford; one of the authors of the 'Essays on the Endowment of Learned Research.'
CRAIG, WILLIAM, M.D., Lecturer in the 'School of Medicine,' Edinburgh.
CRANSTOUN, JAMES, B.A., LL.D., Classical Master, High School of Edinburgh, translator of Catullus, Propertius, and Tibullus.
CULLEN, JOHN, M.A., University of Edinburgh.
DICK, JAMES I., Northern Lighthouse Board, Edinburgh.
DICKIE, JAMES, Glasgow, late of Rangoon and Akyab, British Burmah.
DOBSON, WILLIAM T., Edinburgh.
DONALDSON, JAMES, M.A., LL.D., Rector of the High School of Edinburgh, Author of a 'Critical History of Christian Doctrine,' &c.
DOUGLAS, CHRISTOPHER HOME, Advocate, Edinburgh.
FAIRBAIRN, ALEXANDER, D.D., Principal of Airedale College, Yorkshire.
FERGUSON, JOHN, M.A., Professor of Chemistry, University of Glasgow.

HALDANE, R. B., M.A., University of Edinburgh.
HERBERT, DAVID, M.A., University of Glasgow.
HJALTALIN, JON, Advocates' Library, Edinburgh.
HUNTER, PETER HAY, Medallist in English Literature, University of Edinburgh.
KENNEDY, ALEXANDER B., Professor of Engineering, University College, London.
KENNEDY, ARNOLD, M.A., London.
LEES, Rev. JAMES, D.D., Minister of St. Giles, Edinburgh.
LETTS, E. A., Professor of Chemistry, Bristol College.
M'CULLOCH, WILLIAM, M.A., University of Edinburgh.
MACDONALD, ANGUS, M.D., Lecturer in the School of Medicine, Edinburgh.
MACDONALD, WILLIAM, M.A., LL.D., late Classical Master in the High School of Edinburgh, now Rector of the High School of Dunedin, New Zealand.
M'KENDRICK, JOHN G., Professor of the Institutes of Medicine, Glasgow.
MACKENZIE, ALEXANDER G., London.
MUIRHEAD, JAMES, M.A., University of Edinburgh.
MUSTON, C. N. B., Museum of Science and Art, Edinburgh.
PATON, JAMES, Curator of the Kelvingrove Museum, Glasgow.
PATRICK, DAVID, M.A., University of Edinburgh.
RALSTON, W. R. G., London, translator of 'Krilof,' &c.
RANKING, WILLIAM MONTGOMERIE, London.
REITH, Rev. JOHN, M.A., Rickarton, Stonehaven.
ROBB, JAMES, late of the 'Farmer,' London.
ROBERTSON, ERIC S., M.A., University of Edinburgh.
SADLER, JOHN, Curator of the Royal Botanic Garden, Edinburgh.
SIME, WILLIAM, University of Edinburgh.
SMITH, DAVID MURRAY, author of 'Arctic Expeditions,' &c.
SMITH, GEORGE, LL.D., author of the 'Life of Dr. John Wilson,' 'Life of Dr. Duff,' &c.
SMITH, Rev. GEORGE MUIR, Stirling.
SMITH, W. C., M.A., Advocate, Edinburgh.
THOMPSON, DARCY WENTWORTH, University of Edinburgh.
WALLACE, WILLIAM, London, formerly editor of the 'Dumfries Herald.
WATT, FRANCIS, M.A., University of Edinburgh.
WEBBE, FRANCIS, Lecturer on Botany, Royal Botanic Garden, Edinburgh.
WEBSTER, H. A., M.A., University of Edinburgh.
WHYTE, WALTER, Double-Medallist in English Literature, University of Edinburgh.
WILSON, ANDREW, M.D., Lecturer on Natural History, School of Medicine, Edinburgh.

THE

ILLUSTRATED

GLOBE ENCYCLOPÆDIA.

Shenando'ah, a river of the United States, rises in Augusta county, Virginia, and flows N.W. through a beautiful and fertile valley, known as the 'Valley of Virginia,' until it joins the Potomac at Harper's Ferry. Its 'North Fork' joins at Front Royal. Its length is about 170 miles, for 40 miles of which it is navigable for barges. The valley was the scene of severe fighting during the Civil War. One of the most famous of the Confederate cruisers was named after the S.

Shen'dy, a town of Nubia, on the right bank of the Nile, 120 miles below Khartum (q. v.). It has a considerable trade in wheat, millet, senna, salt, cottons, and cattle. Pop. 10,000.

Shen-se, a province in the N. of China W. of Shan-se. Area, 81,216 sq. miles; pop. (1852) 14,098,499. It is hilly but fertile, and very rich in coal and other minerals. It suffered greatly during the famine of 1875-78.

Shen'stone, William, son of Thomas Shenstone, a gentleman farmer who owned the estate of Leasowes (worth about £300 a year), was born at Hales-Owen, Shropshire, November 18, 1714, educated as a commoner at Pembroke College, Oxford, and in his student days published *Poems upon Various Occasions* (1737), which he afterwards endeavoured to suppress. In 1741 appeared his *Judgment of Hercules*, and the next year saw his most considerable poem, *The Schoolmistress*, its homely theme treated in the stately Spenserian stanza. S. burdened his small estate with debt in seeking to beautify it, and before his death had made it so picturesque that his heirs had to sell it. He died February 11, 1763. His Works were published by Dodsley (3 vols. 1764-69), and there are new editions of his pithy *Essays on Men, Manners, and Things* (Lond. 1868), and *Poems*, with a Memoir by the late George Gilfillan (Edin. 1854).

She'ol (Heb. 'cavity,' from *shaal*, 'to dig') was the Hebrew under-world, which is described in the Old Testament as a vast subterranean place (Job xi. 8), full of thick darkness (*ib.* x. 21, 22), where dwell the shades of the dead (Ps. xxx. 3 [pit], lxxxix. 48 [grave]) and poetically as having valleys (Prov. ix. 18 [depths]), and gates and bars (Job xvii. 16; Isa. xxxviii. 10). See HELL.

Shep'herd's Dog. See COLLEY or COLLIE.

Shep'herd's Purse, a name given to *Capsella bursa pastoris*, the commonest British representative of the order *Cruciferæ*, occurring in all situations up to 1200 feet. It is an annual weed, with radical leaves spread in a rosette, from which arise branched stems with clasping leaves and small white flowers. The plant is indigenous in temperate and Arctic Europe, N. Africa, and Asia to the Himalaya; and has now been introduced into all temperate climates.

Shepp'ey, Isle of (Old Eng. *Sceápig*, 'Sheep Isle'), in the N. of the county of Kent, is separated from the mainland by the Swale, and bounded W. by the Medway, and N. and E. by the North Sea. Area, 19,682 acres; pop. (1871) 18,434. It is 9 miles long by 4½ broad, and consists of seven parishes, two of which, Harty and Elmley, are islands in themselves, formed by the salt-water ditches or 'fleets,' which run up into the interior, from the mud-banks of the S. shore. The soil is rich, and the surface generally low and marshy. On the N. side, however, there are cliffs from 60 to 80 feet high, which suffer an excessive denudation from the sea, as much as 50 acres of land having been washed away in twenty years, according to Sir C. Lyell. The whole island is composed of London clay, which is supposed to have formed the delta of an ancient river, and in which are found rich deposits of fossil tropical vegetation, of the Eocene age, chiefly at Warden Point and Hensbrook. Many barrows, called 'cotterels,' some of them 10 feet high, exist, and are supposed to have been burial-places of the Norsemen. The principal occupations of the people are fishing and farming; the isle is still famous for its mutton. Rich oyster-beds extend along the coast, from Milton to Sheerness (q. v.), the only town in S. See Huxley's *Physiography* (Lond. 1877), and Bevan's *Handbook to the County of Kent* (Lond. 1878).

Shep'ton-Mall'et, a town of Somerset, England, 4½ miles E.S.E. of Wells by rail. It is a place of great antiquity, being mentioned in Doomsday Book There is a fine old parish church. Silk, crape, and stockings are the chief manufactures, and there are several breweries. Pop. (1871) 4363.

Sher'bet (Ar. *sharbat*, 'a drink'), a cooling beverage of Eastern origin composed of fruit-juices mixed with water, and sweetened and flavoured.

Sher'borne (the 'clear burn' or stream), a market-town of Dorsetshire, England, 18 miles N.N.W. of Dorchester by rail, stands in the pleasant Vale of Blackmore, on the southern slope of a hill above the Yeo. The cruciform abbey church of St. Mary, a noble Perpendicular structure (207 by 102 feet), with a Norman tower (114 feet), porch, and transepts, was splendidly restored by the Digby family (1849-56). Other buildings are the Literary Institute (1850), the Yeatman Memorial Hospital (1865-69), Bishop Neville's 15th-c. Hospital of St. John, S. Castle, an Elizabethan mansion built by Raleigh (1593) in the grounds of the old Norman castle (1110-39) of Roger of Salisbury, now in ruins, and Forster's Middle-Class School (1875). Here also is the King's School (1550), originally located in narrow compass on the site of, and in close proximity to, the Abbey Lady Chapel. This has been gradually extended; in 1851 the ancient Abbot's Hall, the Guesten Hall, the Abbot's

Lodgings, &c., were converted into school buildings, and soon after a new headmaster's house and spacious dormitories were built. In 1877 a large quadrangle was formed by the addition of a spacious schoolroom in the style of the 15th c., the Abbot's Hall, now serving as the chapel, being at the same time enlarged. S. ranks high among Public Schools (q. v.), and in October 1878 had 18 masters and 295 boys. Glove-making employed 260 women in 1871, and there are large silk factories. Pop. (1871) 6129. In 705, Ini, King of Wessex, raised S. to a bishopric, with St. Ealdhelm for its first bishop, whose twenty-fifth successor, Herman, transferred the see to Old Sarum (1072). See Hutchins' *History of Dorsetshire* (3d ed. 1861-74).

Shere Ali, Amir of Afghanistan, was born about 1823. On the death of his father, Dost Mahommed, in 1863, he succeeded to the throne, though only the third surviving son, in accordance with the rule of paternal nomination. His early reign was one continual quarrel with those of his own blood. Though at first he maintained his authority, he was driven out of his capital, Cabul, in 1866, and gradually forced back to Candahar and Herat, which latter stronghold was always held for him by his eldest son, Yakub Khan. But the Indian Government of Lord Lawrence refused to recognise his rival brother; and by the spring of 1868 he had again established himself throughout Afghanistan. In March 1869 took place the celebrated Umballa Durbar, at which Lord Mayo, with exceptional magnificence, entertained S. A., 500 miles within the British frontier. The Amir received £120,000 in cash, 10,000 stand of muskets, and a battery of light guns; and cordial expressions of mutual friendship were interchanged. He has since attempted, without much success, to introduce European reforms into Afghanistan, and his supremacy has been outwardly undisturbed. But his avowed preference for a younger son, Abdulah Jan, who died in August 1878, caused Yakub Khan to threaten rebellion. He was first appeased with the government of Herat; but in 1875, with genuine Afghan treachery, he was enticed to Cabul, and thrown into prison. The name of S. A. has recently attracted great interest in England. The armed occupation of Quettah (q. v.) and other measures aroused his suspicious nature. In 1877 his envoy at Peshawur rejected the proposals brought by Sir L. Pelly, which are supposed to have involved the reception of a British Resident at Cabul. All direct relations between Afghanistan and the Indian Government have since been suspended. In August 1878 a Russian mission under General Abramof, with a strong escort, was honourably entertained at Cabul; and in the following month a similar British mission under Sir Neville Chamberlain was contumeliously turned back at the mouth of the Khyber Pass (q. v.). The result was a war between Britain and Afghanistan, in which the latter was rapidly and completely beaten. S. A. was forced to flee from Cabul, and took refuge near the Russian frontier, where he died at Mazan-i-Sherif, 21st February 1879. See *Essays on the External Policy of India*, by J. W. S. Wyllie (Lond. 1875).

Sher'idan, Richard Brinsley Butler, was born in Dublin, 30th September 1751. His grandfather was Dr. Thomas S. (1684–1738), a 'punning, quibbling, fiddling parson;' his father, Thomas S., M.A. (1721–88), by turn an actor, manager, rhetorician, and lexicographer; his mother, Frances S., *née* Chamberlayne (1724–66), the 'quite celestial' author of two novels and comedies. Richard himself, after a year's schooling at Dublin, was sent to Harrow (1762), left it a dunce, but in 1771 published a verse translation of Aristænetus' Epistles. His elopement and double marriage with Miss Linley the singer were followed by his admission to the Middle Temple; but briefs came slowly in, £3000 presented to the lady by an ancient flame ran dry, and the would-be barrister betook himself to play-writing. The comedy of *The Rivals* (1775), damned through bad acting on its first production, when repeated, proved a brilliant hit, yet was well-nigh eclipsed by the comic opera of *The Duenna*. Before the year was out their author was a joint proprietor of Drury Lane—whence deriving the purchase-money, £10,000, is still a mystery—and here in 1777 he brought out *The School for Scandal*, the most finished and faultless comedy in the language, as *The Critic* (1779) is the wittiest farce. At the Literary Club, where Johnson proposed him (1777), he struck up an intimacy with Charles James Fox, and through his influence was returned to Parliament for Stafford (1780). Though his maiden speech was little better received than *The Rivals*, S. obtained office in the Rockingham and Coalition Ministries, and in supporting Hastings' impeachment (1787) 'surpassed,' said Pitt, 'all the eloquence of ancient and modern times.' The purchase, however, of an estate in Surrey on the occasion of a second marriage (1795), crippled his never-abundant means; dissipation, theatrical losses, and the loss by fire of Drury Lane itself (1809), still further reduced them; and beset by duns, worn out in mind and body, S. died in London, 7th July 1816. Save Rogers, Moore, and Holland, all had forsaken him—even 'Europe's First Gentleman,' to whom he was long an unpaid jester; but royal dukes remembered him when dead, and stood by his grave in Poets' Corner. Besides the already-mentioned plays, S. drew upon Molière for *St. Patrick's Day* (1775), upon Vanbrugh for *The Trip to Scarborough* (1777), and upon Kotzebue for his poor 'aftermath,' *The Stranger* (1798) and *Pizarro* (1799). Indeed, even his two inimitable plays, whose 'Joseph Surface' and 'Mrs. Malaprop' live upon every stage, were adaptations from Murphy, Colman, and others of S.'s forerunners. That is, he took rough gems, and by his polishing and splendid setting gave them a value they had never else possessed. Memoirs of S. are prefixed to the editions of his Dramatic Works by Leigh Hunt (1840), and Browne (2 vols. 1873), and to Stainforth's edition of his complete Works (1874); his *Life* was written by Watkins (2 vols. 1817) and Moore (2 vols. 1825). See also Lecture viii. of Hazlitt's *Lectures on the Comic English Writers* (3d ed. 1841), and *S. and His Times* (2 vols. 1859).

Sher'idan, Philip Henry, a distinguished American general, was born at Somerset, Ohio, 6th March 1831. He was educated at West Point, and from 1853 to 1861 he served in Texas and on the Pacific coast. On the outbreak of the Civil War, S. was a captain in the 13th Infantry. At first he held subordinate commands in the west, but in the autumn of 1862 he was transferred to the Army of Ohio, and commanded a division at the battle of Perryville, and again at the battle of Murfreesboro, where he distinguished himself so greatly as to be gazetted major-general of volunteers. In 1863 he served with distinction under Grant at the battle of Chattanooga, and on Grant's transference to the E. he took S. with him, appointing him chief of cavalry of the Army of the Potomac. In the protracted struggle between Grant and Lee in 1864 and 1865 S. rendered the most brilliant services to his chief in several daring cavalry raids into the enemy's country, but especially in the battles of the Wilderness, of Opequan Creek and Cedar Creek, and the final struggles around Five Forks and Appomattox which resulted in the surrender of Lee. In the autumn of 1864 the thanks of Congress were bestowed upon S. and his troops, and he was created major-general in the regular army. Since the war he has held various military commands, and has been raised to the rank of lieutenant-general. He visited Europe, and was a spectator of part of the struggle between the Germans and French. In 1875 he was instrumental in quelling the disturbances in Louisiana.

Sherif' (Arab. 'noble'), the title of a descendant of Mohammed through his daughters Fatima and Ali, now widespread in the Moslem aristocracy. It is common to either sex, the women who inherit wearing a green veil, the men a green turban. In Africa many of the Moslem dynasties were founded by sherifs.

Sher'iff, in Scotch law, denotes two classes of legal officials —the S.-*Depute* and the S.-*Substitute*. From the decision of the latter an appeal lies to the S.-depute, except in criminal matters and in small-debt actions. The civil jurisdiction of the Scotch S. embraces all personal actions on contract, bond, or obligation, actions for rent, forthcomings, poindings of the ground, and possessory actions. He has a summary jurisdiction in all cases whose subject does not exceed the value of £12. The judgments of a S.-depute in civil causes are subject to the review of the Court of Session alone. When the case is partly civil and partly criminal, the Court of Justiciary is the proper court of review. The criminal jurisdiction of the S. embraces all crimes or offences whose penalty is not greater than two years' imprisonment. He has unlimited jurisdiction in matters of bankruptcy and insolvency. He revises lists of parliamentary electors, and he executes and returns to the Crown Office writs for electing members of Parliament. He also discharges the functions of Commissary (q. v.). For S. in England see SHIRE.

Sheriff-Clerk' is, in Scotland, the clerk to the Sheriff-Court.

Sheriff-Court'. See SHERIFF.

Sheriffmuir', a barren spot in the county of Perthshire, Scotland, 5 miles N.E. of Stirling, celebrated as the scene of a conflict between 9000 Jacobites under the Earl of Mar and 3500 royalists under the Duke of Argyle, November 13, 1715. The result was indecisive, the right wing of each army being victorious over the other's left, and the fugitives fleeing in opposite directions. This double discomfiture is humorously sketched in a popular ballad of the period. Burns also penned some rough and racy stanzas on the event.

Sher'lock, William, an English divine, was born at London in 1641, studied at Eton and Cambridge, and became rector of St. George's, London, in 1669. From 1681 to 1689 he was Canon of St. Paul's; in the latter year he was suspended for refusing to preach to King William, but yielding, was reinstated in 1691. He died at Hampstead, 19th June 1707. His *Practical Discourse Concerning Death* (1690), which has passed through more than forty editions, his *Vindication of the Doctrine of the Trinity* (1691), and his *Treatise on the Immortality of the Soul* (1704), are the best known of his voluminous writings.—**Thomas S.**, son of the preceding, born in London in 1678, educated at Eton and Cambridge, where he obtained a fellowship in 1701, succeeded his father in the Mastership of the Temple in 1704, and was elected Vice-Chancellor of his university ten years later. In 1715, concealing his Tory sympathies, he was appointed Dean of Chichester; but in 1717 he stoutly defended against Hoadley the maintenance of the Test Acts, and was removed from the list of royal chaplains. Yet in 1727 he succeeded Hoadley in the bishopric of Bangor, and again in that of Salisbury (1734). During these years he ably combated the doctrines of Collins, Woolston, and other leading rationalists of the day. Declining the Primacy in 1747 he next year accepted the see of London, and died at Fulham, 18th July 1761. A work on *The Use of Prophecy* (1725), *A Vindication of the Christian Religion* (1728), the able and popular *Trial of the Witnesses of Jesus Christ* (1729), and five volumes of *Sermons*, are his chief literary remains.

Sher'man, William Tecumseh, one of the greatest American generals, was born at Lancaster, Ohio, 18th February 1820. Educated at West Point, he entered the army as a lieutenant of artillery in 1840. After serving in Florida and California, he withdrew from the service in 1853, and began business as a banker in San Francisco. At the outbreak of the Civil War he was superintendent of the Louisiana Military Academy, but resigned his post when the State seceded, and offered his services to the Federal Government. He served at the battle of Bull Run as a colonel of infantry, and was shortly after promoted to the rank of brigadier-general of volunteers, receiving command of the department of Ohio. Having stated publicly that for offensive operations he ought to have 200,000 men, it was rumoured that he was insane, and he was removed from his post, but fully regained his military reputation at the battle of Shiloh (q. v.). S. took a prominent part in the operations under Grant around Vicksburg and Memphis in 1862 and 1863. On February 2, 1864, he started from Vicksburg on his famous march to Meridian, the railroad centre of the S.-W., which has been described as a rehearsal for his yet more famous march from Atlanta, but which, owing to a mistake on the part of General Smith, who was to have co-operated with him, was a partial failure. The battles with Hood in Tennessee intervened between this and his great final achievement, the advance from Atlanta 'down to the sea,' which began on the 12th of November. He marched through Georgia, devastating everything on his passage, took Savannah on the 20th of December, and then turned northwards through S. Carolina, and, pursuing the same tactics, compelled the surrender of Johnston's army at Durham Station, 26th April 1865. Washington was reached on the 24th of May, and there, after a grand review, the army which had thus performed one of the most notable of modern military achievements was dissolved. S. ranks along with Grant on the Federal side, and Stonewall Jackson and Lee on the Confederate side, among the very foremost of the great soldiers produced by the Civil War. In originality of design, and fertility of resource, he is perhaps the prince of Transatlantic generals. S. is now (1878) commander-in-chief of the United States army. His *Memoirs of General W. T. S. by Himself* (New York and London, 1875) are allowed to be extremely truthful and graphic, but are rather marred by an ungenerous criticism of his colleagues.

Sherr'y (from Xeres), a generic name for white wines produced in the district of Cadiz in Spain. The principal vineyards are situated near Xeres de la Frontera, the soil there, composed of carbonates of lime and magnesia mixed with clay, yielding the finest quality of S. A full S. vintage averages about 50,000 butts. The annual shipments from Cadiz and Puerto de St. Maria, however, greatly exceed this amount, and the difference is accounted for by the fact that wines are forwarded from other parts of Spain to be made up for export as genuine sherries. In 1874, the export of S. from Xeres and Puerto de St. Maria amounted to 65,363 butts; in 1876, from Xeres alone, 42,622 butts, of which 37,734 were destined for British ports and colonies. Pure S. is a pale, thin, dry wine, and among the finest kinds are Vino Fino, Amontillado, and Manzanilla. These, however, are for the most part retained at Cadiz to form 'Solera,' or 'old-mother-wine,' which is added to inferior wines to induce etherification and improve their quality. The varieties of S. imported into Great Britain vary very much in colour, body, and taste. All export S. is fortified with brandy or alcohol. A factitious wine called 'Hambro' S.' is extensively imported into Great Britain from Germany.

Sher'wood Forest (the forest where the 'shire' motes or meetings were held), a hilly district in the W. of Nottinghamshire, 25 miles by 8, noted in popular legend, and immortalised in *Ivanhoe* as the haunt of Robin Hood (q. v.). Though disafforested, it still contains many fine trees. See White's *Worksop, the Dukery, and Sherwood Forest* (Lond. 1875).

Shet'land, or **Zet'land Islands** (Old Norse, *Hialtlandia*, 'the viking's land'), a group of above ninety islands (of which thirty are inhabited) lying N.N.E. of the Orkney Islands (q. v.), together with which they form a county, returning one member to Parliament. Area, 325 sq. miles; pop. (1871) 31,608, being 97 persons to the sq. mile. The principal are the Mainland (60 miles long, but narrow); N.E. of it Yell (20 miles by 6), Unst (11 miles by 6); Fetlar, Walsay, and Bressay. The lonely islands of Foula, 20 miles W. of Mainland, and Fair Island 25 miles S. of it, are also included in the S. group. The rocks are chiefly Silurian, highly metamorphosed, resting on Laurentian gneiss, and covered in the S. by fragments of the Old Red Sandstone, which characterises the Orkneys. The coast-line of the islands is rocky and precipitous, and much indented; their surface is rocky and bare. The highest summit is Rona Hill, 1590 feet high, in the N. of Mainland: Foula Island attains a height of 1400 feet. The scenery of the islands is very grand. S. is divided into twelve parishes, and contains seventeen Established churches, nine Free churches, six Congregational, five Baptist churches, and an Episcopal church. Of the 208,579 acres in S., 51,803 were under cultivation in 1876. There were 2388 acres of bere (a coarse barley), 8471 of oats, 2749 of potatoes, 618 of turnips, 200 of cabbage, &c., 648 in clover under rotation, 35,027 in permanent pasture. The climate is humid and mild, but severe storms rage during winter. It seems peculiarly healthy for the natives, who frequently attain a great age, and enjoy unusual freedom from pulmonary diseases. In the latitude of S. in midsummer daylight continues throughout the whole 24 hours, while in midwinter the sun is only above the horizon for $5\frac{1}{4}$ hours.

The chief occupation of the Shetlanders is fishing. Cod, ling, tusk, saithe or coal-fish, and herring are caught in great numbers. The bottle-nosed whale and seal are also hunted. The fishing-boats number (1878) 1137, and the men and boys employed 4790. Most of the fishermen possess also small crofts of land, on which they raise oats, bere, turnips, and potatoes. They have an excellent character as sailors throughout the mercantile marine, and many are employed in the Arctic whale-fishery. S. produces peculiar diminutive breeds of horses, cattle, and sheep. In 1876 the islands contained 5772 horses and ponies, 21,050 cattle, 87,925 sheep, and 4663 pigs. The ponies, called *shelties*, are remarkably sure-footed. They were formerly regarded as common property, and ran wild on the moors. Many are exported for use in coal-mines. The salted beef of S. is very delicate, and the sheep afford an excellent wool. The women spend much of their time in knitting, and S. hosiery has long been famous. Though a variety of minerals are found in small quantities, chromate of

iron is the only one obtainable in quantities worth exporting. The chief town of S. is Lerwick (q. v.), 100 miles N. of Kirkwall, with which it communicates by weekly steamers. The only other towns are Hillswick and Scalloway. The chief antiquities are the ruins of Scalloway Castle and of numerous so-called 'Pictish' towers, the chief being Mousa, 12 miles from Lerwick. The S. islands were early peopled by Northmen, and along with the Orkneys were attached to the kingdom of Denmark. Robert Sinclair, Earl of Orkney, held them under the kings of Denmark. In 1469 they were attached to Scotland as dowry of Margaret of Denmark, James III.'s bride. After passing through the hands of various noblemen they were sold in 1766 to Sir Lawrence Dundas, in whose family (the Earls of Zetland) they still remain. Old Norse customs long survived, and are not yet quite extinct, but the English language is now universal. A rich though little-wrought vein of folk-lore is indicated by the survival of many curious incantations or spell-songs, which bear the impress of Odinic origin. A transfigured relic of an Eddic lay—a fragment of Odin's Rune song in a Christianised version —from the lips of an inhabitant of Unst, was received by Karl Blind in 1877.

Shibb'oleth (Heb. 'stream') was the word which the Gileadites under Jephthah made use of at the fords of the Jordan to test the defeated Ephraimites, whom they detected by their inability to pronounce *sh* otherwise than as *s* (Judges xii. 1-6). Hence, in modern English, S. means any peculiarity of opinion which is a test of the adherents of a party or sect.

Shi'ahs. See MOHAMMEDAN SECTS.

Shiel, a loch in the S.W. of Inverness-shire, Scotland, 15 miles long by 2 broad, separating the district of Moidart on the N. from Sunart and Ardgower on the S., and communicating with the sea by Shiel Water and Loch Moidart.

Shield (Ger. *schild*), a piece of defensive armour, consisting of a broad plate carried on the left arm to ward off the missiles or blows of an enemy. It is of great antiquity, but after the introduction of firearms it gradually became obsolete among civilised nations, and is now only used among savage races. The S. of the Homeric age was formed of metal or of bull's hide, wicker, or wood, bound or covered with metal, and was large enough to cover a man. The later Greek shields were more portable, circular or oval, and convex. The S. of Achilles was a marvel of art workmanship (*Iliad*, xviii. 542). The Roman *clipeus* was also round and convex with a boss; the *scutum* was oblong, and curved so as to fit round the body. The Gallic S. was usually oval, and made of osiers or wood, leather-covered and metal-mounted; and of a like nature, having central bosses, were the shields of the Old English, Danes, &c. During the 10th and 11th centuries the 'kite-shaped' or Norman S. prevailed; it was originally flat, afterwards semi-cylindrical. On it were emblazoned distinctive figures and emblems, the immediate origin of the personal armorial bearings commonly borne on the S. in the 12th c. (see HERALDRY). The practice of painting devices on the S. may be traced even in Greek times, and was common among the Germanic tribes, as Tacitus testifies. The old German word *schildern*, 'to paint,' from *schild*, recalls the custom. The 'kite-shaped' S. was succeeded by a smaller one of triangular form, and in the 14th c. the sides of it were rounded, forming the 'heater-shape' of antiquaries. The knightly S. was supported by means of the *guige*, a belt passed across the right shoulder. With the changed conditions of warfare in the 16th c., the S. with heraldic insignia assumed fantastic forms, and then ceased to be carried to battle. Bucklers, roundels, and rondaches were still used in the 17th c., and even in the 18th the Scottish Highlanders fought with the target and broadsword.

Shields, North, a town of Northumberland, England, at the mouth of the Tyne, 7½ miles E. of Newcastle. It stands on the N. bank of the Tyne opposite South Shields (q. v.). There are 5 Episcopal churches and 16 dissenting chapels. Other public buildings are the Townhall, Tyne Sailors' Home, Custom-House, Mercantile Marine Offices, and the Albion and Royal Assembly Rooms. Tynemouth Aquarium and Winter-gardens (309 feet by 117 feet), erected at a cost of £100,000, were opened 28th August 1878. The style is Italian Renaissance, and the façade measures 336 feet in length. The town contains several large iron-foundries, besides which shipbuilding and the subservient manufactures of cables, anchors, sailcloth, &c. are the main industries. Eight boats of 178 tons were built here in 1877. There are a few breweries, salt-pans, and brick-kilns. N. S. returns one member to Parliament, and has one daily newspaper. Many collieries are worked in the vicinity, and much coal and iron are exported from the town, which thus serves as a port of Newcastle, since large vessels cannot ascend the river to the latter place. The harbour and quays can accommodate 2000 large ships. In 1877 the imports amounted to £172,245; the exports to £281,011; and the customs to £25,887. There entered 736 vessels of 246,693 tons, and cleared 929 of 293,981 tons, exclusive of coasting vessels; and on December 31 of the same year, 469 vessels of 142,191 tons were registered as belonging to S., besides 437 fishing-boats. Pop. of borough (1871) 38,941. A village existed here in the time of Edward I., and Cromwell passed an Act for the erection of quays, &c., but the real growth of the modern town dates from the close of last century, when restrictions on its trade were removed. In 1849 the borough of Tynemouth was constituted, comprising the three wards of Percy, Tynemouth, and N. S., but the whole town is usually called N. S.

Shields, South, a town of Durham, England, at the mouth of the Tyne, opposite North Shields, 17 miles N.E. of Durham by rail. It stretches for 2 miles along the river bank, and is in many parts dirty and overcrowded. There are 8 Episcopal churches, including the parish church of St. Hilda, and 10 dissenting chapels. The town-hall, the theatre, and Public Free Library, Custom-House, and Mercantile Marine Offices are the chief public buildings. A new workhouse, to hold 700 inmates and covering 4 acres, is now (1878) being built at a cost of £42,000. Shipbuilding is the chief industry, 25 vessels of 5910 tons having been built here in 1877. There are also rope-walks, sail-factories, iron-foundries, potteries, chemical works, &c. Vast quantities of coal are exported. The extensive harbour contains thirteen dry docks. In 1877 the imports amounted to £1,077,498; the exports to £166,036; and the customs to £9217. There entered 586 vessels, of 278,321 tons, and cleared 364, of 191,079 tons, exclusive of coasting vessels; and on December 31 of the same year, 187 vessels of 69,042 tons were registered as belonging to S. Pop. (1871) 45,336. A fort occupied the site of this town during the time of the Romans, and in the middle ages it was long a fishing station. From the sheds which lined the shore it was called *Le Sheeles*, whence the modern name is derived. Salt-pans long flourished here, and extensive glassworks were started last century. The borough was enfranchised in 1832, and returns one member to Parliament. It has one daily newspaper. It was here in 1790 that Greathead and Wouldhave, natives of the place, launched the first lifeboat.

Shikárpúr, the chief town of the district of the same name, Scinde, British India, 18 miles W. of the Indus, and 330 miles N. of Kurachi. It was founded about 1617, is walled, but has no important buildings. The surrounding country is irrigated with canals. S. stands at the foot of the Bolan Pass, the chief commercial route to Kelat and Afghanistan. Its imports are estimated at £300,000, of which piece-goods and grain are the most valuable; the exports at £100,000, including wool and spices. S. merchants and bankers are renowned throughout the East. The manufactures are carpets, cotton cloth, and paper, which are carried on profitably in the jail. Pop. (1872) 38,107. —S. *district* lies between Kelat and Rajputana on both banks of the Indus. Area 8813 sq. miles; pop. (1872) 776,227. The chief crops are millets, cotton, wheat, barley, rice, and indigo. See Captain Burton's *Scinde Revisited* (Lond. 1877).

Shil'ka, a river of Eastern Siberia, rises in the Trans-Baikal region, among the Yablonoi Mountains, and after a N.E. course of 260 miles falls into the Amur (q. v.) a little beyond Ust Strelka. It is navigable for boats to the foot of the Yablonoi Mountains, and is historically interesting as the 'point of departure' for the Russians in their conquests on the Lower Amur.

Shill'ing, a British coin of currency and account, equal in value to 12 pennies and 1-20th of a pound sterling. Before the reign of Edward I. it fluctuated greatly in value, from five-pence to twenty-pence, with various intermediate values. The coin is in use in several of the states of N. Germany and Denmark, the best known being the Hamburg *schilling*, which is valued at one penny English money.

Shillong' (*Silang*), the administrative capital since 1874 of the province of Assam, British India, and the headquarters of the district of the Cossya and Jynteah Hills (q. v.). It lies among the mountains that form the watershed between the Brahmaputra and Surma river systems, 4900 feet above the sea. It is connected on the N. with Gowhatty (q. v.), the former capital of the province, by a good cart-road. S. is healthy and conveniently situated, and has much increased since it became the residence of the chief commissioner and his staff. There is a church, and permanent official buildings are (1878) being erected. Pop. (1872) 1393.

Shi'loh, Battle of, fought on the Tennessee River, Tennessee, on the 6th and 7th of April 1862, between the Federal army under Generals Grant and Sherman, and the Confederates under Generals Johnston and Beauregard. On the first day of the battle the advantage lay with the Confederates; on the second, the Union army, having received reinforcements, defeated their opponents, and forced them to retreat to Corinth.

Shimo'ga, the chief town of the district of the same name, in the State of Mysore, India, on the left bank of the Tunga river, a tributary of the Kistna, 171 miles N.W. of Bangalore; pop. (1871) 11,034. Paper and chintz are manufactured.—The *district* of S., which lies in the extreme N W. of Mysore, has an area of 3797 sq. miles; pop. (1871) 498,976. The crops are rice, *ragee*, sugar-cane, areca nuts, and coffee. At the village of Sorab the best sandal-wood carving in India is executed. By the falls of Gersoppa, which are among the finest in the world, the Sharavati river, 250 yards wide, throws itself down the E. Ghauts with a leap of 960 feet At Sulekere is an artificial lake 40 miles in circumference, which is now being utilised for irrigation.

Shin, a loch in Sutherlandshire, Scotland, 15 miles long by 2 broad, discharges by the river S. into Dornoch Firth. It abounds with trout and salmon.

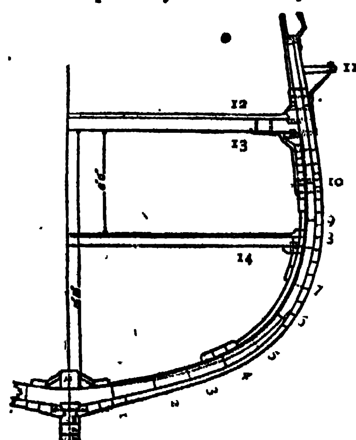
Shing-King, a province of Mantchuria (q. v.), bounded S. by the Gulf of Leao Tong and Corea Bay, W. by the Palisade, or Barrier of Stakes, a continuation of the Great Wall, E. by Corea, and N. by Kir-in-ula. Area, 40,000 sq. miles; pop. about 2,166,000, of whom 942,003 are Chinese. The capital is Mukden (q. v.). The surface is mountainous, but the valleys are fruitful, and the soil is known to contain much coal, iron, gold, &c. Agricultural produce is exported. In 1875 the value of the exports was £511,448, and of the imports £709,660.

Shingles (Comp. Ger. *schindel*; Lat. *scindula*, from *scindo*, 'I split'), are thin narrow boards of oak or pine somewhat resembling the staves of a tub, and are used instead of slates or tiles for covering a roof. They are cut by machinery.

Shingles (Lat. *cingulum*, 'a girdle') is the popular name for the variety of Herpes (q. v.) known as *Herpes Zoster*. It is characterised by the arrangement of the inflamed patches, with their clustered vesicles, in the form of a half zone, following the distribution of one of the intercostal nerves, and extending from the back to the sternum. S. is generally preceded by slight fever and severe pain in the parts; the eruption runs its course in about a fortnight.

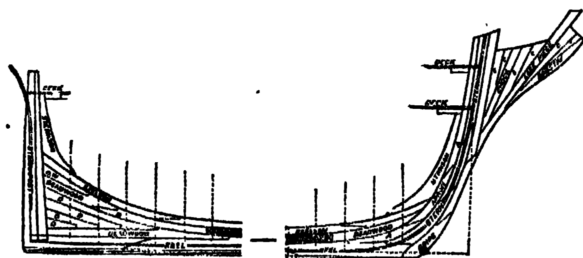
Ship (Old Eng. *scip*, Norse *skip*, Old Ger. *skif*, mod. Ger. *schiff*. the root-meaning is perhaps seen in the Gr. *skaphē*, 'a boat,' from *skaptō*, 'I scoop'), a general term for large vessels of whatever kind, formerly applied only to such as had three complete masts.

Ship'broker, an agent in a seaport town whose business it is to procure and collect *freights*, to enter and clear vessels at the custom-house, and generally to arrange matters of business between shipowners and merchants. Most shipbrokers act also as *Insurance Brokers*, in which capacity they negotiate marine insurances between owners and underwriters, and settle all details, such as the amount and conditions of the risk, the rates of premium required, and the proportionate sums recoverable in the event of partial loss. An insurance broker is responsible for the amount of premium to the underwriter, but not for the settlement of a claim to the owner who makes it. The remuneration of ship and insurance brokers is by commission, in the former case about 2 per cent. on receipts, and the latter 5 per cent. on premiums, and ½ per cent. on claims paid.



Ship'-building. Naval architecture is an art of unparalleled importance in the commerce of the world; and in maritime nations, of which Great Britain is still the first, it is simply the mainstay of national prosperity. No country has more assiduously cultivated the art than Great Britain, and its operations bulk prominently among all British industries. Formerly S. operations were prosecuted as a result of precedent and experience as regards outline, strength, &c., of vessels; now all data for construction are calculated from mathematical principles, and naval architecture thus ranks among scientific industries.

To trace the slow development of S. from the primitive raft or canoe hollowed out of a single trunk—the vessel of our prehistoric ancestors—down to the ironclad war-ships and magnificent merchant steamers of the present day, would be a task as instructive as interesting. But the subject is too vast and varied to permit here more than the briefest notice of the salient points in the history and present state of the art. Doubtless, canoes hollowed out of the trunks of trees, such as are occasionally found in excavating old river-courses, beaches, &c., and which yet continue in use among rude Pacific tribes, were the kind of vessels first made. The paintings and carvings of the early Egyptians show that the art of building boats of planks, and propelling them by sails was known to that people. Basket or wicker-work structures covered with skins or hides were also in use at a very early period, and under the name of Coracles (q. v.) have persisted till modern times. The Phœnicians were the first nation of antiquity who derived greatness from maritime enterprise, and that their ships must have been of considerable size is indicated by the fact that they circumnavigated Africa, starting from the Red Sea and entering the Mediterranean by the Straits of Gibraltar—a voyage of three years' duration. Roman shipping, during the palmy days of the empire, was distinguished into three classes—*naves longæ*, ships of war; *naves onerariæ*, merchant vessels; and *naves liburnæ*, which were equivalent to passenger or despatch boats. The war vessels varied in size from boats with a single bank of oars up to galleys with five banks or rows of oars, called *quinqueremes*. The *triremis*, or three-bank galley, the ordinary type of a war vessel, was constructed with decks or platforms at both extremities, and open in the middle; and those of greater size were completely covered with a deck. The use of sails in the larger class of vessels became general in the early part of the 14th c., and coincidently the discovery or introduction of the mariner's compass gave an enormous impetus to navigation, enabling sailors to dash boldly from coast to coast across seas, instead of timidly hugging dangerous coasts. In the hands of the Venetians, Genoese, Portuguese, Spaniards, Dutch, and English respectively, the art of S. was maintained and has gradually advanced to its present pitch of excellence. The changes and improvements in naval architecture have been greater, more numerous, and important in the 19th c. than the combined advances of all previous ages.



So far as regards the building and fitting up of the hulls and rigging of vessels, which is the work of the shipbuilder proper, modern S. is of two different kinds, one having to do with the building of wooden ships, and the other with the building of iron and steel ships. The construction of armour-plated ships of war may be considered a third kind standing apart, as their purposes and needs are totally different from those of merchant vessels.

Wooden S.—In proceeding to design any vessel, the builder is guided as to general principles not only by accumulated experience, but by the result of an extensive and complex series of mathematical calculations, by which the essential elements of the body of any ship are determined, and questions connected with the stability of floating bodies and other theoretical questions are settled. He at the same time must know the nature of the service for which the vessel is intended, and by calculation he arranges that the displacement or total weight of the vessel afloat shall be in accordance with the required draught of water. The relations of displacement and draught of water are dependent on the length, breadth, and depth of vessel, and the settlement of these proportions is affected by questions as to steering power, stability, and sailing qualities. Further, the weight of the completed vessel, and the freight for which it is intended, must, as far as practicable, be determined beforehand. With these data the designer prepares the constructive drawings of the proposed vessel, three plans being required,—the body plan, the sheer plan, and the

half-breadth plan. The body plan consists of two equal divisions giving the outline of the proposed vessel as seen from before and behind, at its widest part, and these divisions are called respectively the fore-body and after-body. The sheer plan is a side plan of the ship, and the half-breadth plan is, as the name indicates, an outline in one half of the vessel as seen from above. These plans, with certain sectional lines laid down on them, are essential to enable the builder to make various calculations upon which the stability and other qualities of the ship to be built depend. In the practical work of building, the first operation is to 'lay off' on the 'mould-loft' floor, from the prepared plans and drawings, lines representing the full size and real dimensions of the principal parts of the vessel. From these moulds or skeleton outlines are taken for the guidance of the workmen in constructing the various parts of the work. The *keel* is the first part laid down, and it consists of long pieces of elm held together by horizontal scarfs, so as to form in effect one continuous beam. It is the most important part of the vessel, as it forms the connecting link of all parts of the structure. The keel is connected to the stern by a 'scarf,' and to the stern-post

CROSS SECTION OF WOODEN SHIP.

SECTION OF WOODEN SHIP LENGTHWAYS.

it is united by mortice and tenon. The *keelson* is an internal line of timbers which are fitted on the floors immediately over the keel, its principal function being to secure the *ribs* or *frames*. These are composed of the most durable varieties of timber, and according to the class of wood used in the frames and other principal parts of a vessel, the classification in Lloyd's Register is determined. The most approved timbers for frames are oak, teak, sâl, mora, and greenheart. Two sets of timbers are distinguished in the frame, called respectively the 'frame' and the 'filling-frame' timbers. As the ribs are built up of several pieces, the ends or butts of these alternate sets are so arranged that they terminate at different heights, thus giving play or shift to each other. The separate pieces are known as 'futtocks,' the butts or ends of the frame futtocks being called 'heads,' and the butts of the filling frame timbers are distinguished as 'sirmarks.' For receiving and supporting the beams which extend transversely from side to side of the vessel, stout longitudinal beams are worked around the inside of the vessel. These beams are called *shelf-pieces*, and in addition to accommodating the beams, they are themselves of great importance as longitudinal ties and struts. The *beams* are primarily intended for carrying the decks, and they are always made to curve upwards towards the centre, whereby something of the strength and rigidity of an arched structure is obtained, and a convenient means of running water to the *scuppers* is secured. The beams also perform a most important function in acting as shores or struts to prevent the sides of the vessel from collapsing, and as ties to keep them securely knit to each other. Having these important offices to perform, and being subject to numerous and complex strains, the modes of connecting the beams to the sides require careful attention, and there are various methods by which these connections are made. *Carlings* are fore-and-aft pieces which stretch between two whole beams, for receiving the ends of half beams, or such as, owing to the presence of hatches and other openings, cannot stretch from side to side of the vessel. At the bows of the vessel the two sides are connected by *hooks* of timber or iron, which act both as struts and ties according to the circumstances in which the hull is placed. Thus when loaded and immersed in water the sides tend to collapse by external pressure, which is resisted by the hooks internally. On the other hand, when the ship is grounded or in dock, the sides tending to fall apart are tied together by the hooks. The skin or sheathing of the entire vessel, both internal and external, is called the *planking*, and it is put on in continuous *strakes* or lengths, extending from stem to stern. The planks are worked on the sides either in parallel breadths called straight-edged, or in combinations of two strakes, the broad end of the one so fitting to the narrow end of the other, that in combination the two make a combined strake of equal breadth. The upper strakes are termed 'sheet strakes,' and the strake on each side of the keel which fits into the rabbit or inclined plane cut in that timber are called the 'garboard strakes,' and occupy an important place in the structure. At certain points where increased strength of planking is desirable, the thickness of the strakes of planking is materially increased. The internal planking of the hold is termed the ceiling, and the strakes on each side of the keelson are called the limber strakes, and here bilge and any leakage water accumulates so that it may be pumped away. The planking is sometimes secured to each rib or frame over which it passes by one fastening, sometimes by two, or by one and two alternately, the best fastenings being screw trenails with bolts at the butts or ends. The decks, in addition to their office of serving as floors or platforms, add materially to the strength and compactness of the structure, by acting both as ties and struts. They are laid as far as possible in continuous longitudinal strakes, and especial strength of material and fastening is given to the outer-edge strakes, which are generally made of thick planks of hardwood, carefully dowelled and bolted to the beams. After the planking is finished, there remains the important work of *caulking*, which consists of beating oakum with a caulking-iron into every joint in the hull, thereby rendering it thoroughly water-tight, while securing a certain elasticity under strain. The caulked seams are protected with a coating of pitch or of marine glue, a compound of india-rubber and shellac dissolved in naphtha, and the hull is further protected by thin plates of Muntz's sheathing metal, a modified form of brass.

Iron S.—The use of wood for the construction of ships is now being rapidly superseded by iron and steel. In the United Kingdom, indeed, the yards in which wooden ships are now exclusively built are few and unimportant. The art of rolling iron plates such as are used in the building of ships was not developed till 1784, and about 1787 a canal barge of iron was constructed. About the year 1812 such iron barges were in common use on the Staffordshire canals. In 1816 the *Vulcan*, the first iron vessel built in Scotland, was launched on the canal at Monkland. In 1822 the *Aaron Manby*, an iron steamer, was built in sections, put together in London, and steamed to Havre and Paris. The first iron-built vessel classed at Lloyd's was the *Ironsides*, 271 tons register, built at Liverpool in 1838; but she was simply registered as 'built of iron,' and had no letter attached. The same method of registration continued in force till 1844, after which vessels were registered A1, &c., 'built of iron,' with a limit of six years to the duration of the class. In 1857 a special registration was adopted, whereby the designation of class by years was abolished. Thus it may be said that the suitableness of iron for S. has been known for about fifty years, but it is only recently that it has come to be extensively used. In addition to the necessity for overcoming prejudices against a system which had prevailed from the earliest ages, it must be remembered that while wood has been increasing in price and becoming scarce, improvements in the manufacture of iron have

enormously cheapened its production, and rendered it available for many purposes to which in earlier times it could not profitably be devoted.

The superiority of iron to wood as a material for S. is due to many causes. It is cheaper; an iron ship is stronger, and more durable; its carrying capacity is greater, and it is more easily put together than a wooden vessel; moreover, the supply of raw material is more certain and more equal in quality. The only disadvantage, indeed, of an iron ship is the readiness with which its bottom fouls by the adherence of marine organisms, a minor drawback for which no effectual remedy has yet been found.

In an iron ship, ribs of angle iron and rolled iron plates like boiler plate take respectively the place occupied by the timbers and planking of a wooden vessel. A good deal of diversity of opinion and practice exists as to the best forms and methods of combining these in the structure, some advocating light ribs and strong plates, while others are in favour of making the ribs comparatively stronger than the skin of plating. The late Dr. Fairbairn was a powerful advocate of strong ribs and frames, which he held to be essential for the rigidity and strength of the hull, as well as to give a secure basis on which to rivet the outer plates. Looking on an iron-ship as one great girder, he also strongly advocated the cellular construction of the frame vessels, whereby a double bottom is secured, giving great strength to resist compression, and making the ship what is known technically as unsinkable. The riveting or jointing of the iron plates is a subject of great importance, as on that depends to a large extent the power of the structure to withstand the varied and complex strains to which it is subject. At the present time builders are gradually and cautiously feeling their way towards the substitution of steel plates and ribs for the iron now used in building, and it is certain that the improvements which are being effected in steel manufacture, both as regards economy and certainty of material, will have the effect of greatly increasing the use of mild steel in future for all vessels in which strength combined with lightness and speed is desiderated.

Composite S.—By a composite ship is generally understood a vessel in which ribs and other framework are of iron, covered with the planking of an ordinary wood vessel. To increase the strength of the frame in such ships, two longitudinal stringers of iron are run around both sides at considerable distances apart, and these are tied by a series of diagonal plates or stays. Dr. Fairbairn is of opinion that the two materials are seldom united in the constructive arts with any degree of advantage, especially in cases where great strength is required; and more particularly in constructions which have to contend with forces calculated to tear them asunder. Mr. M'Laine, of Belfast, advocates precisely the reverse of the ordinary procedure in composite S., considering that it is 'a mistake to retain only the comparatively useless iron frame in composite vessels; and that it is much simpler, and more in accordance with correct principles, to retain the iron skin to give strength to the composite structure.' Vessels so constructed, Mr. M'Laine holds, would combine all the good qualities of both iron and wooden vessels, and would, in some respects, be much superior to either. In the opinion of Dr. Fairbairn, M'Laine's system gives the best combination of wood and iron applied to the construction of ships; but at the same time he regards it as inferior to and more expensive than his system of double-bottomed iron S.

Other details regarding the construction and fitting of vessels will be found under ARMOUR-PLATES, LAUNCH, MAST, NAVIES, NAVIGATION, SAIL, WAR-SHIPS, &c. See Murray's *S. and Steamships* (1861); Scott Russell's *Modern System of Naval Architecture* (3 vols. 1865); Fairbairn's *Treatise on Iron S.* (1865); Rankine's *S., Theoretical and Practical* (1866); Lissignol's *Navires en Fer à Voiles* (1866); Grantham's *Iron S., with Practical Illustrations* (*Atlas of Plates*, 1868); Reed's *S. in Iron and Steel* (1869); Smith's *Handbook of Iron S.* (1869); Thearle's *Practical Naval Architecture* (post 8vo, and plates, 4to, 1878); and the *Transactions of the Institution of Naval Architects.*

Ship'ka, a village of Turkey, on the S. declivity of the Balkan range, 1798 feet above the sea, and 5 miles W.N.W. of Kasanlik, has 800 Bulgarian houses and two churches. The chief occupation is rose-growing, for the manufacture of rose-oil. S. gives its name to the **S. Pass**, 2938 feet (according to Barth) above it, reached by a steep path nearly impassable for carriages. From the pass a more gradual road (4½ hours' ride) leads 9 miles N. to Gabrovo (1300 houses), 839 feet lower. It was the scene of desperate and bloody struggles in August and September 1877, between Suleiman Pasha and a Russian force which had seized it after crossing the Balkans (14th July) by the Hainkoi Pass, and suffering defeat at his hands at Eski Sagra. In a vain endeavour to force the pass, the Turkish general threw away the lives of more than 20,000 veterans.

Ship'-Money. In 6134 Noy, the Attorney-General, furnished Charles I. with a way to raise an extraordinary supply without the consent of Parliament, viz., by the imposition of a tax upon the port-towns for the provision of ships to guard the seas, and upon the maritime counties for their equipment. His precedents, unearthed from the Tower records, dated from the days when no standing fleet existed, but when the seaports had lent ships for the protection of the country from invasion. However, in 1635 the King sent out writs for S.-M. all over the kingdom, precedents being now abandoned, and Laud having resolved to derive a permanent revenue from the conversion of S.-M. levied on maritime districts into a tax imposed by the royal prerogative on the entire country. Not above £200,000 was raised in 1636 from the tax, which met with strong opposition, and the refusal of Hampden (q. v.) to pay the twenty shillings at which he was rated was one of the proximate causes of the Great Rebellion. The Long Parliament annulled the judgment in his case, and declared S.-M. illegal, in November 1640. See Gardiner's *Personal Government of Charles I.* (vol. ii. Lond. 1877).

Shipp'ing Act. See MERCHANT SHIPPING ACT.

Ship's Hus'band, the owners' agent in the management of a ship, often himself one of the owners. His duties are to keep the vessel in repair and ensure her seaworthiness, to see her properly manned, to attend to her freightage and especially to her provisioning, to look after her papers, and in general to see her properly and efficiently equipped.

Ship'-worm. See TEREDO.

Shiraz', a celebrated Persian city lying in a fertile and well-cultivated plain, 494 miles S.S.E. of Teheran, and 165 miles N.E. of Bushire by road. It is over 3 miles in circumference, and is surrounded by a dry ditch and a low wall of mud, flanked with semicircular towers, and pierced by six gates. Its mosques, covered with lacquered turquoise blue tiles, and surmounted with lofty domes and minarets, give it a highly picturesque appearance. S. has 15 mosques, 11 colleges, 14 bazaars, 13 caravanserais, and 26 public baths. Its principal bazaar, the Bazar-i-Wakil, built by Kerim Khan, is the finest in Persia. It is a quarter of a mile long, and is built of yellow bricks arched at the top. S. has several fine mausolea, among them that of Hafiz, outside the walls. The *ark* or citadel of the town, the residence of the Beglerbeg of Fars, is a fortified square of 80 yards. In the vicinity are many beautiful gardens, the most famous of which is the Jahan Numa ('Epitome of the World'), with fine cypress trees. S. enjoys a delicious climate. It is surrounded by extensive vineyards and gardens. The chief exports are silk, cotton, glass, earthenware, wine, and extract of roses. Pop. (*Almanach de Gotha* for 1878) 30,000. S. was founded during the 7th c., and was a favourite residence of the early sovereigns of Persia. It was improved by Kerim Khan, and in his reign had 10,000 houses and a pop. of 50,000. In 1810, however, when visited by Sir John Malcolm, its pop. was only 20,000. In 1812 and in 1824 it was almost ruined by earthquakes, 4000 persons having perished on the latter occasion; and again in 1853 it was almost entirely destroyed, when upwards of 10,000 persons perished. S. was the birthplace of the famous poets Hafiz (q. v.) and Saadi (q. v.).

Shire, the English equivalent of the Norman County (q. v.), is derived from the Old Eng. *sciran*, 'to divide.' Whether in England the Mark (q. v.) ever possessed the same autonomy as on the Continent, is doubtful. Certain at least it is that with constant Welsh raids to be repelled, and fresh invasions to be

undertaken, the marks must have been connected by military confederations, and such connection growing gradually closer, the shires arose out of their amalgamation, just as later these shires, each governed by its own Ealdorman (see EARL), coalesced into kingdoms under a single king. That the process was a gradual one is proved by the nomenclature. For while the W. Saxon shires still bear the original titles of the principalities founded by Cedric's successors (Wilsætas, Dornsætas, Sumorsætas, &c.), in Mercia the case was otherwise. There, at a date subsequent to Ælfred's reign, the earlier names were replaced by others derived from towns—Cheshire from Chester, Staffordshire from Stafford, and so on. Shropshire, as being rather cognate with than derived from Shrewsbury, may be regarded as an exception, and Rutland is not so much as cognate with any town; but then it does not figure in *Domesday* as a separate S. These considerations, and the fact that while the Wessex shires adhere to the ancient boundaries, these have in Mercia been frequently obliterated, lead to the conclusion that the Mercian shires were artificially mapped out either by the Danish conquerors of the 9th c., or more probably by Eadward the Elder (901-925). Chief among the officers dispersed throughout a S. to attend to the royal interests stood the Scirgerefa, Shire-reeve, or Sheriff (see GRAF), the king's immediate agent and representative. He it was who levied dues, fines, and amercements; to him the regal writs were addressed, and he, in the Ealdorman's absence, or, after the Norman Conquest, in his stead, presided over the hundred and S. courts. The latter were left unchanged by the judicial reforms of the Plantagenets. In them the knighthood, yeomanry, and husbandmen of the S. gathered around the sheriff, as he heard appeals from the hundred or soke courts, published the king's writs and demands of aid, assessed the local taxation, and received the presentment of criminals and inquests. In the S. court the sheriff summoned the lesser barons to the Great Assembly, and in the constitution of the S. court, with its twelve sworn deputies from every hundred, the germs may be discovered of the modern representative system of Parliament (q. v.). At present the sheriff's duties—of 'life of justice' (returning juries), of 'life of the law' (executing judgments), and of 'life of the commonwealth' (preserving the peace of the S.)—are mainly performed by a deputy, the under sheriff. At a meeting presided over by the Chancellor of the Exchequer and held on the 12th November, the judges give in the name of three fit persons for each county, and unless good cause be shown for exemption, the first name on the list is selected. Then the list having been reconsidered at a Cabinet meeting on 3d February, the Queen in Privy Council pierces it with a punch opposite each of the names of the sheriffs-elect, this ceremony being termed 'pricking for sheriffs.' A penalty of £500 attaches to refusal to serve, except in cases of proved disability. See Kemble's *Saxons in England* (vol. i. pp. 77-84), and Freeman's *Norman Conquest* (vol. i. chs. ii.-iii.).

Shiré, a river of S.E. Africa, issues from the southern end of Lake Nyassa (q. v.), and joins the Zambezi after a southerly course of 250 miles. In its upper course the S. is from 9 to 15 feet deep, with very little current, but from 15° 50′ S. lat. it descends 1200 feet in 35 miles by five cataracts, which interrupt navigation. Below these the S. is 12 feet deep and 150 yards broad, with a 2½ knot current.

Shir'ley, James, an English dramatist, born in London, September 13th, 1596, was educated at the Merchant Taylors' School, and at St. John's College, Oxford. He graduated at St. Catharine's Hall, Cambridge, took a cure near St. Albans, and subsequently turning Romanist, resigned his living to teach in St. Albans Roman School. Then he became a playwright in London, and had written in all 33 pieces before 1642, when Parliament suppressed theatres. During the civil wars S. aided the Earl of Newcastle with pen and sword. Returning to London, he gained subsistence once more by teaching, but he and his wife were driven from their Fleet Street home by the Great Fire, and both perished from fatigue on the same day, October 29, 1666. S.'s style is rich and strong. He was only nine years old when Elizabeth died, yet he is usually ranked with the great Elizabethan dramatists, whose intellectual characteristics he possesses. While the licence Charles II. inaugurated did not tempt him to resume the pen, and while his view of humanity is higher than that of the Restoration wits, he occasionally rivals them in filth. *The Traytor*, *The Lady of Pleasure*, and *Hide Park* are S.'s finest plays; but he himself called *The Cardinall* 'the best of his flock.' Gifford and Dyce edited S.'s works, in 6 vols. (Lond. 1833).

Shirt (Old Eng. *sceort*), a familiar article of male attire, was first worn in England during the pre-Norman period, linen being the material of which it was made. Woollen shirts were introduced later, and in the 10th c. the wearing of one was reckoned a severe form of penance. Silken shirts were in use in Chaucer's time, while during the 15th and 16th centuries shirts of fine lawn, richly embroidered on the collar, front, and wrists, were the fashion, and for their display the doublets were worn low-necked and 'slashed' in the arms. In Charles II.'s reign much of the S. was shown, and then it was common to ornament it with cut-work representing historical and religious subjects.

Shir'wa, or **Taman'dua**, a lake of S.E. Africa, 30 miles S.E. of Lake Nyassa (q. v.). It is pear-shaped, 60 miles long, from 10 to 23 miles broad, and 1800 feet above the sea-level, lying in a basin formed by mountains which rise in some parts to a height of 7000 to 8000 feet. The lake receives several streams, but has no outlet, and is brackish.

Shis'dra, a town of Russia, government of Kaluga, on the S., a feeder of the Ugra, 37 miles E.N.E. of Briansk. It manufactures oil, woollens, glass, leather. Pop. (1870) 11,703.

Shis'hak (Egypt. *Shashanga*, Heb. *Shishag*, and Gr. *Sousakim*), the name of several Egyptian monarchs of the twenty-second dynasty, of whom the first and most remarkable, a Semite by race, united Egypt under one government, but failed to conquer the Ethiopian rulers of Napata. Jeroboam took refuge at his court, and in the fifth year of Rehoboam (962 B.C.) S. overran Judah, and plundered the temple and palace of Jerusalem (1 Kings xiv. 25; 2 Chron. xii. 2-9). The Portico of the Bubastites, in the temple of Karnak, is inscribed with the names of 130 cities captured by S.

Shitt'im Wood, of which the Ark of the Covenant was constructed, is generally considered to have been the wood of some species of *Acacia*. Some suggest the African and Arabian variety of *A. Arabica* (*A. nilotica*), and others *A. Sevel* of the Libyan and Nubian deserts.

Shive (Low Ger. *schive*, 'anything round an flat') signifies a flat round cork or bung.

Sho'a, the most southerly division of Abyssinia (q. v.), of which it is now independent. Its boundaries, especially on the W. and S., are very variable. S. is mountainous, well watered, fertile, and populous. The capital is Ankobar (q. v.).

Shock and Collapse'. The condition called shock or collapse is described as follows by Mr. Savory,—'The patient lies in a state of utter prostration. There is a striking pallor of the whole surface, most marked from its contrast to the natural colour of the face; the lips even are quite pale and bloodless. There is a cold, clammy moisture on the skin, and often distinct drops of sweat upon the forehead. The countenance has a dull aspect, and appears shrunken and contracted. There is remarkable languor in the whole expression, and especially in the eye, which has lost its natural lustre, and is partially concealed by the drooping of the upper lid. The nostrils are usually dilated. The temperature is considerably reduced, and if the person be able he will complain of cold, and perhaps shudder. Muscular debility is extreme, apparent at a glance in the condition of the lips and hands, occasionally even in the relaxation of the sphincters. The pulse is generally frequent, sometimes irregular, always very feeble, perhaps imperceptible. In this latter case, although the ear may detect the fluttering action of the heart, the pulse does not reach the wrist. The respiratory movements are short and feeble, or panting and gasping, wanting the relief of sighs, sometimes imperceptible, although in the majority of such cases some action of the diaphragm may be detected by careful observation. Vertigo, with dimness of vision, supervenes. As a rule there is not complete insensibility, although there is much variability in this respect, depending, no doubt, on the nature of the injury; but the person is drowsy and bewildered, yet conscious, and perhaps rational, when roused. Sometimes the intellect is singularly clear and the senses perfect,

the hearing occasionally painfully acute. In the less extreme cases there are often nausea and vomiting with hiccough. The last is very variable in its occurrence.'

S. or C. may be caused by great mental emotion, hæmorrhage, violent injury, especially of the abdominal viscera, the large joints, &c.; severe pain and certain poisons; and in such cases the shock may be so great as to prove fatal at once.

Treatment.—The first care of the surgeon is the avoidance of immediate death in the first shock; and for this purpose, warmth is one of the most essential requisites. Towels wrung out of hot water should be bound round the head, or hot effusions should be employed, and hot fomentations should be applied to the epigastrium and the extremities. Galvanism over the præcordial region is valuable as a remedial agent; ammonia should be applied to the nostrils; and brandy, in small quantities, should be given by the mouth or rectum. Transfusion (q. v.) should be practised if the heart is acting, though the patient seems otherwise dead, and the efforts at revival should be practised for a considerable length of time. See Holmes' *System of Surgery*, vol. i. pp. 765, *et seq.*

Shodd'y is the name given to the wool obtained from worn worsted goods, as flannels, stockings, blankets, &c., by tearing them to separate fibres in a 'devil machine,' which contains a revolving cylinder armed with numerous spikes. Hard and fine woollen rags, and new cloth clippings and shreds similarly operated on, yield 'mungo,' and 'extract' is the residue of mixed wool and cotton rags after the cotton has been destroyed by a chemical process. From these varieties of refuse wool, especially S. and mungo, a great variety of cheap fabrics are manufactured, new wool being spun with the old wool. The fabrics themselves, most of which have cotton warps, receive the general name of S. The first attempt to utilise S. was made about 1813 in Yorkshire in the production of the meanest class of all wool goods. The manufacture made slow progress till 1834, when the use of mungo was introduced, and the successful application of this short-stapled wool, together with the introduction a few years later of cotton warps, gave an immense impetus to the S. cloth industry, which now ranks as one of great importance and prosperity in Great Britain. The West Riding of Yorkshire is the seat of the industry, Batley, Dewsbury, and other towns being wholly devoted to it. The total quantity of material, formerly waste, now utilised in this manufacture cannot be far short of 100,000,000 lbs., a considerable proportion being drawn from foreign sources.

Shoe Manufacture. The original form of covering and protection for the human foot was probably the sandal, which is still worn by the natives of southern countries. In its simplest form, it consisted merely of a sole attached to the foot by leathern belts or thongs. From this the various kinds of shoes and boots have been gradually developed, and though foot-coverings were much less important among the ancient Greeks and Romans than among the nations of the present day, several varieties were distinguished. Thus the *solea* or *soccus* was little more than a sandal, with the addition of a covering at the point for the toes. The *caliga* was the sandal of the common soldier; the *calceus*, a kind of shoe, was worn by superior officers. The form and colour of the *calceus* indicated the rank of its wearer, and of those worn by senators, a kind called *mullei*, from resemblance to the scales of the red mullet, were much admired. Some of these shoes also were made of 'tawed' or alumned leather, and called *alata*. The *pero* was a boot of raw hide worn by rustics and labourers, and the *cothurnus* a boot sometimes laced up to the knee, and specially affected by actors, horsemen, and hunters. For the races inhabiting more rigorous climates than those of Greece and Rome, the open sandal would not present a sufficient protection to the feet, and a kind of mocassin of undressed hide was used by the early Britons. For a brief notice of the subsequent changes in the form of this part of covering, see article Boots. Since their introduction, indiarubber and guttapercha have been variously utilised in the manufacture of boots and shoes. The Sabot (q. v.) is still extensively used in several European countries.

Shoemaking was formerly entirely a domestic handicraft, and to a considerable extent is so still. But within the present generation machinery has been largely adapted to boot and shoe manufacture, and the industry now ranks among the extensive and important factory occupations. In 1871 there were in Great Britain and Ireland 281,455 persons engaged in shoemaking; and in 1875, 147 factories, with 3547 sewing-machines, employed 18,418 hands. The chief seats of this industry in Great Britain are Leicester, Stafford, Ipswich, Northampton, Newcastle-under-Lyme, Maybole; in the United States, Lynn, Haverhill, Marblehead, Worcester, and Danvers in Massachusetts; Portland, Augusta, and Lewiston in Maine; Dover and Farmington in New Hampshire. Lynn alone in 1874 produced 11,000,000 pairs, valued at $14,000,000; Boston, the centre of the wholesale trade, in the same year exported 55,000,000 pairs. France exports to England and other countries large quantities of ladies' boots. The exports from Great Britain in 1877 amounted to 5,243,992 pairs, of which Australia took 2,491,512 pairs. The following are the four principal systems pursued in the manufacture. 1st, Hand-sewing; 2d, Pegging; 3d, Riveting; and 4th, Wax-thread machine-sewing. The first—hand-sewing system—is the old handicraft method by which the best and most durable work, but at the same time the most costly and tedious, is produced. In all kinds of shoemaking two distinct branches of the work are recognised; the making of the 'uppers' or 'vamps,' the portions above the foot, and of the sole or under part of the boot. The stitching of uppers is generally done as a separate branch of the trade, and while hand-sewing entirely prevailed, 'closing,' as the work was called, was frequently done by females. On the introduction of the sewing-machine it was utilised for the stitching of the uppers of even the highest class of hand-made boots. The sole of a shoe consists at least of two sections, the insole, which lies within the lower edges of the upper leather, and the outsole, which is variously fastened as indicated in the above classification. The insole is tacked to the under part of a wooden last; it is then pared down, and holes pierced around its sides for subsequent sewing. The upper is then drawn over the last and tacked above the sole; a welt, or narrow band of leather, is taken, and welt, upper, and insole are all sewed together. Subsequently the outsole is sewed to the welt, the heel is put on, the edges trimmed, blackened with copperas, polished with hot irons, and so finished. The shoemaker works at a low stool in a constrained, unhealthy attitude, and at his side is a tray containing his knives, awls, pincers, thread, rosin, lapstone, iron-last and other tools.

The systems of pegging, riveting, and wax-thread sewing prevail in factory shoemaking, and by all these plans a great deal of the labour involved in hand-sewing is avoided; but the work is less elastic and strong. In factory work the cutting out of the various parts is done by machinery. The edge of the upper is carried well over the insole, and upper, insole, and outsole are connected and secured together by one operation; in the case of 'pegging,' wooden pegs are used; in riveting, brass rivets scored on the sides to give them grip are employed; and in wax-thread sewing the thread is passed through and through by means of a modified sewing-machine having a hook instead of a needle, and a secure lockstitch is formed.

Shoeing of Horses. See Horse-Shoeing.

Sho'la (Vern. *Sola* or *Phūl-Sola*) is a large perennial leguminous water-plant named *Æschynomene aspera*, abundant in tanks and marshes in Bengal and other parts of tropical Asia. The thick stems are mainly composed of light white pith, which is made into floats, toys, swimming-jackets, and the Solah hats or helmets—invaluable as a protection against the sun in hot countries.

Sholapore', the chief town of the district of the same name in the Bombay Presidency, British India, 283 miles S.E. of Bombay by rail. Pop. (1872) 53,403. It has grown with the growth of the cotton trade. The houses cluster round a fort, which was captured by the British in 1818, when this tract of country was acquired from the Peishwa. The *district* of S., which was formed out of Poonah in 1838, lies between the Nizam's Dominions and Sattara. Area, 3925 sq. miles; pop. (1872) 662,986. It is a hilly country, forming part of the Deccan or central plateau of India. The food crops are millets, pulses, and a little wheat; but cotton is the staple of commerce. Weaving is largely carried on in the towns. This tract suffered more than any other part of the Bombay Presidency from the famine of 1877. The cattle especially died in large numbers, and only one-fifth of the revenue could be collected within the year.

Shore. See Sea.

Shore, Sir John (Lord Teignmouth), was born in Devonshire, October 8, 1751, went out to India in 1769, and rapidly rose in the service of the East India Company. Like Warren Hastings, he was a student of the Oriental languages and a sympathiser with the native character, and under Lord Cornwallis he was mainly instrumental in effecting the Permanent Settlement (q. v.). He held the high office of Governor-General from 1793 to 1798, and previous to his retirement was raised to the peerage as Lord Teignmouth. His term of government was only marked by the mutiny of the Bengal European officers, and the assassination of the Resident, Mr. Cherry, at Benares. His policy was opposed to interference with the Native States. In 1804 he published *Memoirs of the Life, Writings, and Correspondence of Sir William Jones*. In 1807 he edited the *Works of Sir William Jones, with the Life of the Author*. After his return to England he became a conspicuous member of the 'Clapham Sect,' and was the first president of the Bible Society. He died at London, February 14, 1834. See his *Life and Correspondence* (2 vols. 1843), by Charles John Lord Teignmouth, whose *Reminiscences of Many Years* appeared in 1878.

Shore'ditch, a metropolitan parish in the parliamentary borough of the Tower Hamlets, 1½ miles N.E. of St. Paul's, covers 648 acres, and in 1871 contained 15,599 houses, with 127,164 inhabitants. Of these the manufacture of boots employed 2685, of upholstery 2571, of watches 396, of engines 375, of brushes 357, of saddles 242, and of silk (a survival from the Huguenot immigration) 224.

Shore'ham, New, a seaport of Sussex, 6 miles W. of Brighton by rail, stands at the mouth of the Adur, which is spanned by a good suspension-bridge (1833). The Norman and Early English parish church has been recently restored; a Roman Catholic church was erected in 1875; and St. Saviour's School, a branch of Lancing College, was opened in 1858. The harbour, though only tidal, was entered in 1877 by 784 vessels of 92,425 tons, and cleared by 460 of 32,222 tons; while on December 31 of that year 140 steamers and sailing-ships of 29,009 tons were registered as belonging to S., besides 307 fishing-boats. The imports amounted (1877) to £406,913; the exports to £3792; and the customs to £2152. Oyster and other fisheries employ 821 persons, and the shipbuilding yards turned out 21 British vessels of 2168 tons during the years 1873-77. Pop. (1871) 3678; of the parliamentary borough, which returns two members and includes 41 parishes, 37,984.

Shores (Dutch *schoor*, Ger. *schore*, Icel. *skorda*), in ship-building, strong props placed under the 'wales' of a ship's bottom, to keep the vessel steady on the slips. Timbers used to prop up walls are also called S.

Short'hand, an art by which writing is abbreviated, so as to keep pace with speaking. Its great and general utility has been recognised in every age, and numberless systems have been devised to facilitate its acquirement. It was practised by the ancients for its secrecy as well as for its brevity, and a work is extant on the art, which is ascribed to Tiro, the freedman of Cicero. The first English treatise on stenography, in which marks represent words, was published in 1588 by Timothy Bright, M.D., under the title, *Characterie; an Art of Short, Swift, and Secret Writing by Character*. In 1602 appeared *The Art of Stenography, or Short Writing by Spelling Characterie*, by John Willis. Notwithstanding the intricacy of this system, in which 'arbitraries' are extensively used, it became popular and found many imitators. It was succeeded by the systems of Edmond Willis (1618), Henry Dix (1641), and Jeremiah Rich (1659), the last taught in Dr. Doddridge's academy at Northampton, and described by Locke as 'the best contrived I have ever seen.' In 1672 appeared *A Pen plucked from an Eagle's Wing: or, The most swift, compendious, and speedy Method of Short Writing*. The author was William Mason, the most famous shorthand writer of the 17th c. His alphabet was formed from Rich's, by altering the signs for six letters, viz., *g, h, j, o, r, w*. In his 2d ed. (1682), Mason altered the alphabet so as to leave only six of Rich's letters; and the 3d ed. (1707) left only five, viz., *e, o, v, w, y*. Gurney, who published his system in 1753, took for his alphabet the signs in Mason's 3d ed., the first six letters of which are

a, b, c, k, d, e, f.

His vowels, when final, were written, *a* and *e*, at the top of the last consonant; *i* and *y* at the middle; *o* and *u* at the foot.

Medial vowels are written by lifting the pen and writing the next consonant at the upper part of the preceding one for *a* and *e*; in the middle for *i* and *y*; and at the bottom for *o* and *u*. Initial vowels are written by their alphabetic characters. Mason's direction (in which he is followed by Gurney and all authors of *a, b, c* shorthands), to 'write words completely according to their sound,' means, as Mr. Pitman observes in his *History of S.*, 'let each vowel represent as many different sounds as it does in the common spelling; and, for two or three vowels coming together, write the one that will most nearly represent the sound, according to the general use of such vowel character;' or, as Mason himself expresses it, 'if a diphthong or two vowels come together in one syllable, set what [consonants] follow in that vowel's place which bears the greatest sound;' thus, the *ea* of *meat* would be considered as an *ee*, and the *ea* of *great* as an *a* (pate, pain), still leaving it doubtful whether the letters *m, e, t* were to be sounded *meet* or *met*, and *g, r, a, t*, *grate* or *grat*. In 1767 was published the system of Dr. Byrom, four years after his death, which, however, had been completed as early as 1720. This was in many respects an admirable system—characterised by 'simple strokes and no arbitrary characters.' In 1785 Dr. Mavor published his *Universal Stenography*, an ambitious improvement on Byrom. His alphabet consists of 18 letters, two of which are for the vowels. The characters for the vowels are a dot (.) and a comma (,). The comma in different positions indicates *a, e, i*; the dot, *o, u, y*. In 1786 appeared the famous system of Taylor, which was almost universally used previous to the publication of *Phonography* by Mr. Pitman in 1837. Taylor has 22 marks or characters: of these, 16 represent the alphabet; the remaining 6 standing for *ch, sh, th, ious, etc., viz.* There are twenty rules to be observed, but of these, eighteen are elaborations of the first two, which are (1) Spell by sound, (2) Vowels are used only at the beginning or end of a word. This system was adapted to the French language by Bertin in 1792, to the Italian by Emilio Amanti in 1809, and to the German by Danzer in 1801, and Berthold in 1819. In 1823 Harding issued an improved edition of Taylor's system, which was much used. In 1812 Lewis published an ingenious system, the alphabet of which was good, though the rules were somewhat complicated. Its chief faults were double letters, such as BL and ST, and symbolical characters. Hunter's *System* (1819), is noted for the ease with which its characters may be correctly formed. In 1837 appeared Pitman's *Phonography*—the first really popular system of S. Melville Bell, following in the path marked out by Pitman, founded his system on the sounds of the language. The first sketch appeared in 1849; in 1852 the first complete edition, under the title *Semi-Phonography*. An improved edition was published as *The Reporter's Manual* in 1857, from which we take the alphabet, comparing it with Pitman's alphabet of Phonography—

BELL'S—*k g* — *t d* — *ch j* — *p b* — *s z*
sh zh — *l* — *f v* — *m* — *n* — *h r*
th th (dh) — *wh* — *ng* o

PITMAN'S— *p b* — *t d* — *ch j* — *k g*
f v — *th th (dh)* — *s z* — *sh zh*
l — *r* — *m* — *n* — *ing* — *w* — *y* — *h*

Bell's letters are written in three sizes; full size, as above, half size, and 'tick' size. Pitman makes his letters of two lengths only, full size and half size (the half-sized letters expressing an additional *t* or *d*). Vowels are expressed in Bell's system by the following rule, which does not distinguish one vowel from another: '*Full*-sized characters are used when a *vowel precedes* the consonant, *half*-sized when no vowel precedes and a *vowel follows*, and *tick*-sized instead of half-sized in all combinations.' Exact vowel marks are, however, furnished, and are recommended to be employed in the writing of foreign words and proper names. They are written opposite the top or bottom of the consonant, thus:

(Top) *eel, ale, an, up, urn, ah, pull, pool, isle, oil*
Symbols: • — ׀ ɔ v ʌ > <
(Bottom) *ill, ell, ere, ask, err, on, all, old, ore, owl, mule*

Pitman's vowel signs are—

ah, · | – *aw*, *ei* or *ī*, v | ˥ *oi*.
eh, · | – *oh*,
ee, · | – *oo*, *ow*, ʌ | ^ *ew* or *ū*.

They are used thus: a dot is placed at the beginning of a consonant to represent *ah*, in the middle of a consonant for *eh*, and at the bottom for *ee*; and so with the short strokes for *aw*, *oh*, and *oo*. The vowel sign is written heavy to represent a long vowel, and light for a short one, the vowels being paired according to their sounds. There are no short powers to the four diphthongal sounds. The principal point of difference in the two systems is, that Bell subordinates his S. alphabet to a theory of sounds which is strictly correct; and Pitman, while acknowledging the principle of a phonetic representation, consults the convenience of the writer in the selection of signs. For example, the broad distinction of voice and breath consonants was first marked by Pitman by the happy expedient of writing heavy strokes for the voice letters *b*, *d*, *j*, *g*, *v*, *th* (in *th*en), *z*, *zh*, and light strokes for the breath letters *p*, *t*, *ch*, *k*, *f*, *th* (in *th*in), *s*, *sh*. Bell adopted the same principle. 'Those articulative actions,' he observes in his 1st ed., 'which are used without voice, the *breath* articulations, are, as in Mr. Pitman's *Phonography*, denoted by a *thin*, *light* marking of their appropriate symbols. In this way the eye is at once informed of the most important literal relationships, and of those organic identities which reduce the simple actions of speech to but little more than half the number of their representative letters.' Five of the articulations that make up our composite speech exist in English only in the *voice* form, namely, *m*, *n*, *ng*, *l*, *r*, but the *breath* forms of *l* and *r* are found in Welsh. No language, so far as we know, employs both the breath and the voice forms of *m*, *n*, *ng*. Bell writes heavy strokes for these five letters, and Pitman light ones, except for *ng*. As heavy strokes require increased exertion on the part of the writer, Bell's system is, in this point, inferior to the other for practical purposes. It is only necessary to observe further that in Pitman's system every frequently occurring word is written by one of its letters for brevity. Such words are called 'grammalogues,' or letter-words. Thus *t* is written for *it*, *n* for *no*, *w* for *we*, &c. Bell's system is far inferior to that of Pitman in legibility and ease of formation. They may be compared in the following sentence, written in both systems, and which may be deciphered with the aid of the alphabets given above.

An ingenious system of S. was published by Moat in 1833, in which the author takes the dot as his basis, 'because all figures must emanate from it,' divides the circle into twenty characters or signs, and introduces 'lines' to mark his vowels with dots. S. is now largely practised both in England and America, and has extended its benefits to many classes besides that of the professional reporter. This is due chiefly to the excellences of Pitman's system and to his activity in disseminating its principles. The existence of two styles of Phonography, one adapted for letter-writing and the other for reporting—the second, however, being only an extension of the first, and not a new system in itself—has been the chief basis of the popularity of Phonetic S. Rejecting Pitman's system on account of its alleged complexity and the difficulties it presents to the student, Matthias Levy (1862), A. H. Thompson (*Stenography*, 1868), and 'A *Times* Reporter,' have recurred to that of Taylor, while Mason's has been adopted by Thompson Cooper (*Parliamentary S.* 1858). The latest modification of Pitman's principles is *S. for General Use*, by Prof. Everett, of Queen's College, Belfast (Lond. 1877). See Levy's *History of S.* (Lond. 1862), Pitman's *History of S.* (Bath, 1868), and *The History and Literature of S.*, by Prof. Zeibig of Dresden (2d ed. enlarged, 1878).

Short'horns. See Ox.

Shot, the general name for solid projectiles, or hollow projectiles without bursting charges. Spheres of stone were fired from the first cannon; lead and iron balls were afterwards substituted. The introduction of rifled firearms has led to the universal adoption of elongated S. and shell, and in the case of the English Palliser S. the same projectile answers both functions, because it is cast hollow, and may be used with or without a bursting charge (see SHELL). Spherical S. of cast-iron are still retained for use with mortars and other smooth-bore ordnance. As cylindro-conoidal S. of ordinary cast-iron were found to be useless against armour plates, chilled iron S. having an ogival head, the invention of Major (now Sir William) Palliser, were selected to replace them. Palliser S. is made of iron of the best brands, cast in a 'chill' (iron) mould instead of sand. The 'chill' imparts intense hardness, owing to the sudden cooling favouring the retention of the carbon in chemical combination with the iron, but at the same time brittleness results. This quality is compensated for by the ogival head, which is the best possible form for the penetration of iron plates. As now practised, only the upper part of the S. is cast in 'chill,' the lower portion being cast in sand. Sand S. consists of small balls of iron cast in sand, and is employed principally in making Case S. (q. v.) and Grape S. (q. v.). Whitworth of Manchester and Krupp of Essen employ steel for rifled S., and from recent experiments in England with ogival S. of home and foreign make, it seems probable that steel, notwithstanding its immense cost, will ultimately supersede the use of chilled iron. Small S. for use with fowling-pieces, &c. is made by running molten lead combined with a little arsenic through a sieve, or pouring it from a ladle with a serrated edge from the top of a high tower (about 180 feet) into water at the bottom. The stream of metal in falling breaks into drops, which become perfectly spherical. The S. is dried and afterwards polished by attrition in revolving cylinders containing some graphite.

Shotts, a large parish in Lanarkshire, comprising the mining villages of Dykehead, Harthill, Salsburgh, Greenhill, and Cleland. Pop. (1871) 8353. But the place best known as S. lies on the Caledonian railway, about midway between Glasgow and Edinburgh, and 11 miles N.E. of Hamilton. Many of the inhabitants are employed in connection with S. iron-works, which were established in the beginning of this century. Coal and ironstone abound in the district. There are five furnaces, one on the old and four on the new system, by which they utilise and consume their own smoke. The principal buildings are the new Free Church, on the neighbouring height, the Commercial Bank, and Calderhead Church. The Kirk of S. is famous as the scene of the Revival in June 1630, under the preaching of John Livingstone. It stands on a bleak height, near the centre of the parish, 3 miles north of the S. railway station.

Shoul'der-Joint, the articulation between the *glenoid* cavity of the *Scapula* (q. v.) or 'shoulder-blade' and the *humerus* or upper arm. The S.-J. illustrates admirably what is meant by an anarthroidal or ball-and-socket joint. The 'ball' is formed by the head of the humerus, the 'socket' being the shallow, saucer-like 'glenoid-cavity' of the scapula. The large head of the humerus working in its shallow socket gives the utmost freedom and mobility to this joint. Displacement is prevented by the arch formed above it by the *coracoid* and *acromion processes* of the scapula, together with the *coraco-acrominal ligament*; while the strong ligaments and tendons surrounding the joint also prevent injury. The articulating surfaces in the S.-J. are covered with cartilage, that covering the humerus being thickest in the centre; while the cartilage of the glenoid cavity is thickest at the circumference. There are *three* chief *ligaments* in the S.-J. The *capsular ligament* encloses the joint, and is attached below to the anatomical neck of the humerus. It is of loose texture, and admits of a large degree of separation of

the bones, and has three openings; one at its inner side, one at its outer border, and one at the lower border for the *long tendon* of the *biceps muscle*. The second is the *coraco-humeral ligament*, which passes from the outer border of the *coracoid process* to the front of the *great tuberosity* of the humerus, where it unites with the tendon of the *supraspinatus muscle*. The third is the *glenoid ligament*, which runs round the margin of the glenoid cavity, protects the bony edge of the cavity, and deepens it for articulation with the humerus.

Diseases and Injuries of the S.-J.—The S.-J. is less frequently diseased than any of the other large joints, and when inflammatory disease does occur, the prospect of recovery is favourable. *Inflammation* may exist for a considerable time without suppuration, but when it does occur, it is often directed by one of the tendons around the joint to a considerable distance, giving rise to doubt as to the origin of the discharge. In cases of inflammation, rest and counter-irritation should be persevered in as long as pain is present, but no longer, as too long confinement is apt to produce rigidity of the parts. In cases of *suppuration* there may be a natural cure by ankylosis, but if the symptoms demand it, the operation of excision may be performed, as it is usually successful. *Osteoarthritis* is rather common in later life, and may be recognised by the crackling in the joint, pain, and change of shape in the parts. *Dislocation* of the S.-J. may take place in one of three directions,—downwards, inwards, or backwards. Dislocation upwards may also take place, but the injury is of very rare occurrence. In every dislocation of the S.-J. there is loss of the natural, rounded shape of the shoulder; a change in the direction of the axis of the humerus; an increase in the vertical measurement of the shoulder; loss of voluntary motion; and resistance to passive movements except in certain directions. For a description of the modes of reduction of the various dislocations of the S.-J., see Holmes' *System of Surgery.*

Shov'el, Sir Cloudesley, an English admiral, born about 1650, of poor parents, near Clay in Norfolk. He entered the navy as a cabin-boy, but had attained the rank of lieutenant in 1674, when, during an expedition to Tripoli to seek satisfaction for outrages on the English in those parts, he was sent by his commander, Admiral Sir John Narborough, with a requisition to the Dey. Twice S. was received with scorn, and the second time sent back without an answer; but from observations he had made he was able the same night to seize the enemy's guardship and burn four other vessels without losing a man. For this feat he was promoted to the command of a ship. Knighted by William III. for gallantry at Bantry Bay, S. in 1692 became Rear-Admiral of the Red. He took part as such in the battle of La Hogue (1694), was Vice-Admiral of the Red in the expedition against Camaret under Lord Berkeley, and in that against Dunkirk held the chief command. He led the van in the battle of Malaga (1704), and took a prominent part in the capture of Barcelona. In 1706 he sailed to Portugal, under Lord Rivers, to aid the king of that country, and the year after joined the Duke of Savoy in the siege of Toulon, but on his voyage home with nine ships of the line he was wrecked off the Scilly Isles, October 22, 1707. A miserable monument marks his tomb in Westminster Abbey.

Shov'eller (*Spatula clypeata*), a species of *Anatidæ* or ducks, having a long bill, with a hooked and very much broadened tip. The average length is from 17 to 20 inches, and the plumage is brown on the back, the head and neck green, and white below, the belly being light brown. The *lamellæ* of the bill are well developed. The S. inhabits Britain in winter. The eggs, eight or nine in number, are of a dirty-white colour tinted with green.

Showers of Fishes, the name given to a curious phenomenon in which fishes of various kinds (*e.g.*, sticklebacks) have seemed to descend from the skies in large quantities. Instances of this kind are most frequent in tropical regions, but they have also occurred in Britain. The only rational explanation of the phenomenon is that they have been caught up along with the water they inhabited in a violent whirlwind, and have been conveyed, it may be, for many miles from their original *habitat*. Fishes have been frequently ejected from the craters of volcanoes; a fact which may be explained on the theory that an eruption is produced primarily by water from lakes or the sea gaining admittance to the interior of our earth and being converted into steam.

Shrap'nel Shell. See SHELL.

Shrew, or **Shrew Mouse** (*Sorex*), a genus and family (*Soricidæ*) of *Insectivorous* quadrupeds, allied to moles and hedgehogs. They are not to be confounded with the common mice, the latter being *Rodentia* (q. v.). The S. mice have hairy bodies, a mobile snout, well-developed ears, and feet adapted for running. Their food consists of insects and their larvæ. The Common S. (*S. araneus* or *vulgaris*) has six upper and four lower incisors; canine teeth are absent, and five small premolar teeth are developed; the molars numbering eight above and six below. The Common S. attains a length of 4 inches, inclusive of the tail. The colour is reddish brown, occasionally tinted with grey. The fur has a musky and somewhat disagreeable odour. The young number four or five, and are born in spring. Shrews are very pugnacious, and are regarded with fear by the ignorant and superstitious. The Water S. (*Crossopus* or *S. fodiens*) attains a length of 4½ or 5 inches. The upper parts are black, and the under fur is white. The tail and feet are fringed with stiff white hairs. The Oared S. (*C. remifer* or *ciliatus*) has the hinder part of its tail broadened and fringed like the blade of an oar. The *Corsira rustica* is the Rustic S. of Ireland and England. The *Sorex Etruscus* of Italy is the smallest known mammal, and attains a length of only 2½ inches. The Elephant shrews form a special family (*Macroscelidæ*), occurring in Algeria and S. Africa, and distinguished by the great relative length of the proboscis. The tail is long and slender, and the nails of the hinder toes are very long. The *Macroscelidus probiscideus*, or common Elephant S. of Southern Africa, and the *M. Rozeti* of Algeria, are the most familiar species.

Shrew Mole (*Scalops*), a genus of *Talpidæ* or Moles (q. v.) inhabiting N. America, and of which *S. aquaticus* is the familiar species. The S. M. attains a length of 7 inches, its colour being a lustrous black. The muzzle is long and has a cartilaginous tip, while the claws of the fore feet are long, sharp, and powerful. The hind feet and legs are short, and the tail is rudimentary.

Shrews'bury, the county town of Shropshire, 42 miles W.N.W. of Birmingham by rail, stands on a promontory formed by a horseshoe bend of the Severn, which is spanned by two bridges, the English Bridge (1774) leading to the suburb of Abbey-Foregate, and the Welsh Bridge (1795) to the suburb of Frankwell; while on the neck of the peninsula rises the dismantled castle, with its 11th c. gateway and a keep erected by Edward I. The winding streets, high spires, and stately timber houses with peaked gables and overhanging storeys—among them the Council House (1501–1620), where Charles I. resided in 1642 and James II. in 1687, the Ireland Mansion, and the Raven Hotel, in which Farquhar wrote his *Recruiting Officer* (1704)—make S. one of the most picturesque of English towns. There are ten churches, the Abbey Church of Holy Cross (founded by Roger de Montgomery, 1083; restored 1864), St. Mary's (restored 1865) with a spire of 220 feet, St. Alkmund's (rebuilt 1795) with the original spire (184 feet), St. Chad's (1788) with a tower of 150 feet, St. Michael's (enlarged 1873), All Saints' (1877), &c.; while the finest non-established places of worship are the Roman Catholic church, designed by Pugin (1856), and a Congregational chapel (1864) with a spire of 115 feet. Other buildings are the Shire Hall (1836); Public Rooms (1849); the new Market Hall (1868), in Italian style, 313 feet long by 150 wide, with a tower of 151 feet; the quaint Old Market House (1596); an Italian-Gothic Working-Men's Hall (1863); the Salop Infirmary (1830), with 151 inmates in 1871; and at Bicton's Heath, the Lunatic Asylum (1845), with 600 inmates in 1878. The grammar-school, founded by Edward VI., ranks high among Public Schools (q. v.), and in March 1878 had 9 masters and 164 boys. S.W. of the town the finely-planted Quarry Promenade, a public recreation-ground of 20 acres, extends along the river for 540 yards; and the monuments of S. include a Doric column to Lord Hill (1816), 133½ feet high, a bronze statue of Clive by Baron Marochetti (1860), and the Clement drinking fountain (1874). The manufacture of farm implements, thread, yarn, and 'S. cakes,' form, with brewing, malting, and glass-painting, the principal industries. S. returns two members to Parliament, and publishes three weekly newspapers, of which *Eddowes's Journal* was founded in 1794. Pop. (1871) 23,406. The Cymric *Pengwern*, S. on the expulsion of the king of Powys by Offa of Mercia (757–95) changed its name to *Scrobbesbyryg* ('the town in the scrub'). The castle, built by Roger de Montgomery,

alone bridled the rising along the Welsh border (1068), and down to the overthrow of Glendower (q. v.) in the 15th c., S. played a foremost place in the frontier wars, being captured by the two Llewelyns in 1215 and 1264, and the place where David, the last native Prince of Wales, was executed (1283). Richard II. held a parliament here (1397–98), and in the Great Rebellion S. was taken by the Parliamentarians (1644). See Phillips and Hulbert's *History of S.* (2 vols. 1837).

Shrike (perhaps from its cry), a general name applied to the members of a family (*Laniidæ*) of *Insessorial* birds belonging to the *Dentirostral* group of the order. Ornithologists distinguish between the ordinary or True S. and the Bush S. The genus *Lanius* to which the common S. belongs, is distinguished by the broad base of the bill, which is hooked at its tip. The nostrils are surrounded by bristles, the fourth quill is the longest, and the tail is graduated. The Red Backed S. (*L. colluris*) is a common species, attaining a length of from 6 to 7 inches, of a grey colour on the head, neck, and shoulders, the back being red and the under parts grey. The food consists of insects, and the male is said to impale his prey on hedge-thorns to save his mate the trouble of looking for prey on her own account, hence its name of 'butcher bird.' The Great Grey S. (*L. excubitor*) is found in Britain in winter, and attains a length of from 4 to 10 inches. The upper colour is grey, white persisting below; while the tail feathers are black with white tips. The Woodchat S. (*L.* or *Euneoctomus rufus*) is a rare British bird, but is common on the Continent and in N. and S. Africa. Its length is about 6 inches; its upper parts are of a dusky brownish hue, the head and neck being chestnut red, and the under parts white. The Bush S. form the sub-family *Thaumophilinæ*, in which the bill is long and its keel arched, its tip being hooked. The tail is long. The *T. Vigorsii* or Vigor's Bush S. is a common S. American species, attaining a length of from 12 to 13 inches. The upper parts are blackish, and the under parts greyish-brown. A crest of red feathers with black tips is found in the males, the crests of the females being black.

Shrimp (lit. 'a small fish'), a genus of *Decapodous* crustaceans allied to the lobsters and crayfishes, and forming the type of a special family (*Crangonidæ*). The members are distinguished by having the first pair of legs thickened, the second pair being slender and two-clawed, while the body is depressed. *C. vulgaris* is the common S. of sandy coasts. Other species are the *C. fasciatus*, or Banded S.; *C. spinosus*: *C. sculptus*, or Bell's S.; *C. bispinosus*, &c. Shrimps are captured in nets which are pushed through the sand before the 'shrimpers.' The Prawn (q. v.) is distinguished from the S. by the fact that the *rostrum* or beak of the shell in the former is serrated and larger than in the S. The name S. is applied to crustaceans belonging to orders more or less widely removed from that to which the common S. belongs—*e.g.*, the Brine S. (q. v.), the Fairy S. (q. v.), the Glass S., and Locust S.

Shrop'shire, or **Sal'op**, a border county of England, bounded N. by Chester, E. by Stafford, S. by Worcester and Hereford, and W. by North Wales. Area, 841,167 acres; pop. (1871) 248,111. The Severn, running S.E., divides S. into two almost equal portions. The northern, belonging to the New Red Sandstone system, is generally level, with the exception of the isolated Wrekin (1320 feet); the southern, of older formations, is mountainous, in the Clee Hills attaining an elevation of 1805 feet. In 1876 there were 168,085 acres under corn crops, 64,003 under green crops, 79,038 in clover, sainfoin, and grasses in rotation, 375,225 in permanent pasture, and 39,699 in woods. There were also 29,794 horses, 138,759 cattle, 481,871 sheep, and 58,141 pigs. S., including as it does the Coalbrookdale, Oswestry, and Bewdley districts, is an important mining centre. The yield of pig-iron in 1876 was 106,711 tons, of lead 5955 tons, of silver 2748 oz., of zinc 491 tons, and of coal 1,054,049 tons. The manufacture of iron employed (1871) 3612 persons, of engines 678, of nails 95, of earthenware 472, of thread 301, of carpets 127, and of woollen cloth 51. The county returns four members to Parliament, and contains four Parliamentary boroughs—Shrewsbury (the capital), Bridgenorth, Ludlow, and Wenlock.

Shrouds (Old Eng. *scrúd*), the great ropes supporting a mast from the sides of a ship.

Shrove'tide, lit. 'confession time' (from the verb 'to shrive;' Old Eng. *scrifan*; prob. con. with Lat. *scribere*, 'to write'), also **Shrove Tuesday**, is the Tuesday before Ash Wednesday (q. v.), or first day of Lent (q. v.), and is so called because the Catholic Church enjoined on the faithful on that day to confess their sins in order to qualify them the better for the observance of Lent. Formerly S. was a time of extraordinary sport and feasting, because licence was granted to those who had been shriven, to indulge in relaxation between that time and the beginning of Lent, before entering on the austerities of that season. Traces of the feasting and amusements of the time, which was not always confined to the Tuesday, have been preserved in the names Collop Monday and Pancake Tuesday, and lingered (till recently) in different parts of England and Scotland in the privilege claimed by school-boys on that day of 'barring out' the master, and then spending the day playing at foot-ball and cock-fighting. See Brand's *Popular Antiquities* (new ed. Lond. 1876).

Shrub (Ar. *shurb*, 'drinking,' from the same root as *sherbet*), a kind of cold punch, composed of rum or brandy and water, flavoured with lemon-juice and sweetened with sugar.

Shrubs (from Old Eng. *scrob*, prov. Dan. *scrub*, 'bush') are plants of which the perennial portion forms the greater part; that, in distinction to trees, branch near the base; and do not much exceed a man's height. To such plants, the terms *frutescent* or *fruticose* are often applied in botanical works. *Under-shrubs*, *suffruticose* or *suffrutescent* plants, comprise those in which the flowering branches, forming a considerable portion of the plant, die down after flowering, but leave a more or less prominent perennial or woody base.

Shugshut' (Turk. *Sügüd*), a small town of Asiatic Turkey, vilayet of Brussa, near the left bank of the Sakaria, 100 miles S.E. of Scutari. In a neighbouring cypress grove is the tomb of Othman, the founder of the Ottoman power. Pop. 1000.

Shum'la, or **Shu'ma**, a fortified town of the principality of Bulgaria, on the Little Balkan, to the N. of the main range, at an elevation of 800 feet, 50 miles W. of Varna, and 60 S.E. of Rustchuk by rail. It is of great strategical importance, commanding as it does the roads from the fortresses in the Lower Danube and in the Dobrudscha, and those from the eastern passes of the Balkans. It is closed in on the N. and W. by mountains, and looks out to the E. and S. on an open plain, where grain and the vine are cultivated, and where there is extensive silk culture. Surrounded by high massive walls, it is further defended by a citadel on the heights, and by several forts. An intrenched camp in the vicinity can accommodate some 60,000 men. S. has forty mosques, large barracks for cavalry and artillery as well as infantry, an arsenal, military hospital, &c. There are manufactures of copper and tin wares, silk, leather, and wearing apparel. The great S. fair is held in June. Pop. 20,000, mostly Turks. The Russians failed to take S. in 1774, 1810, and 1828. No attempt on it was made in the war of 1877–78, but the place was evacuated by the Turks on the conclusion of peace.

Shunt Rifling, a system of rifling (see RIFLED ARMS) invented by Sir William Armstrong, and adopted for the first heavy rifled ordnance of the British service, but since abandoned. Its peculiarity lies in the grooves having a deep and a shallow side, and narrowing some distance down the bore. In loading the 'shunt gun' the studs of the projectile press against the deep side of the groove, but in coming out the projectile is shunted on to the shallow side, and it leaves the gun with its axis perfectly stable.

Shusha, a fortified town of Asiatic Russia, in Transcaucasia, government of Baku, 40 miles from the Persian frontier, on an almost inaccessible chalk height, which rises 3453 feet above the sea and is washed by the Kargar-Tschai, an affluent of the Kur. It experiences great extremes of climate, and produces fruit and silk. Pop. 20,297.

Shus'ter, the capital of the province of Khuzistan, Persia, on the river Karun, 170 miles S.W. of Ispahan. It has a dilapidated wall of unburnt bricks, and is divided into twelve quarters (*mahallas*). The houses are built of stone, some being five storeys high, and the inhabitants, to shelter themselves from the heat, have excavations (*sardabs*), some of which are 60 feet deep. The district produces abundant grain and fruits. Pop. 8000.

Shut'tle (Old Eng. *sceathel*, from *scebtan*, 'to shoot'); in weaving, a boat-shaped implement of boxwood, carrying a bobbin surrounded by weft yarn, which is 'shot' by mechanical means along the S.-race through the shed of the warp. The ordinary loom S. is figured under LOOM.

Sial'ogogues are medicines which, by local stimulating action, increase the flow of saliva and of the buccal mucus. Some of them, dissolved in the saliva, exert a direct stimulant influence on the mucous membrane of the mouth, the fauces, and the epiglottis, while others, by exciting the flow of saliva, lessen the congestion of the part. Cubebs, either in the form of capsules or made into lozenges, is useful in relaxation of the fauces, of the uvula, of the upper portion of the larynx, and in hoarseness from relaxation following over-use or slight inflammation in the case of public speakers.

Siam' (Malay, *sâyâm*, 'brown'), the name applied by Europeans to the Indo-Chinese kingdom of Muang Thai ('realm of the free,' *i.e.*, free from Brahmanism), which, lying in lat. 6°-20° N. and long. 98°-106° E., is bounded N. by Burmah, E. by Anam, S. by the Gulf of Siam and the independent states at the extremity of the Malay Peninsula, W. by the Indian Ocean and the Tennasserim provinces. Estimated area, 188,000 sq. miles, or, including the semi-independent Lâos and Cambodjan provinces, 309,000 sq. miles; pop., according to the French consul (1873) 4,650,000, or with the 1,100,000 tributaries, 5,750,000. Offsets of the Himalayas extend along the western and eastern frontiers, attaining an occasional elevation of 5000 feet, and inclosing the great central plain of the Meinam, which is traversed by a third but lower and less continuous range. Of numerous streams, only three can rank as rivers—the Saluen in the W. and Meikong in the E., between them the Meinam ('mother of waters'), which, rising amid the snow-clad Yunan Mountains, divides S. into two unequal portions, and enters the Gulf of S. by three different channels after a course of nearly 900 miles, 45 only of which are navigable for sea-going vessels. To the annual inundations of these rivers in the wet season (June-August) the great fertility of the soil is due. Though barely one-third of the entire area is under cultivation, rich crops are gathered of rice, sugar, teel-seed, pepper, cotton, tobacco, vegetables, and spices, besides durians, mangoes, pineapples, and other fruits; and the remaining two-thirds are largely covered by valuable forests of teak, ebony, dye-woods, bamboo, banyans, and palm trees. These forests are denizened by the common elephant, the sacred white or rather salmon-coloured elephant, the striped tiger, rhinoceros, buffalo, python, cobra di capello, and countless birds of the most gorgeous plumage; the rivers contain huge water-snakes and crocodiles; and flying-fish, sardines, and molluscs are taken along the coasts. Tin abounds throughout the Malay Peninsula, and in the N. are found gold, copper, lead, iron, zinc, antimony, sulphur, and precious stones, but the mining industries of S. are still almost totally undeveloped. Salt and saltpetre are manufactured by evaporation.

Trade.—Commerce is almost wholly in the hands of the Chinese, and is restricted to the port of Bangkok (q. v.), which in 1876 was entered by 621 vessels (182 British) of 224,911 tons, with cargoes of £147,293 value, and cleared by 625 of 225,366 tons, the value of whose cargoes was £173,243. The exports in that year included 41,990,462 cwts. of rice, 24,270 cwts. of pepper, 20,542 cwts. of sesamum, 4207 cwts. of cardamum, 1819 tons of sapan wood, and 5360 tons of hides. How extremely the trade fluctuates may be seen by comparing the exports to and imports from the United Kingdom in 1876 and 1877. The value of exports in 1876 was £127,110, in 1877, £23,947 (sugar £23,140, and dyewoods £147); that of imports in 1876 was £5902, in 1877, £25,444 (coal £2578, machinery £9881, iron £1234, and copper £234). As a rule, Hong-Kong and Singapore engross at least three-fourths of the entire exports, Europe and America receiving barely one-tenth. For instance, in 1875, the latest year for which full returns have been published, the total exports, amounting to £1,755,711, were divided thus:—Hong-Kong, £704,540; Singapore, £569,295; China, £57,229; Europe and America, £140,576, &c. Of the imports, amounting to £1,329,841, Singapore alone furnished £836,197, the chief items being *chowls*, opium, shirtings, piece-goods, firearms, and treasure. The mercantile navy of S. consists of 2 steamers and 58 sailing vessels, with a total tonnage of 22,713 tons, besides a large number of smaller craft.

Ethnology, Religion, and Education.—The inhabitants of S. are divided by M. Garnier, the French consul, into 1,800,000 Siamese, 1,500,000 Chinese, 1,000,000 Lâos, 200,000 Malays, 50,000 Cambodjans, 50,000 Peguans, and 50,000 Karenians, &c. The Siamese themselves are generally of a medium height, with reddish-brown complexion, high cheek-bones, retreating chin, and scanty beard, standing ethnologically between the natives of China and Burmah. Their faults of indolence, vanity, cowardice, and superstition are partly redeemed by temperance, liberality, and politeness. The Siamese language forms with the Ahom, Lâos, Khanti, and Shan dialects the Taic class of the southern division of the Turanian family, but is so copiously intermixed with Sanskrit and Pali elements (5000 out of 12,000 words) as to have been erroneously regarded as an Aryan tongue. Buddhism is the state religion, but toleration is extended to both Mohammedans and Christians. The famous Phra Bat ('mountain of the sacred footstep of Buddha'), in the interior of the country, is yearly visited by crowds of pilgrims. According to the German consul, S. had in 1876 over 10,000 monasteries (*vats*), where instruction is given in reading and writing, sometimes also in Pali, arithmetic, and astrology, to boys between five and sixteen years of age. An English school for members of the royal family was established in 1862, and many of the young nobility have been educated in Europe.

Constitution, Army and Navy, Revenue, &c.—Theoretically a duarchy, the government is practically monarchical, the authority of the second king, who is chosen from the royal family by a council of twelve, being wholly dependent on that of the first. The latter exercises a mild despotism, and has the right of nominating his successor, subject to the approval of the council. He has a small standing army officered by Europeans, and all natives of twenty-one years of age are bound to serve for four months yearly in the militia. S. has two corvettes and six gunboats, with a total armament of 34 guns, and several gunboats are now (1878) in course of construction. The revenue is estimated at £8,000,000, an immense share of which, however, is embezzled by the officials, whose pay is nominal, and who are largely in excess of what is required either for the maintenance of order or the purposes of administration. Writing in 1876, the British consul states that the 'country is overtaxed, nearly all the producers' profits being taken from them by government, while no part of the taxes is spent for the people's benefit or the encouragement of trade.' For administrative purposes S. is divided into forty-nine provinces, each ruled by a *p'haya* or governor, and the chief towns after the residence Bangkok are the former capital Ayuthia (pop. 30,000), Meklong (12,000), and Chieng-Mai (15,000).

History.—The annals of S., covering the reigns of forty rulers, go back to the founding of Ayuthia in 1350 A.D., but the country first became known to Europeans through a Siamese embassy sent to the Portuguese viceroy, Alfonso d'Albuquerque, at Goa (1511). S. was subject to Pegu (1568-90) and Burmah (1758-68), but, having regained its independence under Pitak, has gradually extended its frontiers by the annexation of the Cambodjan territory (1809), the Lâos districts (1829), and the Malayan principalities (1831). Commercial treaties were concluded with England (1855), with France and the United States (1856); the first printing press was established (1862); and slavery was abolished (1872) by the present king, Somdetch Chowfa Chullalonkorn, who succeeded to the throne in 1868. See Sir John Bowring's *S.* (2 vols. 1857), and J. Bradley's *Narrative of Travel and Sport in Burmah, S., and the Malay Peninsula* (Lond. 1876).

Siam', Gulf of, a southern arm of the Chinese Sea, lies between Upper Siam and the Peninsula of Malacca. It penetrates inland from Cape Cambodja to Bankok, a distance of 450 miles, and its greatest breadth is about 240 miles.

Si'amese Twins. See MONSTER and MONSTROSITY.

Sibb'ald, Sir Robert, was a younger son of David S., third brother of Sir James S. of Rankeillour, and a scion of the Sibbald family of Balgonie, Fife. He was born at Edinburgh, 15th April 1641, educated at the High School, and studied medicine at Edinburgh University, and subsequently at Leyden, Paris, and Angers. He settled in Edinburgh as a physician in 1662, and continued his scientific studies. Together with Sir Andrew Balfour, he established a botanical garden at Edinburgh,

and was one of those who founded the Royal College of Physicians in Edinburgh. In 1682 he was knighted by the Duke of York, then High Commissioner in Scotland, and in the same year was appointed geographer-royal for Scotland. He died about the year 1712. S. published *Scotia Illustrata, sive Prodomus Historiæ Naturalis* (1689), *The History, Ancient and Modern, of the Sheriffdoms of Fife and Kinross* (Edin. 1710; new ed. Cupar, 1803), besides numerous pamphlets and treatises on medicine, botany, zoology, and antiquities. His essays contributed to the Royal Society chiefly on subjects connected with Scottish antiquities were published (1739) under the title, *A Collection of Treatises Concerning Scotland, as it was of Old and also in Later Times.*

Sibe'ria, the chief part of Asiatic Russia, occupies the whole of N. Asia, from the Ural Mountains to the Seas of Okhotsk and Kamtchatka, and from the Arctic Ocean on the N. to Corea, China, Russian Central Asia, and European Russia. The furthest N. point of S. is Tchelyuskin, or North-East Cape, the most E. Tchokotsnoi, or East Cape, on Behring Strait, the S.-most Yasyung on the Korean border, the W.-most Toll-pos-is, in the Ural, 5540 feet high. (For the inlets, islands, &c., see RUSSIA). S. is divided into the following governments :—

Governments.	Area in sq. miles.	Population.
Tobolsk	531,963	1,086,848 (1870)
Tomsk	329,026	838,756 ,,
Yeniseisk	992,838	396,783 (1873)
Irkutsk	309,180	358,629 ,,
Transbaikalia	240,774	447,563 ,,
Yakutsk	1,517,075	236,067 ,,
Amur Territory	173,554	25,204 ,,
Coast Territory	729,998	50,512 ,,
Total	4,834,408	3,440,362

Physical Aspect, Products, &c.—Except towards the Altai Mountains, and their north-eastern continuations in the Yablonoi and Stanovoi ranges which shut off the seaboard of Okhotsk and Behring Strait, S. is as low and level as Russia in Europe. Most of the seaboard thus excluded to the N.E. is highly mountainous; for instance, the peninsula of Kamtchatka is traversed by a range containing fourteen volcanoes, one of them (Kliutschevskaia) 16,152 feet high. Owing to the very gradual rise of the land from the Arctic Ocean, about one foot per mile, the great rivers Obi (q. v.), Yenisei (q. v.), and Lena (q. v.) are deep and slow, and steamers have accordingly been placed upon them, but they are not practically available for seagoing vessels on account of their mouths being almost constantly closed by ice. The Lena and Obi are purely Russian rivers, and the Irtish, the great affluent of the latter, with scenery equal to that of the Rhine, is also wholly within R. since the annexation of Dzungaria, which contains its lake-source, Zaisang. The Amur (q. v.) is defended by a steam-flotilla. By the tributaries of the Yenisei and Obi, and Lake Baikal, the entire distance from Tobolsk to Kiachta (8000 miles) can be accomplished by water, and although the route is circuitous it is the cheapest for goods. Lake Baikal (q. v.), the largest in S., and about half the size of Scotland, is a fresh-water mountain lake, with magnificent scenery, which can be viewed in summer from steamers, or (with some danger owing to landslips and torrents) from the encircling roads. It is the deepest lake known (12,360 feet). Other lakes are Changa (1689 sq. miles), Tchany (1253 sq. miles), Barum-Fari and Taimyr. The land of wheat extends E. as far as Tomsk, beyond which lie the Siberian forests. Along the Arctic seaboard are the *tundras*—treeless, shrubless, mossy flats, rendered habitable only by the presence of the reindeer. The heat which follows the extreme cold of a Siberian winter has a striking effect even N. of the Arctic circle, where a luxuriant vegetation bursts forth on land submerged by the spring thaw. In S. vast forests extend from the Altai Mountains to the Arctic circle, where vegetation dies down to dwarfed willows, hardy bushes, and saline plants. The Siberian cedar, 120 feet high at its best, gradually diminishes as it is traced E. along the same parallel of latitude, till beyond the Lena it is reduced to a mere bush. Magnificent grapes are grown around Tomsk, and on the Yenisei vegetation extends further N. than in Scandinavia. Wheat is cultivated chiefly in the basin of the Obi, and other crops are flax, hemp, tobacco, &c. The minerals found in S. are gold (of which the districts of Altai and Nertchinsk yield an annual average of 5940 pounds), silver, iron, copper, graphite, coal, and salt.

Climate.—The climate of the E. and N. is intensely cold during the nine months of winter, and very warm during the brief summer. The lower basin of the Lena is the coldest known region of the globe, and Yakutsk probably the coldest town on its surface. Here mercury remains frozen for two, sometimes three, months in the year, and the earth is frozen for a depth of 382 feet, while the summer thaw reaches only 3½ feet down. Mosquitoes are the great pest of S.; in spring they literally swarm, and the centre of a broad stream is the only refuge. From the results obtained by the levelling expedition under Kropotkin, Voyeikoff has concluded (1878) that the average pressure of the air is greater in East S. than anywhere else on the globe. In the district of Lake Baikal and the upper tributaries of the Amur it is about 30·63 inches, or ·3 inches higher than in any other part of Asia. East S., except in the extreme N., is mainly a great mass of valleys and plateaux, surrounded by mountains, and it is the hindrance these offer to the disturbance of the lower strata of the air that produces its characteristic calm and cold.

Roads, Railways, Fleet, &c.—S. is traversed by a great road connecting Tioumen, Ishim, Tomsk, Irkutsk, and Kiachta, and from E. to W. by a line of telegraph, continued (1869) along the Amur to join the Nikolaievsk-Vladivostok line opened in 1867. The first Siberian railway, between Perm and Ekaterinburg, was opened September 1878, and surveys are being pushed beyond the latter point for the projected line into Central Asia, which will probably start from Tioumen, the continuation of the Orenburg line in that direction being deemed impracticable on account of the inhospitable nature of the country. The Siberian fleet consisted in 1875 of nine war-steamers with 33 guns, and 18 steamers (not armour-plated)—in all 8300 tons burden. A University will be opened (July 1, 1880) at Tomsk, the official centre of West S.

Inhabitants.—Three-fifths of the pop. of S. are Russian colonists, miners, soldiers, officials, and exiles. An official report for 1875 says, '16,889 persons were banished to S. between May and October 1874. 1220 of these, criminals of the worst description, were sentenced to hard labour, and 1624 had been expelled from their communities as obnoxious, drunken, or burdensome. 1080 women and children over fifteen years of age, with 1269 younger children, voluntarily accompanied the exiles.' On January 1, 1876, there were 51,122 exiles in the province of Tobolsk. The native Asiatics are, in the W., Ostiaks, Samoyedes, Tungus, and Soyotes; in the E., Yakuts, Tungus, Yakuhirs, Tchuktchians, and Koryaks.

History.—Russia's possession of S. dates from 1587, when the Tartar khanate of Sibir (the modern Tobolsk) was incorporated with the Russian Empire by the Czar Feodor I., in consequence of the decisive defeat of Yermak, the proscribed hetman of the Cossacks, on the Irtish (October 23, 1581). The territory was gradually extended, and by 1639 Russia had annexed the greater part of what is now S. Kamtchatka was added in 1695-1730, Transbaikalia in 1851, the Amur territory between 1858 to 1869, and Sakhalin in 1875. From 1734 to 1743 the Russian Government carried on a 'Great Northern Expedition' for the purpose of finding a practicable passage from the White Sea to Kamtchatka. The greatest names of this undertaking were Prontchishteff, C. P. Lapteff, Tchelyuskin, Minin, and Sterlegoff. A century later, in 1843, Middendorff explored the country between the Yenisei and the Taimyr Gulf, and in 1844 he travelled E. to the Sea of Okhotsk. Schmidt's vain search (1860) for a mammoth skeleton in S. was rich in botanical and other scientific results. Tchekanovsky, in his journey through the N. part of Central S. in 1873, surveyed the Lower Tunguska for 1600 miles, and completed the explorations of its upper course, begun in 1850. In 1876 J. S. Polyakoff traversed the valley of the Obi to the mouth of the river, and collected much information regarding its fisheries, carried on by the Ostiaks. See his *Briefe und Berichte* (St. Petersb. 1877).

Two expeditions were in 1877 sent out by the Sixth or W. Siberian section of the Imperial Russian Geographical Society—which was opened at Omsk in the latter part of 1876, and has a yearly allowance of 2000 roubles—one, under Czersky, to investigate geologically the shores of Lake Baikal, the other, under Agapidin, to study the botany of the Balagan district of the

government of Irkutsk. A scientific staff, chiefly of engineers, left St. Petersburg on the 4th March 1878, under Baron Aminoff, to explore the watershed between the Obi and the Yenisei, for the ultimate object of constructing new canals. An Imperial Commission will be employed during 1879 in preparing a comprehensive work on the geographical, ethnographical, and commercial development of S., from its first conquest by the Russians to the present time. The most important fact in recent Siberian history is the establishment of sea communication between the White Sea and the Obi Estuary. Carlsen and Palliser, captains of Norwegian fishing vessels, in 1869 crossed in a few days the ill-reputed Karian Sea to the Obi Gulf, which Malygin and Shuratoff had taken two whole years to reach in 1736–37. The Swedish Professor Nordenskiöld (q. v.) made the same voyage in a sailing vessel in 1875, and in 1876 sailed in a steamer from Tromsö to the Yenisei and back between 25th July and 18th September 1876. Nordenskjöld has repeatedly made the passage since, and is now on a N.E. Passage Expedition which left Norway on the 25th July, and reached the Lena 27th August 1878. The first cargo from S. by sea consisted of 370 tons of wheat shipped at the mouth of the Obi, to which it had been brought in river boats from Tomsk, 700 miles up the river. It reached Hammerfest on the 7th September 1878, after a five weeks' voyage. See Captain B. W. Bax, R.N., *Russian Tartary, Eastern S.* (Lond. 1876), and the works of Middendorff (1859, *et seq.*), Radde (1862–64), and Etzel (1864).

Sibsaugor (*Sibsagar*, 'lake of the god Siva'), the chief town of the district of the same name, in Assam, British India, about 11 miles S. of the left bank of the Brahmaputra, 46 miles S.E. of Luckimpur. Pop. (1872) 5278. In the neighbourhood are many tanks and temples of the old native kings.—The *district* of S., which lies between the river and the Naga Hills, has an area of 2413 sq. miles; pop. (1872) 296,589. The tea-plant grows here indigenously, but the tea-manufacture did not flourish till 1852. In 1874 there were 22,573 acres under cultivation, yielding nearly five million lbs. of tea, or more than half the entire yield of the Assam valley; there were 92 Europeans and 24,000 natives employed, of whom the majority are imported from Chota Nagpur. An acre of adult plant ought to produce an average of 400 lbs., worth £40 in the English market. In 1876–77 the exports by river-steamer were 5,771,000 lbs. of tea, 64,000 lbs. of tea-seed, and 41,000 lbs. of caoutchouc. The imports included £44,000 of cotton cloth, £18,000 of grain, £13,000 of liquors, and £12,000 of salt.

Sib'yl (Gr. *Sibulla*, from *Dios Boulē*; Doric, *Sios Bolla*, the 'Counsel of Zeus') is the name by which certain prophetic women were designated in ancient times. Their number is variously stated. Ælian (*Var. Hist.* xvii. 35) mentions four—the Erythræan, the Samian, the Egyptian, and the Sardian; but it was popularly believed that there were ten in all. Of these the most famous is the Cumæan, known by the names of Herophile, Demo, Phemonoë, Deiphobe, and Amalthæa. She was consulted by Æneas before his descent into the lower world, and accompanied him in his journey through the land of Shadows. It was she who appeared before King Tarquin, offering him nine books for sale. The king refused to buy them, whereupon she went away, burnt three, and then returned, asking the original price for the remaining six. On his still refusing to purchase them she again left, destroyed other three, and on her return offered to let him have the remaining three at the price which she had asked for the nine. Tarquin, astonished at such singular conduct, bought the books; and the S. vanished. On inspection, they were found to contain directions as to the worship of the gods and the policy of the Romans. They were kept with great care in a stone chest in an underground chamber of the temple of Jupiter Capitolinus, at first by two commissioners (*duumviri sacrorum*), afterwards by a college of ten (*decemviri*), finally increased by Sulla to fifteen (*quindecemviri*). These oracle-keepers alone consulted them, by special order of the senate, in the case of prodigies, dangers, and calamities.

In 83 B.C. the temple of Jupiter was burnt, and the original Sibylline books destroyed. Ambassadors were accordingly sent to the different towns of Italy, Greece, and Asia Minor, to make a fresh collection. This was deposited in the temple when rebuilt. Spurious Sibylline books now began to accumulate and circulate in Rome. Augustus, fearing danger to the state from the abuse of them, ordered that all such should be delivered up to the prætor urbanus and burnt. Over 2000 were thus destroyed. Those that were accounted genuine were deposited in the temple of Apollo on the Palatine. The writing of these having become faded, Augustus commanded them to be re-written. The Sibylline books were carefully examined at the instance of Tiberius, and many were rejected as spurious. In the conflagration of Rome in the reign of Nero they were all again destroyed. New collections were made, which were publicly and finally burnt by the Christian Emperor Honorius. The Sibylline oracles to which Christian Fathers refer are in no sense whatever to be confounded with the older pagan collections. They are 'pious frauds,' belonging to early ecclesiastical literature, and are a curious mixture of Jewish and Christian material, with here and there, probably, a snatch from the older pagan source. The labours of MM. Alexandre and Ewald have conclusively shown that their composition ranges from the 2d c. B.C. to the 6th or 7th c. A.D., the earlier poems being Jewish and Messianic, and the later ones distinctively Christian. An exhaustive collection of these Sibylline oracles was published by Gallæus (Amst. 1689). Fragments have since been edited by Angelo Mai (Milan, 1817) and Struve (Königsb. 1818). See Bleek, *Ueber die Entstehung und Zusammensetzung der uns in acht Büchern erhaltenen Sammlung Sibyllinischer Orakel* in Schleiermacher's *Theologische Zeitschrift* (Berl. 1819), and Ewald's *Abhandlung über Entstehung, Inhalt und Werth der Sibyllischen Bücher* (1858).

Sicili, a town of Sicily, province of Syracuse, on a rocky hill overlooking a small stream, 3 miles from the coast and 8 S. of Ragusa. It occupies the site of the ancient Syracusan colony of *Casmenæ* (founded in 644), and has considerable trade, and a pop. (1875) of 10,887.

Sicilia'na, or **Sicilia'no** (Ital.), in music, a simple pastoral melody in $\frac{6}{8}$th or $\frac{12}{8}$th time, taking its name from a slow Sicilian dance.

Sicil'ian Ves'pers (Ital. *Vespro Siciliano*), the name given to a massacre of the French at Palermo on Easter Monday (March 30), 1282. The government of Charles of Anjou (1266–85), who on the fall of Manfred had mastered the kingdom of the Two Sicilies, aroused a general discontent throughout the island, and led to a conspiracy, headed by the aged Ghibelline nobleman, Giovanni da Procida, for placing Pedro of Aragon on the throne. An insult offered by a French soldier to a Sicilian bride hastened the revolt; at the vesper hour the bell of San Giovanni degli Eremiti rung the Palermo burghers to arms, and in a few hours' time 8000 French, men, women, and children, who could not pronounce the shibboleth *ciceri*, were put to the sword. Ere the end of April Messina and the other Sicilian towns followed the example of Palermo; but only after twenty years of warfare did Charles's namesake and successor formally abdicate in favour of the Aragonese dynasty. See Amari, *La Guerra del Vespro Siciliano* (2 vols. Pal. 1842; 8th ed. 1859; Eng. trans. by the Earl of Ellesmere, 1850).

Si'cily, the largest of the Mediterranean islands, is severed from Italy by the Strait of Messina, 2 miles wide, while Capo Boeo, its most westerly point, is 368 miles N.E. of Cape Bon in Africa. In shape it resembles an irregular triangle, with its apex to the W., the northern side being 200, the eastern 135, and the south-eastern 177 miles long. Area (as corrected by Petermann, 1878) 9822 sq. miles; pop. (1877) 2,736,545.

Physical Aspect, Soil, Products, &c.—S. is extremely mountainous. From the Faro di Messina in the N.E. angle, extend two ranges of Primitive formation, one southwards to Taormina, with Dinnamari (3707 feet) for its highest peak; the other westward to Milazzo, whence as far as Monte S. Giuliano (2464 feet) there runs a line of hills of Secondary formation, culminating in Monte S. Calogero (4347 feet). The rest of the island belongs almost wholly to the Tertiary formation, which, however, near Monte Laura (3231 feet) alternates with volcanic rocks, which were probably once lava streams from submarine volcanoes. Etna (q. v.), the loftiest point (10,840 feet), is a subsequent upheaval. The contrast between the heart of the island and the maritime zone extending from Palermo to Messina is striking; the former a treeless, houseless solitude, the latter a smiling champaign, rich in groves of lemon, orange, almond, and Indian fig. Navigable rivers there are none, only mountain torrents that run dry in summer; and the drought, caused by

the felling of primeval forests, is poorly compensated by a rude system of irrigation transmitted to the islanders by their Saracen predecessors. Agriculture generally is in a backward state, the rotation of crops is extremely simple, farm implements are of the rudest, and guano and artificial manure things unknown. Yet the deep loam, kept from exhaustion by the mineral substance washed down from the hills by winter rains, is of great fertility; and the hard bearded wheat, which gained for S. the title of 'Rome's granary,' retains its ancient fame, being much in request for the manufacture of macaroni.

Commerce, Industries, Roads, Railways, &c.—About one-half of the land under cultivation is in grain, one-eighth more in rice, linseed, and pulse; and the value of cereals exported in 1871 amounted to £260,000. Other exports in that year were 1,770,000 boxes of oranges and lemons, 7500 tons of dried fruits (nuts, raisins, and currants, almonds, walnuts, &c.), cotton to the value of £90,390 (its culture, extended during the American Civil War, has since declined), 3038 cwts. of manna (grown mainly in the province of Palermo), 15,800 tons of olive oil, and 22,550 tons of sumach; while in 1874, 26,495 pipes of wine, of £266,339 value, were shipped abroad, chiefly from Marsala (q. v.). Since 1858, disease has played sad havoc with the silkworms, and in 1875 the yield through S. and Calabria was only 485,100 lbs. of cocoons, and 176,400 lbs. of raw silk. Mineral products are confined to marble, sulphur, and salt (both rock and sea), the export of sulphur amounting (1874) to 191,740 tons, and that of salt being valued (1871) at £9900, a falling-off of £12,350 from the preceding year. Tunnies, anchovies, sardines, and sturgeon are caught along the coast, and the value of preserved fish exported (1871) exceeded £35,000. The trade of the island, which a century ago was almost exclusively in English hands, now passes chiefly through Swiss and German merchants. In 1871 the total exports amounted to £4,060,987; the imports (coal, iron, copper, timber, cottons, &c.) to £2,554,614; and 17,353 vessels, of 2,547,812 tons, entered the eleven ports. The roads of S. are singularly bad, 102 out of its 360 communes being inaccessible (1876) to wheeled conveyances; and three disconnected railways, with a total length (1878) of 258 miles, at present lose themselves in the interior. It is hoped, however, that the loop Palermo-Girgenti line may soon be opened, and another from Licata to S. Caterina is in course of construction.

Education, Condition of the People, Literature, &c.—Education is certainly improving. In 1862, according to official statistics, 86 per cent. of males and 95 of females could neither read nor write; in 1869 there were 944 public and 265 private elementary schools, attended by 25,073 boys and 12,454 girls, besides 74 institutions for secondary and higher education; and in 1875 the universities of Palermo, Messina, and Catania had 163 professors and 625 students. But the moral state of S. remains unchanged. Each commune has still its *mafia*, or organisation of crime, which, embracing all classes of society, controls elections, the administration of funds, the very hire of workmen; has *bravi* and bandits in its pay; and, sheltered by the *omertà* (a code of honour forbidding appeal to law), defies the Italian Government. And 'in the interior,' says Signor Franchetti, 'brigandage is the only constituted authority.' The peasants, huddled together in towns, and drained of two-thirds of their earnings by the *gabellotti* or middle-men of the great proprietors, look on the robber chieftains as champions of their wrongs. In 1876, 17,042 persons were tried—7481 for crimes (662 murders, 666 murderous assaults, 31 abductions, &c.), and 9561 for misdemeanours. Of these 13 were sentenced to death, 61 to penal servitude for life, 290 to penal servitude for shorter terms; but 6217 prosecutions were abandoned for want of proof to convict, and the total number who escaped unpunished was 10,490.—The *Sicilian dialect* contains a large proportion of foreign elements, Greek, Hebrew, Arabic, French, and Spanish. A grammar of it is prefixed to Pitrè's valuable collection of 400 *Fiabe, Novelle, e Racconti popolari Siciliani* (4 vols. Pal. 1875); and it is further illustrated in Vigo's *Conti popolari Siciliani* (2 vols. Catania, 1871-74), which furnishes specimens of the muse of Pietro Fulloni (died 1670), whom Meli places with Virgil, Dante, and Petrarch on Parnassus' heights, as also of Stefano la Sala, the blacksmith 'Ariosto of the Rustics.'

History.—When S. first looms through the mist of ages, we find its older races, the Iberian Sicani and Latini Siculi, hemmed in by Phœnician and Hellenic colonies. Already the strife of eighteen hundred years between Semite and Aryan was begun; gradually the Phœnicians were withdrawing to the north-western coast, leaving behind them traces of their presence in names like Pachynus ('station'), Catana ('little'), and Ætna ('furnace'). In 735 B.C. Chalcidians founded Naxos, Corinthians Syracuse in 734, and ere two centuries were over the Greeks had fourteen flourishing towns along the eastern and southern shores of Trinacria, as their early navigators named the 'three-cornered' isle. The Canaanite was still in the land, and Carthage, allied to him by blood and interests, came to his aid; but Hamilcar, called in by the exiled despot of Himera, was totally routed (480) by Gelon of Syracuse and Theron of Acragas. A golden age of thirty years set in, when Pindar sang the Olympic triumphs of Hiero, when Doric temples arose nobler than those of Greece, and S. boasted three millions of inhabitants. The strife of Dorians and Ionians for the hegemony, reaching to S., led Athens to undertake its fatal Syracusan expedition (415-13), which left the Dorian islanders so weakened by their victory that Carthage renewed its assaults, and soon had mastered the northern coast as far as Mylæ, the southern to Camarina. Syracuse alone checked further progress, under Dionysius (406), Timoleon (344), Agathocles, who carried the war into Africa (312), and Pyrrhus, king of Epirus (278); till finally the contest ended in the establishment of Rome's supremacy (246-10). From the time when S. became the first Roman province it steadily declined, scourged by the Servile Wars of 135 and 103, and plundered by governors of whom Verres (73-70) stands as the deathless type. Under Sextus Pompeius (46-32 B.C.) it seemed for the moment likely to rise to a separate maritime power; under the Emperors we hear of it only as the scene of a third Servile War (259 A.D.). Attached to the Eastern Empire in 395, it was conquered by the Vandal followers of Genseric (440), and by Theodoric's Ostrogoths (480), whose expulsion by Belisarius in 535 restored the island to Byzantine sway. But in the 9th c. the ancient struggle of Semite and Aryan began anew; the Saracens, landing in 827, took Mazzara (830) and Syracuse (878), and from the Sicilian coasts ravaged the realm of the Greek emperors. Two hundred years they had held their ground, and their memory still survives in monuments of Saracenic architecture and in 300 Arabic local names, when the new Norman power stepped in to wrest the prize from Greek and Saracen alike, as Rome had done twelve centuries before. After a war of thirty years, Roger (q. v.) de Hauteville, brother of Robert Guiscard, subdued the entire island (1090); his namesake and successor united the Norman conquests under his sceptre; and from his coronation (1130) as 'King of the Two Sicilies' the history of S. becomes closely identified with that of Naples (q. v.). The Sicilian Vespers (q. v.) in 1282 made S. an independent kingdom under the House of Arragon, to be again united with Naples by Alfonso V. (1442) and Ferdinand II. (1505). Since then they remained united, but for the brief period of the Savoyard government (1713-20), and of Ferdinand IV.'s expulsion from the mainland (1806-15), down to October 1860, when by the exploits of Garibaldi (q. v.) S. was incorporated with the kingdom of Italy. See L. Franchetti, *La Sicilia nel* 1876 (2 vols. Flor. 1876); G. di Blasi, *Storia del Regno di Sicilia* (3 vols. Pal. 1844); and P. San Filippo, *Compendio di Storia di Sicilia* (7th ed. Pal. 1859).

Sick'ingen, Franz von, a famous German knight, was born 2d March 1481, at the Eberburg, near Münster-am-Stein. His father, of an old knightly family of the Palatinate, had made himself a power on the Rhine, and from his mother he inherited Landstuhl and Hohenburg. After years spent in the maintenance of private feuds, S. was in March 1515 outlawed by Maximilian for warring against the city of Worms, but in spite of this he appeared before the town with 6000 foot and 1100 horsemen, among them Götz von Berlichingen. While the struggle lasted, he fought first against, then for, the Duke of Lothringen, aided François, King of France, and Ulrich, Duke of Würtemberg (1516), and in 1518 was reconciled to Kaiser Max, who freed S. from the ban to gain his service. After the Emperor's death, François and Karl both solicited his help to obtain the imperial dignity. He attached himself to Karl, who lent him 20,000 gulden 'without pledge or surety.' Ulrich von Hutten, who lived with S. at Ebernburg, gained him over to the reforming principles, and persuaded him to support Reuchlin (q. v.) against the Dominicans of Köln, and take Butzer, Œcolampadius, and Schwebel into his service. In 1521 and 1522 S. fought for Karl V. in the

Ardennes at the head of an army of mercenaries. Systematically secularising the church lands on the Rhine, 'to make way for the new learning,' he was gradually nearing his great aim, a principality for himself, when in the autumn of 1522, during his feud with Trier, Philipp of Hessen and Ludwig of the Palatinate advanced against him, and on the 10th October he was outlawed by King Ferdinand. Shut up and besieged in Landstuhl, he was on the 1st May 1523 mortally wounded, and died on the day after the capitulation, 7th May 1523. His children regaining the castle twenty years after, erected a stone monument over his grave in the chapel there, which has been restored by the present owners. Maximilian raised the S. family to the rank of 'Reichsfreiherren,' Joseph III. to 'Reichsgrafen.' The line of S.-Hohenburg is still flourishing. See Ulmann, *Frans von S.* (Leip. 1872).

Sickle. See REAPING.

Si'cyon, the capital of Sicyonia, a state of ancient Greece, 2 miles S. of the Corinthian Gulf, and 10 miles N.W. of Corinth, part of the site of which is occupied by the modern village of *Vasilika*. The city was built upon a flat hill defended on every side by precipitous rocks, and washed E. by the Asopus, and W. by the Helisson. It was one of the oldest cities of Greece, and is spoken of by Homer as the abode of Adrastus. At first dependent upon Argos, it afterwards was closely allied to Sparta, and aided her in the Megarian and Peloponnesian wars. It joined the other Greeks in the Lamian War (368 B.C.), was captured by Demetrius Poliorcetes (303), after whom it was subject to various tyrants until freed by Aratus (251). By the influence of the latter it became one of the most important cities in the Achæan League, but it was afterwards ravaged by Cleomenes (233), and by the Ætolans (221). S. was the earliest school of statuary in Greece, and gave its name to one of the great schools of painting, which was founded by Eupompus, and to which belonged Pamphilus and Apelles, both natives of S. Its art treasures were removed to Rome in the ædileship of M. Scaurus.

Si'da, an extensive genus of *Malvaceæ*, consisting of herbs or shrubs of very various habit and character, usually covered with a soft tomentum. They are spread through the tropical and subtropical countries of the world, but are most abundant in America. The characteristic mucilaginous and fibre-yielding properties of the order are represented in the genus. Several species enter into Indian materia medica, the root of *S. acuta* being used as a bitter tonic and as a remedy for snake-bites, its leaves and those of *S. retusa*, *S. stipulata*, and *S. mauritiana* as poultices, other species for rheumatic affections, &c. *S. tiliæfolia* is cultivated in China for its fibre.

Siddhártha, 'he who has accomplished his aim,' the name said to have been given at birth to Gautama Buddha. This was his individual name, Gautama that of his family, and Buddha ('enlightened') a subsequent appellation. See BUDDHISM.

Sidd'ons, Sarah, England's greatest tragic actress, was the eldest daughter of Roger Kemble, manager of a provincial company, and was born at Brecon, in S. Wales, 5th July 1755. She was already an actress of some experience, when in 1773 she married a Mr. S., a member of her father's company, with whom she removed to Cheltenham, where her acting attracted attention and procured her an introduction to Garrick. As 'Portia' she made her *début* at Drury Lane, 29th December 1775, but failing during the season to produce any great impression, she was not re-engaged in the summer following. Her self-confidence, however, was unshaken, and the ensuing six years, spent in the provinces, chiefly at Birmingham and Bath, brought her splendid powers to maturity. On the 10th October 1782, she again appeared at Drury Lane, and this time her triumph was complete. She continued to play at Drury Lane, adding to her fame in every new part, till the difficulty of obtaining her salary from Sheridan, that 'drowning gulf,' drove her to Covent Garden in 1803. Here she played till she bade farewell to the stage, 29th June 1812. Subsequently she appeared only on behalf of a charity or a 'benefit;' but she continued to give wonderful public readings—at Oxford and Cambridge, by special invitation of the universities—till within a year or two of her death, which took place in London, 8th June 1831. Her majestic beauty is preserved in Reynolds' famous portrait of her as the 'Tragic Muse.' The vast audiences she enthralled carried their admiration to the pitch of rapture, and in later times, critics, uninfluenced by the 'S. fever,' write of her as the peerless queen of the English stage. Her power in tragedy was of the widest range, compassing the grandest transports of passion and the tenderest subtleties of pathos. Among her more famous parts were Lady Macbeth, Queen Catherine, Isabella in *Measure for Measure*, Constance in *King John*, Desdemona, Hermione in *Winter's Tale*, Jane Shore, Elvira in *Pizzaro*, and Millwood in *George Barnwell*. The minute, intelligent study she bestowed on Shakespeare, is proved by her Memoranda. In her greatest triumphs, such as *Macbeth* and *Measure for Measure*, she was associated with her brother, John Kemble (q. v.). Mrs. S. imparted new dignity to her profession, no less by her spotless reputation than by her genius. Esteemed by George III. and his queen, she numbered among her friends Johnson, Reynolds, Burke, Fox, &c. See the *Lives* by Boaden and Thomas Campbell (Lond. 1834); also Lewis' *Actors and Acting* (Lond. 1875).

Side'real Day is the interval of time between two successive meridian passages of the same star, and the sidereal year is the interval between the sun's being in the same position amongst the stars. A sidereal clock is a clock which indicates sidereal time, and is an indispensable instrument in an observatory.

Sideroxy'lon is a genus of about sixty species of erect trees or shrubs belonging to the natural order *Sapotaceæ* spread round the world within the tropics, and reaching also New Zealand, Madeira, and the Cape. The fruit of *S. dulcificum* being exceedingly sweet is used as food to counteract the acidity of other food or drink. The timber of some species is so heavy as to have acquired the name of iron-wood—hence S. Gr. *sidēros*, 'iron,' and *xylon*, 'wood.'

Sidi-Bel-Abbés, a fortified town of Western Algeria, 50 miles S. of Oran, with which it is connected by a railway opened in 1877. It is the centre of the chief district in Algeria for producing the alfa or esparto grass (*Macrochloa tenacissima*). Pop. (1872) 8787.

Sid'laws (the 'South Laws' or 'Hills;' *i.e.*, south of the Grampians), a range in Scotland extending from Kinnoull Hill, near Perth, N.E. through Forfarshire to Brechin. The highest point is Kingseat (1255 feet), the most interesting Dunsinnan (1114 feet), the *Dunsinane* of Shakespeare. The chief formation is Old Red Sandstone, alternating with shale and conglomerate, and resting on porphyry and greenstone.

Sid'mouth, a watering-place of S. Devon, 20¾ miles E.S.E. of Exeter by rail, lies in a valley between the sandstone cliffs of High Peak (513 feet) and Salcombe Hill (497 feet). The church of St. Giles (rebuilt 1860) contains a stained W. window erected by the Queen in memory of her father, who died here (1820), and there are assembly, ball, and reading rooms, public baths, and a fine promenade 1½ miles long. S. publishes one weekly newspaper. Pop. (1871) 3360, considerably increased since the opening of the railway in 1874.

Sid'mouth, Henry Addington, Viscount, the son of a London physician, was born at Reading, May 30, 1757, and passed from Winchester School to Brasenose College, Oxford (1774). He graduated B.A. (1778), and entering Lincoln's Inn was called to the bar (1784), a week later being returned to Parliament for Devizes. A firm supporter of Pitt, he filled the office of Speaker from 1789 to 1801, when differences having arisen on the question of Catholic Emancipation, Addington, as one of the 'King's Friends,' was called on to form a ministry, the chief event of which was the short-lived Peace of Amiens (1802). Pitt's return to power on condition of his abandonment of Emancipation (1804) was accepted by Addington, who for six months held the presidency of the council (1805), being at the same time raised to the peerage as Viscount S. As Secretary of State for the Home Department (1812-22) he incurred considerable obloquy by his conduct at the Manchester Reform meeting (1819); and having in 1824 withdrawn from official life, died at his residence in Richmond Park, February 15, 1844. Fearless and conscientious S. certainly was, but withal 'as dull and bigoted as George III. himself' (Green). See his *Life* by Dean Pellew (3 vols. 1847).

Sidney, Algernon. See SYDNEY.

Sid'ney, Sir Philip, born at Penshurst, Kent, November 29, 1554, was the eldest child of Sir Henry S., who during his son's college days was lord-deputy of Ireland. From Oxford Philip retired without a degree in his seventeenth year, and after a brief season of idleness, probably spent at court, he accompanied the Earl of Lincoln on an embassy to Paris in 1572. While there he witnessed the Massacre of St. Bartholomew. After travelling in Germany, Hungary, and Italy, he returned to England in 1575, in time to join the Court at Kenilworth. At the age of twenty-two he was sent by Elizabeth to congratulate Rudolf II. on his accession to the imperial dignity, and on his return he wrote a masque called *The Lady of May* (1578), to amuse the Queen at Leicester. Favourite as he was, he dared the Queen's frown by presenting to her a 'remonstrance' on her contemplated marriage with the Duc d'Anjou, and they say that his 'remonstrance' had great weight with its recipient. However, he was soon after this called to account for quarrelling with Oxford, and retired from court. While living with his sister, the Countess of Pembroke, he composed *The Countess of Pembroke's Arcadia* (1580–81), a romance in prose and verse. It is a medley after an Italian fashion then popular, its verse too full of conceits to read like poetry, and the rest too poetical to read like prose. It is full of noble imagination, decked out in laboured rhetoric; in form it grafts the heroic upon the pastoral. Its author wished to destroy it a short time before his death, but the Countess of Pembroke rescued it, and published it in 1590. It passed rapidly through many editions. Waller and Cowley treasured it highly, and it was the solace of Charles I. in prison. To the same period belongs a metrical version of the Psalms of David executed by S. in conjunction with his sister, and *The Defence of Poesy*, first published in 1595 as *An Apologie for Poetrie*. It is written in terse, simple language, with dignity defends letters from the attack of such as Gosson, and forms the first piece of serious literary criticism in our language. S. was knighted by Elizabeth in 1583, and in the same year married Frances, daughter of his friend Sir Francis Walsingham. His love, however, had been centred on another, Penelope Devereux, daughter of the Earl of Essex, who married Lord Rich. His suit to this lady, expressed partly in words of unaffected passion, partly in the chivalrous flattery then forming the current coin of courtiers, is contained in the sonnets entitled *Astrophel and Stella* (1591). As in the case of Shakespeare, editors have made these sonnets to bear a complete history of their writer, tracing his love through its innocent dawn, its guilty noon, to the serene evening of purified and sacrificed love. This theory in S.'s case is plausible. History or not, *Astrophel and Stella* contains rich poetry, sometimes worthy of Spenser at his best. The Queen had now grown so fond of Sir Philip that she prevented his accompanying Drake on an American expedition, and even, it is said, disappointed him of the Polish throne. He was made Governor of Flushing in 1585, and in the latter part of that year served as general of horse under his uncle, the Earl of Leicester. Leicester was as ignorant of military tactics as his nephew was skilful, and Sir Philip gained scope for his generalship, but at Zutphen, on September 22, 1586, he received a Spanish ball in the left thigh, and, after great agony, died on the 7th of October. He was buried in St. Paul's Cathedral, and a public mourning was decreed him. Panegyrics, English, French, Latin, Greek, Hebrew, were written upon him by the score; of these Spenser's elegies are the best known. The figure of S. is the one in Elizabeth's court upon which the eye rests most delightedly. He was the favourite of his Queen, the patron and friend of Spenser, the contemporary of Shakespeare, a polished courtier, an accomplished scholar, a spirited general, a subtle poet, a true, tender-hearted gentleman, the idol of his age. He is described best in words he used regarding another, 'high thoughts seated in a heart of courtesy.' His *Miscellaneous Works* were published by Gray (Oxford 1829). The latest and most complete collection of S.'s Poems is that by the Rev. A. B. Grosart (3 vols. Lond. 1877). See *Lives* by Fulke Greville (1652), Zouch (1808), Lloyd (1862), and H. R. Fox-Bourne (1862).

Sidney Sussex College, Cambridge, founded in 1598 by the Lady Frances Sidney, Countess-Dowager of Sussex, consists of a master, ten fellows, and twelve foundation-scholars, three of whom receive £60 and nine £40 per annum. There are also six senior Taylor scholarships of £60, and ten junior of £40, three Blundell scholarships for Tiverton school of £60, and ten other scholarships and exhibitions of from £50 to £12. S. S. presents to eight livings, and in 1878 had 47 undergraduates, 98 members of the Senate, and 198 members on the boards.

Si'don, or **Zi'don** (Heb. 'fishery'), one of the cities of ancient Phœnicia, on the coast of the Mediterranean. It lay on the southern side of a small promontory. The history of S. down to the 13th c. is given under Phœnicia (q. v.). Although the city was almost completely destroyed during the troubles of the 13th c., in the middle of the 15th c. it reappeared, under its modern name of *Saida*, as the port of Damascus, and under Fakhr-ed-Din, Emir of the Druses (1594–1634), a period of prosperity was begun, during which it regained not a little of its former splendour. It became again the great emporium on the Syrian coast of the trade between the East and West, and its population at one time rose to about 20,000. S. suffered severely in the wars between the Druses and the Turks in the 18th c., and after Jezzar Pasha expelled the French consul (1790) and merchants, it again lost all its trade. The ruin of the city was completed in 1837 by an earthquake, which partly destroyed it. The population was estimated in 1876 by the British consul to be about 10,000, and it still has a small trade in exporting tobacco, fruits, olive oil, and grain. In 1876 there entered and cleared 79 vessels of 40,944 tons, the imports amounting to £15,454, the exports to £23,922. See Bädeker's *Syrien und Palestina* (1876).

Sie'bengebirge, an interesting group of trachyte and basalt peaks situated on the right bank of the Rhine, about 20 miles above Köln. The seven highest peaks, from which the name is derived, are Oelberg (1522), Löwenburg (1505), Lohrberg (1444), Nonnenstromberg (1105), Petersberg (1096), Wolkenburg (1076), and Drachenfels (1066 feet). From the Drachenfels which is the nearest of all to the river, a beautiful picturesque view is obtained.

Sie'bold, the name of a gifted family of physicians, anatomists, and physiologists in Germany, of whom the most distinguished was **Philipp Franz Balthasar von S.**, born February 17, 1796, at Würzburg, where he studied medicine and the natural sciences. Entering the service of Holland, he accompanied the troops to Batavia in Java as medical officer in 1822. In 1823 he was commissioned by the government to visit Japan in the interest of science. S. spent six years in studying the flora and fauna of the Japanese islands, returning to Europe in 1830 to complete the publication of his results. In 1859 he again visited Japan, and returned to Europe in 1862. He died at Munich, October 18, 1866. S.'s chief works are *Epitome Linguæ Japonicæ* (1826, 2d ed. 1853), *Fauna Japonica* (6 vols. 1832-41), *Niphon, Archiv zur Beschreibung von Japan* (20 vols. 1832–57), *Bibliotheca Japonica* (6 parts, 1833–41), *Flora Japonica* (1835-53), *Isagoge in Bibliothecam Japonicam* (1841), *Catalogus Librorum Japonicorum* (1845), and *Urkundliche Darstellung der Bestrebungen Niederlands und Russlands zur Eröffnung Japans* (1854).

Sied'lec, the chief town of a Russian government of the same name, kingdom of Poland, 40 miles E. by S. of Warsaw. The seat of a Roman Catholic bishop, it has a fine palace, girt with beautiful gardens, and carries on important baking, distilling, and sugar-refining industries. Pop. (1872) 10.013. The *government*, lying between the Vistula and the Bug, nearly corresponds to the old palatinate of Polachia. Area, 5534 sq. miles; pop. (1872) 548,970. In 1872 it yielded 1,430,369 chetwerts of potatoes, and the produce of its 359 factories (607 distilleries, 400 sugar-refineries, 339 glass-works), employing 1951 men, was 1,921,160 roubles.

Siege (Fr. *siège*, 'a sitting down,' from Lat. *sedeo*, 'I sit'), the prosecution of offensive works against a fortified position with a view to its reduction. The Romans perfected the methods used by the Greeks in such operations, and their great sieges, such as Carthage, Jerusalem, &c., were models in regard to the skilful employment of every possible military resource of the time. They constructed with great rapidity strong intrenched lines in front of the point of attack, faced by a covered gallery from which various galleries were run forward for the conveyance of material to fill up the ditch. Square wooden towers with rams and drawbridges supported the attack. A breach was made by the ram or mine, or the works were

captured by escalade. In modern warfare the operations of a siege depend on the character of the works and the number and gallantry of its defenders. Recent improvements in weapons of offence and the means of defence have greatly altered the conditions of a campaign, and where so much depends on particular circumstances, it is impossible to lay down any hard and fast rules for the reduction of strong places. There are several broad leading methods pursued, however, such as an assault prepared by the system of parallels, a vigorous bombardment, or an effectual blockade. In the S. of a single fortress, and often of more important places, the method of parallels, invented by Vauban, has been steadily followed by military commanders for nearly two centuries. The point of attack having been decided upon, a strong position is taken up beyond the reach of the enemy's artillery, and a road is gradually cleared to the fortress. When the ground has been gained for its construction, the first parallel is begun during the night. It consists of a trench 3 feet below the ground, while the earth thrown up forms a mass 3 feet above the level, thus giving ample shelter to troops. It extends along the entire front to be attacked, and if it does not terminate in a natural obstacle such as a river, should have protecting redoubts at either end. The batteries of the second artillery position are next established, and, after they have silenced the fire of the fortress, zig-zag roads are constructed to the site of the second parallel. A similar course is followed till the total number of parallels, from three to seven, according to circumstances, are completed. The approaches are then pushed on by sapping till the glacis is neared and the passage of the ditch accomplished, when the fortress is ready for storming. A S. of this kind is attended with comparatively small loss of life, and is effectual in the long run, but requires at least several weeks for its operations. The S. of Sebastopol lasted eleven months, during which 50 miles of trenches were constructed. In the S. of Strassburg in 1870, the Germans took 51 days to complete their approaches, upon which the garrison surrendered. The number of men required for a S. by this method in proportion to the garrison varies according to the strength of the latter. Sir John Jones is of opinion that the besieging army should be five to one to the besieged when the garrison is 15,000, eight to one when the garrison is 3000, and in still greater proportion when the garrison is smaller. During the recent Franco-Prussian and Russo-Turkish wars many fortresses capitulated after a few days' or weeks' bombardment.

In the case of a city or an intrenched camp occupied by a large army, the operations are either made on the foregoing plan or are confined to a thorough blockade until the stores of the besieged are exhausted. Fighting in the latter case is usually confined to a struggle for the communications of the place, bombardments, and encounters with sorties. Where the possibility exists of the approach of a relieving army, lines of defence, called lines of circumvallation, should be thrown up by the besiegers to protect their rear, and a vigilant watch kept up by a reserve portion of the army. Such was the simple plan followed at Metz, Paris, and latterly at Plevna. A strong intrenched line of outposts was established all round the fortifications, behind which lay the main line of the army, while to the rear central points were selected and strongly fortified. The line of investment at Metz was 24 miles, and at Paris 45 miles. In the case of Metz the besiegers numbered 200,000, while the beleaguered army amounted to 173,000. After the investment has been completed, the advantage even in armies of equal numbers appears to be on the side of the besiegers, as they can accomplish their purpose without leaving their works, while the besieged are compelled to throw themselves sooner or later against the intrenchments. In these days of breechloaders, the open assault of even slight intrenchments well defended is almost impracticable. Nothing in modern warfare could equal the folly of the attempts by the Russians to carry Plevna by assault when their losses were so appalling, except, perhaps, the foolhardy attacks by the Turks on the Russian positions in the Shipka Pass.

Siege Artill'ery, large ordnance too heavy for field purposes, used in the operations of a siege. A *siege train* of 105 pieces consists of

55 rifled 64 pounders, } on travelling carriages
20 ,, 40 ,, } with siege limbers.
and 30 ,, 8-inch howitzers, on travelling carriages.

Sieg'en, a town in the S. of Westfalen, Prussia, on the left bank of the Sieg, 63 miles E. of Köln by rail. Situated in the richest iron district in Germany, it has extensive iron works, manufactures of paper, leather, soap, and hosiery, besides woollen and cotton-weaving, bleaching, dyeing, and printing. S. is possibly the birthplace of Rubens (q. v.). Pop. (1875) 12,902.

Sie'mens, Ernst Werner, a celebrated electrician, was born at Lenthe, near Hanover, December 13, 1816. In 1838 he became an officer in the Prussian artillery; but devoted most of his time to scientific studies. In 1841 he patented a method for electroplating and gilding; and in 1848, in Schleswig-Holstein, he laid the first submarine mines which were fired by electricity. The next year he retired from the army, and, along with Halske, founded a telegraphic establishment at Berlin, which has constructed the telegraph lines of Russia, Spain, Brazil, N. Germany, &c. By his numerous improvements and inventions he has rendered great services to telegraphy; and has, besides, made valuable researches in electrical science generally.—His brother, **Karl Wilhelm S.**, was born at Lenthe, April 4, 1822, and studied at Göttingen. In 1843 he settled in London as a civil engineer, and in 1853 founded a branch of the Berlin house, at the same time erecting a large establishment at Woolwich for the construction of telegraphic apparatus. He became a member of the Royal Society in 1862, was president of the Institution of Mechanical Engineers, and was first president of the lately-constituted Society of Telegraph Engineers. He also presided at the Iron and Steel Congress which met for the first time at Paris in the summer of 1877. He is the inventor of a regenerating gas furnace, a bathometer, a pyrometer, &c. His pyrometer measures high temperatures by the change of electrical resistance in a given bar of metal due to heat. His publications relate chiefly to these inventions, and are valuable contributions to the literature of science. The most important are *On a Regenerative Condenser* (1850), *On the Conversion of Heat into Mechanical Effect* (1853), *On a Regenerative Steam-Engine* (1856), and *On the Increase of Electrical Resistance in Conductors*, &c. (1871).—**Friedrich S.**, a third brother, was born December 8, 1826, at Menzendorf. He began life as a seaman, but in 1846 followed his brother Karl to London, and greatly aided him in perfecting his gas furnace. Of late years he has conducted a large establishment for the manufacture of glass at Dresden.—**Walter S.**, a fourth brother, has established himself in Tiflis, and conducts large copper and cobalt works.

Sie'na, a city of Central Italy and capital of a province of the same name, picturesquely situated on three hills, 58½ miles S. of Florence by rail. It is still surrounded by an ancient wall about 4 miles in circumference, with seven towers and nine gates, and has in its N.W. quarter a citadel, the Forte S. Barbera, built by Cosmo I. in 1560, which is connected by the Lizza promenade (laid out in 1779), with the Via Cavour, one of the principal streets. In the centre is the semicircular Piazza del Campo, now called Vittorio Emanuele, the largest square, from which eleven streets radiate in irregular lines. It contains the Palazzo del Governo (1469-1500), since 1859 the repository of one of the largest collections of archives in Italy, with 52,000 parchment charters; and the Palazzo Pubblico (1289-1309), with fine paintings by Sodoma and others of the Sienese school. Adjoining the latter is the tower Del Mangia, 295 feet high, and opposite is the marble Fonte Gaza, with bas-reliefs of Scriptural subjects by Jacopo della Quercia (1419). The noblest edifice of S. is the Duomo or Chiesa Metropolitana, which is one of the finest specimens of Italian Gothic architecture. It is 291 feet long and 80 feet wide, while the transept is 165 feet long. Its façade is of red, black, and white marble, and its pavement is covered with 'Graffito' representations in marble. The Duomo contains many works of art by Michael Angelo, Pinturicchio, Duccio, and other masters. Other interesting buildings are the churches of S. Maria della Scala (13th c.), and S. Domenico (1220-1465); the Biblioteca Comunale, said to be the most ancient in Europe, containing 40,000 vols. and 5000 MSS.; the Instituto delle Belle Arti, with a rich collection of pictures, principally of the older Sienese school; and the house, now converted into an oratory, in which St. Catharine of S. was born in 1337. The university was founded in 1349, and had in 1874-75 28 professors and 113 students. S. has important manufactures

of woollens, silks, paper, beet-sugar, and alcohol. Pop. (1877) 21,887. S. was made a *colonia* under Augustus, with the name *Sena Julia*. It became a free city at the beginning of the 12th cent., and joined the Ghibelline party. Long the powerful rival of Florence, it inflicted upon that republic a severe defeat at Monte Aperto in 1260. Intestine strife, however, gradually sapped the strength of S., and the supremacy fell into the hands of various tyrants, last of whom was Pandolfo Petrucci, surnamed *Il Magnifico*, by whose influence it became subject to the Medici of Florence, and was finally joined to Tuscany in 1557.

Sienna Earth. See BURNT SIENNA.

Sierr'a, the name given in Spain and Spanish colonies to mountain ranges. The Portuguese form is *serra*. The word is commonly derived from Lat. *serra*, 'a saw;' but is more probably the Arabic *sehrah* (the same as 'Sahara'), 'a desert place.'

Sierr'a Leo'ne ('lion mountain'), a British colony on the W. coast of Africa, situated between 7° 20′ - 8° 40′ N. lat. and 12° 20′-13° 20′ W. long. It consists chiefly of a peninsula, 25 miles by 12, and a number of islands, the total area of the colony being 468 sq. miles. A narrow strip of low and fertile land borders the coast, but the bulk of the country consists of rugged granite mountains, which reach a height of 3000 feet. The rainfall is excessive, amounting to 144 inches annually, and combines with the heat to render the climate so deadly to Europeans that S. L. has earned the evil designation of 'the white man's grave.' Though indigo grows wild, and much of the country is also well adapted to the growth of sugar and coffee, none of these crops is cultivated. The chief exports are palm-oil, ground-nuts, caoutchouc, gum, ginger, and ivory; and the imports consist principally of cottons, wearing apparel, arms and ammunition, and hardware. In 1875 there entered 491 vessels of 143,181 tons, and cleared 465 of 141,282 tons; the imports amounting to £326,011, the exports to £350,202, of which but £25,248 were produce of S. L. itself. The first British settlement was made in 1787, when a number of negro refugees were brought to S. L. by a company which disposed of its interest in the place to the British Government in 1809, though S. L. was not duly accredited as a colony till 1822. The population was chiefly recruited by the slaves captured by British cruisers after the abolition of the slave-trade in 1807, and has declined since the cessation of this supply. In 1871 it amounted to 37,089, of whom only 107 were whites. The capital, Freetown, contains about half the population of the colony. It has a good harbour. The government is administered by a governor appointed by the Crown, and assisted by executive and legislative councils, and forms with the Gambia (q. v.) the 'Government of the West African Settlements,' in which the Gold Coast (q. v.) and Lagos (q. v.) were also included from 1866 to 1874. S. L. is also the see of a bishop.

Sierr'a Ma'dre, a branch of the Mexican Cordilleras, extending in a N.W. direction to the borders of the United States. Here there is a long break in the chain; but another range of mountains in New Mexico retains the name. The S. M. is very rich in silver deposits, but as yet has been imperfectly explored.

Sierr'a More'na (Lat. *Montes Mariani*), a chain of mountains in Southern Spain, separating the tablelands of New Castile from the plains of Andalusia. It is about 220 miles long, and from 15 to 50 miles wide, and runs as a rule nearly due E. and W., though tending slightly to the N. It forms the watershed between the Guadiana on the N. and the Guadalquiver on the S. Some of the peaks rise to a height of about 5200 feet, but most of them reach only a little over 3000 feet.

Sierr'a Neva'da, so called from the perpetual snow with which some of the peaks are crowned, a bold and picturesque mountain range in the province of Granada, Southern Spain, about 60 miles long and from 20 to 25 miles wide, running almost due E. and W. The peak of Mulhacen (11,372 feet high) is the loftiest mountain in Europe W. of the Alps, while the Picacho de Veleta (11,000 feet) has the most southern glacier. The S. M. is celebrated for the picturesque abruptness and boldness of its form.

Sierr'a Neva'da. See ROCKY MOUNTAINS.

Sieyès, l'Abbé Emmanuel-Joseph, Comte, born at Fréjus, 3d May 1748, was educated by the Jesuits of his native town, the Doctrinaires of Draguignan, and lastly in the seminary of St. Sulpice. He took the priesthood, and was attached in 1775 as canon to the Bishop of Tréguier, following him (1780) to his new diocese of Chartres, of which he became the vicar-general. Shrinking within his shell, the 'light, thin, passionless man' lived wholly for his studies—languages, metaphysics, mathematics, political economy, only not history. 'To judge the present by the past,' he would remark, 'is to deduce the known from the unknown.' Three pamphlets by him broke the lull that followed the dissolution of the Assembly of Notables, of which the last, *Qu'est-ce-que le Tiers État* (1789) had a great effect. 'There is then one man in France,' said Mirabeau, and wrote to the author, 'My master, for such you are;' while Madame de Staël observed, 'The writings and opinions of the Abbé will form an era in polity, as Newton's in physics.' One of the twenty Paris deputies to the States General, he solved the question raised by the schism between the Orders and the Third Estate, by his suggestion to the latter's representatives of the title 'National Assembly;' and in the Convention voted the execution of the king, with or without—historians differ—the famous formula: 'Death, and no words about it.' He had, indeed, his phrase for each turn of revolution, as when, after cowering through the Terror, he reappeared with 'I have lived;' or on the fall of the Directory exclaimed, 'I must get me a sword.' Napoleon's colleague in the Consulate (1799) with Ducos, he quietly went on building constitutions, till, sick of shadows, he dropped them for the realities of a pension, estate, title, decoration, and seat in the Senate. S. was one of the earliest members of the Institute, from which, however, his banishment as regicide at the Restoration excluded him (1815), nor was he re-admitted till his return from exile (1830). He died in Paris, 20th June 1836, leaving behind him a number of published and unpublished works, all equally forgotten. Those who would understand his paper constitutions may find them discussed at length in Boulay de la Meurthe's *Théorie Constitutionelle de S.* (1836) and Beauverger's *Étude sur S.* (1851).

Sigh'ing, a respiratory act, often prompted by mental impressions of conscious or unconscious kind, and commenced by a prolonged effort of inspiration, in which the diaphragm descends. The expiratory act which follows, and which constitutes the 'sigh,' is caused by the recoil of the chest walls and lungs, and by the action of the abdominal muscles. S., in short, illustrates simple respiration as modified by mental conditions. In the 'breathless attention' of a person listening to a speaker, or witnessing some exciting scene, the respirations become very short and quickly recurring, with an occasional long 'S.' inspiration at intervals.

Sight, in gunnery, is a piece of metal attached or applied to a gun or firearm, so as to give more accurate means for directing the shot. It consists of two parts, one fixed near the muzzle, and the other near the breech; and these are brought into the same line with the object aimed at.

Sigilla'ria, one of the most abundant and striking of the trees which flourished during the deposition of the great coal strata, and the remains of which contributed very largely to the formation of coal itself. When deterioration occurs in some of the coal seams, by the presence of earthy constituents, the carbonised stems of S. may be observed, piled one above another in almost unbroken succession, so as to form a compact coaly mass, enough of the stem markings being left to render identification easy; while in the associated shale and sandstone beds impressions of it are commonly found. When in a mature, living condition, it must have presented the appearance of a tall and massive pillar-like tree, which either remained simple or forked towards its extremity; the stem being traversed longitudinally by grooves or ridges, and at regular distances between these, long narrow leaves were attached, known in a fossil state as *Cyperites*. As regards its minute internal structure, there has been proved to be a close approximation to the other genera of fossil *Lycopodiaceæ*—the natural order to which S. itself belongs. A central cellular portion or medulla was surrounded by a cylinder of barred vessels; outside this, another layer of loose, cellular tissue was succeeded by one of elongated cells or pleurenchyma.

Sig'ismund, German Emperor, born February 14, 1362, son of the Emperor Karl IV. of the house of Luxemburg,

on the death of his father (1378) inherited the markgrafdom of Brandenburg. He married Maria, daughter and heiress of Lewis the Great of Poland and Hungary, and after a hard struggle gained the crown of the latter country in 1387. Becoming involved in war with the Turks, he was decisively defeated by Bajazet I. at Nicopoli in 1392. After his return he was imprisoned by the Hungarians and deposed (1401), but at length, on the death of Ruprecht of Pfalz in 1410 chosen Emperor by some of the electors, he was universally recognised as such from the death of his rival, Jobst, Markgraf of Moravia (1411). S. was a zealous promoter of the General Gouncil of Constance (1414-18), which put an end to the 'Great Schism,' burnt Huss, and brought about the Hussite War. On the death of his brother Wenceslaus (1419) S. inherited Bohemia, but did not obtain possession of it till 1436. He sold Brandenburg in 1415 to Friedrich Hohenzollern, burg-graf of Nürnberg, the ancestor of the present German dynasty. S. died 9th December 1437, when the male line of the house of Luxemburg became extinct. See Aschbach, *Geschichte Kaiser S.'s* (4 vols. Hamb. 1838-45), Dr. L. von Bezold, *König S. und die Reichskriege gegen die Husiten* (Munich 3 vols. 1872-77).

Sig'ismund I. (*Zygmunt*), King of Poland, the youngest son of Casimir IV., was born January 1, 1467. He was elected Grand Duke of Lithuania, and succeeded his brother Alexander on the throne of Poland (1506), whose independence he had much ado to maintain against the Russians and Tartars. To his sister's son, the Grandmaster Albrecht, S. granted the hereditary Duchy of Prussia, on the 8th April 1525. The policy of his reign was tolerant to the Dissidents, and favourable to the advancement of art and science. Lutheranism penetrated into Poland in his life-time. S. died at Cracow, April 1, 1548.—His son and successor, **S. II.**, born August 1, 1520, became ruler of Lithuania in 1544, and of Poland in 1548. His reign is chiefly remarkable for the complete union of Lithuania with Poland, and for the incorporation of W. Prussia, Volhynia, Podolia, and the Ukraine at the Diet of Lublin in 1569. He guaranteed complete religious toleration at the Diet of Warsaw in 1572, and died on the 18th July of that year, the last of the Jagellons.—**S. III.**, born June 20, 1566, only son of King Johan III. of Sweden and the Polish Princess Catharine, was in 1587 elected King of Poland. In 1594 he was crowned King of Sweden, where he left as regent his uncle, Karl IX., on whose taking possession of the crown in 1604, S. made war on Sweden (q. v.). In a war against the Turks he gained the great victory of Chodkiewitz in 1621. He died April 30, 1632.

Sig'nalling, a means of communication between distant points by visible or audible signs, according to a preconcerted system. The firing of beacons to warn off the approach of an enemy, or to spread the news of the consummation of some expected event, is probably the most ancient really efficient method. With the rise of commerce and the growth of national intercourse, S. became a much more important consideration, especially at sea, where ships though within sight of each other are usually far beyond the limit at which articulate sounds can be heard. In naval S. flags are very generally employed. By combining different coloured flags in various ways a large number of distinct signals can be made. Each of these indicates a number corresponding to a word, phrase, or sentence, which is entered in a book. By furnishing these books to all vessels intercourse may readily be carried on between them. Such a system of signals is technically called a *code*. That of the British navy is capable of expressing about 14,000 words or phrases. In the merchant service the code is not so extensive, since, excepting the signals of distress, more is rarely required than is sufficient to give a ship's name, nationality, her captain's name, the port to which she is bound, &c. At night instead of flags lights are substituted. Flashing signals constructed upon the principle of the Morse telegraph alphabet, with long and short flashes may be advantageously used. This system is strongly advocated by Sir William Thomson of Glasgow, himself an experienced navigator, who further recommends the substitution of two loud notes of different pitch for the long and short flash when on account of fog the light could not be seen. On railways S. is also of extreme importance. Here, however, the code is small, and different coloured lights or flags are amply sufficient. The electric telegraph is itself a most efficient yet simple method of S., and has completely displaced the semaphore as a transmitter of intelligence across large tracts of country, besides linking together in a close bond continents thousands of miles apart. See BEACON, SEMAPHORE, TELEGRAPH. Bells, horns, bugles, guns, rockets, whistles, &c., are constantly used in S. The storm warnings now issued by the Admiralty Office in Great Britain are signalled by means of cones hoisted at various stations round the coasts. See STORMS.

Sig'nature, in music, the signs placed at the beginning of a composition, denoting the time and key. The time S., expressed by a fraction, the denominator expressing fractional parts of a semibreve, and the numerator the number of these in a bar, is only printed at the commencement of the first line, and where there is a change in time; while the key S. governing the notes requiring sharpening or flattening is placed at the beginning of every stave. When a new key in a piece of music continues only for a short time, the alterations are made by the prefixing of sharps and flats as required, but where it is lengthy a new S. contradicting the preceding is used. The signatures of relative major and minor keys are the same, and the body of a piece often requires examination to see whether it is in the major or minor mode. See MUSIC.

Sig'net. The seal for the authentication of royal grants was so called in England. But warrants under the Royal Sign Manual (q. v.) are now effective if countersigned by a Chief Secretary of State. In Scotland, there is a class of law agents called 'Writers to the S.' (q. v.), the S. having been, in that country, the seal of state affixed to royal warrants.

Sign'ing, Seal'ing, and Deliv'ery is the mode of executing a deed in English law. The signature of the party, or parties, to the deed, must be written, or owned, in presence of two witnesses. A wafer, or seal, is attached, on which the party puts his finger, and says—'I deliver this as my act and deed.'

Sign-Man'ual is the signature of the sovereign, which must be affixed to writs under the Great Seal, or the Privy Seal (see SIGNET). The S.-M. is usually only the initial of the sovereign's name, with the letter R, for *Rex* or Regina, as *V. R.*

Signorell'i, Luca, the forerunner of Michael Angelo, was born at Cortona 1441, and in his thirteenth year apprenticed to Piero della Francesca. From him he acquired that mastery of anatomy seen in his first 'Madonna' and 'School of Pan,' both which he painted for Lorenzo de' Medici soon after coming to Florence (1475). At Florence and Loreto, in the Sixtine Chapel at Rome and half the Umbrian and Tuscan churches, he painted in the next twenty years frescoes and altarpieces, the finest perhaps a 'Circumcision,' now in the Hamilton Collection. All were eclipsed by the eight spirited 'Scenes from the Life of St. Benedict' in the monastery of Monte Oliveto (1497), as these again by the 'Doom' at Orvieto (1499-1503), where, in his kinsman Vasari's words, 'angels, devils, ruins, nudes, and foreshortenings are done with a wondrous and inventive fancy.' This the most daring and learned outcome of the Renaissance, the painter's triumph and monument, brought him a second summons to the Vatican; but in 1510 he withdrew to his native city, where, working to the last, he died in 1525. See two articles by Prof. Colvin in the *Cornhill* (1875), and Fisoher's *L. S. und die Italienische Renaissance* (1878).

Sigour'ney, Mrs., an American authoress, born at Norwich, Connecticut, 1st September 1791. Her maiden name was Lydia Howard Huntley, but in 1819 she married Mr. Charles Sigourney of Hartford. Her first work was *Moral Pieces in Prose and Verse*, published in 1815, after which her literary productiveness was unceasing. She published fifty-nine volumes of tales, poems, and essays, principally on moral and religious subjects, earning by the general tone of her writings the name of 'the American Hemans.' Among her most notable works are *Letters to Young Ladies* (1833), *Pocahontas, and other Poems* (1841), *Pleasant Memories of Foreign Lands* (1842), in which she recorded her impressions of a tour in Europe in 1840, and her posthumous autobiography *Letters of Life* (1866). She died at Hartford, June 10, 1865.

Sig'urd or **Sieg'fried**, originally **Sig'ward** ('the victorious'), was the son of Siegmund the Volsung and Queen Sigelind. Brought up by the smith Mimir, he acquires prodigious strength, and fights with and slays the dragon Fafner, thus obtaining the hoard of the Niebelungen and the tarn-cap of invisibility. A

bath in the blood of the dragon gives him invulnerability, except in a spot between his shoulders, where a leaf had adhered to his skin. He next rescues Brynhild, but becomes by the influence of magic oblivious of all that had passed, presents himself at the court of Wurms, and receives in marriage Gudrun or Chriemhild as a reward for having, by means of his tarn-cap, made Brynhild the submissive bride of Gunther. Brynhild, being taunted on this account by Chriemhild, sends against the hero Hagen, who pierces S. through his vulnerable spot as he was lying on his face drinking from a fountain in the forest.

Sihun. See JAXARTES.

Sikhs (a corruption of a Sanskrit word meaning 'disciples') is the name of the great community, half religious, half military, who founded a state in the Punjaub, India, under Runjeet Singh (q. v.) at the beginning of the present century. According to the general census of 1868-72, they number 1,174,436 throughout British India, of whom more than one million are found in the Punjaub; but even in that province they only form 6 per cent. of the total population, being most numerous between the Ravi and Sutlej rivers, in the districts of Lahore, Umritsur, Umballa, and Jullundhur. Externally, they may be known by blue garments and unshaven hair. As a religious sect, the S. acknowledge Nanuk (q. v.) as their founder. He preached a doctrine of fervid monotheism, based upon a religious and moral purity, which owed something equally to Hinduism and to Islam. He was himself of the Khetri or ancient warrior caste; but the greater number of his followers were Jats or Juts (see JAT), the prevalent race in N.W. India, supposed to be of Scythic descent. From Nanuk ten *gooroos* or apostles are traced down to Govind Singh, who died in 1708, having transformed a religious sect into a community of fanatical warriors. Up to this date the S. had passed through much persecution from the Mohammedans, the memory of which is still fresh. But they saved themselves from extermination in their mountain fastnesses at the foot of the Himalayas, and retained their faith with incredible tenacity. Taking advantage of the decay of the Mogul empire, and with the example of the Mahrattas to encourage them, they gradually extended themselves down both banks of the Sutlej, forming an armed confederacy bound together partly by the principle of religious equality, and partly by that of feudal submission. The name by which they called themselves was *Khalsa*, an Arabic word, meaning 'select' or 'liberated;' their point of union was the acceptance of the *Grunth* or 'Book,' compiled by Arjun, the fourth *gooroo*: and their watchword was *Wah goorro!* or 'Hail, *O gooroo!*' The rite of initiation consisted in being sprinkled with sugar and water from a vessel which had been stirred with a dagger; and they devoted themselves to the service and contemplation of steel, as of a patron deity. During the 18th c. the S. took advantage of the continuous warfare between the Moguls, the Afghans, and the Mahrattas to strengthen their political power. Though Govind Singh left no successor, and a cruel persecution fell upon them immediately after his death, the fervour of their religious belief kept them together. In 1757 one of their chiefs was sufficiently established at Lahore to coin rupees, in the name of the *Khalsa*. They organised *misls* or recognised confederacies, and year by year all met at the sacred city of Umritsur, to hold council together and to bathe in 'the pool of immortality' dug by the third *gooroo*. But the Sikh supremacy dates from the rule of Runjeet Singh, who was appointed governor of Lahore by the Afghan emperor in 1799, and quickly enforced his recognition as the chosen leader of the *Khalsa*. Before this time the S. had been mere freebooters, who owed their impunity chiefly to the disordered state of the country. On his death in 1839, he had established an undisputed dominion from Multan to Cashmere and from the Sutlej to Peshawur. He left a revenue of two and a-half millions sterling, and an army of 50,000 men, trained by European officers, and with a full complement of guns. He died during the disastrous expedition of the English into Afghanistan, towards which he had himself unwillingly contributed. Of the sons who succeeded him the first was an imbecile, the second (the present Maharajah Dhuleep Singh) an infant of a few months. The ministers were either incapable or treacherous; and the army of the *Khalsa* would be content with nothing less than an invasion of English territory. This caused the first Sikh War of 1845-46, followed by the second Sikh War of 1848-49, after which the Punjaub was finally annexed. The Sikh army fought worthily of its reputation, and the English victories in the field were dearly purchased. The sepoy had found his match, and even European regiments were known to quail before the disciplined fanaticism of the S., who courted martyrdom. It was only the enormous resources of England, and an overwhelming weight of artillery, that finally gained the day at Gujerat. Since then, Sikh history has been merged into the general administration of the Punjaub, the greatest triumph of English character and energy which India has seen. During the Mutiny of 1857-58, not only the Sikh cultivators of the Punjaub, but also the Sikh irregular regiments, stood loyal. It was Sikh feudatory chieftains who were among the first to join the camp before Delhi; and before and after that date, Sikh soldiers have been found most useful on distant or foreign service, as having a special zest for military duties, and being destitute of any caste prejudices against crossing the seas. From being the most formidable foes, they have been converted into the strongest support of the English power. See Cunningham's *History of the S.* (Lond. 1853); Sir J. W. Kaye's *History of the Sepoy War* (Lond. 1876); Professor E. Trumpp's *Adi Granth, or the Holy Scriptures of the S.* (Lond. printed by order of the Secretary of State for India in Council, 1877).

Sikkim', a native state in the Himalayas, between Nepaul and Bhutan, in political connection with the government of Bengal. Area, about 1550 sq. miles; pop. about 7000; estimated revenue £1600, including £600 a year paid by the English and £200 by the Chinese. S. is important as containing the most direct trade-routes from India into Thibet, which have hitherto been kept closed by the jealous influence of the Chinese Government. The ruling family is Buddhist in religion, and of Thibetan descent. In 1835 the sanitarium of Darjeeling was ceded to the British, in consideration of a payment at first of £600, now of £1200, per annum. In recent years much has been done to develop the transit trade with Thibet. The Lieutenant-Governor of Bengal has had repeated interviews with the Rajah and his minister. In 1876-77 the registered imports from British India were valued at £14,000, chiefly indigo, cattle, metals, and tobacco; the exports at £80,000, including £70,000 of timber floated down the Runjeet river. The capital is at Tumlung from November to May; for the rest of the year it is removed to Chumbi, on the Thibetan side of the range. The products are rice, Indian corn, millet, oranges, tea, and cotton cloth; the minerals are lime and copper. See Dr. Hooker's *Himalayan Journals* (Lond. 1854).

Sile'ne, the type-genus of the tribe *Sileneæ*, of the natural order *Caryophyllaceæ*, consisting of annual or perennial herbs or sometimes slightly shrubby plants. There are upwards of 200 species, of which eight are British, seven of these being dispersed more or less through the N. temperate zone, and one (*S. gallica*) is now spread as a weed over all temperate regions. The genus does not contain any very showy or remarkable species, though several are in cultivation as dwarf annuals or perennials. Among such *S. acaulis*, forming bright green moss-like cushions, with an abundance of pretty pink flowers, is well adapted for rock-gardens. It is a native of most alpine rocks in N. and Central Europe and N. America, attaining in Scotland an altitude of 4300 feet. Some are night-flowering plants, and are sweetly fragrant, *e.g.*, the British *S. noctiflora* and *S. nutans*, and a large group are glandularly hairy —hence the English name of 'Catchfly.' *S. inflata* and *S. maritima* are noticeable for their inflated calyx-tube, and are generally called 'bladder-campion.'

Sile'nus, the name of the chief Satyr (q. v.) who faithfully attended Dionysus. He was son of Pan and Gaia, fought against the giants, and slew Enceladus. Besides the voluptuous inclinations which he shared with the other satyrs, S. had a far-reaching gift of prophecy.

Sile'sia. See SCHLESIEN.

Si'lex (Lat. 'flint'), a generic name given by some mineralogists to the silicates which occur in nature as minerals. Of these rock-crystal, quartz, chalcedony, and flint may be mentioned. See QUARTZ.

Silhet or **Sylhet**, the chief town of the district of the same name, now annexed to the province of Assam, British India, at the foot of the Khasi Hills, on the river Surmah, a tributary of

the Brahmaputra. It is a Mohammedan town, built on raised ground among the marshes. Pop. (1872) 16,846.—The *district* of S., transferred to Assam in 1874, though entirely disconnected from the valley of the Brahmaputra, lies S. of the Khasi and Jyntia Hills. Area, 5383 sq. miles; pop. (1872) 1,719,539, nearly half the total population of the province. It is crossed by the river Surmah, which is navigable by steamers. The chief crops are rice and oil seeds. In 1876-77 the registered exports to Bengal were valued at £597,000, chiefly tea, £285,000 (mostly from Cachar), rice £86,000, lime £79,000, oil seeds £52,000, potatoes £37,000, oranges £13,000; the imports were valued at £440,000, including piece-goods £144,000, salt £112,000, sugar £28,000, tobacco £26,000, spices £22,000. Special manufactures are the weaving of fine mats and carving in ivory, and formerly the making of shields.

Silhouette', profile portrait or representation of an object, outlined and filled in with black colour, a few white lines being sometimes introduced for effect of relief. These shadowy portraits were fashionable in France during the reign of Louis XV., and their name arose out of public ridicule for the niggardly finance of his minister, M. Etienne de Silhouette.

Sil'icate Paints. The manufacture of S. P. is extensively carried on by the Silicate Paint Company at Liverpool and London. The new industry originated a few years since on the discovery of a large deposit of almost pure silica near Llandudno, in N. Wales. This natural silica, when dried, forms an almost impalpable powder, which mixes readily with colours and oil. The S. P., which may be had of all colours, are non-poisonous, unlike the ordinary lead paints. The new silicate white has a base of sulphide of zinc, is whiter, more durable, and has a greater body and covering power than white lead; the colour is not affected by gases, and heat of 500° is successfully resisted.

Sil'icon (Si = 28), a chemical element resembling carbon in many of its properties. It occurs in nature as a constituent of *silica* (SiO_2), the best-known varieties of which are quartz, sand, and flint. For long silica was regarded as an elementary substance, and it was not till 1813 that Davy succeeded in decomposing it by the action of potassium, and thus obtaining a specimen of S. The element is obtained now more easily by decomposing silico-fluoride of potassium ($2KF,SiF_4$) with potassium or sodium at a high temperature, when the alkaline metal combines with the fluorine to form a salt soluble in water, and S. is left in the form of a brown powder. It may be obtained in two other conditions: as *graphitoid S.*, by heating amorphous S. to a high temperature out of air; and as *crystalline S.*, obtained by cooling from fusion. The amorphous form burns brilliantly in oxygen, and resists all acids except hydrofluoric. The graphitoid variety, on the other hand, refuses to burn in oxygen or dissolve in hydrofluoric acid. S. forms only one hydride (SiH_4), in this respect differing widely from carbon. This hydride takes fire spontaneously in air, evolving clouds of silica and depositing a brown film of the element upon a cold surface. Besides silica, two other oxides are believed to exist. They have been obtained, however, only as hydrates, having the compositions represented by the formulæ $3SiO,2H_2O$ and $Si_4O,2H_2O$, and are known respectively as *leucone* and *chryseone*. Silica, like carbonic acid, is a weak acid, but owing to its being non-volatile at a high temperature displaces most of the other acids from their combinations. United with bases it forms *silicates*, the chemistry of which is very complicated. The greater part of the earth's crust is composed of these silicates, which are mostly fusible, and all except the alkaline compounds insoluble in water. Hydrofluoric acid is a universal solvent; and heating with a fluoride and strong sulphuric acid has the effect of decomposing the silicate and driving off the S. as fluoride (SiF_4). This gas also results from the action of hydrofluoric acid upon silica. It is colourless, fumes strongly in air, and is decomposed by water into silica and silico-fluoric acid ($Si_2H_2F_6$), an acid liquid which attacks metals, forming a series of salts known as the silico-fluorides. Of these the alkaline salts, and especially the silico-fluoride of potassium, are soluble in cold water. See CLAY, FELSPAR, GLASS, &c., for more detailed account of the common silicates and their use in the arts.

Silis'tria, or **Silis'tra** (also *Distra*, the anc. *Dorostorus* or *Dorostena*), a fortified town of Bulgaria, 70 miles below Rustchuk, on the S. bank of the Danube, and 5 miles from the point where the easterly frontier of Bulgaria retires from the river, which is here a quarter of a mile wide, and is studded with islets. A fortress of the first rank, it is defended by walls of solid masonry and by detached forts of great strength, and forms the most advanced point of the Bulgarian quadrilateral, the other posts of which are Rustchuk, Varna, and Schumla. S. is badly built and dirty, many of the houses being mere huts, but it has twelve mosques, a Greek cathedral, and four churches, an agency of the Danube Steam Shipping Company, many public baths, large bazaars, and a house of quarantine. There are leather and cloth industries, and considerable trade in grain, timber, wine, and garden produce. Pop. 20,000, comprising Turks, Bulgarians, Greeks, and Jews. S. was the scene of a victory gained by the Byzantine emperor, John Zimiskes, over the Russians under Sviatoslav in 971. It has played an important part in the Russo-Turkish wars. Attacked in vain by Romanzov in 1773, it capitulated to Langeron in 1810, was beleaguered and taken in 1829, and on the outbreak of the Crimean War was besieged by Paskievitch, with an army of 80,000. On this occasion it was defended by Mussa Pasha and the former Prussian officer Grach, with a garrison of 15,000, and after thirty-nine days of siege and assault, during which two young English officers, Captain Butler and Lieutenant Nasmyth, displayed incomparable gallantry, the Russians retired with a loss of 12,000 men.

Sil'ius Ital'icus, a Roman poet, born about 25 A.D., rose through high distinction as a pleader at the bar to the consulship in 68, the year of Nero's death. Vitellius made him proconsul of Asia, and, after discharging this office with honour, S. retired from public life, and died at the age of seventy-five. His chief work was the *Punica*, an heroic poem in 17 books, narrating the events of the Second Punic War. The materials are drawn from Livy and Polybius, and worked up 'maiori cura quam industria' (Pliny) into the coldest and dreariest composition ever misnamed a heroic poem. This, the only extant work of S., was discovered by Poggio at St. Gall during the Council of Constance, and was first printed at Rome in 1471. The best editions are those of Cellarius (Leip. 1695), Drakenborch (Utrecht 1717), Ernesti (Leip. 1791-92), Ruperti (Gött. 1795-98), and Lemaire (1823). There is a translation into English by Ross (Lond. 1661); into French by Villebrune (Par. 1781); and into German by Bothe (Stuttg. 1856).

Silk-Cott'on is the name given to the enveloping silky fibre of the seeds of various species of *Malvaceæ*, belonging to the genus *Bombax* (Gr. *bombyx*, 'raw silk'), or the allied genera *Eriodendron* (Gr. *erion*, 'wool or down,' and *dendron*, 'tree'), *Chorisia*, and *Ochroma*. *Bombax* consists of tall trees with digitate leaves, and solitary or clustered red and white flowers on axillary or terminal flower-stalks. Their fruit is a large, woody, five-celled capsule, containing numerous seeds, each of which is surrounded with a quantity of beautiful silky hairs, designed for the ready dispersion of the seed when the capsule bursts. The genus has its headquarters in tropical America, with outliers in tropical Africa, Asia, and N. Australia. *B. Munguba*, of Brazil, &c., has the S.-C. of a light-brown colour; thus far it has not been utilised for more important purposes than stuffing cushions and similar domestic services. Of *B. Malabaricum*—a very large tree, attaining a height of 150 feet and a girth of 40 feet in S. India and Burma—the fruit is collected before it opens, and the S.-C. with which it is filled is used to stuff quilts and pillows. The calyx of the flower-bud in this species is eaten as a vegetable; a gum which exudes from the bark is used in native medicine; and the light porous wood serves for planking, canoes, floats, scabbards, &c. *E. anfractuosum*—the W. Indian cotton-tree—is a lofty tree, generally with a straight columnar stem, and of a strikingly imposing appearance; the leaves are palmate, and it produces a profusion of pale rose-coloured flowers. The 'wool' is used both in Jamaica and Africa for mattresses, &c. So also is the material obtained in Brazil from *C. speciosa*, and in Central America and the W. Indies from *O. Lagopus*.

Silk'worm and **Silk'-Culture.** Silkworm is the name given to those species of *Lepidopterous* insects which spin a silken-*cocoon* or pupa-case in their larval condition for the enclosure of the *pupa* or *chrysalis*. The silk-gland and *Spinneret* or thread-joining organ are situated on the *labium* or lower lip of the larvæ. The family *Bombycidæ* (Latreille) includes the various species of silkmoth.

The bodies are thick and heavy. The head is sunk in the thorax and is of small size. The mouth-parts are ill-developed as compared with those of other moths, and the antennæ are comb-like. The genus *Bombyx* itself includes the *B. mori*, the typical Chinese silkmoth, which has white fulcate front wings, its hind wings falling short of the tip of the abdomen, whilst the antennæ are markedly comb-like. The average length is 3 or 3½ inches. The larvæ is naked and slender, and possesses a horny process on the tail. It is cream-coloured, but the hue varies greatly. Captain Hutton, in the Proc. Entom. Society of London, has given a number of interesting particulars regarding the silkmoth larvæ. Bad food, scanty light, and bad ventilation have the effect of causing disease in the silkmoth larvæ, the effects of interbreeding also causing disease. The 'worms' of a brood which are dark grey or brindled, the *vers tigrés* or *vers zébrés* of the French, are examples of the healthy original stock of the silkworm larvæ. Captain Hutton maintains that the original colour of the worm was dark, and his experiments of selecting the dark worms of each brood and of interbreeding the dark-coloured forms, resulted in the production of a healthy race, producing better cocoons than the ordinary or pale-coloured larvæ. White cocoons, according to Hutton, are a sign of the degeneracy of the race. The silkmoth may breed twice or three times yearly in India, and the larvæ moult three or four times. About 360 cocoons of ordinary size weigh 1¼ lbs., and in France and Italy about thirty-six days elapse between the hatching of the larvæ and the manufacture of the cocoon. Four days is the usual period occupied in the formation of the cocoon. In England and in some districts in India thirty-six days may be required. The *Bombyx mori* feeds on the leaves of the mulberry, which itself was derived from the mountainous provinces of China. Hutton, however, has shown that no less than twelve species of S. worms have been confounded with the *B. mori*. At least six species of the genus *Bombyx* are domesticated. The following is a list of other genera and species of moths producing silk :—

Bombyx Pernyi of N. China; feeds on oak leaves; cocoon large, greyish brown; reeled only in China as yet.

B. Cynthia feeds on *Arlanthus glandulosa*, of China and N. Asia, produces a long greyish cocoon; not reeled in Europe.

B. Yama-Mai, a Japanese silkmoth, feeds on oak; cocoon greenish, thread strong; much valued in Japan.

Antheræa paphia of India, large, hard, dark-grey cocoon, known as the *Tussur moth*: affords 'Tussur silk' of India.

B. ricini of Bengal, feeds on castor-oil plant; produces a cocoon similar to *B. cynthia*.

Telea polyphemus is the American silkmoth. The silk is coarser than that of *B. mori*, but has a rich gloss. Larvæ feed on the oak. Moths leave cocoons late in May, eggs laid in middle of June; caterpillars hatched in ten or twelve days; larvæ moult five times; cocoon formed late in September; pupa state passed in winter. Many other species of moths have been made the subject of experiment and investigation, but the foregoing are the chief species depended on by silk-cultivators.

Silk is the strongest, most lustrous, and therefore most valuable of all textile fibres. Ordinary S. is the produce of the cocoons of the common silkworm, *Bombyx mori*; but increasing attention is now being devoted to the cocoons of various allied species of *Bombyx*, *Attacus*, &c., the most of which are enumerated under the article COCOON. Such as have come into prominent industrial notice in Europe will be hereafter alluded to, attention being first given to the common silkworm alone.

There is no doubt that the now widespread silkworm was originally a native of China, where according to native records it was reared, and S. was reeled from a period, according to our chronology, anterior to the Deluge. It certainly was there cultivated from an exceedingly remote period. From China the cultivation extended to the Corea and Japan several centuries before Christ, and in spite of the most rigorous precautions on the part of the Chinese S. culture was begun in N. India before our era. Its progress westward was slow; in 420 A.D. it was produced in Khotan, whence it travelled to other Central Asiatic regions, Bokhara, Khiva, Samarcand, &c., and in the 6th c. the industry was firmly established throughout Persia. The culture did not reach Europe till A.D. 552, when, according to Gibbon, the Emperor Justinian encouraged certain monks to revisit China, who accordingly 'deceived a jealous people by concealing the eggs of the silkworm in a hollow cane, and returned in triumph with the spoils of the E.' From Constantinople, where the worms were first reared, the cultivation spread but slowly westward, and it was the 16th c. before the industry was fairly established in France under the patronage of François I. To a limited extent only S. culture has been introduced into America, and in Australia, New Zealand, and the Cape of Good Hope considerable attention is now being devoted to the industry.

The S. industry, pursuing it no further than the production of the raw fibre, divides itself into two sections; 1st, the rearing of the cocoons, and 2d, filature or reeling of the raw S. The silkworm, like all its congeners, in its life history passes through four stages or periods of existence—the egg state, the caterpillar, the chrysalis, and the moth. A large trade exists in the eggs, called 'graine,' of the silkworm, and since the development of the disease which at one time threatened the extinction of European S. a great quantity of 'graine' has been annually brought to Europe from Japan. The eggs in a French 'manganerie' are deposited by the female moth on a piece of soft cloth or paper, to which they adhere by a gluey liquid which covers them. They are preserved in the egg state till spring, women carrying them in small parcels about their persons, and placing them under their pillows at night; and other means are taken to defend them from undue cold. The eggs are hatched at that period when food is prepared for the caterpillars by the development of the leaves of the mulberry, and in the subsequent growth of the worm five ages or periods of moulting are noted, extending altogether over about one calendar month, when the caterpillars are kept in a uniform favourable temperature. In the first age of five days the worms from 1 oz. of 'graine' eat 6 lbs. of leaves; during the next four days, the second age, they require 22 lbs.; in the third age, embracing six days, 65 lbs. of leaves are required; in the seven days of the fourth age 200 lbs. of leaves are consumed, and in the nine days of the fifth age no less than 1200 lbs. of leaves are eaten by the worms. At this point the worm 'mounts,' or ceases to feed, and takes up the position where it is to spin its cocoon. The cocoons are finished in a few days, and in order to prevent the development of the moth, and its puncturing the cocoon in order to escape from its prison, means must be taken to kill the insect at this point. This is accomplished by the application of artificial heat, an apparatus for steaming the cocoons being now in very general use. If 'graine' for the next season is desired, the best-developed cocoons are chosen, and from these the perfect moths are permitted to escape when they have reached maturity. On an average 1 oz. of 'graine' produces about 88 lbs. of cocoons. The cocoons vary in size considerably; the largest being about the size of a pigeon's egg, with a golden yellow or white colour, and generally having the appearance of a slight construction around the centre of their long diameter. A cocoon yields a continuous fibre varying in length from 750 to 1150 feet. The varieties of the ordinary silkworm in cultivation are extremely numerous. About the year 1820 there appeared in France a disease among the silkworms which subsequently became known as *Pébrine*, and which, gradually spreading, attained by the year 1855 the dimensions of a great national calamity. From France the disease extended into N. Italy, where its effects became equally disastrous, and the fatal blight travelled eastward, similarly affecting every S.-producing country, and even China itself. The disease showed itself by the eggs placed for incubation dying; such worms as were developed presented an unequal and starved appearance, and frequently died before spinning their cocoons; while such as actually propagated a new generation produced eggs and worms still more degenerate. Thus arose, primarily in France, but subsequently in other countries, the necessity of importing 'graine' from distant unaffected provinces, and by degrees the 'graine' had to be drawn from regions more and more remote, while the demand for healthy eggs increased, and the price advanced in proportion. A time actually came when Japan, the only country free from the disease, had to supply eggs to all European S.-growing countries, and in 1868 not less than 2,800,000 oz. of eggs were sent to Europe from Japan alone. The direct loss to French cultivators during thirty years preceding 1867, was calculated to be one milliard of francs, while in Italy in ten years the loss was not less than two milliards. From the *Statisque de la Production de la Soie en France et à l'Étranger*, issued by the Syndicate of the Union of Lyon S. merchants in 1877, we learn that the total production for 1876 in Europe, the Levant, and Eastern Asia, amounted to 17,946,600 lbs., or nearly a fifth less

than for 1874. There were in the United States 213 S. factories, employing 18,007 hands, and producing goods to the value of $27,158,071 in 1876.

S.-Reeling.—The fibre of S. differs from all other textile fibres in being produced in one unbroken thread of indefinite extension, whereas all others are, more or less, in short lengths. The preparation of raw S. from cocoons, therefore, differs in its processes from the other fibres in use. The operation of reeling is conducted in establishments termed 'filatures,' and the process is one of considerable simplicity. The essential apparatus consists of a reel, attached to which is a guide-rod, a series of eyelet-holes and crossing-points, and a basin for water. The basin in which the cocoons are placed is divided into a number of compartments, and there is an arrangement for heating and maintaining the water it contains at any required temperature by means of steam. Into each of the compartments, say four, a definite number of cocoons are placed, according to the size of filament to be made. The reeler switches them about briskly till all the superficial floss is removed and the ends of the true thread are obtained. These he seizes and passes through the first guide-hole, where they are twisted into a single strand. A corresponding number of similar filaments pass through a neighbouring guide, and the strands from the two are carried forward, twisted together, so as to form for a short space a thread of two strands. They again diverge, pass through separate guide-eyes, meet again to form a single strand, which, meeting another pair which has been similarly advancing, intertwist, separate again, and finally the whole four, intertwisted as one, pass over the guide-rod to the reel. By this 'croisage' or intertwisting and re-separation of the filaments, and finally twisting into one, a round smooth thread is obtained. The filament on the outer part of a cocoon is much thicker and stronger than the inner layers, and therefore, in reeling, great skill and judgment are necessary on the part of the operative to maintain the resulting thread of uniform size throughout. On this uniformity the quality and value of the raw S. greatly depends, and to maintain it the reeler from time to time varies the number of filaments which go to make up the strands and final thread. In other words, the reeler must skilfully vary from time to time the number of the cocoons from which he reels the filaments. The fineness of raw S. is determined by the weight of each skein containing 400 revolutions of the reel (400 ells), and is expressed by 'deniers,' of which there are 24 in every grain. The number of deniers is called the 'title' of the S., and it is usually quoted as an indication of quality. It is in this condition that raw S. is usually imported and sold; but before it is ready for the weaver or other use it undergoes several operations, all of which are embraced under the term

S.-Throwing.—Of the process comprehended under this term the first is winding, or transferring the raw S. from skeins to bobbins. The skein is stretched on the 'swifts,' a light revolving framework from which the S. is transferred to bobbins. The S. is next 'cleaned' by reeling it from one bobbin to another, the thread in its progress passing between two parallel plates placed so close to each other that the occurrence of any knot or husk is automatically detected, and the machine is thrown out of gear till the cause of obstruction is removed. In 'doubling,' which next follows, two threads from separate bobbins are brought side by side and wound together without any twist on a single bobbin. The amount of twist necessary to give coherence and uniformity to the thread is given in a subsequent operation, and according to the method and amount of twist given, the S. is known in commerce as 'singles,' 'tram,' or 'organzine.' Singles simply consist of the single filament of raw S., either untwisted as it is delivered by the reeler, or only sufficiently twisted to give it the necessary amount of compactness to bear the operations of boiling and dyeing through which it passes before weaving. 'Tram' consists of two or more untwisted filaments doubled, and subsequently twisted only sufficiently to make a compact thread. 'Organzine' is made up of two or more filaments first separately twisted, then doubled and retwisted in the reverse direction.

Raw S. in the natural condition, or 'in the gum,' as it is termed, presents a somewhat hard wiry appearance from the presence of gummy exudation which surrounds the filaments as they are formed by the worm. For some purposes, as, for example, in the manufacture of ordinary crape, the gum is retained in the S., but generally the raw material is cleaned, the colour discharged, and the fibre softened by a process of boiling, or 'discharging.' For this purpose the hanks of raw S. are ranged on a long stick, immersed for half an hour in boiling water which contains soap and soda carbonate, squeezed, and again steeped for several hours in a hot solution of soap. It is afterwards rinsed perfectly free from the soapy solution in cold water, and at this stage it is ready to receive any dye for which it may be intended. In the boiling, S. loses at least a fourth of its original weight.

Spun or Waste S. Manufacture.—A very large amount of the raw material of the S. industry comes into commerce as pierced cocoons, floss, reelers' waste, and other forms which cannot be treated by the filature processes above alluded to. These materials are dressed, combed, formed into rovings, and spun by processes and on machinery analogous to that used in the alpaca or worsted wool manufactures.

Tussah Silks.—Under this name may be conveniently embraced the raw S. produced by a variety of moths other than the ordinary *Bombyx mori*, and to which a large share of attention has been devoted since the devastating disease manifested itself among the worms of that species. Several of them have, however, been known and used in Oriental countries for a long period. Of these the most important in India is the common Tussah or Tusser moth, *Antheria paphia*, which produces in the jungles throughout the whole of India, a large, firm, grey-coloured cocoon, from which a peculiarly strong S. is prepared. Of more limited range, but still producing a large amount of valuable fibre, are the Assam Tussah, *Antheria Assami*, the so-called Ailanthus worm. *Attacus cynthia*, originally a Chinese species; the Arrindy, or castor-oil plant silkworm of India, *Attacus ricini* (*vel Bombyx arrindia*), and the Bughy worm of Bengal, *Attacus mylitta*. The Yama-mai oak-feeding silkworm of Japan yields in that country a large amount of useful S. Of these species, the Yama-mai, the Arrindy, and the Ailanthus have received a large amount of attention in France; but the difficulty experienced in communicating to them delicate shades of dye-colours has hitherto greatly retarded their progress. Recent experiments, conducted by Mr. Thomas Wardle, F. C. S., however, indicate that these difficulties have been successfully overcome, and in the Indian section of the Paris Exhibition, 1878, that gentleman exhibited dyed Tussahs little if anything behind common S. in purity and delicacy of shade.

S. is readily enough distinguished from other animal and from vegetable fibres by appropriate chemical tests, and by its microscopic appearance. In a mixed fabric animal fibres may be dissolved out by the action of caustic potash, under a strong solution of which they readily dissolve. Among other animal fibres S. is most readily recognised by various tests which show the presence of sulphur in wool, &c., but from which S. is entirely free. In a solution of oxide of lead in caustic potash wool becomes black, and treated with nitro-prusside of sodium in a caustic alkali, wool gives a violet coloration, both reactions due to the presence of sulphur, and consequently not yielded by S. fibres. Under the microscope S. presents the appearance of a smooth cylindrical fibre destitute of external structure.

The imports of S., raw and thrown, into Great Britain during the year 1877, and the localities whence derived, were as follows:—Bengal, 154,350 lbs., value 10s. to 27s. per lb.; Chinese Taysuam, 554,268 lbs. at 13s. to 26s.; Chinese Tsaltee, 1,487,670 lbs. at 23s. to 29s.; Canton, 691,240 lbs. at 15s. 3d. to 23s. 6d.; Chinese thrown, 9184 lbs.; Se-chuen, 136,068 lbs. at 7s. 6d. to 16s.; Japanese, 929,700 lbs. at 20s. to 33s.; Bokhara, 83,880 lbs. at 8s. 9d. to 18s.; Patent Brutia, 15,400 lbs. at 11s. to 16s.; Italian raw 101,790 lbs., and thrown 240,120 lbs. at 36s. to 44s., the total imports being 4,155,197 lbs., a very great falling off as compared with certain previous years, the imports of 1871 having been upwards of 8,000,000 lbs., and in some years more than 9,000,000 lbs. have been imported. The imports from Bengal especially show a marked falling off, being less in 1877 than one-tenth part of what they were in 1867, and they have, excepting the year 1871, declined steadily between these points.

Silk'worm Gut is prepared from the caterpillars of the ordinary silkworm. The creatures are taken just at the point when they are about to begin spinning their cocoons, and immersed in a strong preparation of vinegar. In this they are left for a period varying according to the heat of the weather, a comparatively short time being necessary during the heat of the summer. The bodies are then taken, gently broken in two, and when drawn

out a long glutinous thread is formed by the silky secretion the caterpillar had formed for making its cocoon. These are separately stretched on a board, and held down by slits or pegs till they dry, and they then constitute the lustrous exceedingly strong line so well known to anglers under the name of 'gut.'

Sill'iman, Benjamin, an American chemist and geologist, born at N. Stratford, Connecticut, 8th August 1779, graduated at Yale College in 1796, and went to the bar in 1802, but in the same year was elected professor of chemistry at Yale. In 1818 he founded the *American Journal of Science and Arts*, of which he was sole editor until 1838, and joint editor along with his son until 1846. He resigned his professorship in 1853, but continued to lecture on geology until 1855. He died at New Haven, Connecticut, on November 24th, 1864. His principal works are a *Journal of Travels in England* (New York, 1810), *Elements of Chemistry* (1830), and *A Narrative of a Visit to Europe* (1853). See *Life of B. S.*, by G. P. Fisher (New York 1866).—His son, **Benjamin S.**, born at New Haven, 4th December 1816, became professor of applied chemistry at Yale in 1846, and succeeded his father as professor of chemistry in 1854, a post which he still (1878) holds.

Sill'oth, a town of Cumberland, England, on the Solway Firth, 20 miles W. of Carlisle by rail. It is of recent origin, and owes its rise chiefly to its mild climate. The sea-bathing is good, and the place is much resorted to by persons suffering from pulmonary complaints. With a fine dock and pier, it has become a principal port for steamers to the Isle of Man and Ireland. Pop. (1871) 1931.

Silu'rian Sys'tem, a great succession of strata intervening between the Cambrian formation and the base of the Old Red Sandstone. It received its name in 1835 from Murchison, who first carefully studied these rocks in S. Wales, the district once occupied by the ancient British tribe of the Silures.

The following is a convenient classification of the Silurian rocks in Britain; the numbers expressing the thickness of the beds being of course only approximate.

			Feet.
I. Lower Silurian.	1. Lower Llandeilo, Arenig, or Stiper Stones group		10,000
	2. Upper Llandeilo, or Llandeilo Flags		4,000
	3. Bala and Caradoc Beds		8,000
	4. Lower Llandovery Rocks		1,000
II. Upper Silurian.	1. Upper Llandovery Rocks	Mayhill group.	800
	2. Tarannon Shales		800
	3. Woolhope Limestone	Wenlock group.	50
	4. Wenlock Shale		1,000
	5. Wenlock Limestone		200
	6. Lower Ludlow Rocks	Ludlow group.	1,000
	7. Aymestry Limestone		50
	8. Upper Ludlow Rocks		600
	9. Downton Sandstones		200

In Great Britain, the Lower Silurian is typically developed in the counties of Merioneth, Caernarvon, and Caermarthen in Wales; in Shropshire and in the lake district; and in the S. of Scotland, throughout the greater part of the area included between lines drawn from Girvan to Dunbar, and from Dumfries to St. Abb's Head. In Ireland, besides occurring in numerous scattered localities, Lower Silurian strata are well seen in Wicklow, Wexford, and Waterford, in Limerick and Kerry, and in a band stretching from Cavan, &c., to county Down.

The Upper Silurian is typically shown in Denbigh, Montgomery, Radnor, &c., in Shropshire, Staffordshire, and Worcestershire; in Scotland, in patches in the neighbourhood of Girvan, Lesmahagow, &c., and on the Pentland Hills; in Ireland, in the counties of Galway, Limerick, and Kerry.

The S. S. is well developed in N. America, and the following are its chief subdivisions in the State of New York.

Silurian Strata of New York.	*British Equivalents.*
1. Trenton group: comprising the Chazy, Bird's Eye, Black River, and Trenton Limestones.	Lower Silurian.
2. Hudson River group: including the Utica Slates, &c.	
3. Clinton group: including the Oneida Conglomerate, Medina Sandstone, &c.	Llandovery Group.
4. Niagara Limestone.	Upper Silurian.
5. Saline group: including the Onondaga Salt-rock, &c.	
6. Lower Heidelberg group.	

On the Continent of Europe, the S. S. is well represented in Russia from St. Petersburg to the Baltic, in Bohemia, and in Scandinavia, where it has been studied respectively by Murchison, Barrande, and MM. Linnarson and Angelin. It is also well developed in Brittany, Spain, and Portugal.

The volcanic rocks of the period include great beds of traps and tuffs, interstratified with the Lower Silurian rocks, and well seen in Radnorshire and around Snowdon.

The Silurian rocks have as yet furnished no remains of land or fresh-water organisms, with the exception of a few fragments of Lepidodendron, and some spore-cases of Lycopods, which have been detected in the Upper Ludlow beds. Sponges, Foraminifera, &c., are well represented; but, geologically speaking, the most important fossils are the Graptolites. There are an enormous number of species, often restricted to thin beds, which are easily identified thereby in other localities. With the exception of Holothuroids, all the orders of Echinodermata are represented, the most notable being the Cystidea, which are especially characteristic of the Lower Silurian. Among the Arthropoda, Trilobites here attain their maximum of development, and Phyllopods, Ostracods, &c., are not rare. In the Mollusca, the Brachiopods and Orthoceratites show an extraordinary preponderance, the latter chiefly in Upper Silurian strata. Lastly, the earliest known fossil fish-remains occur in the Ludlow Formation; five or six species are known, referable probably to the sharks and ganoids.

Silu'ridæ, a family of *Teleostean* fishes belonging to the *Malacopterous* division of the order. The Siluroid fishes have spines formed by the first rays of the 'pectoral' or breast-fins. These spiny rays are largely developed, and may be erected or depressed at will. They are articulated by means of a ring-joint or *shackle-joint* with another bone. The fin-spines were at first regarded as presenting similar structures to the fossil fin-spines, or *icthyodorulites*, of *Elasmobranchiate* and *Ganoid* fishes; but they are really different, since the fin-spines of dogfishes, &c., are implanted in the flesh, and not articulated to another bone. The head in S. is protected by an armour-plating of dermal plates. Of this family the best-known species is the *Silurus glanis* of Swiss lakes and European rivers. This fish may attain a length of 6 or 8 feet, and may weigh from 300 to 400 lbs. It is common in the Danube and Elbe, and it or an allied species occurs in some of the N. American rivers. Attempts have been made to introduce it as a food fish into England. It is sluggish, and lies at the bottom of the water. Long tentacles surround the mouth. The colour is dark green above and yellowish below; the fins are blue and yellow, and the body is spotted. The *Malapterurus* (q. v.) of the Nile is one of the S.

Silva'nus (from *silva*, 'a wood'), an Italian divinity, guardian of trees, fields, and husbandmen. He marked out the boundaries of fields, he fostered the growth of trees, and he shielded flocks from destruction. The peasants had a festival in his honour, and offered him corn, milk, wine, and other rustic products. Through similarity of function, S. came to be identified with Pan and Faunus. His appearance was that of a hale and cheerful old man.

Sil'vas, or **Sel'vas** (Span. *selva*, 'a forest'), a name given to the immense wooded plains of the central Amazon, the area of which is estimated at from 750,000 to 1,000,000 sq. miles. Being low, with a level surface, they are flooded for a fifth part of their extent by the annual rise of the Amazon and its tributaries. The moisture and heat of the climate combine with the richness of the soil to render the forests luxuriant in the extreme, the trees being matted together by innumerable climbing plants, which form an impenetrable screen, so that even the jaguar is compelled to advance from tree to tree along the branches instead of along the ground. Unspeakably gloomy in the rainy season, the S. on its departure are brilliant with countless flowers. Birds, insects, monkeys, and snakes throng these regions, but human life is represented only by a few miserable Indians.

Sil'ver (Ger. *silber*), a metallic element very generally distributed, and which has been known from the most remote times. In the Book of Genesis mention is made of S., and it is frequently alluded to throughout the whole Bible, having formed the medium of currency before the art of coining was invented. The ancient Greeks, whose mines in Attica, Thessaly, and Epirus yielded abundance of the precious metals, also imported large quantities from foreign states, and till the 3d c. before the Christian era nearly all the coins of high value were S. The Romans, although

using the Greek S. coinage, had none of their own till about B.C. 269, when they obtained large quantities of S. from Spain, where rich mines had been very early wrought. In later times Austria, Germany, Spain, and Norway were the principal sources of S. in Europe; but on the discovery of America, and the opening up of the extremely rich mines of Mexico, Nevada, Peru, Chili, and Bolivia, the European mines were to a great extent neglected. The S. obtained in Great Britain is generally contained in galena, the most argentiferous coming from the Isle of Man, but it is also found in considerable quantities in different parts of the kingdom. Pure S. is a white metal, having when polished a brilliant lustre, which cannot be excelled by any other metal with the exception of steel. It is very malleable and ductile, and may be beaten into leaves $\frac{1}{100,000}$th of an inch in thickness, or drawn into very fine wire. S. has also great tenacity, a wire $\frac{1}{18}$th of an inch in diameter being capable of bearing a strain of 187 lbs. In hardness it is intermediate between copper and gold, and in thin plates it transmits light of a bluish-green colour. It melts at a bright red heat in a temperature of 1873° F. (1023° C.), and if exposed in a molten state to the air, takes up oxygen to the extent of 22 times its own bulk, which it liberates on cooling. The outer surface as it cools solidifies, but the escaping oxygen ruptures it, and forcibly expelling small globules of the molten S., causes a loss of the metal. The *spitting*, as this phenomenon is termed, may be prevented by the addition of a small portion of copper, lead, or gold, which prevents the absorption of the oxygen, 1 to 2 per cent. of the copper being a sufficient proportion. If S. be heated several times it becomes very brittle, and assumes a crystalline appearance. S. is the best conductor of heat and electricity known, and in the construction of delicate electrical instruments, when long metallic wires are required, it is preferred to any other metal.

Native S. occurs abundantly in S. mines, and is generally alloyed with gold, platinum, copper, iron, arsenic, cobalt, &c., most frequently with platinum. In Norway and in Mexico masses from 200 to 800 lbs. weight have been found; and it is said that a piece weighing 9000 or 10,000 lbs. was on one occasion discovered in the Johanngeorgenstadt mine. The ores of S. are numerous, and indeed there are few metallic ores which do not contain some traces of it. The following are the principal ores:—*Monochloride of S.*, or *Horn S.*, AgCl, containing about 75 per cent. S., is a soft bluish-grey mineral, found chiefly in Chili and Peru, but also in smaller quantities in Siberia, the Harz, Norway, Saxony, Brittany, and Cornwall; *Argentite, Vitreous Sulphide of S.* or *S. Glance*, Ag_2S., containing about 86 per cent. S., is a dark leaden-grey ore, soft, and with a metallic lustre when cut; it is found in Saxony, Bohemia, Hungary, and Mexico; *Brittle* or *Black Sulphide of S.* or *Stephanite*, Ag_5SbS_4, containing about 67 per cent. of S., a brittle, blackish mineral found at Allémont, Freiberg, Peru, and Mexico; *Polybasite* $(AgCu)_9(Sb,As)S_6$ containing from 64 to 72 per cent. of S; another form of the brittle sulphide is of an iron-grey colour, and found in Mexico, Chili, Nevada, and Idaho; *Dark Red S. Ore, Ruby S.* or *Pyrargyrite*, Ag_3SbS_3, a widely-disseminated ore, yields about 60 per cent. of S., and has a brilliant dark-red or reddish-black colour, with a metallic lustre; *Native Amalgam*, AgHg, containing about 36 per cent. of S.; a soft mineral of a bright silver-white appearance is also found in many localities; *Argentiferous Galena*, the sulphide of lead, which yields a variable amount of S., and is reckoned very rich when it contains 0·005. Among the other and less important ores of S. are:—*Dycrasite*, or *Antimonial S.*; *Proustite, Light Red S. Ore*, or *Arsenical Sulphide of S.*; *Sternbergite*, a sulphide of S. and iron; *Bromide of S.*, or *Bromyrite*; *Iodide of S.*, or *Iodyrite*; and *Chlorobromide of S.*, or *Embolite*.

The processes by which S. is extracted from its ores and separated from the other metals with which it combines in nature are numerous, but all fall under the two heads of wet and dry processes. Under wet processes are comprehended amalgamation of the metal with mercury, and the obtaining of solutions from which metallic S. is precipitated. In the dry processes the lead-yielding ores are enriched by concentration, and the final separation of lead and S. is effected either by a refining process similar in principle to cupellation, or by the Pattinson or zinc processes alluded to under LEAD. The ancient Saxony amalgamation process is not now prosecuted, but in Mexico and S. America a large proportion of the metal is yet obtained by an analogous method. The ores are first crushed in stamping mills, and ground under edge-stones with water and 1 to 5 per cent. of common salt to a uniform impalpable paste. After some days, there is added to it from ½ to 3 per cent. of 'magistral,' roasted iron and copper pyrites, and the whole is thoroughly intermixed. Mercury is then incorporated with it to the extent of six times the amount of S. the mass is calculated to contain, and in this condition it is submitted to a process of kneading every alternate day for a period varying from two to five months. Thereafter the mass is washed with water, which carries away the light gangue from the heavy amalgam. The amalgam is then strained in canvas bags to carry off the uncombined mercury, and the mercury and S. are subsequently separated by the volatilisation of the mercury by distillation. The theory on which this process is based is obscure; but in effect the interaction of the various substances results in the formation of a soluble chloride of silver which in the presence of mercury is decomposed; metallic silver is formed which amalgamates with the mercury, and at the same time a portion of the mercury combines with the liberated chlorine, forming calomel. The process has resulted in an enormous waste of mercury by the formation of this compound. It is calculated that up to the end of last century not less than six million cwts. of mercury had been lost by the process. For ores containing silver, copper, and iron alone, certain metallurgical methods are practicable whereby the S. is obtained in solution, from which it is easily precipitated in the metallic state by the addition of copper. In Augustin's process a soluble double chloride of S. and sodium is formed, when horn S. is treated in excess, with a hot solution of chlorides of common salt. Sulphur ores may also first be changed to chlorides by roasting with common salt and similarly treated. In Ziervogel's process sulphates of copper and S. soluble in hot water are obtained by roasting certain ores.

The important lead and S.-yielding ores are treated in the first place by the ordinary metallurgical processes (see LEAD), and the subsequent separation of the two metals is effected by various processes partly determined by comparative richness in S. of the compound. In the process of refining, the mixed metal is placed on the hearth of a reverberatory furnace, the hearth being specially prepared of a porous material so as to absorb the litharge formed in the process. The lead is oxidised in the heat of the furnace, and the litharge so formed separates in a fluid condition, and is absorbed by the porous hearth, leaving the S. unaffected. The heat is gradually increased as the separation proceeds, until the phenomenon of 'brightening' is observed (see CUPELLATION), after which it is withdrawn, and the metal left is gradually cooled. Pattinson's process is based on the fact that pure lead solidifies or crystallises on cooling more readily than lead containing S., and the higher the proportion of S. the less readily does the material solidify. Taking advantage of this fact, a mixture very rich in S. is gradually obtained by successive meltings in a series of vessels—pure lead solidifying and being ladled out in one direction, while in an opposite direction the S. becomes increasingly concentrated. The last portions of lead are removed in the reverberatory furnace as above indicated. The zinc process again, which is now extensively worked, is based on the fact that while zinc has no affinity for lead, it readily enters into combination with S. Thus zinc, when added to the molten compound, takes up the whole of the S., and as the mixture cools it rises and forms a hard cake on the surface. This is removed, and the zinc is subsequently separated from the silver by distillation. See LEAD.

The production of S. in different parts of Great Britain varies in quantity, the argentiferous ores of Cornwall and Devonshire being the richest, the poorest those of Derbyshire and Shropshire. The following statement shows the total yield of S. in the United Kingdom for the years mentioned:—

	1870	1871	1872	1873	1874	1875	1876
	oz.	oz.	oz.	oz.	oz.	oz.	oz.
England	443,546	434,358	342,516	221,556	192,160	140,978	148,047
Wales	159,993	145,216	134,028	124,553	137,633	142,618	146,216
Isle of Man	172,528	176,631	145,433	163,058	161,612	183,524	170,105
Ireland	2,815	....	1,040	4,420	6,555	6,935	6,840
Scotland	5,680	5,285	5,900	10,720	11,317	13,303	12,214
Total	784,562	761,490	628,917	524,307	509,277	487,358	483,422

The total yield of the United Kingdom for 1877 was 501,435 oz. On the Continent the yield of S. has of late years been less

than formerly. In Spain the mines in the district of Guadalajara are considered the most important, and yield an average of 32,390 lbs. troy annually, and according to Phillips the total produce of Spain in 1865 was about 110,000 lbs. troy. The yield of Austria in 1876 was 84,676 metrical cwts. of ore, whence 25,165 kgs. of metal, Saxony 80,000. The Hartz 28,000, Germany 70,000, France 18,000, Sardinia 25,000, Norway and Sweden 18,000, and the Russian Empire 58,000 lbs. troy. No S. is obtained from Africa, and the production of the Old World is comparatively small. America yields by far the largest quantity of S.: the amount produced has been rather exaggerated, there being no reliable statistics, but there is reason to believe it is about 1,000,000 lbs. troy, the largest amount being from the Comstock lode in Nevada. In 1877 this lode yielded $20,139,860, and the other mines of Nevada $51,117,624. Mexico, which in the early part of the present century yielded annually 1,440,650 lbs. troy, yields at present 1,600,000 lbs. troy annually; Bolivia produces annually about 450,000 lbs. troy; Chili and Peru each yielding about 300,000 lbs. troy. See A. D. Anderson's *S. Country, or the Great S.W.* (New York 1877).

Medicinal Properties of S.—The pharmaceutical preparations of S. are the *nitrate* and the *oxide*. The *cyanide* is contained in the pharmacopœia of the United States, but it is used solely for making hydrocyanic acid. *Nitrate* of S. coagulates albumen, and acts as a caustic on living tissues. A dilute solution acts as an astringent, and is apparently alterative to the nutritive processes. When taken in large quantities it produces gastro-enteritis, and acts directly upon the nervous system. When taken in small quantity for a lengthened period the skin acquires a bluish-slate colour, the discoloration being due to the presence of *nitrate* of S. in the skin. In cases of poisoning by S. both convulsions and paralysis are present, finally ending in death by asphyxia, the results of chronic poisoning being analogous to those produced by antimony, arsenic, and probably other metallic poisons. *Nitrate* of S. is most frequently applied for its local action, either upon the surface of the body, or upon those mucous membranes that can be reached directly. As a caustic and an alterative it may be applied to ulcerated surfaces, and as an antiphlogistic it is employed in various inflammations of the mucous membranes, such as *conjunctivitis, faucitis, laryngitis, urethritis*, &c. Internally, nitrate of S. is useful as a stomachic, in certain forms of *dyspepsia*, in chronic *gastritis*, and in *gastric ulcer*. It is sometimes of great service in *chronic enteritis* or *colitis*, especially if there be ulceration. It should be administered in the form of pill in doses of ¼ to ½ a grain three or four times a day, taken when the stomach is empty. *Oxide* of S. is given in the same cases of nervous disease as the nitrate, and it is said not to discolour the skin. The dose is a grain given in pill three times a day.

Sil'vering, the art of covering metal, wood, glass, or other material with silver. See ELECTRO-METALLURGY and PLATING.

Simaruba'ceæ is a dicotyledonous natural order, embracing shrubs or trees with bitter bark; pinnate leaves without stipules; small regular flowers; hypogenous stamens with 2-celled anthers, and one-sided fruit carpels. It is limited to the tropical zones of America, Asia, and Africa. The most important representatives furnish Quassia (q. v.); and among other genera the bark of *Simaruba amara* is a good tonic, and is used in the W. Indies for dyspepsia, diarrhœa, and chronic dysentery; *S. glauca* yields a glutinous juice, used in Cuba for certain skin diseases; the kernel of *Simaba Cedron* of New Granada is universally believed to be an effective antidote for the bites of snakes and other noxious animals, and is further used in intermittent fever and rheumatism; the seeds, bark, and sub-acid leaves of *Balanites Roxburghii* are employed in Indian native medicine; the very bitter bark of *Picrasma* or *Nima quassioides* is administered as a tonic and stomachic; and *Ailanthus malabarica* gives a resin used in medicine and incense.

Simbirsk', a government of Russia, bounded N. and N.W. by Kasan and Nijni-Novgorod, W. by Pensa, S. by Saratov, and E. by the Volga. Area, 19,108 sq. miles; pop. (1870) 1,205,881. The surface is mostly level, and is watered by the Sura and its affluents. The soil is fertile, but the greater part is under pasture; three-tenths is covered with wood.—S., its capital, on the right bank of the Volga, at the mouth of the Sirjaga, 78 miles N. of Sysran, has 16 churches, 2 monasteries, manufactures of leather, soap, and candles, and a great fishery and transit trade on the Volga. In 1865 it was almost destroyed by fire. Pop. (1870) 26,822.

Sim'eon, the second of Jacob's sons by Leah, took part in the massacre of the Shechemites, and was selected by Joseph as the hostage for Benjamin. The *tribe* of S. received the S.W. corner of Canaan as its share of the conquered land, and it was still partially in possession of that territory at the time when the chronicler wrote (1 Chron. iv. 41–43).

Sim'eon, Rev. Charles, born at Reading, Berkshire, 24th September 1759, from Eton proceeded to King's College, Cambridge, where he gained a scholarship (1779) and a fellowship (1782). Having taken orders, he became vicar of Trinity Church, Cambridge (1783), and vice-provost of his college (1790), both which posts he retained down to his death, 13th November 1836. A zealous preacher and earnest promoter of missionary enterprise, S. may be looked on as the father of the Evangelical or Low-Church party, whose permanence he sought to ensure by organising a system for the purchase of advowsons in the Church of England, to which evangelically-minded preachers only should be presented. His *Horæ Homileticæ*, comprising 2536 sermons and 'skeleton-sermons,' were edited by the Rev. T. H. Horne (21 vols. 1832–33), and his Life has been written by the Rev. W. Carus (Lond. 1847).

Sim'eon Styli'tes. See PILLAR SAINTS.

Simfero'pol, a town of S. Russia, in the Crimea, capital of the government of Taurida, on the Salghir, 49¾ miles N.E. of Sebastopol by rail. It consists of a European and a Tartar quarter (*Ak-Metched*), and is surrounded by productive gardens and orchards. It has 7 churches, 4 mosques, large barracks, and government buildings, and exports a great quantity of fruit. Pop. (*St. Petersb. Cal.* 1878) 17,129.

Sim'ia. See MONKEY.

Sim'ilar, in geometry, when applied to plane figures or solids, signifies exact correspondence in shape without regard to magnitude. Thus all equilateral triangles are S., as also all squares, circles, cubes, spheres, &c. Parallel sections of any cone or pyramid give S. figures.

Sim'ile (Lat. a 'likeness') is a figure of speech which consists in the *formal* expression of the resemblance perceived or supposed to exist between two different things. Ex., 'As the stars, so shall thy seed be;' 'When ye pray, use not vain repetitions as the heathen do;' 'Pleasures are like poppies spread, you seize the flower, its bloom is shed.'

Sim'la, the chief town of a district of the same name in the Punjaub, and the most important hill sanitarium in British India, about 98 miles N.N.E. of Umballa, the nearest railway station, which is about 1170 miles by rail N.W. of Calcutta. S. is 7156 feet above the sea. Pop. (1868) 7037, but the numbers fluctuate greatly according to the season. Situated on a series of wooded hill ridges, covered with deodaras, rhododendrons, and an innumerable variety of ferns, and with an equable temperature that rarely exceeds 70°, S. is a perfect elysium to Anglo-Indians who have come from the burning plains of Hindustan or the swamps of Bengal. For many years past it has been the permanent headquarters of the supreme government of India for more than six months of the year. The Governor-General and the Commander-in-Chief annually remove hither with their entire staff from Calcutta, and even the *Gazette of India* is printed here during their residence. It is in contemplation to erect a large block of buildings for the clerks thus transferred, who now receive extra allowances to cover the increased cost of living at a place to which nearly all commodities have to be carried by porters. This tract of hill country was first acquired by the British in 1816, as a result of the Gurkha war, and has since been augmented by purchase, lapse, and exchange. The first house was built in 1819; Lord W. Bentinck was the first governor-general to select it as his summer quarters. There are now churches, schools, hotels, clubs, bank, and breweries; and all the environs are dotted with picturesque villas. The chief schools are the Roman Catholic Orphanage for the children of soldiers, on the model of the Lawrence asylums; the Mayo industrial schools, for the orphans of poor civilians; Bishop Cotton's school and the Punjaub girls' school, both for the higher

education of the children of well-to-do Europeans.—The *district* of S., which is entirely surrounded by petty native states, has an area of 18 sq. miles, of which only about 12 are cultivated. Pop. (1868) 33,995. The crops are wheat, Indian-corn, ginger, and poppy. There is one small tea-garden, and great efforts are being made to grow hops. The neighbouring mountains yield lead, iron, and slate. For a vivid description of S. life, see *Chronicles of Dustypore* (Lond. 1875).

Simms, William Gillmore, a voluminous novelist and poet, was born at Charleston, S. Carolina, 17th April 1806. He began life as a druggist, then went to the bar, and ultimately took to journalism and literature. He died at Charleston, 11th June 1870. S. published twelve volumes of poems, two dramas, innumerable essays and biographies, and an edition of the seven doubtful plays attributed to Shakespeare. It is as a novelist, however, that he is remembered in America. His tales are after the manner of Cooper, the material for most of them being taken from the Revolutionary War. His best works of fiction were republished in New York in 19 vols. (1853-59), and a new edition in 17 vols. was published in 1865.

Simo'da ('lowland'), a port at the extremity of Cape Idzu, on the S. coast of the island of Nipon, Japan, 67 miles S.W. of Yokohama. It was thrown open to European commerce in 1857. It is subject to earthquakes, by one of which, in 1854, it was frightfully desolated. Pop. about 7000.

Simon, Jules, properly **Jules François Simon Suisse,** a French philosopher and politician, was born at Lorient, department of Morbihan, on December 31st, 1814. Educated at the École Normale, Paris, he succeeded his master, Cousin, in the professorship of philosophy at the Sorbonne in 1839. In 1852 he lost this post on account of his refusal to take the oath of allegiance to Napoleon III., and afterwards held several courses of lectures in different towns in Belgium, on philosophy and education. He was elected to the French Academy in 1863, and in the same year was returned to the Chamber of Deputies, where he took his place among the members of the moderate Left. After vigorously opposing the plebiscite of 1870 and the declaration of war with Prussia, he became a member of the Provisional Government on the 4th September 1870, and afterwards occupied the position of Minister of Education in the Thiers Government from 1871 to 1873. In 1875 he was elected to the Senate, where he became the leader of the Republicans; and from December 13th, 1876, till May 16th, 1877, he was Minister of the Interior under President Macmahon, whose strongest opponent he had formerly been. He afterwards became the editor of the *Echo Universel*, a moderate Republican organ. Among his principal works are *Histoire de l'École d'Alexandrie* (1844), *Le Devoir* (1854), *La Religion Naturelle* (1856), *La Liberté de Conscience* (1859), *L'Ouvrière* (1860), *L'École* (1864), *Le Travail* (1866), *La Politique Radicale* (1868), *Le Libre-Échange* (1870), *Souvenirs des 4 Septembre* (1874), and *Le Gouvernement de M. Thiers. 8 Février* 1871-24, *Mai* 1873 (Par. 1878), a most valuable contribution to the history of the critical period with which it deals.

Simon, Richard, the father of the historical exegesis of Scripture, was born, 13th May 1638, at Dieppe, where he studied under the fathers of the Oratory, entering their order in 1662. After lecturing for a time on philosophy in the College at Juilly, he went to Paris to prepare a catalogue of the Oriental MSS. in the library of the Oratory, returning to Juilly in 1668. Two years afterwards he was ordained a priest, but in 1678 was forced to withdraw from the Oratory, whose chief members feared the consequences of his doctrines, and retire to the village of Belleville, in Normandy, of which he had been appointed curé in 1676. In six years he resigned his cure, and went to Paris, to devote the remainder of his life to study. He died at Dieppe, 11th April 1712, leaving his books and MSS. to the Cathedral of Rouen. In S.'s famous *Histoire Critique du Vieux Testament* (Par. 1678; imperfectly reprinted by the Elzevirs at Amsterdam, 1680, but accurately by Leers at Rotterdam, 1685), which was suppressed at the instance of Bossuet, he maintains that the Pentateuch was not the work of Moses, but of scribes of the time of Ezra. Though his *Histoire Critique du Texte du Nouveau Testament* (Rotterdam, 1689), and *Histoire Critique des Versions du Nouveau Testament* (*ib.* 1690), were well received, his *Histoire Critique des Principaux Commentateurs du Nouveau Testament* (*ib.* 1692) provoked yet greater hostility than his work on the Old Testament. Its bold strictures on the teaching of the Fathers, especially on Augustine's doctrines of original sin, efficacious grace, and predestination, which he characterised as innovations foisted on the Western Church, were vigorously combated by Bossuet in his *Défense de la Tradition et des Saints Pères.* Of the many other works of S., his chief one, the *Nouveau Testament traduit en Français, avec des Remarques Littérales et Critiques* (Trevoux 1702), was suppressed by the influence of Bossuet and Cardinal de Noailles. See Trochon, *R. S. et la Critique biblique* (Rouen 1848).

Simon'ides (1) of Amorgos, the second, both in time and reputation, of the three great iambic poets of early Greek literature, was the son of Crines, a Samian, who led a colony to Amorgos, and there founded three cities, Ægialus, Minoa, and Arcesine. The period of S. is somewhat uncertain, but it seems to lie between 693 and 660 B.C. His chief works, according to Suidas, consisted of an elegy in two books, and a number of iambic poems. On the latter his reputation rests. They are of two kinds, gnomic and satirical. As a poet S. was distinguished by force, fitness, and fulness of expression, combined with exquisite simplicity. His fragments are included in most of the collections of the Greek poets; in Brunck's '*Analecta;* in Jakobs's *Anthologia Græca;* 'and in Bergk's *Poetæ Lyrici Græci.* A complete edition was edited by Welcker (Bonn. 1835, 8vo.). **Simonides** (2), the most celebrated elegiac poet of Greece, was born at Iulis in Ceos, an island in the Ægean Sea, 556 B.C. His paternal grandfather, also a poet, bore the same name. S. was highly educated in music and poetry with a view to following these arts as a profession. The invitation of Hipparchus induced him to leave his native isle and to reside in Athens, where then lived Anacreon and Lasus, Pindar's teacher. No intimacy seems to have existed between S. and his two rivals. After the expulsion of Hippias (510 B.C.) he probably resided in Thessaly, poorly patronised by the Aleuads and Scopads. Shortly before the Persian invasion he returned to Athens, writing the while elegies, epigrams, dirges, &c., bearing on the battle of Marathon (490 B.C.), and wresting the palm from his powerful rival Æschylus. In 477 B.C. S., now eighty years of age, was victor for the fifty-sixth time in the poetical contest at Athens. Shortly thereafter he went to reside at the court of Hiero of Syracuse, where he died (467 B.C.) in his 90th year. S. is credited with completing the Greek alphabet by the addition of the double letters and long vowels, and with the invention of a mnemonic art. He made literature a profession and earned its legitimate rewards. The morality of his writings is high. Pindar, perhaps with reason, accuses him of avarice. Yet the attentions paid to S. by Hipparchus at Athens, Pausanias at Lacedæmon, and Hiero at Syracuse, attest the high estimation in which he was held by the magnates of his time. Moreover, the people of Syracuse showed him a degree of honour rarely accorded to poets in their lifetime, and after his death erected a splendid monument to his memory. His compositions excelled in sweetness (whence his surname *Melicertes*) combined with the most tender pathos, rare poetic conception, and harmony of expression. Though inferior in originality and passionate intensity to some of his predecessors and contemporaries, his lays were esteemed by Hiero more than the odes of Pindar and the strains of Bacchylides. His works, which included dramatic, elegiac, epigrammatic, and lyrical pieces, now for the most part lost, were written in the Doric dialect. S. was the inventor of the new Elegy (*elegos*), the '*queremonia*' of Horace, as distinguished from the old martial poem (*elegeion*), also written in hexameters and pentameters, whose origin is attributed to Callinus (B.C. 776). In addition to the collections referred to in the preceding article, see the standard edition of Schneidewin (Bruns. 1835).

Simonose'ki, a port of Japan at the S.W. extremity of the island of Nipon, on the Straits of S., otherwise called Van der Capellen Straits, dividing Nipon from Kiusiu. It is about 225 miles W.S.W. of Hiogo, and 472 miles W.S.W. of Yokohama. It has a very active coasting trade. In 1864, owing to a violation of international law on the part of the Japanese, it was bombarded and destroyed by British, American, French, and Dutch men-of-war. Pop. about 10,000.

Sim'ony (so called from its resemblance to the sin of Simon Magus) in English law is an offence consisting in the presentation to an ecclesiastical benefice for a reward. By 31 Eliz. c. 6, a simoniacal presentation is declared void, and two years' value of the benefice forfeited, one-half of the forfeit to go to the crown, the other half to the person suing; and the person accepting the benefice is for ever debarred from holding it. 9 Geo. IV. c. 94, however, legalises engagements for the resignation of ecclesiastical preferments in favour of one of two persons specially named, being by blood or marriage an uncle, son, grandson, brother, nephew, or grand-nephew of the patron. The bond must be entered into before the presentation, and entered in the registry of the diocese. The resignation in terms of the bond will be void, unless one of the presentees named in it is presented within six months after notice of resignation has been given to the patron.

Simoom' (Arab. *samûm*, from *samma*, 'hot'), a hot arid wind peculiar to the sandy deserts of Africa and Western Asia, and the districts bordering these. The air, heated by contact with the noonday burning sand, ascends, and the influx of colder air from all sides forms a whirlwind or miniature cyclone, which is borne across the desert laden with sand and dust. It occurs usually at the time of the equinoxes, and is greatly dreaded by travellers crossing the desert. Its intense dry parching heat, combined with the cloud of dust and sand which it carries with it, has a very destructive effect upon both vegetable and animal life. In the great sandy track known as the Sahara, which stretches across nearly the whole length of N. Africa, these winds are especially frequent at certain seasons of the year, and are felt, variously modified by the nature of the earth's surface over which they have passed, in the countries bordering the Mediterranean. The hot moist *sirocco* of S. Italy, the blighting *samiel* of Turkey, the irritating *solano* of Spain, and the *hamsin* of Egypt, have their origin as simooms in the Sahara.

Sim'ple Con'tract. See CONTRACT.

Sim'plon (Ital. *Sempione*), one of the Lepontine Alps in the canton of the Valais, Switzerland, whose culminating point (*Monte Leone*) is 11,695 feet high. It gives a name to the S. pass which leads from Brieg, in the Rhone valley, to Domo d'Ossola in Italy. The total length of this pass is 39½ miles, its maximum elevation is 6594 feet, its breadth 30 feet; and it has 611 bridges. Near the summit stands a *Hospice* where travellers are received. Besides this there are nineteen refuges for storm-stayed tourists. At 12½ miles' distance from Brieg is the S. village (altitude 4856 feet). The road over the pass was constructed by Napoleon I. in 1800–6 at a cost of £720,000.

Simp'son, Sir James Young, a celebrated Scotch physician, was born at Bathgate, Linlithgowshire, June 7, 1811. In 1825 he entered Edinburgh University, and graduated M.D. in 1832. He had already devoted considerable attention to obstetric medicine, and in 1840 his established reputation secured him the chair of midwifery in Edinburgh. At once he took a foremost position as a teacher, and to the end of his life maintained his great popularity as a lecturer in spite of an ever-increasing practice. In 1847 S. was appointed one of Her Majesty's physicians for Scotland, and the same year made the bold experiment which established chloroform as an anæsthetic in obstetrics, an innovation in medical practice which excited much opposition and controversy. His fame now spread rapidly and widely. In 1853 he was nominated a foreign associate of the Paris Academy of Medicine, and in 1856 obtained from that Society the Monthyon Prize for the most important benefits done to humanity. He was knighted in 1854 and created a baronet in 1867. He died May 6, 1870, and received the honour of a public funeral. S. was not only a great physician, but a brilliant archæologist, and found time to compose numerous works, medicinal and archæological, including *Homœopathy, its Tenets and Tendencies* (3d ed. 1853); *Obstetric Memoirs and Contributions* (3 vols. 1855-56), and *Acupressure, a New Method of Arresting Surgical Hæmorrhage and of Accelerating the Healing of Wounds* (1864). His principal works were re-published collectively in 1871, and his *Archæological Essays* in 1872. A statue of S. was unveiled in Edinburgh in the spring of 1877. See Professor Duns' *Memoir of Sir J. Y. S.* (1873).

Sim'rock, Karl, an illustrious German scholar and poet, born at Bonn, 28th August 1802, proceeded in 1820 from the Lyceum to the University of his native city, and here, while studying law, became imbued with Heine's admiration of the older German literature. At Berlin, where he concluded his juristic studies, he published a metrical translation of the *Nibelungenlied* (1827; 32d ed. 1875), and wrote for various journals, till an outspoken article on the July Revolution closed the legal career against him. Accordingly in 1832 he returned to his Rhenish birthplace, and spent some years in busy literary retirement. Appointed Professor of the German Language and Literature at Bonn (1850), he laboured as such without intermission down to his death, 18th July 1876. No man did more than S. to foster German nationality by popularising the ancient national literature, in modernisations of the *Nibelungenlied*, *Gudrun* (8th ed. 1873), *Kleines Heldenbuch* (3d ed. 1874), and *Amelungenlied* (2d ed. 1863), which together constitute his *magnum opus*, the *Deutsches Heldenbuch*, in versions of the mediæval chivalric romances, and in collections of German Legends (3d ed. 1876), Proverbs (2d ed. 1863), Riddles (1874), &c. His own *Gedichte* (1844) have often the genuine epic ring, and from his numerous miscellaneous writings may be singled out the *Lauda Sion* (1850), *Quellen des Shakespeare* (2d ed. 1872), and *Handbuch der Deutschen Mythologie* (4th ed. 1874). See Dr. N. Hocker, *Karl S., sein Leben und seine Werke* (Leips. and Lond. 1877).

Sim'son, Robert, a celebrated Scotch mathematician, was born at Kirton Hall, in Ayrshire, October 14, 1687. In 1701 he entered the University of Glasgow with the intention of studying for the Church. In mathematics, however, and especially in ancient geometry, he found a more congenial study, and his appointment in 1711 to the vacant mathematical chair at Glasgow determined his future career. He retired from his professorial duties in 1761, and died October 1, 1768. He devoted almost his whole life to the restoration of the works of the Greek geometers. In 1746 he published the *Loci Plani* of Apollonius, and this was followed by Euclid's *Elements* and *Data* (1758). In 1776 Earl Stanhope published at his own expense S.'s restoration of Euclid's Porisms, and two books *De Sectione Determinata* of Apollonius, together with a tract on the limits of ratios and on logarithms all written by S. An edition of Pappus was also found among his manuscripts, and was sent to the University of Oxford. See Dr. William Trail's *Life of S.* (Lond. 1822).

Sin, according to 1 John iii. 4, is lawlessness. This would be as explicit and complete a definition as could be framed, if it were absolutely certain what *law* is. Some consider the above definition to be complete in itself, since the Apostle referred to the moral or Mosaic law. Others, not satisfied that the Mosaic law covered everything, consider that a test of what is sinful is furnished by conscience, or an innate moral faculty. But this, it is alleged, does not supply an absolute test, since the consciences of no two persons are alike. According to the conscience of the S. Sea Islander it was right for him to steal another man's wife; wrong for another man to steal his. It has, therefore, been argued that the only real test of law in relation to S. is the tendency of actions, upon the whole and in the long run, to produce happiness or to produce pain, suffering, and misery. Not that having the one tendency or the other constitutes an action virtuous or sinful, but that this is the only valid criterion of what is the will of God and what is lawlessness. The teaching of Scripture, however, carries the doctrine of S. into a higher region. It recognises the 'exceeding sinfulness of S.;' *i.e.*, whatever shape S. may take, its true character and its supreme offensiveness are only perceived when it is viewed in its relation to the infinitely pure God and Father of all men. See J. Müller, *Die Christl. Lehre von der Sünde*.(Eng. trans. Edinb. 1853); Hodge, *Syst. Theol.* (Edinb. 1873); Tulloch, *The Christian Doctrine of S.* (Croall Lectures, 1876).

Si'nai. In the third month after their departure from Egypt, the Israelites arrived in 'the desert of S.,' and 'camped before the mount' (Exod. xix. 1, 2). The mountain in question is constantly called S. so long as the Israelites stayed there (xix. 18, 20, 23, &c.), but afterwards it is generally spoken of as Horeb (Exod. xxxiii. 6; Deut. i. 2, &c.); the former name being used, however, when a more exact description of the place is to be given. From

this it may be inferred that, while the two names were to a certain extent synonymous, Horeb was a more general name than S., perhaps pointing to some natural feature (the name—Heb. *Choreb*—means 'desert'); in other words, that Horeb was the group of mountains of which S. was a particular summit. The peninsula of S. stretches S. into the Red Sea. It is a right-angled triangle of about 11,055 sq. miles, whose hypotenuse extends along the Bay of the Suez on the W., and whose N. side intersects the desert El-Tih, while the other side is the shore of the Gulf of Aila. To the peninsula of S. the Israelites travelled after their passage of the Red Sea. Beke will have the Mount S. of the Bible on the E. side of the Gulf of Aila, but this is hardly credible. It is more difficult to decide between the Jebel Musa of tradition, Ras Sufsâfeh, and the Serbal. The few topographic details in the Bible most naturally point to the nearly isolated Jebel Musa (confirmed by the results of the expedition sent out from England in 1868 by the 'S. Survey Fund'), between which and the plain on the N., Er-Raha, stood the two horns of Ras Sufsâfeh (6830 feet). Jebel Musa (7363 feet) cannot be seen from Er-Raha, but from the smaller plain Wady Sebaiyeh, which with the declivities to the E. affords room for a great number of people. It rises from great rows of granite blocks, and extends from N.N.W. to S.S.E 1½ miles, with a breadth of ⅔ miles. S.S.W. of Jebel Musa is Jebel Katharin (over 8000 feet), the highest point of the peninsula, and N.E. is 'Aribeh (Arab. form of Horeb), which even in the 6th c. A.D. was recognised as Horeb by Antoninus Martyr. Ritter, *Palästina und Syrien* (Berl. 1848–55); Tobler, *De Locis Sanctis quæ perambulavit Antoninus Martyr* (St. Gall 1863); Fraas, *Aus dem Orient* (Stuttg. 1867); Ebers, *Durch Gosen zu S.* (Leip. 1872); Stanley's *S. and Palestine* (new ed. 1872); Palmer, *The Desert of the Exodus* (Camb. 1872); Bædeker's *Palestine and Syria* (Leip. 1876), and Wilson & Palmer's *Ordnance Survey of the Peninsula of S.* (Lond. 1872).

Sina'pis. See MUSTARD.

Sin'clair, a Scottish family of Norman origin, whose founder, William de Sancto Claro, obtained from David I. a grant of Rosslyn in Midlothian. A William S., comrade-in-arms of Robert I., was charged with the Douglas to bear that monarch's heart to the Holy Land, and with the Douglas was slain by the Moors of Spain (1330); his son and successor, Henry, by marriage with Isabel, daughter of the last Earl of Stratherne, and grand-daughter of the last Jarl of Orkney (q. v.), himself became Earl of Orkney and Stratherne, holding his island fief alike from Hakon VI. of Norway and Robert II. of Scotland. William, the latter's grandson, was Lord High Admiral and Chancellor of Scotland, in 1455 received the earldom of Caithness, but in 1471 must relinquish Orkney to James III. (q. v.), and was poorly compensated by the castle of Ravenscraig in Fife. Rosslyn's exquisite chapel, reared by him (1446), attests the splendour of one whose court was attended by seventy high-born dames and more than 200 gentlemen; but at his death his wide domains were parcelled among three sons, William Lord S., Sir Oliver S. of Rosslyn, and William Earl of Caithness. Sir Oliver's line became extinct in 1778; the last of the eldest line, Catherine S., married in 1659 John S. of Herdmanston, lineal descendant of a Henry de Sancto Claro, who in 1162 had received a grant of Herdmanston in Haddington, and from this marriage the present Lord S., the Earls of Orkney and Rosslyn, and the Duke of Sutherland, trace their descent through female ancestors. From William, the third son, come the Earls of Caithness, and from them in the 16th c. sprang the Ulbster branch, to which belonged **Sir John S.,** born at Thurso Castle, 10th May 1754. From the tutorship of the poet Logan he passed to the High School of Edinburgh, and having studied at the university of that city, of Glasgow, and of Oxford, was admitted member of the Scotch Faculty of Advocates (1775), and also called to the English bar (1782). He succeeded his father in the family estates (1770), and entered Parliament for Caithness-shire (1780), and for thirty years of parliamentary life he devoted himself to the improvement of agriculture, commerce, and finance, publishing on these and miscellaneous subjects no fewer than 39 volumes and 367 pamphlets. A *History of the Public Revenue* (2 vols. 1784) established his reputation as an economist; in 1786, the year that Pitt created him a baronet, he made a scientific tour through northern Europe; in 1791 he established the British Wool Society, and the Board of Agriculture in 1793. On his own estate he bred 6000 Cheviot sheep, planted 345,000 trees, and by 1812 redeemed 11,209 acres of uncultivated land; while to his vast *Statistical Account of Scotland* (20 vols. 1798), compiled from contributions by the ministers of each separate parish, all Scotland is deeply indebted, since its exposure of numerous abuses led to their redress. S. held at the same time twelve different offices, including the colonelcy of two battalions raised at his own expense (1794); he was sworn of the Privy Council (1818), and was an active member of countless foreign and home societies down to his death at Edinburgh, 21st December 1835. See the *Correspondence of Sir John S.* (2 vols. Lond. 1831), and a *Life* (2 vols. Edinb. 1837) by his third son John. The latter, born 20th August 1797, was Archdeacon of Middlesex from 1842 till his death, 22d May 1875, and further published *Dissertations Vindicating the Church of England* (1833), *Sketches of Old Times and Distant Places* (1875), &c. The fourth son, Archibald (born 20th September 1801; died 1st June 1859), rose to the rank of captain in the Royal Navy, and wrote *Reminiscences of the Discipline, Customs, and Usages in the R. N. in the 'Good Old Times'* (1859). His fourth daughter, Catherine (born 17th April 1800; died 6th August 1864), is better known by her *Modern Accomplishments* (1836), *Holiday House* (1839), *Scotland and the Scotch* (1846), &c., than is his grandson, Sir John George Tollemache S., Bart. (born 8th November 1825), by a *Defence of Russia* (1877).

Sin'ecure is an office with revenue without duty attached to it. 3 and 4 Vic. c. 113 abolishes S. rectories.

Sin'ew. See TENDON.

Sin'gapore, a British settlement in the East Indies, situated on the S. extremity of the Malay Peninsula, and consisting of the island of S., and about 59 islets lying S. and E. of it, in the Straits of S. Area, 224 sq. miles; pop. (1871) 97,111 (74,348 males), of which 1946 were Europeans and Americans. The surface of the island is undulating, and largely covered with wood; the higher grounds are seldom more than 100 feet above the sea, and the shores are low, surrounded with mangrove trees, and indented with salt creeks. The soil is rich, and as the island is less than 100 miles from the equator, there is no variety in the seasons. The mean temperature in the shade for the year 1875 was 79° F. Reckoning complete saturation at 100, the mean humidity was 77, and the total rainfall was 93·96 inches. Tropical fruits and vegetables are produced, and cocoa, pepper, gambier, and sugar are raised for export. S. is infested with tigers, and as many as 300 people are annually carried off by their ravages. S. had, in 1875, 17 schools with 1653 scholars; in the same year its revenue was £327,007; expenditure, £383,611. S. was first taken possession of by Sir Stamford Raffles in 1819, and finally yielded by the Sultan of Jahore in 1824. In 1826 it was placed under the provincial government of the Straits Settlement, but was with Malacca and Prince of Wales Island constituted a separate government in 1851.—**S.,** the capital, and the emporium of Southern Asia and the Indian Archipelago, is situated at the mouth of a stream on the S. side of the island. It extends for 2 miles along the shore, and has two fine harbours. A second graving-dock, 450 feet long by 60 wide, is now (1878) being constructed at a cost of £48,000. S. has been declared a free port, and is the mart of trade for China, the Dutch and Spanish islands, and the native powers of the Archipelago. In 1875 there entered S. 2261 British and foreign vessels of 1,283,786 tons (1378 of 809,610 British), and cleared 2348 of 1,003,601 tons (1384 of 700,479 British). Of native vessels, there entered 3171 of 83,850 tons, and cleared 6492 of 83,129 tons. The total value of imports from foreign trade in the same year was £8,263,817, and exports £7,712,772. In the trade between the Settlements, the imports were valued at £1,036,495, exports at £1,131,875. The principal imports were rice, bullion, hardware, opium, pepper, sago, cotton goods, coals, coffee, apparel, raw silk, sugar, tobacco, woollens, and tea; and exports, bullion, cotton goods, gambier, rice, opium, pepper, sago, and silk. Pop. (1871) 61,752.

Singbhum, a non-regulation district of the province of Chota Nagpur, Bengal, British India, lying among the hills W. of Midnapore. Area, 3897 sq. miles; pop. (1872) 322,396. It

contains several semi-independent states; and the tract known as the Kolhan, where the fighting Hos or Larka Kols, an aboriginal tribe who have often given much trouble, are now most peaceably settled. The products are rice, grown upon artificial terraces in the valleys; *tussur* silk, lac, and beeswax; iron, limestone, and soapstone. Copper also was formerly mined. The chief town is Chainbasa, where a large annual fair is held. The inhabitants are almost all hill tribes, among whom the Christian missions are most successful. See Dalton's *Ethnology of Bengal* (Calcutta, 1872).

Singh (Sansk. *sinha*, 'a lion'), a name commonly adopted in India by the Rajput or military and ruling caste, and also by the fighting men among the Sikhs.

Singhá'ra Nut. See TRAPA.

Sing'ing, the production of music by the human voice. The principal requisites in singing are a good voice, a correct ear, and a sound rudimentary knowledge of music. By careful practice, purity of tone and flexibility of execution may be attained, and the sweetness, brilliancy, and compass of the voice increased in a marked degree. Good singing is dependent as much upon training as on natural gifts, as a vocalist who sings correctly and with taste will often afford more pleasure than another who has much greater compass and power of voice, but lacks cultivation.

There are three kinds of female voices—soprano, mezzo-soprano, and contralto; and three of male voices—bass, baritone, and tenor, for the usual range of which see article on MUSIC. A higher and uncommon class of male voices is known in England as alto or counter-tenor. The range and compass of voices among singers of all kinds are extremely variable, and it is not the compass alone, but the quality of notes in portions of the compass which determines the class under which a voice should be placed. In voices there are, numerically speaking, three qualities or registers—the chest voice (*voce di petto*), the middle voice, and the head voice (*voce di testa*). The chief distinction is, however, between the natural voice and the falsetto voice. To produce the notes of the former, the impulse should be made wholly from the chest, while the notes of the falsetto are given by directing the voice to the head. An accomplished singer is able to link the notes in the different registers without apparent effort, so as to completely disguise the effect of the break.

The best position in S. is standing. The singer should be at his ease, with his head erect and his chest well forward. The mouth should be sufficiently open to give a distinct pronunciation and a round quality of tone. The breath should be taken as silently as possible, and at judicious intervals, such as at the end of phrases or sections, after rests or staccatoed notes, and before long notes and cadences. To become a correct reader at sight it is necessary to be able to take all musical intervals with readiness and precision.

In exercising the voice the best method is to sing the notes of the diatonic and chromatic scales slowly, commencing and ending each note softly with a swell in the middle to the full power of the voice. This is known as the *Messa di Voce*. The graces of S., such as turns, shakes, and cadenzas, can only be accomplished with facility after assiduous practice. Expression depends on the power of modifying the voice through the gradations of *piano* and *forte*, and a correct application of accent, emphasis, &c. As a rule, ascending passages are sung with a gradual increase of tone and descending scales with a corresponding diminution; syncopated and tied notes require extra emphasis; slow movements are elegantly and softly sung, and rapid movements with spirit and brilliancy. Where a phrase or a note is repeated, a variety of expression should be introduced. Above all, the singer should feel what he sings, and his voice should faithfully express the emotions depicted in the words. Only thus will the language of his song touch the hearts of his hearers.

The *Vibrato*, or vibration of the voice, when judiciously applied, is often effective and pleasing, but its continual and indiscriminating use is a grave fault.

Bass and baritone parts are written in the F clef, the others usually in the C clef.

Sin'gular Success'or, in Scotch law, means one succeeding to real estate otherwise than as heir at law; as by purchase.

Sinigaglia or **Senigall'ia** (anciently *Sena Gallica*), a town of Italy, province of Ancona, at the mouth of the Misa, 18½ miles W.N.W. of Ancona by rail. It has ten churches, of which the best are the cathedral and the church of San Marino. S. was for centuries the scene of the greatest fair in Italy, which took place annually from 30th July till 8th August, but since 1869 has declined. It was the birthplace of Pius IX. and Angelica Catalini, the famous singer. Pop. (1877) 22,346, mostly engaged in the fisheries. S. was a city of the Senones, was colonised by Rome in 289 B.C., and made an episcopal see as early as the 4th c. Frequent devastations have left few traces of its antiquity. Near S. was fought the battle of the Metaurus, where Hasdrubal fell.

Sin'ister. See HERALDRY.

Sink'ing Fund, the name given to a fallacious scheme for the payment of the National Debt of Great Britain. At first (1716) it consisted in making certain taxes perpetual which had hitherto been imposed for a limited period, and creating a fund out of their surplus to reduce and ultimately to extinguish the debt. But the permanent taxation was as great a drain upon the resources of the nation as the S. F. was an accumulation of capital. The nation was in reality borrowing from itself to pay its debt, and was therefore practically doing the same thing as if it had incurred fresh debt of equal amount to that liquidated. Under the younger Pitt, the scheme of a S. F. attained much vaster dimensions. The loans raised to meet the requirements of the Exchequer were saddled with a surplus for this fund, and thereby the rates of interest were increased. A S. F., projected by Sir Stafford Northcote, was adopted by Parliament with 189 against 122 votes, in June 1875. Mr. Gladstone's objections to the scheme were held to be equally applicable to his own method of reducing the National Debt by terminable annuities.

Sino'pe (Turk. *Sinub*), a town in the vilayet of Kastamuni, Asia Minor, on the S. coast of the Black Sea. It stands on the isthmus of a small peninsula which terminates in a hill partly occupied by houses. It has an arsenal and shipbuilding-yard and extensive fortifications, completed in 1876. An old Byzantine castle, now used as a prison, stands on the S. side of the Turkish quarter. 'The Castle of Mithridates' is the only ancient building preserved. S. has trade in corn, fish, and timber, and forms a port of call for steamers between Constantinople and Trebizonde. Pop. 10,000. S. was at an early date colonised from Miletus. It became a great naval power, and aided the Ten Thousand on their return to Greece. Taken by Pharnaces in 183, it surrendered to Lucullus in 72, and was made a Roman colony in 45 B.C. Sultan Mohammed II. took it in 1461. On November 30, 1853, the Turkish fleet stationed here was destroyed by Russia. Diogenes (q. v.) and Mithridates the Great (q. v.) were natives of S.

Sin'ter, a word of German origin applied to the deposits or incrustations formed by the so-called 'petrifying springs.' They are all of comparatively recent origin. Common or calcareous S. consists of carbonate of lime deposited in various forms around a central nucleus, and often produced with such rapidity that perishable articles immersed in the water are entirely covered by it. Quartz S. or Silicon S. is a deposit occurring in the Geysers of Iceland and of the Yellowstone Region in America. Iron S. or pittacite is a product of the decomposition of iron pyrites, and often forms brown patches in old coal-mines.

Si'nus, a name applied to very varied structures and cavities in human and comparative anatomy. (1) Some of the most familiar sinuses are those spaces in the *frontal bone* known as the *frontal sinuses*. These form two cavities of irregular shape which extend upwards and outwards between the two layers or *tables* of the skull. They are absent in the child, but are developed with the full growth of the frontal bone. They are larger in men than in women, and communicate with the nose. The frontal sinuses in sheep often, and in man occasionally, form the abode of the larvæ of flies, which become a source of irritation and disease. A very large development of *frontal sinuses* is seen in the elephant, the air-cells of whose cranium serve to lighten the ponderous skull. (2) The term *S.* is also applied in anatomy to the channels or spaces of the skull through which venous blood flows. These channels are lined by the *dura mater*, an outer of the brain membranes, and num-

ber fifteen. They include a set of sinuses placed at the upper and back part of the skull, and a second series at the base of the cranium. Within these sinuses, the walls of which are thus formed of unyielding bone, a steady, uniform pressure of blood is secured, and the brain-structure is thus protected against the effects of variable blood-pressure.

Other sinuses of the body are found in the *heart*, the *kidney*, the *eye*, and the *penis*.

Sion (Ger. *Sitten*), capital of the canton of the Valais, Switzerland, at the confluence of the Sionne and Rhone, 62 miles E. of Lausanne by rail. Its chief buildings are the Gothic (partly Romanesque) cathedral, the Rathhaus, also Gothic, the fine church of St. Théodule, and the Castle of Valeria (on a hill 2054 feet high), now used as a seminary for priests, which contains the Church of St. Katharine, dating from the 9th c. On another hill 2165 feet high are the ruins of the Castle of Tourbillon, erected in 1294. A third episcopal castle, that of Majorca, is likewise a ruin. The town is defended by fortifications. Good wine and some silk are manufactured. Pop. (1870) 4898. S. was the *Sedunum* of the Romans, of whose presence traces still exist. The town suffered from a great fire in 1788.

Siout' or **Assiout'**, a well-built town of Upper Egypt, near the left bank of the Nile, 227 miles S. of Cairo by rail. It lies in a fertile district at the end of the Libyan Mountains. S. has fifteen mosques, a large palace surrounded by gardens, erected by Ibrahim Pasha, and as the terminus for caravans from Darfur, Nubia, &c., has a large trade. Its earthenware and saddlery are famed, and its bazaars rival those of Cairo. *El Hamar*, a small village on the river, serves as the port of S., with which it communicates by the *Yusuf* Canal. Pop. (1872) 27,470. S. occupies the site of the Græco-Egyptian town *Lycopolis* ('Wolf-town'), and mummies of wolves have been found here.

Sioux Indians. See INDIANS, AMERICAN.

Si'phon, in its most usual form, is a bent tube with one leg longer than the other. If it be filled with liquid and its shorter leg plunged into a filled vessel, the S. will draw liquid off until the surface of the liquid is brought down to the level of the shorter leg. To study its action, suppose two vessels placed side by side and filled with water to different levels. Fill the S., and plunge one leg into each vessel. If the level of the water were the same in both, there would be no flow, since the pressure is the same at each extremity of the S. But, because the levels are different, the pressure at the extremity of the S. which is immersed in the water at the higher level is greater than the pressure at the other extremity by an amount equal to the weight of a column of liquid, whose cross-section is equal to that of the bore of the S., and whose height is equal to the difference of level of the two masses of liquid. Consequently, there is a flow from the one vessel to the other until the levels are equalised The S. is employed in aqueducts, and in some of the drainage-works of the Bedford Level, but its chief use is in the racking of wines and liquors from off the lees.

Siphonostom'ata (Gr. 'siphon-mouths'), a term variously applied in zoology. 1. It is given to a division of Gasteropoda in which the mouth of the shell is perforated by a notch or groove for the passage of a *siphon* or respiratory tube. This type of shell is seen in the whelks, cowries, &c. 2. It is given to a group of lower *Crustacea* (also known as the *Ichthyophthira* or fish-lice) from the peculiar shape of the suctorial mouth.

Sipun'cle, the name given to the membranous tube perforating the septa or divisions of the shell in such *Tetrabranchiate* cephalopods as the Pearly Nautilus (q. v.), &c.

Sipun'culus, or **Spoon Worm**, a genus of lower *Annelida* or marine worms inhabiting the sand of British coasts, and frequently found within the cast-off shells of molluscs. The members of this group vary in length from half-an-inch to half-a-foot. *S. Bernhardus* is a familiar species. The S. has an anterior retractile proboscis. The digestive system is convoluted, and the anus or vent is anterior. The sexes are situated in distinct individuals, and the young undergo a metamorphosis. A species of S. (*S. edulis*) is eaten by the Chinese.

Sir (from Lat. *senior*, 'elder;' Fr. *sire*, *sieur*, *seigneur*), originally a translation of the Teutonic *elder* (preserved in *alderman*), is now either prefixed to the Christian name of a knight or baronet, or by itself is a respectful form of address corresponding to the Fr. *monsieur* or Ger. *mein herr*. Formerly it was also applied, like *dan* or *don* (q. v.), to bachelors of arts or the clergy generally, *e.g.*, 'Sir Hugh Evans.' In France, under the feudal system, *seigneur* was the title borne by the holder of a fief; and *sire*, since the 16th c., has been the exclusive appellation of royalty, as 'Sire, votre Majesté.' The plural 'sires,' however, is poetically used for ancestors.

Sir-Daria. See JAXARTES.

Si'ren, a musical instrument which affords a ready means for determining the number of pulses per second, and therefore the *pitch* of a given note. In its simplest form, it consists of a circular disc capable of rapid rotation round a central axis, and perforated by a concentric circle of holes equidistant from each other. If a stream of air be directed against the disc so as to pass through any one hole, and if the disc be then set in rotation, the current of air, let through and stopped in rapid alternation, will break up into a rapid succession of pulses. The faster the disc is made to rotate, the more quickly do the pulses follow one another the higher the pitch of the note. The rate of rotation is adjustable so as to make the S. note the same as any given note, and is then readily determined by a simple mechanical arrangement of screw and pinion which gives the number of revolutions of the disc per second. In Seebeck's S. there are several concentric circles of holes, each of which for a given rate of rotation produces a distinct note. A S. thus fulfils two purposes. It teaches what a musical note physically is, and supplies a convenient method for determining the pitch of any note. Cagniard-de-Latour, a French physicist, constructed a S. on an improved principle, which did away with the necessity of rotating the disc by mechanical means. His instrument consisted of two discs, pierced with exactly the same number of holes, and set close together, so that the holes faced each other. The one disc was fixed, the other capable of rotation. The holes, however, were bored obliquely through the discs in such a way that when the discs were in position any two corresponding holes met at an angle. A current of air traversing a hole in the stationary disc struck the side of the corresponding hole in the movable disc, and was then deflected through the hole, forcing the disc on at the same time. In other words, the blast of air which, by its interruption, was to give rise to the note, at the same time impelled the disc onward, thus itself providing the conditions for the production of the necessary discontinuity. The characteristic peculiarity of Helmholtz's S. is that there are in reality two sirens attached to the same axis. These are constructed on Cagniard-de-Latour's principle, and each is capable of sounding four distinct notes, being perforated in four concentric circles. By a simple mechanical arrangement, any one or any combination of two or more of these possible eight notes can be sounded at pleasure, and the notes are so related numerically that the ordinary major and minor triads can be produced. See Helmholtz's *Tonempfindungen* (1862, 3d ed. 1870; English translation by Ellis, 1875).

Si'ren, a genus of Amphibian vertebrata forming the type of the family *Sirenidæ*, of which the *S. lacertina* or mud-eel of American rice swamps is the most familiar example. The gills of early life persist as in *Proteus*, &c.; the hinder legs are wanting, and the front legs, which are weak, have four toes. The tail is long, slender, and compressed. The average length is about 3 feet. Lungs are developed in addition to the persistent gills. The food of the S. is worms and insects.

Sire'nia, an order of *Mammalia* (q. v.) including but two existing genera—the Manatees (q. v.) and Dugongs (q. v.). Another Sirenian, the *Rhytina*, was discovered by Behring, but became extinct in 1768.

Si'rens (Gr. *seirēnes*, 'ensnarers' or 'entanglers,' from *seira*, 'a rope'), in Greek mythology, were maidens like the Lorelei of Northern folklore, who by their enchanting strains lured mariners to their destruction. Ulysses, stuffing his comrades' ears with wax and binding himself to the mast, escaped their wiles; and in the Argonautic Expedition Orpheus so vanquished them in melody that for very shame they cast themselves into the sea, and were turned into rocks.

Sirhind', an extensive tract in N.W. India, forming the watershed between the basins of the Sutlej and Jumna rivers.

Area, about 17,000 sq. miles. It is now divided among several administrative districts of the Punjaub and a few native states, but formerly was a unit of political and geographical importance. It was the original cradle of the Sikh religion, and here the great town of S., now in ruins, was reduced to its present condition in 1709 by Sikh fanatics, in revenge for outrages there perpetrated on one of their *gooroos*. In 1809 the British established their supremacy, and Runjeet Singh was confined to the left bank of the Sutlej. The chief towns are Loodiana, Umballa, and Ferozpore; the principal native state is Puttiala.

The S. Canal is a project, now in course of execution, for irrigating this sandy tract and opening a navigable communication between the Sutlej at Ferozpore and the W. Jumna Canal above Kurnul. The proposed length is 554 miles, which will irrigate 783,000 acres. The estimated cost is three millions sterling, of which one million will be paid by the native states benefited. Convict labour is being largely used on the work.

Sir'ikul, a lake of Central Asia, on the Pamir plateau, at an elevation of 15,600 feet, whence rises the N. arm of the Amu-Daria. The direct road E. to Kashgar is a difficult track along its shore.—**S.** is also the name of a district on the E. side of the plateau (11,000 feet high), which was an independent state till annexed by Kashgar in 1868. The chief city is Tashkurgan (anc. *Lithinum pyrgum*), formerly a place of note on the route to China.

Sir'ius, or **The Dog Star**, the brightest star in the heavens, situated in Canis Major, a constellation of the southern hemisphere. As seen in middle latitudes in the northern hemisphere it lies low on the southern horizon below Orion, and is therefore visible during the winter months. Through a good telescope it is seen to have a companion, which some regard as really a planet.

Sir'loin (Fr. *sur*, 'over,' and loin), a loin of beef. Tradition reports that the name originated through Charles II., after dining off a loin of beef, playfully knighting it—

'He held his sword pleased o'er the meat,
"Rise up, thou famed *Sir-loin*."'

A double S. is called a Baron of Beef (q. v.).

Siroc'co. See SIMOOM.

Sir'sa, the chief town of the district of the same name in the Punjaub, British India, 149 miles N.W. of Delhi. The modern town was founded in 1837, near a ruined site. There is some trade in grain, sugar, and salt. Pop. (1868) 11,000.—The *district* of S., which is bounded W. by the Sutlej and traversed by the Ghuggur, has an area of 3121 sq. miles. Pop. (1868) 210,795. It is much overgrown by jungle. The breed of cattle is famous; at the fair at S. town 150,000 are sold annually.

Sismon'di, Jean Charles Léonard Simonde de, 'the great liberal historian,' was born of an old Pisan family at Geneva, May 9, 1773. After a course of study in the college of his native town he entered a counting-house at Lyon, which he left in 1793 to accompany his family to England. He returned to Geneva in 1795, next lived some years at Peschia in Tuscany, and settled finally at Geneva in 1800. In 1803 he published here his first work, *Traité de la Richesse Commerciale*, an exposition of the economic principles of Adam Smith, which, however, he afterwards abandoned in his *Nouveaux Principes d'Économie Politique* (2 vols. Par. 1819), and his *Études des Sciences sociales* (3 vols. Par. 1836–38). In 1813 he visited Paris for the first time, and in 1814 contributed a series of articles to the *Moniteur*, which were published in a volume under the title *Examen de la Constitution Française* (Par. 1815). This work procured him the honour of an interview with Napoleon. He now returned to Geneva, where he continued to prosecute historical studies till his death, June 25, 1842. His principal works (besides those named) were *Histoire des Républiques Italiennes du Moyen Age* (16 vols. Zur. and Par. 1807–18); *De la Littérature du Midi de l'Europe* (4 vols. Par. 1813–29, English translation by T. Roscoe, 1823); *Histoire des Français* (31 vols., the 30th written by Amedée Renée, the first being the general index, Par. 1821–44); *Julia Severa, ou l'An 492* (3 vols. Par. 1822); *Revue des Progrès des Opinions Religieuses* (Par. 1826); *Histoire de la Renaissance de la Liberté en Italie, de ses Progrès et de sa Chute* (2 vols. Par. 1832); *Études sur les Constitutions des Peuples Libres* (Par. 1836); *Précis de l'Histoire des Français* (2 vols. Par. 1839); besides many articles in the *Bibliothèque Universelle, Atti della Accad. Italiana, Revue Encyclopédique*, and Lardner's *Cyclopædia*. See the collections of his correspondence with Mlle. de Sainte-Aulaire (Par. 1863); *Lettres inédites à Mme. d'Albany* (Par. 1864); and *Vie et Travaux de S.* (Par. 1845).

Sis'ters of Char'ity. See BROTHERS AND SISTERS OF CHARITY.

Sis'tova, a town of Bulgaria, on the Danube, opposite Simnitza, 38 miles S.W. of Rustchuk, beautifully situated on undulating slopes. It has 19 mosques and 5 churches, and carries on manufactures of wine, leather, and wool. Pop. 12,000. Here was signed, on 4th August 1791, a treaty of peace between Turkey and Austria. S. was a place of some importance in the Russo-Turkish war. Part of the Russian army crossed the Danube here, and the town fell into their hands on 27th June 1877.

Sis'yphus, a mythical king of Corinth, son of Æolus and Enarete, and husband of Merope, who for his wickedness on earth was doomed in Hades to roll up a hill a huge block of marble, which as soon as it reached the top fell straightway down again, making his toil endless.

Sítápur ('the town of the goddess Sita'), the chief town of the district of the same name, in the province of Oude, British India, 105 miles S.E. of Bareilly and 51 N.W. of Lucknow. Pop. (1869) 5780. It was formerly the site of an important military cantonment, and the headquarters of the Khyrabad Division. In June 1857, the three battalions of native infantry and Oude Irregulars mutinied. Most of the European residents, civil and military, were immediately killed, a few escaped for the time, two women and one child alone survived, to be ultimately rescued from their prison in the Kaiserbagh at Lucknow, in March 1858.—The *district* of S. lies between the Bapti and Gumti rivers. Area 2250 sq. miles; pop. (1869) 930,224.

Sit'ka, or **Baranof'**, the chief island of the King George III. or S. Archipelago, on the W. coast of N. America, politically a part of Alaska, and belonging to the United States. The surface is rocky, and covered with pine forests. Area, 1567 sq. miles.—**S.** or **New Archangel**, on S. island, is the capital of Alaska, and is garrisoned by 180 United States troops. It has a few small public buildings, a magnetic observatory, a hospital, arsenal, &c. Several San Francisco merchants have established warehouses here. The harbour is excellent, and there is some trade in fish and peltry. Pop. 1200.

Sitt'a. See NUTHATCH.

Siva (pronounced Shĭvă, or in Bengal Sheeb, from a Sanskrit word meaning happy), the god of destruction, and the most popular of the Hindu trinity. His emblem is the *Linga* (q. v.) or *phallus*; and he is represented with every horrible sign of human bloodshed, and frequently accompanied by his bull Nundy. His wife is Kali (q. v.) or Durgah. Other names by which he is worshipped are Mahadeva, 'the great god,' and Iswara, 'lord.' His worship is unknown in the earliest period of the Vedas, and is chiefly developed by the later Puranas; at present it is undoubtedly predominant over the milder worship of Vishnu. Though plausibly conjectured to have been borrowed either from the aboriginal tribes or the Dravidian race, it has been especially adopted by the Brahmins as opposed to the cultivated laity. According to the Madras census of 1871, 16,159,000 persons in that presidency, or 50 per cent. of the total population, are Sivaites.

Sivathe'rium, an extinct genus of *Ruminant* quadrupeds, allied to the existing Giraffe (q. v.). S. remains occur in Miocene strata in N. India. Some authorities regard the S. as having been most nearly related to the antelope. Like the four-horned Indian antelope it had four horns, two small, and two large and palmate. The neck was long, and the face short. An allied fossil form is *Helladotherium*, the remains of which occur in Tertiary strata in France and Greece.

Sivaji', the founder of the Mahratta power in India, and the boldest warrior the Hindus have ever produced, though, like Hyder Ali and Runjeet Singh, he could neither read

nor write. He was born of Rajput descent at the hill fort of Sewneri in 1627, and was brought up at Poonah, which belonged to his father, who had also feudal estates in the Carnatic. At the age of nineteen he began his career by seizing the neighbouring strongholds, and by attacks upon the Mohammedan kingdoms of Bijapur and Delhi. In 1659 he treacherously assassinated with his own hand the Bijapur general, and established his power over the whole Mahratta country. He twice sacked Surat, and fitted out a fleet to intercept the pilgrims to Mecca. In 1664 he assumed the title of Rajah and established a mint, but shortly afterwards joined the imperial army, and even appeared at the court of Aurungzib at Delhi. In 1674 he was solemnly enthroned at Raighur, which he had lately stormed. On this occasion he was weighed against gold, and the sum (about 10 stone or 16,000 *pagodas* in value) was distributed among Brahmins. At this time the British at Bombay made a treaty with him. The whole of the Deccan was now tributary, and he led a marauding expedition as far S. as Tanjore. S. died at Raighur in 1680. None of his children showed any ability, but his descendants ruled in the diminished State of Sattara (q. v.), latterly under English protection, until 1848. The present Raja of Kolhapur is also a lineal descendant, and the Princess of Tanjore is descended from a half-brother. In ridicule of his birthplace and of the characteristics of the Mahrattas, he was styled by Aurungzib 'the mountain rat;' but the Mogul dynasty never recovered from the shock which he gave to it. S. was a bigoted Hindu, and had consecrated himself and his sword to the goddess Bhowani, one of the appellations of Kali, the destroying wife of Siva. See *The History of the Mahrattas*, by Colonel Grant Duff (Lond. 1826).

Si'vas (anc. *Sebasteia*), capital of the vilayet of S. and of Armenia Minor in Asiatic Turkey, at the head of the Kizil-Irmak valley, 400 miles E. of Scutari. It is on the line of the proposed Euphrates Valley Railway. In the centre of the town rises a ruined citadel. There is a bazaar, a prison, barracks, one fine mosque, and many smaller ones. Two miles off is the Armenian monastery of Nishan, or the Cross, with conspicuous Gothic towers, 500 years old. S. is a most important military position, as it commands the only entrance to the tableland of Asia Minor, but the Turks have neglected to fortify it. Tobacco is the staple product, but the surrounding district being very fertile, sugar, beetroot, and sweet carrot could be raised in great quantities. There is abundant waterpower, and coal is found. The climate is healthy for Europeans. Pop. 28,000, partly Christian and partly Mohammedan. Originally *Sebasteia*, it was enlarged and called *Megalopolis* by Pompey, and was an important place under the Roman and Byzantine empires.

Sivash', or **Gniloe-More** (Russ. 'Foul Sea'), a large shallow lake in the N.E. of the Crimea (q. v.), 92 miles long, 2 to 12 broad, and 916 sq. miles in area. It is bounded on the E. by the long narrow Tongue of Arabat, 2 feet high, and communicates with the sea by the Genitchesk or Tonko Strait, little above 100 yards wide. S. is marshy, overgrown with sedge, and peopled by waterfowl.

Six'tus, the name of five popes.—**St. S. I.**, Bishop of Rome from 119, was beheaded by Hadrian, 6th August 128.—**St. S. II.**, born at Athens about 180, pope from August 24, 257, suffered martyrdom at the hands of Valerian, 6th August 258.—**St. S. III.**, born at Rome, was pope from July 31, 432. He sent St. Patrick as a missionary to Ireland, and to him Augustine addressed his celebrated letter on grace. He died at Rome, August 18, 440.—**S. IV.** (Francesco della Rovere), born 22d July 1414, pope from August 9, 1471, equipped a fleet against the Turks, which had small success. He is accused of complicity in the Pazzi conspiracy against the Medici, in which his nephew, Cardinal Riario, bore an active part. The Florentines discovering the plot, S. excommunicated them, ostensibly on the ground that they had hanged an archbishop. In 1482 he leagued with Venice to deprive Duke Ercole d'Este of the city of Ferrara. Naples and Florence opposing this, and the Emperor threatening to call a general council, S. suddenly made peace, and excommunicated the Venetians for not following his example. S. has the credit of effecting certain reforms of the religious orders, but his reign was marred by intrigue, nepotism, and extravagance. He built the Sistine Chapel of the Vatican, and founded (1474) the festival of the Conception of the Virgin. He died at Rome, August 13, 1484.—**S. V.** (Felice Peretti), born of poor parents, 13th December 1521, at the village of Grotteamare, in the March of Ancona, entered the Franciscan order in 1534, and was successively professor of canon law at Rimini (1544), of theology at Siena, vicar-general of his order (1566), bishop and cardinal (1570). Under Gregory XIII. he lived the most retired life, and according to the chroniclers cultivated an appearance of premature senility, which contributed to his election to the pontificate, April 24, 1585. No sooner had he become Pope, however, than he instituted rigorous measures of reform, clearing his territory of robbers with such merciless severity that the name of 'Papa Sisto' is proverbial in Rome to the present day. He drained the Pontine marshes, established linen and silk manufactures, and erected many buildings within the city, among these the basilica of St. Peter and the library buildings of the Vatican. He carried out many reforms also in the administration of the Church, fixed the number of cardinals at seventy, and purified the discipline of the religious orders. He was liberal to scholars, and new editions of the Vulgate and Septuagint are connected with his name. The main object of his foreign policy was to check the ambition of Philip II. of Spain, and promote the influence of the Church. He excommunicated Elizabeth of England, and lent his aid to coerce the Huguenots in France and the Lutherans in Germany, but vigorously opposed the severities of the Spanish Inquisition. S. died August 17, 1590, leaving a reputation against which his numerous enemies could bring no charge save that of severity, but at the same time so unpopular that his statue was immediately broken by the Roman populace. See Tempeste, *Storia della Vita e Gesti di Sisto V.* (2 vols. Rome, 1754); J. Lorenz, *S. V. und seine Zeit* (Mainz 1852); and Segretain, *S. V. et Henri IV.* (Par. 1861).

Size, a kind of weak glue or adhesive varnish used in many industrial pursuits. House-painters' S. is prepared from shreds of leather, boiled and strained; papermakers use two kinds, one made from hide-cuttings, alum, and soap, and a second of rosin and potash; and the S. employed in gilding, japanning, &c., is variously composed of linseed-oil, copal, red lead, litharge, vermilion, &c., with turpentine. See GELATINE.

Sjæll'and (Eng. *Seeland*), the largest of the Danish islands lying between the Cattegat and the Baltic. It is separated from Sweden by the Sound, and from the island of Fünen by the Great Belt. Its length from N. to S. is 80 miles, and its greatest breadth from E. to W. 67 miles. The area of S., together with the small islands Möen and Samsö, is 2793 sq. miles, and pop. (1875) 671,400. The coast is deeply indented in the N. by the Isefjord and the Roskildefjord, and has on the E. the Kjöge Bucht and Faxö Bucht. The surface is flat, or sloping gently to hills, nowhere exceeding 400 feet in height. Many lakes dot the surface, and find an outlet by numerous streams. Large tracts are covered with beech and oak forests, and corn is abundantly raised for export. On the E. coast is situated Copenhagen, from which railways radiate through S. to Elsinore in the N., and Korsör in the S.W. of the island.

Ska'gen, or the **Skaw** ('the promontory' or 'isthmus'), the most northerly point of Jutland, Denmark. Near it is a village of 1615 inhabitants, and on the point stands a stone lighthouse 72 feet high.

Ska'ger-Rack, or (Dan.) **Skagerak** ('the strait of the promontory'), an arm of the North Sea, between Norway and the Danish peninsula of Jutland, connecting the North Sea with the Cattegat (q. v.). Its breadth varies from 70 to 90 miles, its length is 140 miles. The current usually sets E. along the coast of Jutland, where there are no harbours and the depth is 30 to 40 fathoms, and W. along the Norwegian coast, where the depth is 200 fathoms and good harbours are numerous.

Skald (Icel. *skáld*, O. H. Ger. *scellan*, 'to sound'), a reciter and singer of heroic poems and eulogies among the Norsemen. Specimens of their poems are found in the younger Edda (q. v.), in the Sagas (q. v.), and in the Heimskringla.

Skate (*Raia*), a genus of *Elasmobranchiate* fishes, belonging to the section *Batides*, in which the body is greatly broadened owing to the large size of the breast fins, which are united to the body. The mouth and gill-openings are on the under surface.

The eyes and *spiracles*, the latter, openings for admitting water to the gills, are on the top of the head. The tail is long and slender. It is *heterocercal*, and is often armed with formidable spines. The teeth are usually flat, and form a pavement-like arrangement in the mouth. The common Thornbank S. (*Raia clavata*) is a notable species, deriving its name from the spines which are borne on the upper surface of the tail. Skates are largely captured for food, the flesh being palatable and easily digested. The common S. is the *Raia batis*, often named the blue and grey S. Other species are the long-nosed S. (*R. mucronata*) and the sharp-nosed S. (*R. oxyrhynchus*), often named in Scotland the white S.

Skates (Dutch, *schaat*) and **Skating**. Skates are contrivances which, when fastened to the boots, enable a person to move rapidly over ice. They consist of a steel runner or ridge fixed either to a wooden sole provided with straps and buckles, or to a light iron framework having adjustable clamps, or other means of attachment to the boots. Skates with iron ribs were brought to England from the Netherlands about 1650. Pepys has noted in his *Diary* that he witnessed the 'very pretty art' of skating in 1662, the year of the great frost. Before the introduction of these skates, English people amused themselves on the ice by tying pieces of bone to their shoes, and urging themselves forward by means of a spiked staff. Skating is a most agreeable, healthy, and invigorating exercise, and with courage and confidence the first steps of the art are easily acquired. Figure-skating has been carried to great perfection by both sexes in Europe and America, and the skill and gracefulness displayed in it fairly entitle it to rank as a fine art. In Holland nearly every person is proficient in skating, and winter travelling is usually performed by means of it. The manner of skating called 'Dutch-roll'—a series of parallel sinuous curves executed on both feet—is commonly practised in that country. The inhabitants of the fen counties of England have also great repute for dexterity in skating, and it is recorded that one fen 'champion' attained a speed of one mile in two minutes.

Roller-skating, re-introduced some years ago from America, was until lately a very fashionable pastime in Great Britain. The skates used in it are provided with little wheels instead of iron ribs. The skating-ground, called a 'rink,' is commonly constructed of asphalt or concrete, or formed of artificial ice, so that the amusement may be enjoyed at all seasons, unlike skating on natural ice. Roller or 'parlour' skates were first patented by one Petitbled in France in 1819. Four years later, R. J. Tyers of London patented his 'volitos,' as he termed them, which had five little wheels in single line. Roller-skating did not then take the public fancy. About forty years later, when the pastime had become an American 'institution,' attempts to introduce it into England met with more success, and it gradually rose in popularity. Mr. J. L. Plimpton's roller-skates, patented in America in 1863, and two years later in England, are now in very general use. They have two pairs of rollers or runners, which are so attached to the footstand that by tilting it the axes of the rollers converge, enabling curves to be described with the greatest facility. With roller-skates skilful performers may dance and execute all the elegant evolutions of ice-skating.

Skeat, Rev. Walter William, born in London, 21st November 1835, proceeded in 1854 from King's College School, London, to Christ's College, Cambridge, graduated B.A. as fourteenth wrangler in 1858, and obtained a college fellowship in 1860. S. now took orders, and after three years of parochial duty, became mathematical lecturer at Christ's College (1864-67), and English lecturer (1867-76). Appointed Director of the 'English Dialect Society' on its establishment in 1873, he has been one of its most laborious and successful editors. In 1878 he was unanimously elected to the newly-founded Elrington and Bosworth Professorship of 'Anglo-Saxon' in the University of Cambridge. S. is perhaps the most admirable editor of Early English literature that has ever lived. Familiar with all its contents, and more profoundly skilled than any of his contemporaries in the difficult lore of MSS., he also brings to the elucidation of his texts a keenly penetrative yet sympathetic criticism that overlooks nothing and weighs everything. Some of his editorial labour, *e.g.*, *Piers the Plowman* and his Essay on the 'Rowley Poems' of Chatterton, is as masterly as anything ever achieved in regard to a Greek or Roman classic. Among his most important works are his *Mœso-Gothic Glossary* (printed by the Philological Society 1868), and *The Gospels of St. Mark and St. Luke in Anglo-Saxon and Northumbrian Versions* (2 vols. Camb. Univ. Press, 1875); for the 'English Text Society' his editions of *Launcelot of the Laik: a Scotch Metrical Romance* (1865); *Parallel Extracts from Twenty-Nine MSS. of Piers the Plowman* (1866); *The Vision of William concerning Piers the Plowman* (parts i.-iv. 1867-77); *Pierce the Ploughman's Crede* (1867); *The Lay of Havelok the Dane* (1868); *The Bruce; by Master John Barbour* (1-2, 1870-); *Joseph of Arimathie; or the Romance of the Seint Graal, or Holy Grail; with other Lives of Joseph of Arimathea* (1871); Chaucer's *Treatise on the Astrolabe*; for the Clarendon Press he has edited one vol. of *Piers the Plowman* (1869); the 2d vol. of *Specimens of English Literature* (1871), and 2 vols. (1874-77) of Chaucer's *Canterbury Tales*; and has edited Ray's *Collection of English Words and Seven other Glossaries* (1875) (for the 'English Dialect Society),' and Shakespeare's *Plutarch* (vol. i. 1875).

Skel'eton (Gr. *skeletos*, 'dried up'), the name given generally to the hard parts of both Invertebrate and Vertebrate animals. In comparative anatomy the *exoskeleton* denotes such parts as the teeth, scales, &c., which are formed from the skin or *dermal layer*, while the *endoskeleton* denotes the internal S. found in *Vertebrate* animals alone, and which serves to support the various tissues of the body, as well as to form cavities (*e.g.*, skull and thorax) for the protection of organs. As examples of the exoskeleton of *Invertebrata*, the 'shell' of the lobster, sea-urchin, or whelk, may be selected. In vertebrates, the scales of the Armadillo or Pangolin, of fishes and reptiles, the feathers of birds, and the teeth at large may be taken as representing an outer S. There are two skin layers—an outer, the *ecteron*, and an inner, the *enderon* or *dermis*. The ecteron or *epidermal* structures never form bony masses; they may, however, be horny, as is seen in the tortoiseshell plates of turtles, or in the *callosities* of horses and monkeys. The *dermis* or *enderon* frequently, on the other hand, becomes ossified, as is seen in the bony armour of the armadillos over which an epidermal horny layer is placed. In the crocodiles and turtles there is a similar arrangement of dermal and epidermal coverings.

The *internal S.* or *endoskeleton* of vertebrates varies exceedingly in its structure, form, and composition. In the *Amphioxus* or *Lancelet*, at once the lowest fish and vertebrate, the *endoskeleton* is represented by a single cellular body, the *notochord* or *chorda dorsalis*, which extends, as it does in no other vertebrate, quite to the interior extremity of the body. This notochord appears as the early representative of the spine in all other vertebrates. The *vertebral column* or *spine* forms the foundation of the entire endoskeleton, and usually consists of definite segments or *vertebræ*, which are *homologous* throughout. Professor Owen's idea of the composition of a vertebrate S. is that it consists essentially of a series of modified *vertebræ*, the limbs and their girdles being extraneous parts or appendages of the vertebræ of these several parts. Other anatomists have sought to show that the skull is not developed after the fashion of vertebræ, but owes its origin to a different mode of formation. In Owen's view there is much that is consistent and remarkable as applied to the homology of the spinal elements; his researches serving to supply a connected view of the modifications of the spine perceptible throughout the vertebrate series. Regarding the spinal column as made up of a series of homologous or like parts, what is the composition of the *ideal* or *typical vertebræ?* It consists (1) of a body or *centrum*, (2) of two upper arches (*neural arches*, or *neurapophyses*), which spring superiorly from the centrum and inclose the spinal cord; (3) of a *neural spine* formed by the coalescence of the neural arches; (4) of two inferior arches (*hæmapophyses*, or *hæmal arches*), inclosing the main parts of the circulatory or hæmal system; (5) of a *hæmal* or *inferior spinous process* formed by the junction of the hæmal arches. To these essential parts other elements are added, consisting of *processes* for articulation with neighbouring vertebræ, and of *processes* for the attachment of muscles. The *typical vertebral segment* is thus seen to consist of two arches, inclosing the nervous and circulatory centres respectively and appendages. In man, a typical vertebra includes not the spine alone, but the ribs and sternum; the latter forming the hæmal arch, including the heart or circulating organs. In the tail vertebræ of the crocodile, on the contrary, the typical parts are well seen.

The study of the comparative anatomy of the S. shows us that

the human S. belongs to a much-modified type of structure, and that for the due understanding of the homologies and relationship of skeletal parts we must study the S. of some lower form (*e.g.*, crocodile), in which most of the parts typical of a vertebrate S. are well represented. The various regions of the human S., and general descriptions of that of lower animals, are described in special articles.

Skell'igs (Ir. Gael. *sceilig*, 'a rock'), three islets, 6 miles W.S.W. of Bolus Head, County Kerry, Ireland, named Great S., Little S., and Lemon Rock. On Great S. are ruins of an abbey, and a light visible 25 miles off.

Skel'ton, John, born in Norfolk of Cumbrian ancestry about 1460, appears from entries in the Treasury Books to have been an under-clerk in the Exchequer (1472-73). He graduated M.A. of Cambridge (1480), having also it seems studied at Oxford, since by that university he was created poet-laureate (1490), as by the former (1493). In 1498, being then tutor to the Duke of York (afterwards Henry VIII.), he took holy orders; as rector of Diss in Norfolk (1504-15) he played the unholiest pranks, at least if the *Merie Tales* speak anything true. When Wolsey's patronage of him began, or why it ceased, we know not, only that in one poem S. extols the Cardinal's 'noblenes,' in another loads him with every epithet of abuse. Forced to take sanctuary at Westminster from Wolsey's vengeance, he met a kindly welcome from Abbot Islip, and there abode till his death, 21st June 1529. S.'s chief satires—and satire was his forte—are *The Bowge* (reward) *of Courte*, in 7-lined stanzas, and in the short-lined metre known by his name, *Colyn Clout* and *Why come ye not to Courte?* one an attack on the clergy generally, the other on Wolsey in particular. His *Tunnyng* (brewing) *of Elynour Rummyng*, sketching an ale-wife and her gossips with equal wit and coarseness, presents a singular contrast to *Phyllyp Sparrowe*, where a Norwich nun mourns, like the 'Lesbia' of Catullus' poem, over her pet, 'whom Gyb our cat hath slayne'—a dainty theme handled with rare and delicate fancy. The *Garlande of Laurell*, like most self-adulations lengthy and dull, completes, with thirty-three other English, one French, and nineteen Latin poems, his extant pieces, of which the lines *Of the Death of Edwarde the Fourth* (1483) was probably his earliest essay, as his *Magnyfycence* is one of our oldest and finest interludes. See the introduction to Dyce's edition of S.'s works (2 vols. Lond. 1843).

Skene, James, a scion of an ancient Aberdeenshire family, was born at Rubislaw, 5th March 1775, spent several years of his youth in Saxony, where he acquired a perfect knowledge of German. On his return to his native country, he formed a close friendship with Sir Walter Scott, who dedicated to him the fourth canto of *Marmion*. In 1806 he married Jane, daughter of Sir William Forbes of Pitsligo, by whom he had three sons and four daughters. He died 27th November 1861. S. was a man of fine character, cultivated tastes, and lively talents. Scott owed him not a little in various ways. Some of the Jewish scenes in *Ivanhoe* were suggested by S., who also furnished the great novelist with part of his materials for *Quentin Durward*. His archæological tastes he transmitted to his second son, **William Forbes S.**, born at Inverie, Kincardineshire, 7th June, 1809, educated at the High School of Edinburgh, studied in Germany and at the Universities of St. Andrews and Edinburgh. In 1831 he became a Writer to the Signet, a profession which he still (1878) follows. For upwards of forty years S. has devoted his leisure to laborious researches in the most remote, obscure, and difficult parts of the national history. His first important contribution to literature was *The Highlanders of Scotland, their Origin, History, and Antiquities* (2 vols. 1837). Since then, besides numerous papers of the highest critical value, read before the Royal Society of Edinburgh and the Society of Antiquaries, Edinburgh, he has edited *The Dean of Lismore's Book, with Introductions and Notes* (1861), *Ancient Gaelic Poetry, Chronicles of the Picts and Scots, and other Early Memorials of Scottish History* (1867), Fordun's *Cronica Gentis Scotorum* (2 vols. 1871) in the 'Historians of Scotland,' and has published two original works, *The Four Ancient Books of Wales* (2 vols. Edin. 1868), and *Celtic Scotland, a History of Ancient Alban* (2 vols. Edin. 1876-77), which have given him a foremost place, not merely among Scottish, but European archæologists. Nothing in the least comparable to S.'s work has been done by any earlier Scottish scholar. In thoroughness of investigation, solidity of knowledge, critical insight, and reconstructive power, he is far above the best of his contemporaries, and may safely be pronounced the greatest archæologist that Scotland has yet produced.

Skerr'ies (Ir. Gael. *sceire*, 'sea-rocks'), the name of various bare rocky islets off the British coasts. The chief are (1) the Pentland S., on the E. entrance to the Pentland Firth (q. v.); (2) the S. off the coast of County Dublin (q. v.), Ireland. The S. railway station is 17¾ miles N. of Dublin; (3) the S. or Isle of Seals, a rocky islet off Carmel Point, Anglesea, England, with a lighthouse; (4) Skerryvore (q. v.).

Skerryvore' Light'house, a lighthouse built on a rock forming one of an extensive reef lying about 12 miles S.W. from the wild Isle of Tyree on the W. coast of Scotland. Lying in the fairway of vessels making for the Clyde and Mersey, it was long the terror of mariners. The reef is exposed to the mighty 'fetch' of the Atlantic. The rock on which the tower is built is composed of gneiss worn so smooth by the continued action of the sea that the foreman mason compared landing on it to climbing up the neck of a bottle. In order that the light might show far beyond the foul ground, the tower was designed so that it might have a range of 18 nautical miles. The tower is 137 feet 11 inches in height, 42 feet in diameter at base, decreasing to 16 feet at the top, and contains a mass of granite masonry of 58,580 cubic feet. For 26 feet in height the tower is solid, and the contents weigh nearly 2000 tons. The walls, as they spring from the solid, are 9½ feet thick, gradually diminishing to 2 feet at the top. Above the solid the interior is 12 feet in diameter, divided into nine storeys, surmounted by a lightroom and lantern. Operations were commenced on the rock in 1838, and the light was exhibited in February 1844, six years being thus occupied in the work. The apparatus is dioptric revolving, the light attaining its greatest brilliance once a minute; the machinery which drives the apparatus is also employed to toll fog-bells. The tower is the tallest and most graceful rock lighthouse in Britain, if not in the world. The cost of the work, including the steam-vessel, the small harbour for the attending vessel, and the dwellings for the keepers and seamen, was £86,977. The lighthouse, which was designed and erected by the late Mr. Alan Stevenson, is a noble monument of his engineering skill.

Skew, a stone built into the bottom of a gable, to form an abutment and support for the coping above: an oblique arch.

Skew-Bridge, a bridge whose arch is skewed or oblique, its plan being rhomboidal, not rectangular. Skew-bridges are of frequent occurrence on railroad tracks, which, by their use, are carried across roads, rivers, &c., at an oblique angle, thereby avoiding the awkward turns that would sometimes be necessary in striking the roads at right angles.

Skibbereen' (Ir. Gael. *Scibirin*, 'the place of the *scibs*' (Eng. 'skiffs') or 'boats'), a market-town of County Cork, Ireland, 34 miles W.S.W. of Bandon by rail, on the Ilen, which is navigable for vessels of 200 tons up to Aldcourt, 2 miles below S. The chief buildings are a Catholic and a Protestant church, a new townhall, market-house, hospital, &c. There entered, in 1877, 337 vessels of 23,347 tons, and cleared 152 of 13,095 tons, while on December 31 of that year 21 vessels were registered as belonging to the port, besides 433 fishing-boats employing 1834 hands. The imports amounted (1877) to £20,465, and the customs to £313. Pop. (1871) 3695, of whom 3209 were Catholics.

Skid, in army, a slab of iron or timber placed below a gun or other object to keep it off the ground. On board ship a beam used as a support for a heavy body is known by the same name. Timbers laid across a ship to support the larger boats are called S.-beams.

Skidd'aw, a mountain in Cumberland, 3058 feet high, lies to the right of the road from Derwentwater to Bassenthwaite, and may be easily ascended from Keswick, 6 miles distant.

Skin, the name given generally to the outer layer or investment of animal bodies, consisting typically of two layers, the

ecteron or *epidermis*, and the *enderon* or *dermis*. The former is devoid of nerves and bloodvessels; the latter is sensitive, and plentifully provided with vessels. At the tips and other orifices of the body, the outer layer is modified to form the more delicate *epithelium*, which is continued inwards to form the lining of the alimentary canal and the other passages of the body. As mentioned in the article SKELETON, the *ecteron* may secrete hard parts (*e.g.*, nails and hair); and the *enderon* may also form hard structures, represented by the teeth. The outer layer of the skin or *epidermis* consists of flattened *epithelial* cells, often named *pavement* or *tesselated* epithelium. The deeper cells are long in shape, the superficial cells flattened and scale-like. The epidermal cells often contain pigment; its *rete mucosum*, or deeper layer, being that wherein pigment is typically developed. The sensitive *dermis*, *corium*, or *cutis vera*, consists of *fibro-cellular* tissue, exhibiting numerous spaces or *areolæ*. It rests in turn upon *cellular* and *adipose* tissue. The surface of the *dermis* is elevated into numerous *Papillæ* (q. v.), these structures being the organs of touch. The *papillæ* vary in form. They may be *simple*, or may have their extremities divided, as seen in the palm of the hand, where they are disposed in double rows and in parallel curved lines. The average length of papillæ is about the $\frac{1}{100}$th inch, and their diameter at the base about $\frac{1}{250}$th inch. To each papilla a capillary loop supplies blood, a nerve-fibre affording the means for exercising sensation. Nerve-fibres terminate in papillæ in so-called *touch-capsules*, bodies of oval shape, and *end bulbs*; the latter, according to Krause, being little oval-shaped bodies having a diameter of $\frac{1}{600}$th inch. The papillæ are invested by the non-sensitive epidermis, so that the sense of touch is exercised through the upper layer of the S.

The S. has certain very important *glands*, which enable it to perform a large share of the work of *Excretion* (q. v.). Of the *S.-glands*, the most important are the *sudoriparous* or *sweat-glands*. These are situated in the adipose or fatty tissue beneath the dermis, and consist of a convoluted tube, opening on the surface of the S. by a minute opening. Each gland is surrounded by a coil of minute bloodvessels, from the blood of which the *sweat-secretion* (consisting of water, chloride of sodium, chloride of ammonium, urea, &c.) is secreted, and finally excreted on the external surface of the body in the form of the well-known *perspiration*. The sweat-glands are most numerous in the palms of the hands (2736 to 3528 to the sq. inch) and soles of the feet. They are least numerous in the neck and back. The *sebaceous glands* of the S. are small glands, found very generally distributed over the body, and which usually open by ducts into the follicles of hairs. The *sebaceous matter* secreted in these glands (which are absent in the palms and soles of the feet) is of an oily nature, and is believed to aid in the nutrition of the hairs.

The *functions* of the S. are (1) to serve as a general covering or investment to the body; (2) as a means of exercising the sense of touch; (3) as an absorptive surface in some degree; (4) as an excretory surface; and (5) as an important means of regulating the temperature of the body. The quantity of watery vapour excreted per diem by the S. under ordinary circumstances is about 1½ or 2 lbs. The skin exhales *carbonic acid gas* in addition to the sweat, and also normally excretes traces of urea. In these latter facts the correlation of the S. with the lungs and kidneys is well seen. The S. is believed to excrete daily about $\frac{1}{200}$th to $\frac{1}{150}$th part of the amount of carbonic acid excreted by the lungs. The *absorptive* powers of the S. are presumably limited. Mercurial salivation is produced by rubbing mercury into the skin; and many other substances produce characteristic effects when thus administered. But it is still a question whether the S. can absorb water. The case of shipwrecked sailors relieving thirst by wrapping wet clothes around their bodies, is explicable on the idea that evaporation is thereby hindered. See SENSATION.

Diseases of the S.—Diseases of the S. have been variously classified by different authors. Affections of the cutaneous system may be divided into those of the skin, and those of its appendages, such as the hair, nails, and cellular tissue. Diseases of the S. may be divided anatomically into (1) exanthemata, or rashes; (2) hæmorrhages; (3) vesicles; (4) parasites; (5) blebs; (6) pustules; (7) papules; (8) scales; (9) tubercles; (10) stains; and (11) zerodermata, or unnatural dryness of the skin. The more important diseases of the S. are described under special articles.

Skinn'er, Rev. John, son of an Aberdeenshire schoolmaster, was born at Balfour in the parish of Birse, 3d October 1721, studied at Marischal College, and in 1739 became assistant teacher at Monymusk. While here he abandoned Presbyterianism and joined the Episcopal communion. In 1742 he was appointed to the charge of an Episcopal congregation at Longside, near Peterhead, where he officiated for the long period of sixty-five years, residing 'all the time in a small thatched cottage.' S. died at Aberdeen, 16th June 1807. His controversial pamphlets are long since forgotten, but his bright, genial, and humorous verse seems destined to resist the tooth of time. 'Tullochgorum,' which Burns declared to be 'the best Scotch song Scotland ever saw,' is as delightsome to-day as it was a hundred years ago. Hardly less so are 'The Ewie wi' the Crooked Horn,' 'John of Badenyon,' 'O! Why should Old Age so much Wound Us,' &c. In 1809 his *Miscellaneous Works* were published in 3 vols., with a biographical memoir by his son, Dr. John Skinner, Bishop of Aberdeen. See also Reid's biographical sketch prefixed to an edition of S.'s *Songs and Poems* (Peterhead, 1859).

Skip'ton ('Sheeptown'), or **Skipton-in-Craven**, a town in the W. Riding of Yorkshire, England, on the Aire, 26 miles N.W. of Leeds and 231 N. of London by rail, is the chief town of the district of Craven. It is a station on the Midland Railway, and an important junction for Liverpool, Manchester, Blackburn, and Lancashire with Scotland, and where all the important trains stop between London and Scotland. S. has a picturesquely situated parish church, and Christ Church, built in 1839. The Grammar School is a fine building opened in 1877, and the Midland Railway Company completed in 1876 the erection of a large and commodious station. A reservoir for S. was finished in 1877. S. is the ancient seat of the Cliffords, whose interesting castle, founded by William de Romillé at the close of the 11th c., still commands the town. The population is partly engaged in agriculture, and the fortnightly cattle-fair is one of the largest in that part of England. The town is also at present (1878) experimenting on a sewage-farm. S. has (1878) eight mills, two of which were opened in that year. The chief manufactures are cotton and wincey goods and sewing-cottons. Pop. (1871) 6078; estimated pop. (1878) 10,000.

Skir'mishers (Ital. *scaramuccia*, but originally a Ger. word meaning 'shield-bearers'), dispersed soldiers in the first line of battle. They act in front of battalions or masses of soldiers so as to cover the advance of an army and prevent surprises. During recent years the scope of S. has been widely extended in the important modifications of military science represented by the Prussian 'swarm' and the British 'advance in loose order.'

Skirr'it is an umbelliferous tuberous-rooted perennial, a native of China, from whence it is said to have been introduced into Britain in 1546. The bunch of fleshy tubers was formerly much esteemed as a vegetable for either boiling or frying, but S. is now rarely seen in the kitchen garden. Where grown it is propagated either by dividing the root or by seed, and its cultivation is in all respects similar to that of the beet.

Skittles, a game of skill played in an oblong court known technically as a 'skittle-alley.' Nine pins are set up at the one end according to a certain arrangement; and the object of the player, who aims a ball at them from a fixed distance, is to knock them all down in as few throws as possible.

Skopin', a town of Russia, government of Riasan, on the left bank of the Verda, 89½ miles E. of Tula by rail; has nine churches, and manufactures of leather. Pop. 9447.

Skob'eleff, General, a brilliant and daring Russian officer, born about 1840, is the son of a general (with whom he is sometimes confounded), and is said to be the great-grandson of a 'Scobie' from the W. of Scotland, who emigrated to Russia, and rose to distinction in the Russian navy. S. first served in Central Asia under Kaufmann (q. v.), where his extraordinary audacity and splendid courage soon won him a great name. His exploits have almost become legendary among the soldiers of the Czar. Intrusted by Kaufmann with the command of the forces sent against Khokand, he conquered and annexed a territory containing two millions of inhabitants. At the outbreak of hostilities between Russia and Turkey in 1877,

S. happened to be in disgrace at court, and came to the seat of war unattached. At the crossing of the Danube at Sistova he fought in the ranks as a private soldier, took part in the great surprise-march of Gourko through Bulgaria, obtained command of a regiment of Cossacks after the Russian disasters at Plevna, and gave material help at the recapture of Loftcha, 3d September. Appointed commander of the left wing of the Russian army at Plevna, S. stormed with frightful loss the Sofia and Krishine redoubts (September 11), but was forced to abandon them next day, was present at the surrender of Osman Pasha (q. v.), whom he was the first to greet, afterwards captured the entire Turkish force at Shipka, and marched with the victorious Russians from Sofia to San Stefano. S. is the soldiers' hero. His eccentricities enchant, as his valour inspires them. He is covered with decorations. Yet he is not a merè hare-brained enthusiast in fighting. He is a thoroughly scientific and accomplished officer, and has even more than a Russian's skill in languages, speaking and writing with ease, in addition to his native tongue, French, German, English, Italian, Roumanian, Bulgarian, Polish, Turkish, and modern Greek.

Sku'a, or **Sku'a Gull** (*Stercorarius*, or *Lestris catarrhactes*), a species of *Laridæ* or Gulls, notable for its predatory habits in compelling other gulls to disgorge their finny prey. It inhabits northern regions, and attains a length of 2 feet. The usual plumage is brown, varied with chestnut; the under parts are light-brown. Other species are the *S. cepphus*, or Buffon's S., and the Pomarine S. (*S. Pomarinus*).

Skull, the name given to the bony or cartilaginous case in which the brain of Vertebrates is protected. In Invertebrates no traces of a skull exist, except the cartilaginous capsule found in the highest molluscs or cuttlefishes, and enclosing the chief nerve-mass. The S., as mentioned in the article SKELETON, was regarded by Owen as composed of four modified vertebræ, a view from which other anatomists of repute materially differ. In its *development*, the human S. first appears as a thin capsule of membrane, enclosing the primitive traces of the brain. Its walls are continuous with those of the vertebral canal in which the *spinal cord* is contained. The *notochord*, or primitive spine, is continued along the base to the fore part of the S., at which latter point it tapers to a point. At the base of the S. the first development of cartilage takes place, this deposition assuming the form of two symmetrical portions, one on each side of the middle line. Ossification begins in the roof of the S., and the primitive membrane of the S. becomes the periosteum of its bones, and unites with the *dura mater*, or outer of the three membranes of the brain. At birth the process of ossification is further advanced in the base than at the vertex of the S., and the bones of the vertex and sides are separated by four spaces filled in with membrane and named *fontanelles*, and correspond to the union of the four angles of the parietal bones with its neighbours. The anterior fontanelles remain open until the first or second year of life; the others close soon after birth.

Anatomically considered, the S. is divisible into a *cranial* and a *facial* portion. The most prominent of the S.-apertures are the *occipital* foramen behind, this being the aperture through which the brain becomes continuous with the spinal chord. The two articular processes or *condyles* are on each side of this opening. At each side of the S. and near the occipital condyles the two blunt *mastoid* processes are seen. The *zygoma*, a kind of projecting buttress, connects face and S. together at each side, and becomes continuous in front with the *malar* prominence or that of the cheek. The *orbits* or eye-cavities and nostrils, or *nares*, are seen in front. The only bones which are separable from the adult human S. are the *lower jaw* and *hyoid bone*, the latter giving support to the tongue. In the human S. twenty-two bones are found. Eight of these form the *cranium* or brain-case, and are named as follows:—*occipital*; *parietal* (*two*); *frontal*; *temporal* (*two*); *sphenoid* and *ethnoid*. Fourteen bones enter into the composition of the face: *nasal* (*two*); *superior maxillary* (*two*); *lachrymal* (*two*); *malar* (*two*); *palate* (*two*); *inferior turbinated* (*two*); *vomer*; and *inferior maxillary* or lower jaw. In this category it will be seen the *auditory vesicles*, or three small bones found in the internal ear, are not included; nor are certain small bones named *Wormian bones* (so named from Wormius, a Danish physician), which are occasionally developed in the spaces or *fontanelles* between the cranial bones, where the process of ossification has been incomplete. These Wormian bones from their shape are also named *ossa triquetra*. The osseous or bony tissue of the S. is that seen in flat bones generally. The bones of the cranium consist of two layers of dense horny material, enclosing a network-like tissue, named *cancellated bony tissue*. The dense layers are named the *inner* and *outer tables* of the S.; and of these the outer is the thicker and tougher, the inner being often named the vitreous table from its brittle nature. The name *diploë* is given to the intervening or soft and cancellated substance. The bones of the S. are well supplied with blood by arteries which arise from the *dura mater*, and also from the inner scalp-tissue or *pericranium*.

The chief anatomical differences of the human cranium from that of the highest apes are these: the cranio-facial angle varies from 90° to 120°, whilst the brain cavity is more than 2½ times the length of the basi-cranial axis; the *superciliary ridges* over the eyebrows are but little developed in man, and he has a nasal spine; the jaws are relatively small, and the condyles by means of which the S. articulates with the spine are situated further forward on the base of the cranium than in anthropoid apes. Classifications of the human race by the variations of S. formations have been frequently proposed. Retzius proposed to divide mankind into *dolichocephalic*, or long-headed, and *brachycephalic*, or short-headed races. Other classifications remark the existence of (1) *oval*, or *elliptical skulls* (natives of W. and S. Europe); (2) *prognathous* (*e.g.*, negro and negrito); and (3) *pyramidal* (*e.g.*, Mongolian, Esquimaux).

Diseases and Injuries of the S.—The bones of the cranium are liable to be affected with all the diseases peculiar to osseous structures, such as *Caries*, *Necrosis*, &c. (q. v.). The most frequent injuries of the S. are *fractures* which may be divided into those of the *vault* and those of the *base*. The chief varieties of fracture of the vault are simple fissures, starred and comminuted fractures, fractures with depression of the entire thickness of the skull, fractures with depression of the outer or inner tables only, and fractures with elevation of the fractured portion; and any of these forms of fracture may be simple or compound. Fractures with depression of one table only and elevated fractures are rare, but the other forms are of frequent occurrence.

The only diagnostic signs of a simple fracture of the skull are the symptoms of depression by which it may be accompanied. The gravity of the injury depends entirely, or chiefly, upon the amount of depression; and if there be no depression, a simple fracture is not more serious than a fracture of any other bone.

The *treatment* of an undepressed fracture consists merely in such precautionary measures as watching for and treating any cerebral symptoms which may arise; and if the fracture be compound, the usual measures should be adopted to promote the healing of the wound. In cases of simple depressed fracture accompanied by symptoms of compression, or of irritation of the brain, the depressed portion of bone should be elevated by operation, but not otherwise. Depressed compound fractures should also be elevated if there be symptoms of compression, and some surgeons follow the practice of elevating even in cases where there are no symptoms of compression, but the judiciousness of this is somewhat doubtful.

Fractures of the base of the S. may be caused by direct violence; but, in the great majority of cases, they are extensions downwards of fractures of the vault, and are caused by indirect force. Fractures of the base caused by direct violence most frequently occur in connection with wounds of the orbit; or the condyle of the lower jaw may be driven through the base of the S. The great majority of the fractures caused by indirect violence pass through the middle fossa of the base. Sometimes a fracture of the base may originate in a shock transmitted through the spine to the base of the S., as when a person falls on his feet from a considerable height. In some cases the fracture is confined to the base, but it generally extends up into the vertex.

The symptoms of fracture of the base of the S. are the escape of the contents of the cranial cavity, viz., blood, subarachnoid fluid, or brain-matter through the fissure, or injury of the nerves which pass through the foramina at the base of the skull; but the usual symptoms are either extravasation of blood or escape of the subarachnoid fluid. In fractures of the anterior fossa, there is extravasation of blood in the deep cellular tissue of the orbit, and afterwards under the ocular conjunctiva and the

lids; or the blood may pass through the sphenoid bone into the nose, causing persistent epistaxis. The latter condition may also occur in fracture of the middle fossa; but, in such cases, the hæmorrhage is more frequently from the ear, the membrana tympani being lacerated, and affording a passage for the blood from one or other of the large vessels in its neighbourhood. In fractures of the posterior fossa, the extravasation may be at the mastoid process, in the occipital region, or at the side of the neck. The most important and unmistakable sign of fracture of the base is the discharge of serous fluid from the ears. A copious discharge of watery, saline fluid from the ears can come only from the subarachnoid space. Lesions of the nerves which pass through the foramina at the base are of frequent occurrence in fractures of the base; and paralysis of the nerves, especially of the seventh pair, occurring in connection with an injury of the S., is a strongly confirmatory symptom, though not unequivocal, as paralysis may result from extravasation into the substance of the nerve, or it may follow an injury of any kind.

Fracture of the base of the skull is a very grave injury, and though generally fatal is by no means necessarily so. The only treatment is that which is appropriate for the concomitant injury of the brain.

Skunk (*Mephitis*), a genus of Carnivorous mammals included in the weasel family (*Mustelidæ*) and occurring in the New World, where they are widely distributed. The *M. putorius* is the common species, and attains a length of about 18 inches, exclusive of the tail. The colour is a dark-brown variegated with lighter streaks, and the tail is long and bushy. The fur is valuable. The S. is most notable for the persistent and highly disagreeable odour of its *anal glands*. The nauseous odour of this secretion has, in fact, become proverbial. It impregnates any article of clothing so as to be incapable of removal, and a very small quantity of the fluid ejected by the animal when irritated is sufficient for the purpose. The secretion is said to possess therapeutic properties.

Skye (Gael. *Ealan-skianach*, 'winged island'), after Lewis the largest of the Scottish islands, and the most northerly of the Inner Hebrides, is included in Inverness-shire. Area, 547 sq. miles; pop. (1871) 17,330. Separated from Ross-shire in the N.W. by the Sound of Rona, and from Inverness in the S.W. by the Sound of Sleat, it approaches within half a mile of the mainland between these two channels at Kyle Rhea. It is very irregular in shape, and is so cut up by inlets that no part of it is more than 4 miles from the sea. The chief inlets, all towards the W. and N., are Lochs Eishart, Slapin, Scavaig, Bracadale, Follart, and Snizort; the principal headlands are Aird Point, Ru-Huinish, Dunvegan Head, and Vaternish Point, which are extremities of the peninsulas of Duirinish, Vaternish, and Trotternish in the N., and Sleat Point in the S. Its extreme length from Aird Point to Sleat Point is 47 miles; its greatest breadth, from Portree to Copnahow Head, 22 miles. S. is a wild, highland country, and its rocky mountains and precipitous headlands are shrouded in the mists of the Atlantic. The southern portion, however, is 'comparatively soft and green,' the long promontory of Sleat being the 'best wooded, the sunniest, and the most carefully cultivated' part of S., with its larch plantations and trim hedgerows. Towards the S.W., bounding Loch Scavaig, are the romantic Cuchullin Hills, jagged and precipitous, attaining their greatest height of 3183 feet in Scuir-na-Gillean. The outlying Blabhein (pronounced Blaavin), 3200 feet high, rises to a narrow ledge, overhanging a lofty precipice on either side. Among the Cuchullins lies Loch Coruisk, the most savage scene of desolation in Britain. Its dark-green waters are girt with tiers of cliffs and steep rocky slopes strewn with gigantic masses of hypersthene. Glen Sligachan, 'to which Glencoe is Arcady,' passes N. between Scuir-na-Gillean and Marscow, to the eastern loch of the same name. Near the E. coast, 7 miles N. of Portree, the Storr (2348 feet) rises conspicuously. Its summit is cut vertically for 500 feet, and is fenced with fantastic pinnacles, while the steep declivity below is littered with detached rocks. In the bleak promontory of Trotternish rises the Quiraing (1774 feet), perhaps the most singular sight in S., happily described as 'a nightmare of nature.' It is a natural basaltic cathedral, formed by huge fluted columns of basalt, and rugged pyramidal masses, in the midst of which stands a truncated rocky hill. This hill, the Quiraing proper, rises abruptly; its sides are worn by rivulets and ribbed with fissures, and at its top is a spacious, verdant plateau, 100 paces by 60. The coast to the S. and E. of the Quiraing presents basaltic formations, at various points rivalling in size those of Staffa and the Giants' Causeway. Here and there the base of the cliffs is hollowed into remarkable caves (*e.g.*, Prince Charles' Cave), and their face is worn by waterfalls. The N. part of S. is still spoken of as 'Macleod's country,' and the southern part is the country of the Macdonalds. Macleod's Tables are two contiguous hills in the E. of the island, flat-topped as a dining-table, and covered far into spring with a layer of snow. Macleod's Maidens are three spires of rock, rising sheer out of the sea. S. has no rivers, but the streams at Skeabost, Portree, Ose, Hammer, &c., afford salmon and sea-trout fishing. In the bays there are profitable fisheries—herring, cod, ling, saithe, oyster, &c. On account of the humidity of the climate, agriculture is almost abandoned, only green crops being produced in any quantity. Sheep-farming and cattle-rearing are the chief occupations, and important fairs are held at Broadford. Game, which was formerly plentiful, is now scarce. The inhabitants are mainly Celtic, and universally speak Gaelic, although the use of English is gradually increasing. There is a strong Norse infusion, and the names of the northern headlands are Norwegian, not Gaelic. Since 1851 the population has decreased, chiefly by emigration, to the extent of one-fifth. The chief families in S. are the Macdonalds of Sleat, who trace their descent to the Lords of the Isles, and the Macleods, originally Norsemen, who still occupy old Dunvegan Castle. The island is historically interesting as the home of Flora Macdonald and the refuge of Prince Charles. At the old house of Kingsburgh Flora entertained Dr. Johnson and Boswell in 1773. The grave of Flora in the churchyard of Kilmuir, long in a state of sad neglect, was marked by the erection of an Iona cross, a granite monolith 28 feet high, in November 1871. In the winter of 1877, however, the monument was blown down and broken into five pieces by a strong westerly gale. Four bridges over the S. streams were in course of erection in 1878. There are masterly descriptions of S. scenery in Scott's *Lord of the Isles*, and in Black's *Princess of Thule*. See also Alexander Smith's *Summer in S.* (Lond. 1866).

Sky'lark. See LARK.

Sky'ro (anc. *Skyros*), an island in the Grecian Archipelago, the largest and most easterly of the northern Sporades, belonging to the nomarchy of Egripo. Area, 64 sq. miles; pop. (1870) 3029. It is mountainous in the S., but the N. part has fertile plains which yield abundant crops of wheat. Wine, olives, and honey are exported. Coloured marble is produced, and in the N. half of the island are numerous ancient quarries. The only town is S. on the E. coast. Pop. 2029.

Slag, the fused and hardened refuse from smelting-works, glass-foundries, &c. The different varieties of S. are silicates of lime, alumina, &c., often beautifully crystallised, and very variously coloured by the different metals. S. from ancient smelting-works frequently contains a sufficient proportion of metal to pay for its further extraction under our improved methods. Among the various patents which have been taken out for the utilisation of the immense quantities of S. produced every year, none have as yet been perfectly successful. It is sometimes cast into blocks of the size of bricks or larger, and used for building houses or paving streets. Broken S. is also often laid upon roads and garden-walks, though it forms a somewhat ugly and uncomfortable pavement.

Slan'der is, in law, an injury done by speech to the character of a person. Any words injurious to the person spoken of in his business, or social position, may be S. Though much will depend on the *animus* of the speaker, there may be S. without malice. The legal remedy for the injury is an action for damages. To this the defence may be that the words imputed were not spoken; or that they were true and justifiable. See LIBEL.

Slang, the secret jargon of thieves and vagabonds, otherwise known as Cant or Flash, and answering to the Fr. *Argot*, Span. *Germania*, Ital. *Lingue Furbesche*, Ger. *Rotwälsch*, and Russ. *Afinskoe*. Although confounded by Ben Jonson, Beaumont and Fletcher, Scott, and Disraeli, S. and the Romani or Gypsy

tongue are as distinct as 'Pidgin English' and the language of Shakespeare's plays. Yet Romani probably suggested to 'valiant roags' the manifold advantages of a speech not understanded of constables; and out of words picked up from Jewish receivers of stolen goods, from Gypsies, and heaven knows whence besides, they concocted with the assistance of copious metaphors a jargon as patched and piebald as *Hudibras'* Babylonish dialect. Thus modern English S. has its Romani elements, *pal* (R. *pral*, 'brother'), *cosh*, 'life-preserver' (R. *kosht*, 'a stick'), *dust*, 'money' (R. *dosta*, 'plenty'), &c.; its Welsh, as *win*, 'a penny' (W. *gwen*, 'white'), and *skipper*, 'a barn' (W. *ys-gubor*); its French, as *vile*, 'a town,' *nysey*, 'a simpleton' (F. *niais*); its German, as *slang*, 'a chain' (G. *schlange*, 'serpent'); its Italian, *e.g.*, in '*scarper* with the *feeley* of the *donna* of the *carser*' (*scappare colla figlia della donna della casa*); even its Latin, as *pannum*, 'bread,' and '*grannam*, 'corn.' Then, as already stated, there are a host of metaphors, like *dew-beaters*, 'feet,' *canaries*, 'sovereigns,' *devil-driver*, 'parson,' and *fall of the leaf*, 'the gallows drop.' And it is much the same with Continental jargons, Rotwälsch containing 137 Romani words, about as many French, and numerous metaphors, as *teller*, 'wheel,' *regenwurm*, 'sausage,' &c. It is curious how the same words and concepts often crop up in widely-different jargons, proving the close-knit union of knaves' fraternities. For instance, the S. *cocum*, 'sly,' *gonnof*, 'thief,' and *shickster*, 'lady,' reappear in Rotwälsch as *kochum*, *gonof*, and *schikse*; *red-rag*, for 'tongue,' is matched by the Argot *chiffon rouge*; and while your Spanish bravo calls 'fingers' *mandamientos*, in *The Four P. P.* (1540) it runs, 'The wife's ten *commandments* may search thy five wits.' Curious, too, is the antiquity of much modern S. In Fletcher's *Christ's Victorie* we light on *bouzing kan*, in the *Merry Wives of Windsor* on 'what the *dickens*,' in the *Conflict of Conscience* on 'but *to the pot* he is sure to go;' and *tick*, *cove*, *beak*, &c., were current at least two centuries ago. How wary the 'slangologist' has need to be is shown in the countless puerile etymologies of Grose and Hotten, or in Mr. E. P. Tylor's derivation of *conk*, 'a nose'—whence *conky*, the Duke of Wellington's familiar nickname—from the 'spouting *concha* of classical fountains.' It is simply a case of back-slang, the inverted gibberish of London costermongers, *conk* equalling *hnoc* or *nok*, the Romani for 'nose,' which further appears in the S. *nark*, 'a *nose* or spy.' See the works cited in Hotten's *S. Dictionary* (new ed. Lond. 1874), and in Miklosich's *Zigeunerische Elemente in den Gaunersprachen Europa's* (Vien. 1876).

Slate, a hard metamorphic rock which splits readily into thin layers, not necessarily in the plane of the original bedding, but in a direction cutting this at a variable angle. This phenomenon is due to *Cleavage* (q. v.). True slate is exclusively obtained from the Cambrian and Silurian formations: to fulfil its purpose it must be hard and fissile; but in colour it varies greatly, from grey and green to blue or black. Besides the small thin slates used for roofing purposes, and for writing, large slabs are employed for billiard-tables to ensure a level surface. S. is found in Wales, Cornwall (Tintagel and Delabole), the Lake District, Argyleshire, Perthshire, and other British localities, in geological horizons not higher than the Carboniferous, and mainly Cambrian and Silurian. North Wales (in the mountains around Llanberis, Bangor, and Festiniog) produces more slate than any other country; the total output during 1877 amounted to 600,000 tons, while the total production of the British isles during the same period was estimated at 750,000 tons. The export from Great Britain in 1877 amounted to 37,565,282 'tales,' valued at £294,515, of which Germany took £210,438 worth. In slate-quarrying large blocks are removed by blasting, and are broken into smaller blocks, two inches thick, and of several widths suitable for splitting into slates, the main use of which is in covering the roofs of buildings. Blocks of slate unfitted because of unusual hardness for slate-making are planed down and sawn into slabs. These are afterwards ground, scoured, and polished for use as dairy fittings, in constructing cisterns and tanks, billiard tables, drawing-boards, and pavements, and after being 'enamelled' and decorated in imitation of marbles and porphyries, as chimneypieces and architectural panels. Welsh roofing-slates from Bangor quarries in Carnarvon are unequalled for lightness, thinness, and uniform colour; Westmoreland slates are much esteemed; while Scotch slates from Ballachulish and Easdale quarries are rougher, thicker, and more durable than English varieties. Tough and heavy slates are procured from several Irish localities. The trade names and sizes of roofing-slates are: 'ladies' 15 inches × 8 inches, 'viscountesses' 18 × 10, 'countesses' 20 × 10, 'duchesses' 24 × 12, 'princesses' 24 × 14, and 'queens' 36 × 24. 'Doubles' measure 13 × 7 or thereby, and in Scotland a slate of less dimensions is termed 'undersize.' Slating is the industrial art whereby the boards, battens, or laths on a roof are covered with slates. The slates are dressed to a uniform width or 'gage,' and sorted in lengths. Two nail-holes are punched near the 'head' of each S.; the nails used are of copper or galvanised iron. The slates are placed in courses on the roof, the longest next the eaves and the shortest at the ridge. The courses break joint, and overlap twice, the lower edge of the third course covering a few inches of the first course, and so on. Scotch slates are irregular in thickness and are not trimmed to a uniform gage; greater care is therefore demanded of the workman for their proper disposition on the roof, in order to have it perfectly water-tight.

Mica and *Hornblende* S. contain the minerals named. *Whet* S. has much silica in its composition, and is used for hones. *Drawing* S. or black chalk contains carbon, and is employed for crayons. *Polishing* S. is very fine grained and of a yellow colour. See D. C. Davies, *A Treatise on S. and S.-Quarrying, Scientific, Practical, and Commercial* (Lond. 1878).

Slate-Pencils are thin cylinders of slate used for writing on school-slates. 'Prepared S.-P.' are made after the manner of black-lead pencils, a thin parallelopiped of compressed slate-powder being substituted for one of plumbago.

Slave-Coast, a name given to the northern coast of the Bight of Benin, from Lagos to the Volta River. Besides Lagos, its chief ports are Badagry, Whydah, and Palma.

Sla'very, the state in which one man is another's property, originated in the primeval code of warfare by which a captive's death was exchanged for a life of bondage, as much from covetous as merciful motives. Then the same family feeling which led to hereditary dignities, ordained that the man who had forfeited personal liberty had likewise forfeited the liberty of his children, and thus by degrees a servile class arose. Everywhere this class was constantly recruited by insolvent debtors, by criminals, and by freemen who sold themselves as slaves; but the servile condition varied greatly in different countries and at different times. The mildest form of S. the world has seen was that amongst the Jews. So mild was it that sometimes a Hebrew bondman would not accept the liberty offered him by the law of Jubilee (q. v.)., whilst even foreign slaves were strictly protected by the Mosaic legislation, were admitted members of the Jewish faith, and did they escape, might not be given up. Far otherwise was the lot of a slave in Greece or Italy. Ancient philosophers denied to him the right, not merely of citizenship, but of humanity itself. He was to them an animated chattel, who differed from his master as utterly as brutes from man, devoid of forethought, incapable of government. So argued Aristotle in his *Polity*, blind to the fact that slaves might have once been free, or might at any time acquire freedom. Hence all his precepts concerning the treatment of slaves are addressed solely to the owners' self-interest, and how feeble a restraint this often proved is shown in the cruelties that led to 'Servile Wars.' Neither did Christianity combat the principle of S., though from the first it must have tended to better the condition of slaves. The Fathers of the Church seem not to have dreamed of the possibility or advantages of a general enfranchisement; the Church itself held slaves; under the Christian emperor Justinian a bondman's testimony against his master continued worthless; and as late as the 9th c. Basil the Macedonian vainly enacted that servile marriages should receive the priestly benediction. Chiefly to men's awakening sense of the dignity of labour was emancipation due; its progress was gradual and not unmixed with evil. As amongst the Jews there were the two classes of native and foreign slaves, so in the Greek, the Roman, and the Teutonic system we find various degrees of personal dependence, and may distinguish absolute slaves from *periœci*, *clientes*, *lætas*, &c. There was, however, a constant tendency towards the fusion of slaves and such 'unfree,' by raising the former while lowering the latter class. In England we mark this process in the creation of the intermediate class of villains *regardant* from *theows* and *ceorls*. Already before the Conquest many causes were uniting to lower the status of free-

men, who under Eadward the Confessor had each their lord; but in *Domesday* the free landowner, who could go where he would with his land, is still entirely distinct from the personal slave, liable to be sold and shipped off to Ireland. In the succeeding century, however, the manorial system, by changing free commendation and tenancy into servitude both of man and land, thrust down the *ceorl* into a semi-slavish state; while at the same time absolute slaves, finding no place in the feudal theory, rose to the semi-freedom of villainage. Neither S. nor villainage were ever formally abolished, but the former had ceased to exist in the 12th, the latter in the 16th c. Russian serfdom bears a close analogy to English villainage, so far as *adscriptio glebæ* lay at the root of both; but the serfs came far nearer S. than did ever the villains. At the outset of Russian history the population consisted of slaves, of free agricultural labourers without a fixed abode, and of the peasants proper; at the beginning of the 18th c. all these three categories were blended under the common head of serfs. The primary cause, according to Mr. Wallace, of this great change was that, though peasants were anciently free to wander at their will, there was always, in a country so thinly populated as Russia, a tendency on the part of proprietors and communes to hinder migration. This was difficult so long as the land was broken up into a number of principalities, when one landowner could tempt his neighbour's labourers to settle upon his own estate. But with the establishment of the tsardom of Moscovy and the feudal granting of land to *boyars* with a certain number of hands to till it, new reasons for and means of fixing the peasants to the soil arose; and whilst they retained their civic rights, they lost the privilege of changing their domicile. The tie between master and servant once rendered indissoluble, the rights of the weaker soon yielded to the stronger's might. If land might be sold, the peasants attached to it of course were included in the bargain; and from this it was but a step to the sale of peasants apart from land, as allowed by the *ukázes* of 1682. Peter the Great grouped slave and peasant under the common head of serfs, effecting thereby the final obliteration of class distinctions; and his successors in various *ukázes* (1742-66) permitted proprietors to punish unruly serfs by the knout or by perpetual banishment to the mines. Under Catharine II. serfage attained its climax, 'serfs being bought, sold, and given in presents in hundred and thousands, sometimes with the land and sometimes without it, sometimes in families, and sometimes individually.' In 1768 a lady was brought to trial, who in eleven years had murdered one hundred serfs, most of them girls; and the cruelties of Count Arakchéyef, in the beginning of this century, were hardly less horrible. But with Alexander's accession (1801), began a series of attempts at emancipation, which in the face of strong national opposition resulted in the law (February 19, 1861), by which 21,625,609 serfs received their freedom.

Meanwhile, there had grown up in the New World the gigantic system of negro S. The natives of Hayti, forced by their Spanish conquerors to labour in the gold-mines, dwindled in twenty years from 2,000,000 to 14,000; and Las Casas, to save the remnant, suggested the employment of negroes in their stead. Accordingly in 1510 Karl V. conferred on a courtier a patent to transport 4000 Africans a year into the island, and thus the slave-trade was begun. England and other countries soon followed Spain's example, with the result that at the beginning of the present century the number of negro slaves in North and South America and in the West Indian islands was estimated at over 4,000,000 souls, one half of whom belonged to the United States. On the cruelties of the traffic there is now no need to dwell; the world has acknowledged by renouncing them. The history of its abolition is briefly this:—In 1787 a society was formed in London by Dillwyn, Granville Sharpe, Clarkson, and Wilberforce, for the suppression of the slave-trade; and coldly countenanced by Pitt, warmly by Fox and Burke, its members achieved their end after twenty years' defeat, their measure receiving the royal assent 25th March 1807. Twenty-three days before a similar act was passed by the Congress of the United States, where since 1762 the Quakers, supported by Washington, Franklin, and Jefferson, had pleaded the cause of anti-S. Slowly and reluctantly Spain, France, and Portugal followed the example, and the slave-trade became piracy in the eye of international law. But this abolition of the slave-trade was only the prelude to a fiercer contest, waged for the abolition of S. itself. In 1833 an Act, introduced by the late Lord Derby, emancipated the slaves of the British colonies, their owners receiving £20,000,000 as compensation; and by 1820 S. had ceased to be a power in all the American States to the N. of Delaware and Maryland. In that year the famous 'Missouri Compromise' established that S. should never exist above the parallel of 36° 30' N. lat. (see MASON AND DIXON'S LINE); its repeal (1854) left Kansas and Nebraska the choice whether they were to be slave-holding territories or no. Lincoln's election to the presidency (1860) decided the question in the negative, and this decision led to the withdrawal from Congress of the senators and members of seven of the Southern States. The history of the Civil War that followed belongs to the history of the United States (q. v.); enough that it ended in the abolition of S. throughout the Union, 31st January 1865. S. had already ceased in every part of the American continent except Brazil, and there the Act of 1871 has freed the slaves belonging to Government, whilst ensuring liberty to all children born after the date of enactment. See De Wette's *Lehrbuch der hebräisch-jüdischen Archäologie* (4th ed. Leip. 1864); vol. x. of Grote's *History of Greece* (new ed. Lond. 1872); vol. v. of Freeman's *Norman Conquest* (Oxf. Clar. Press, 1876); Mackenzie Wallace's *Russia* (2 vols. Lond. 1877); Clarkson's *History of the Abolition of the Slave-Trade* (2 vols. Lond. 1808); Goldwin Smith's *Treatise on American S.* (Lond. 1863); and H. Wilson's *History of the Rise and Fall of the Slave Power in America* (3 vols. Bost. and Lond. 1874).

Sla'vic Nations form a large and important branch of the Aryan family, numbering about 80,000,000, and occupying nearly a third of Europe. Of their history prior to the 6th c. of our era, little is known with certainty. Their ancestors, together with those of the Letts and Lithuanians, are supposed on linguistic evidence to have been once united in a Letto-Slavic group; but the separation of the Lettic from the Slavic family must have taken place at a very remote period. No evidence exists, even in tradition, as to the time at which the Slavs entered Europe, but their wave of immigration appears to have been later than the Celtic, Græco-Italic, and Teutonic waves. The eastern shores of the Baltic, in the neighbourhood of which are still found the dwindling remains of the Lettic races, are claimed as the early homes of some Slavic tribes, while others are supposed to have long dwelt near the northern shores of the Black Sea, or roamed over the vast tract vaguely designated as Sarmatia, stretching from the Caspian towards the mouth of the Vistula. From the 5th c. B.C., they are supposed to have existed in Europe for nearly a thousand years without materially affecting its history, at first confused in the opinion of the ancients with Scythians and other unfamiliar races, afterwards more clearly distinguished by Greek and Roman writers as *Venedi* or *Veneti* (a name suggestive of the German *Wenden*). At length a southern movement seems to have brought them into contact with the Roman Empire, and in the 6th c. of our era they appear in the works of the historians Jornandes and Procopius as *Sclavini* or *Sclabenoi*; names from which comes the superfluous *c* in the word 'Sclavonic.' The origin of the name *Slâv* is uncertain. It has been derived from *slava*, glory, and from *slovo*, a word; the latter derivation being supported by the fact that the Slavs termed foreigners *Nyemtsy*, dumb, *i.e.*, 'wordless.' The name Serb or Servian is also of doubtful origin. Attempts have been made by hostile critics to connect it with the Latin *servus*, but they involve a false etymology. The words 'slave' and 'Slav' are undoubtedly connected, but only because so many Slavs were in the course of time reduced to servitude did their name become a synonym for a thrall. Ranked at first among the barbaric foes of the Empire, the southern and western Slavs gradually became civilised, entered into alliances with the Emperors, accepted Christianity, and founded principalities which for a considerable time flourished prosperously. Bohemia, Moravia, Servia, and Bulgaria, were all important Slav states, which long maintained their independence. Poland was another, and it held its own until modern times. The northern Slavs were not all equally fortunate, many of their tribes being gradually driven out or absorbed without ever attaining to political importance. But in the N.E. a combination of Scandinavian rulers and Slav subjects laid the foundations of the power which eventually developed into the Russian Empire.

Polity, Religion, Culture, &c.—There never seems to have been any political cohesion between the various S. N. The idea

of Panslavism, of Slavonic unity, is a modern creation, due principally to a religious sentiment. In ancient times each tribe of Slavs appears to have been independent of the rest, itself divided into a number of self-governing clusters of family-communities. Each of these clusters was among the western Slavs called a *jupa*, and had at its head a ruler who bore the title of *jupan*. In the centre of the *jupa* was the *grad* or town, in which business was transacted and religious rites were performed. Each head of a family-community was supreme within its limits, ruling his household with patriarchal power, and, at least among the eastern tribes, being priest as well as judge. Agriculture was everywhere the main pursuit of the Slavs, who are therefore supposed to have been of a peaceable nature, though they fought bravely when attacked, surrounding themselves with a rampart of linked cars. Of their religion in general not much is known. Accounts have been preserved of the temples and rites of some of their tribes, especially of the Baltic Slavs, on whom, however, much influence seems to have been exercised by Lithuanians and Scandinavians. But with respect to the religious ideas of the great majority, scarcely any direct evidence can be cited. Allusions to the ancient gods are found in the popular songs which exist in such numbers among all Slav races, but no compiler of a Slav Edda has ever arisen. A collection of Bulgarian popular poems was commenced in 1874, under the title of *Le Veda Slave*, which professed to throw much light upon Slav mythology, but it has not been accepted as a trustworthy guide. Like the other Aryan races, the ancient Slavs appear to have based their religion upon the reverence they paid to the forces of nature and to the spirits of the dead. The chief deity worshipped by at least the eastern and southern tribes was the thunder-god Perun, the Perkunas of Lithuania, whom mythologists are inclined to identify with the Vedic Parjanya. With him were linked in honour a pastoral divinity named Volos, a Dazhbog or 'Day-god,' 'Ogon' or Fire, a being evidently akin to the Vedic Agni, and Svarog, the Slav counterpart of the Vedic Varuna and the Hellenic Ouranos. Along the Baltic special reverence was paid to a Triglaf, a Sviatovit, and other divinities, represented by idols having several faces or heads. After the introduction of Christianity, the worship of these and similar divinities was long kept up by the different Slav tribes in unfrequented spots, and to this day numerous superstitious ideas and rites point to the once prevalent belief in them, such as the sacrifices employed to avert cattle-plagues, and the credence given to stories about Domovoys, Rusalkas, Vilas, and other supernatural inhabitants of fields, forests, hills, and streams. To the present day also have survived customs which, though now connected with Christian ceremonies, are really survivals of old rites performed in heathen times on behalf of the dead. About the language spoken by the ancient Slavs it is possible to speak with more certainty, as records exist which show what was its nature a thousand years ago. There were, no doubt, many dialects spoken at that time by the various Slavic tribes, but they seem to have long continued to be very closely allied. And therefore the translation of the Scriptures which was made for one set of Slav converts to Christianity might well suffice for another. When the inhabitants of the extensive principality known as 'Great Moravia' accepted Christianity in the 9th c., their first teachers, the Greek monks Cyril and Methodius, translated the Bible for their benefit, inventing for the purpose the alphabet known as the Cyrillic. This translation, written in what is generally called 'Old Bulgarian' or 'Church Slavonic,' still forms the authorised version of the Bible for the whole Slavonic race. It represents the language of their ancestors as it existed in the 9th c., one which is no longer understood anywhere by the common people, but which does not differ much more from that now spoken by some of the S. N.—the Russians and Servians for instance—than the English of the 14th c. differs from that of the present day. Modern Slavs may be divided linguistically into two branches, the eastern and the western. And this division may be used also to distinguish them, though not with the same precision, according to their religious doctrines, for the great mass of the eastern Slavs belong to the Greek Church, of the western Slavs to the Church of Rome. The eastern group comprises the Russians, Servians, Bulgarians, and a number of races akin to the Servians. The western contains the Poles, the Czekhs of Bohemia, Moravia, and Hungary, and the Wends of Lusatia. An educated Slav can generally understand, or at least very quickly learn, the dialect spoken by any member of the branch to which he belongs. But the speech of an eastern Slav is generally unintelligible to a western. A Pole will easily communicate with a Czekh, but a Lusatian Wend will find little that is familiar to his ear in Russian or Servian. And the difficulty of communication between the members of the two branches is increased by the difference between the alphabets they use, the eastern Slavs employing, as a general rule, a modified form of the Cyrillic, and the western having adopted the Roman.

Ethnography.—It is not quite so easy to divide and group the existing Slavs. The majority of the 'Great Russians'—that is to say, the inhabitants of the greater part of Russia in Europe, the 'White Russians' and 'Little Russians' being excluded—seem to be descended from Slav settlers among Finnic races, who intermarried with, and forced their language upon, the original inhabitants of the lands they colonised. The 'Little Russians' of the S.W. provinces appear to be of purer Slav descent, and less akin to the 'Great Russians' or 'Muscovites' than to the Poles with whom they were so long politically united. Among the speakers of 'Serb' dialects—the Servians, Croatians, Bosnians, Slovenes, 'Slavonians,' Dalmatians, and above all the Montenegrins—the Slav type appears to have been preserved in comparative purity. But they differ among themselves in many respects, especially as regards religion. Of those who are under Austrian rule, the majority belong to the Church of Rome, while the rest are for the most part members of the Greek Church. In Bosnia and Herzegovina many of the inhabitants, though certainly of Slav origin and speaking a Slav tongue, are Mohammedans. But their case is a singular exception to the general rule. For the eastern Slavs, in spite of their long subjection to Turks and Tartars, clung to their Christianity with a firmness in striking contrast to the docility with which, at the command of their own princes, their ancestors gave up their heathenism. To what race the modern Bulgarians belong is uncertain. They speak a Slav language, but one which has been considerably modified. It has lost its infinitive, it has accepted the use of an article, it has borrowed a great number of Turkish words, and it has undergone other changes. Still it retains its original Slavonic character. But the people who speak it appear to be the descendants of a tribe not belonging to the Aryan family, but who settled down among Slavs and adopted their speech. Of the members of the western branch, the Poles seem to have kept nearest to the old Slav type. For the original nature of the Czekhs, owing to the long union of their principalities with German states, has become considerably modified, a large German element having entered into their constitution. Both the Poles and the Czekhs belong to the Church of Rome, but the two races differ widely in the degree of their attachment to it. The long antagonism of Poland to Russia has produced an intense devotion on the part of the Poles to the Vatican, the constant foe of the Russo-Greek Church. The national movement among the Czekhs against their Roman Catholic German rulers, gave rise in the 15th c. to a Protestant feeling, which culminated in the teaching of John Huss and Jerome of Prague, and the armed resistance of their adherents, and has of late induced some of their leaders to look favourably upon the Eastern Church. The Wends of Lusatia, the last remains of the once numerous and flourishing races settled along the course of the Elbe, are closely linked by language with the Poles and Czekhs; but they differ from them in religion, the great majority being Protestants. They have become to a great extent peacefully Germanised. Of the once flourishing Slav settlements along the Baltic, from Kiel to Danzig, but few remains are now to be found, though here and there appears among German neighbours some hamlet where Slav customs and a Slav speech are still to be recognised. See Shafarik's *Slaw. Alterthümer* (Ger. trans. Leip. 1843); *History of the Slavic Language and Literature* (Ofen. 1816); Mickiewicz's *Lectures on Slavic Literature* (4 vols. Leip. 1849); and *Veda Slovena; Le Veda Slave*, edit. by E. J. Verkovitch (vol. i., Belgrad. 1874).

Slavo'nia, a former kingdom now constituting with Croatia (q. v.) an Austrian Crown-land, has an area of 3644 sq. miles, and lies between the Drave and Military Frontier. Formerly part of Pannonia (q. v.), it was seized by Dalmatian Slavs in 797 A.D., was long contended for by Hungary and Byzantium, but in 1165 fell to the former power. It was held by the Turks from 1524 till 1699, when the Peace of Karlowicz restored it to Leopold I.

Slea'ford, a market-town of Lincolnshire, England, on the Slea, 14 miles E.N.E. of Grantham by rail; has a cruciform parish church (1271-1403), with a spire 144 feet high; almshouses (enlarged 1858) and a grammar-school founded by Robert Carre in 1604; and a Second Pointed cross, 70 feet high, erected (1850) as a testimonial to Mr. Handley, M.P. for S. Lincolnshire. S. publishes one weekly newspaper, and has a considerable trade in agricultural produce. Pop. (1871) 3735.

Sleep, the state of suspension of the active powers and mental faculties which recurs as a normal part of the existence of higher animals. The obvious use of S. is specially a nutritive one. Through the rest afforded to the various organs in a state of repose nutrition is subserved. Especially is this the case with the nervous system, the functions of which during S. are suspended and abrogated in a general sense. The alternation of work and rest afforded by the recurrence of S. is paralleled by the occurrence of periods of rest in the work of the continuously-operating organs of the body. Thus a distinct interval occurs in the work of the heart,—the period of work, like that of rest, averaging about half a second. The respiratory muscles have a larger interval, averaging about 2 or 3 seconds. In the case of the brain, of which the active functional period is long and protracted, there exists an absolute necessity for a lengthened period of rest. In S. the requisite conditions are therefore complied with by the supervention of unconsciousness for a longer or shorter period. The exact condition of the brain during S. is still a matter of hypothesis, as also are the determining *causes* of S. Arguing from a pathological standpoint, physiologists generally maintained that the condition of the brain in S. was one of congestion. Its vessels were presumed to be distended with blood, and S. thus became in some degree analogous to the condition of insensibility produced by pathological congestion. Experiments conducted upon the brain-surface, however, led to the opposite conclusion. The brain is observed during S. to become pale and anæmic. Dr. Hughlings Jackson has also observed that the optic disc becomes pale during S., and this latter fact would seem to confirm the previous conclusion. The consideration of the general physiology of the blood-supply of the brain leads to a similar result. Blood supplied to the brain in S. is required in less quantity than in the waking state, since there exists in S. merely a nutritive demand, and not one calling for a large supply of blood for transformation into nerve-force. The physiological and proximate cause of S. is therefore regarded as being an anæmic condition of the brain, and the conditions determining S. may be considered simply as those which, through over-exertion or from normal exercise, produce nervous lassitude and conditions favouring anæmia. The relation of S. to dreams and somnambulism affords material for further researches on S. itself. Many physiologists hold that the normal S. is a dreamless one; others maintain that we may dream even in profound S., but that we do not remember our dreams. In dreaming, the cerebrum is regarded as active in part. In somnambulism we have an acted dream, with activity of motor centres, although confessedly in certain cases of somnambulism—as where mathematical problems have been solved, &c.—there are elements which render the entire phenomena very difficult of explanation. Cases of *protracted* S. are on record in which long periods of S. extending to forty and fifty days, and even to nearly a year, were observed. Such cases became of pathological interest, as also do those in which S. has been delayed for long periods. *Age, state of health, temperament,* and above all *habit,* are the chief causes which modify S. As an instance of the power of habit to modify S., Dr. Carpenter cites the case of Sir Edward Codrington, who, when serving under Lord Hood as signal-lieutenant with the British fleet, had frequently to remain on duty for nineteen hours at a stretch. His hours of sleep were so profound that no ordinary noise could awake him, but the word 'signal' whispered in his ear at once aroused him. A dominant idea thus serves to modify the sleeping habits, a common example of this fact being found in the habit acquired by many persons of awaking at a given hour fixed upon at bedtime. See Macnish, *Philosophy of S.* (1850); Macario, *Du Sommeil* (1857); Durham, *Physiology of S.* ('Guy's Hospital Reports,' 1860); Maury, *Le Sommeil et les Rêves* (1865); Hammond, *S. and its Developments* (1869).

Sleep of Plants is a name popularly given to the phenomena exhibited by certain plants which at night depress their leaflets, as in the wood-sorrel, the sensitive plant, and many other *Oxalideæ* and *Leguminosæ*, or close their flowers, as in numerous *Compositæ*. Such movements are periodic in some plants; in others, they depend simply upon exposure to or withdrawal of light. The regularity with which the opening of the flowers occurs in some commonly cultivated plants was the basis of what was tabulated by Linnæus as a 'floral clock.'

Sles'vig (Dan.), or **Schles'wig** (Ger.), capital of the Prussian province of S.-Holstein, and of the district of S., consists of a single street about 3½ miles long, extending round the W. end of the arm of the sea called the Schlei. Of the three churches of S. the finest is the Gothic Dom, dating from the 12th c., and completed in 1260, with a fine altar-piece (1521) of carved oak, representing the history of the passion in 14 sections. The old ducal castle of *Gottorp* is now used for government offices. S. has a gymnasium, and asylums for deaf mutes and for the insane. The industries are pottery, sugar-refining, and the manufacture of cambric, lace, and woollens. Pop. (1874) 14,546. At S., anciently called *Hedeby,* Ansgar (q. v.) began his work (827), and the first Christian church in Denmark was erected in 850.

Sles'vig-Holstein, since 1866 a province of Prussia, bounded N. by Denmark, E. by the Baltic, W. by the North Sea, and separated S. from Hannover by the Elbe. Area, 8524 sq. miles; pop. (1875) 1,074,085.—**Slesvig,** the northern part of the province, was formerly a duchy known until the 14th c. as S. Jutland, and belonging to Denmark previous to 1864. It was bounded N. by Jutland, E. by the Baltic and the Little Belt, W. by the North Sea, and separated on the S. from Holstein by the Eider and the Kiel Canal. Area, 3529 sq. miles; pop. (at its annexation in 1864) 406,486. S. was Danish in Karoling times; the Eider being, as Eginhard tells us, the boundary between Saxonia Transalbiana (Holstein) and the Terra Nortmannorum (wherein lay the town of Sliesthorp), inhabited by the Scandinavian heathen. Conquered, in common with all Jutland, by Otto the Great, it remained a markgrafdom of the empire until the time of Konrad II., who made the Eider again the boundary, yielding up all his claims on S. to the Danish king, Knud, in 1027. In 1232 King Valdemar II., dividing his dominions among his three sons, gave S. as a fief to Abel, whose family intermarried with that of the Counts of Holstein, and borrowed their aid in feuds with Denmark. The family of Abel having died out in 1375, S. returned to Denmark, but was in 1386 given in fief to Gerhard, Duke of Holstein, whose family having become extinct in 1459, it recurred to Christian I., the founder of the House of Oldenburg, who procured his election as Duke of Holstein by promising that the two duchies should always be united under one government. His successors on the Danish throne divided from time to time the duchies among the younger sons of the royal house, thus creating a number of families, who found it their interest to intrigue with Germany, in order to secure their power. In 1721, however, all the ducal lines were expelled from S. for having plotted against Denmark during the war with Sweden, and S. was incorporated with the crown of Denmark under Frederik IV. Yet the German colonisation of S. went on, and the number of the Danish inhabitants probably somewhat declined. In 1848 the two duchies, with the connivance of Prussia, broke into revolt, but were subdued after a severe defeat at Judsted, July 25, 1850. On the death of Frederik VII. in 1863 and the extinction of the direct Oldenburg line, Prince Augustenborg refused to recognise the claims of the new king, Christian IX., to the duchies, and, styling himself Frederik VIII. of S.-Holstein, revived a claim which had been set aside in consequence of a money payment in 1848. He was recognised by the Holsteiners, but the Austrians and Prussians seizing the opportunity to interfere, invaded Holstein, and after a gallant struggle of ten weeks the Danes were compelled to yield S., Holstein, and Lauenburg, October 30, 1864. By the convention of Gastein (August 14, 1865) Austria occupied Holstein, Prussia S.; but in consequence of the war between the two powers, and the Treaty of Prague (August 23, 1866), both duchies are retained by Prussia, and have been formed into a province of the empire. The Provincial Assembly for the Duchies of S. and Holstein having (August 4, 1878) voted an address to the German Emperor on the occasion of the attack upon his life, the members representing North S. and the island

of Alsen protested, on the ground that, by Article V. of the Treaty of Prague, the northern Danish-speaking part of S. was to be restored to Denmark, a provision which had not been carried out by Prussia.

Slick'ensides, a technical term applied to the smoothed and polished sides of two contiguous faces of rock when their relative positions have been altered by a 'fault.' The glazed appearance often shown in such cases is probably due to the action of heat and the presence of gases.

Sli'ding-Rule, a mathematical instrument consisting of two graduated scales, one of which slides over the other. The graduations are logarithmic, and by its means calculations involving multiplication and division of numbers are greatly facilitated. It is used chiefly in gauging and in mensuration of timber.

Sli'go, a maritime county of Ireland, province of Connaught, is bounded N. by the Atlantic and the Bay of Donegal and landwards by Roscommon, Leitrim, and Mayo. Area, 461,796 acres; pop. (1871) 115,493, of whom 104,242 were Roman Catholics. The coast is rocky and much indented, the chief inlet being S. Bay, and the principal headlands, Ballyconnel and Lenadoon Point. The surface is mountainous in the S.W. and N.E., and there are large tracts of bog, while the only navigable rivers are the Moy, Owenmore, and Garrogue. The small Loughs Arrow, Gill, and Gara are singularly picturesque. In the southern part of S. there are extensive tracts of corn-land and pasture. In 1874 the valuation was £211,574, and in 1876 there were 88,308 acres under corn crops, 236,081 in grass, 6612 in woods, and the remainder in waste, bog, and water. The live stock comprised in the same year 99,899 cattle, 60,471 sheep, 22,568 pigs, 7041 horses, 7774 asses, 3410 goats, and 338,817 poultry. S. also yields some minerals (copper, lead, iron, and manganese), and has valuable coast fisheries. S. was anciently the seat of the O'Connors, and contains many Celtic remains. It sends two members to Parliament.

Sli'go, the chief town of County S., on the left bank of the Garrogue (called *Sligeach*, 'shelly water,' whence the name S.), 131 miles N.W. of Dublin by a branch of the Midland Great Western Railway. The chief industries are fishing (in 1878 employing 2884 persons), flour-milling, brewing, and distilling. In 1877 there entered 470 vessels of 81,674 tons, and cleared 453 of 63,989 tons. The imports amounted to £279,645, the customs to £17,394, the exports to £2215; and on December 31 of the same year 27 vessels of 2884 tons were registered as belonging to S., besides 444 fishing-boats. The Garrogue, here crossed by two bridges, is navigable to Lough Gill. The erection of a Roman Catholic cathedral, the see of Elphin, was begun in 1867. S. publishes three weekly newspapers, and till 1870 returned one member to Parliament. Pop. (1871) 9340, showing a decrease since 1861 of 4021. S. grew up around a Dominican abbey founded by the Earl of Kildare in the 13th c., and received its charter from James I. In the vicinity is the Giant's Grave, marked by a stone circle similar to that of Stonehenge.

Sling, a primitive weapon consisting of a leather or platted socket with two long cords attached for throwing stones or other missiles. The ends of the cords are grasped in the hand and the socket containing the missile is whirled rapidly round till a great velocity is attained; one of the cords is then suddenly slipped, and the missile flies off with great force. The S. was commonly used in ancient and mediæval times, and so late as the 16th c. it and an improved weapon called the 'staff S.' were employed to hurl grenades. The inhabitants of the Balearic Islands were formerly skilled slingers.

Slip, in a dockyard, is an inclined plane, down which a vessel which has been built or has been getting repaired is run into the water. A repairing S. is furnished with a cradle which is run under the ship as it floats at high tide, and is drawn up when, after the ebb of the tide, the vessel is stranded upon it.

Sloane, Sir Hans, physician and naturalist, was born of Scotch parentage at Killyleagh, County Down, Ireland, April 16, 1660. Scientific study early proved attractive to him, and after studying medicine for some years in London he repaired to Paris in 1683. In 1684 he settled as a physician in London, became a Fellow of the Royal Society in 1685 and of the College of Physicians in 1687. This same year he accompanied the Duke of Albemarle to Jamaica, where he made a large collection of plants, but where he was unable to stay more than fifteen months, on account of the death of his patron, who was governor of the island. On his return to London in 1689 he entered upon a successful practice. In 1693 he was elected secretary and in 1702 became one of the vice-presidents of the Royal Society. The French Academy of Sciences made him a foreign associate in 1708, and George I. created him a baronet in 1716. He was president of the College of Physicians from 1719 to 1735, and succeeded Newton as president of the Royal Society in 1727. He died January 11, 1752, at his seat at Chelsea. S. was a man of fine character and genuine benevolence, as well as a distinguished savant. His museum, which contained 300 volumes of dried plants and 30,600 other objects of natural history, together with his library of 50,000 volumes and 3566 manuscripts, was bought by Government, and formed the nucleus of the British Museum. His chief work was *The Natural History of Jamaica* (2 vols. 1707–27), besides which he wrote several pamphlets, and contributed many papers to the Philosophical Transactions.

Slobodskoi', a town of Russia, government of Viatka, on the river Viatka, and 23 miles E.N.E. of the town of that name. S. has twelve churches, manufactures soap and leather, and trades in corn. The district in 1875 manufactured iron-wares to the value of £375,000. Pop. (*St. Petersb. Cal.*, 1878) 7198.

Sloe or **Sloe-Thorn** (*Prunus spinosa*) is a rigid, much-branched shrub of 3 to 8 feet high, with usually spinous branches, and possesses a very hard, tough wood. It blossoms before the leaves are developed, and by its early white flowers is one of the first plants to announce the spring. The fruit is a small dark-purple drupe, of a very austere taste, but can be made into a palatable preserve. From the tendency of the S. to throw out suckers it is more adapted for field hedges than for those of gardens; it makes an impenetrable fence. The leaves of the S. have been used to adulterate tea, the fruit to manufacture fictitious port-wine, the bark as a febrifuge, and the juice of the unripe fruit as a dye. The S. is abundant in Britain and most parts of Europe. *P. spinosa* is now united with the Bullace (q. v.), the Plum (q. v.), and some Eastern allies, as one variable species under the name *P. communis* of Hudson.

Slonim, a town of Russia, government of Grodno, on an affluent of the Niemen, 115 miles S. of Wilna, has manufactures of cloth, and a pop. (*St. Petersb. Cal.*, 1878), of 11,596.

Sloop, a vessel with one mast rigged fore and aft, usually with a boom mainsail, foresail, gaff-topsail, jib and jib topsail. It differs from a cutter in having a fixed bowsprit and a jib-stay. War vessels of about 2000 tons carrying 12 to 22 guns are denominated sloops.

Sloth, the name given to various species of *Edentate* quadrupeds, forming the family *Bradypodidæ*. In this group no incisor teeth are developed, and the molars are simple. The stomach is of complex structure. The fore limbs exceed the hind limbs in length, and the bones of the fore-arm are exceedingly mobile. The feet are normally club-footed, the animals walking upon the dorsal surfaces of the feet, a disposition of parts which renders their gait on the ground exceedingly awkward, but adapts them admirably for a life among trees; to which they climb and adhere back downwards. Of the S., the best known is the Ai or Three-toed S. (*Bradypus tridactylus*), which has three toes to each foot. Sixteen pairs of ribs exist, and the molars are destitute of roots. The Unau or *Cholœpus didactylus* is the Two-toed S. Sloths feed on the foliage of trees, and are strictly S. American in their distribution.

Slott'ing Machine', a kind of planing machine employed for cutting slots in metal. A cutting tool descends vertically with a slow motion, pares the metal, and returns with a quick movement. The work rests on a feed table, to which circular and transverse motions are communicated automatically or by hand.

Slough, a market-town of Buckinghamshire, England, 2½ miles N.N.E. of Windsor by rail. Its parish church, built about forty years since in Transition style, was enlarged (1876–78) by the addition of a chancel, transepts, &c.; and a spire is hereafter to

be erected in memory of Herschel (q. v.), whose telescope occupied the site of the present tower. The British Orphan Asylum (1863) had 158 inmates in 1871. Pop. (1871) 4509.

Slovacki, Julius, a Polish poet, son of a professor in the University of Wilna, was born there, August 23, 1809, and after completing his studies threw himself, as a soldier and a poet, into the popular war of 1830. On its failure he went abroad; and, after travelling through the East and various parts of Europe, settled at Paris. He died at Rome, April 3, 1849. Most of S.'s poems depict the darker sides of human life and character. There was something demoniac in his genius, which drove him, like Mickiewicz, after a long struggle, into the mystic religio-political sect of Towianski. His chief works are the epic poems *Zmija*, *Jan Bielecki*, *Hugo*, *Mnich*, *Arab*, *Lambro*, *Anhelli*, *Trzy poemata*, *Poema o piekle*, *Beniowski*; lyrics, *Gröb Agamemnona* and many war songs; dramas, *Kordjan*, *Mindowe*, *Maria Stuart*, *Balladina*, *Lilla Weneda*, *Mazeppa*, &c. A collection of his poems, entitled *Pisma*, appeared thirteen years after his death (4 vols. Leip. 1862). See his life by Malecki (2 vols. Lemb. 1867).

Slovaks' form, with the Poles, Czechs, and Lusatian Wends, the western branch of the Slavic family, and are chiefly found in Northern Hungary and Moravia, but are also scattered through Lower Austria, Slavonia, and the Bukovina. Their total number in the Austro-Hungarian monarchy was estimated (1877) at 4,000,000, three-fourths of whom are Catholics. Their language is closely akin to Czech, by which, under Hussite influences, it was almost superseded, till in the present century Kollar (q. v.), Palkovitsch, Holly, and other writers revived it as a literary speech. Under native princes the S. fought with the Czechs against the Avars, and in the 9th c. they formed with Moravia an independent kingdom; but the battle of Pressburg (907) rendered them subject to the Magyars, and they are now a simple race of agriculturists and woodcutters.

Slow Match consists of slightly twisted hemp which has been boiled in an aqueous solution of a salt, and dried. The fibres are thereby coated with minute saline particles, which retard combustion. English S. M. is prepared with carbonate of potash, and burns at the rate of one yard in eight hours. In France acetate of lead is employed, and the hemp treated with it burns slightly faster than English S. M.

Slubb'ing. See SPINNING.

Slug (*Limax*), a genus of *Pulmoniferous* or land *Gasteropods* (q. v.), destitute of a shell in the adult state. They have four tentacles, the eyes being borne on the tips of the larger pair. Slugs are well known as destructive visitants of gardens. They lie dormant in winter. Their eggs are deposited in clusters among the grass. Of the slugs the most familiar are the Black S. (*L. ater*); the Grey S. (*L. agrestis*); the Great Grey S. (*L. antiquorum*); and the Red S. (*Agrion agrestis*).

Slur, in music (⁀), a curve connecting several notes of different pitch, indicating that they are to be played in a smooth blending manner. Where a similar mark (called a tie) is placed over only two notes of the same pitch, it signifies that the second note is not to be repeated, though it adds its duration to that of the first. In violin music slurred notes are played with one bow.

Smack, a small vessel with one mast, rigged like a sloop or cutter, used in the fishing or coasting trade.

Small Arms, a generic term for muskets, carbines, rifles, pistols, revolvers, and bayonets.

Small Arms Factories are Government establishments where small arms of every kind are manufactured, repaired, viewed, and served out to the various branches of the army. The principal establishment of this kind in England is the great factory at Enfield, which was remodelled on its present large scale under the superintendence of General Manley-Dixon after the outbreak of the Crimean War, and where over 1000 arms ready for use can be turned out daily if required. The arms are made on the system that the parts of one rifle will fit another, as a heap are frequently taken to pieces and thrown promiscuously together. Small arms supplied by contract are viewed at a large Government establishment at Birmingham, and the success of the Enfield factory has helped very materially to reduce the price of small arms of private manufacture. At Pimlico there is an establishment for repairs, where instruction is also given to armourer sergeants. The annual cost of these factories to the country averages nearly £200,000.

Small Debts. See COUNTY COURTS, and DEBTS, RECOVERY OF.

Small'pox, or **Vari'ola**, is an infectious fever, attended with a peculiarly characteristic eruption. It is undoubtedly one of the most ancient and dreaded diseases with which the human race has been afflicted. Epidemics of S. are referred to in the most ancient Chinese and Indian books; and by the former, among whom it is known as the 'bean disease,' it is traced to the reign of the first emperor of the (eastern) Han dynasty, Kwang Wu, who reigned A.D. 25-28, and is said to have been imported from Central Asia or from South-Western China. According to some authorities, however, the disease has been known in China only since about the end of the 9th c. of our era. The earliest Chinese work on S. was published in 1323, and from it we learn that inoculation has been known and practised in China since the Sung dynasty (A.D. 960-1127). According to the Chinese, the poison is communicated from the parents to the fœtus; and all, therefore, possess the germ in their constitutions, waiting only for the appearance of circumstances favourable to its development. The exact period of the introduction of S. into Europe is unknown; but it is almost certain that the Arabian army was attacked by it at the siege of Mecca in A.D. 569, and it is known to have visited both France and Italy in 570. In the 8th c. all Europe was infected with it, the dissemination being probably due to the Saracens. The first accurate description of the disease is that of Rhazes, an Arabian physician, who flourished early in the 10th c. S. probably reached England towards the close of the 9th c. In 1517 it was carried from Europe to St. Domingo. Three years later, it reached Mexico, and thereafter spread with intense virulence throughout the New World. It was estimated that in Mexico alone three and a half millions of people fell victims to the disease. In 1707 S. was introduced into Iceland, and in 1733 into Greenland, where it almost depopulated the country.

The history of S. in England may be divided into three periods, the first period extending from its introduction to 1721, during which its ravages were altogether unchecked; the second, from 1721 to 1802, during which it was somewhat checked by inoculation; and the third, from 1802 till the present time, the period during which vaccination has been in operation. During the first period, S. was the most fatal of all the contagious diseases, and the annual mortality in Europe was estimated at 494,000. During the second period, that of inoculation, the mortality from natural S. was 1 in 5; in inoculated S., first 1 in 50, and afterwards, when greater care was taken, and more skilful operations possible, 1 in 500. Dr. Wynter Blyth says—'Dividing the last forty unvaccinated years of the 18th c. into four decades, and taking six decades of the vaccinated 19th c. up to 1860, by calculating out the ratio of deaths from S. to deaths from all causes, we get the following remarkable series: For the four unvaccinated decades, 108, 98, 87, 88; for the six vaccinated decades, 64, 42, 32, 23, 16, 11.' In the latter part of 1870 S. began to increase in this country, and in 1871 and 1872 it attained alarming proportions. It raged also in Paris, Vienna, Holland, America, and other places; but it was observed that in all cases the thoroughly vaccinated took the disease but lightly or not at all, and that those who had been but imperfectly vaccinated, or not at all, suffered most severely and fatally.

S. is essentially an infectious or contagious disease, the contagium being conveyed in minute particles of living matter proceeding from a pustule. When the *materies morbi* enters the circulation of an unprotected subject it multiplies within the body, and eventually causes high fever followed by the breaking out of little pimples, each of a peculiar oval shape and with a central depression. When the pustules are solitary and apart from each other the disease is called *discrete*, but when they are so thick that they run into one another, there being no space between, it is then called *confluent*.

S. in its course may be divided into four stages: (1) the period of incubation; (2) the febrile stage; (3) the exudative stage; and (4) the suppurative stage. The first period is non-infectious; the second may be infectious, but it is not certainly so; the third and fourth are most certainly infectious. The period of *incuba-*

tion, in ordinary S., is between thirteen and fourteen days, so that persons coming from an infected district cannot be pronounced safe until about eighteen days have elapsed. In inoculated S. the stage of incubation is generally from seven to nine days. The *second*, or *febrile stage*, in discrete S., lasts four days and then the eruption appears; but in confluent S. the eruption appears at the end of the third day, or even on the second. This stage is characterised by rigors, a hot and dry skin, quick pulse, furred tongue, pain in the stomach, nausea, vomiting, headache, and pain in the back and limbs. In children there are frequently convulsions, and in adults delirium. On the third day small red specks appear in the following order, viz.; (1) on the face; (2) on the neck and wrists; (3) on the trunk; and (4) on the lower extremities. As the eruption extends the febrile symptoms decline. The *third stage*, or *exudative stage*, commences when the eruption is fully out. The eruption, at first a pimple, then a vesicle, and afterwards a pustule, is generally at its height on the eighth day from the commencement of the fever. The pustules are at first depressed in the centre, but by the fifth day they become turgid and hemispherical. The pustules then break and scabs form over them, which fall about the thirteenth or fourteenth day of the disease, though sometimes longer. The severity of the case is in proportion to the number of the pustules. There is usually swelling of the skin of the face, and often of the scalp, soreness of the mouth and salivation, and the patient exhales a peculiar and disagreeable odour. About the eighth or ninth day from the beginning of the febrile stage there is a recurrence of the fever, known as 'the fever of maturation.' The scabs are usually completely gone by the twenty-first day, leaving behind them reddish-brown blotches which sometimes continue for several months, and some of the pustules, in consequence of ulceration of the true skin, leave marks, commonly called pock-pits, more especially on the face. The most dangerous period is that of suppuration, more especially if the disease be confluent. In ordinary cases of S., the incubation period lasts a fortnight, and the illness itself another fortnight.

S. may be communicated by direct contact, by emanations from the sick, by insects, and by articles of clothing, books, letters, &c., and the contagion may remain dormant, as in clothing or buildings, for an indefinite number of years. Regarding the *prevention* of S., Dr. Wynter Blyth says:—'First among the preventive means stands *effective vaccination*. By effective vaccination is meant *four large* distinct vaccine vesicles inoculated on the arm of every child under three months; a second vaccination, which may or may not take effect, at the age of ten or twelve; and a third vaccination in another ten or twelve years. Besides these, on the approach of S., every individual should be *tested*, by vaccine, whether he or she is susceptible of S. When S. actually appears, every case, however mild, must first be isolated as much as possible. Thin curtains should be fixed to the open windows, so as to allow no flies to go out and in, and fly-catchers should be suspended in different parts of the room. The patient's body should be well anointed with carbolic acid oil, the excreta received in vessels containing some disinfectant, and buried deep in the ground. The attendants should be thoroughly vaccinated, and all cloths, rags, &c. used to wipe discharges from the mouth should be burnt. If the patient recovers, he must not be allowed to go out until all desquamation ceases, which will be in about a week after the scabs drop off: and before going out he should have a thorough change of clothing; the skin should be rubbed over with oil and then washed. If the case should be fatal, a coffin should be prepared lined with chloride of lime; the body should be laid out only by some one who is protected by vaccination or a previous attack, and it should be covered with disinfectants. Burial as soon as possible is very desirable, and no one should follow the coffin who has not been re-vaccinated.'

Smalt, a beautiful blue pulverised glass prepared by fusing cobalt ore with potash and quartz. It is used for making blue glass, in colouring porcelain, earthenware, paperhangings, &c., and tinting linen, calicoes, and paper. Saxony produces considerable quantities of S.

Smart-Money, a fine of 20s. paid by a recruit desiring to free himself from his enlistment contract. See RECRUITING.

Smea'ton, John, the designer of the Eddystone Lighthouse, was born May 28, 1724, at Austhorpe, near Leeds. His father was an attorney, and sent his son to London in 1742 to study law; but this he was permitted to give up for the more congenial study of mechanical and engineering science. In 1750 he began business as a mathematical instrument maker, made various improvements in hydraulic machinery, and obtained the Copley medal of the Royal Society in 1759 for his improvements in millwork. In 1753 he became a member of the Royal Society, and, recommended by the president, the Earl of Macclesfield, was intrusted in 1756 with the re-erection of the Eddystone Lighthouse, which had been destroyed by fire the previous December. The cutting of the rock for the foundation was begun on August 5, 1756; the first stone was laid on June 12, 1757; and the lantern was first lighted on October 16 of the same year. In 1764 he obtained the post of receiver of the Derwentwater estate, which he resigned in 1777 in consequence of increased professional duties. His other chief engineering works were the construction of the Ramsgate harbour (1774), the laying out of the Forth and Clyde Canal, the rendering of the Calder in Yorkshire navigable, the construction of Spurn Lighthouse at the mouth of the Humber, besides many important bridges in Scotland. Towards the close of this useful career he published an account of the Eddystone Lighthouse (1791), and at his death, which occurred at Austhorpe, October 28, 1792, was engaged upon a *Treatise on Mills*, which was never published. He was also the author of valuable *Reports* before the Society of Civil Engineers, of which he was one of the chief promoters. For the greater portion of his life he was the general adviser on engineering matters to Parliament, being undoubtedly the greatest authority of his time upon such professional questions. His *Reports*, published by the Society in 1812, were accompanied with a biography of S.

Smectym'nuus, an answer to Bishop Hall's *Divine Right of Episcopacy*, was published at London in 1641, and was so entitled because the joint work of five Presbyterian divines—Stephen Marshall, Edmund Calamy, Thomas Young, Matthew Newcomen, and William Spurstow.

Smell. See NOSE.

Smelt (*Osmerus eperlanus*), a species of *Teleostean* fish belonging to the Salmonidæ (q. v.), and inhabiting both sea and lake. The average length is about 4 or 5 inches. The body is long and compressed, and the eyes are large. The colours are brilliant and iridescent. A strong violet odour is said to be exhaled from the S. As a food fish it is considered a delicacy. An allied species is the American S. (*O. irridescens*), which may attain a length of 10 inches. The back has a green lustre. The common S. is often named the *Spirling* and *Sparling* in Scotland. The term Land S. is applied to the *Atherina presbyter*, a near relation of the Mullet (q. v.). This fish attains a length of 6 inches, and is plentiful on the British coasts.

Smelt'ing is the metallurgical process by which ores are, in furnaces of various kinds, reduced to their metallic condition. (See IRON and METALLURGY.)

Smew (*Mergellus albidas*), a species of swimming-bird common on the coasts of Britain, and also found inland. The bill is broad and hooked at its tip. Its average length is 17 inches, the female bird being smaller. The male is white on the head, neck, and chin, the back being blackish grey. The head has a crest. The female is reddish brown marked with grey. The eggs are brown, and number eight or ten.

Smila'ceæ is a natural order of monocotyledonous herbs or undershrubs, often climbers, with net-vined leaves, and a small berry for fruit. By the best modern systematists it is now included in *Liliaceæ*. In addition to the species of *Smilax* furnishing Sarsaparilla (q. v.) and China root, others supply evidence of the widely recognised value of the genus in medicine, thus—*S. ovalifolia* and *S. lanceæfolia* are used in India, *S. glyciphylla* in Australia, *S. Macabucha* for dysentery in the Philippines; and *S. anceps* in the Mauritius. In the eastern United States and Canada there is an immense local use of the roots of *S. rotundifolia* for the bowls of tobacco-pipes; it is estimated that nearly three millions of these 'briar-root' pipes are now manufactured annually.

Smiles, Samuel, the historian of industrial enterprise, was born at Haddington, Scotland, in 1816, educated for the medical profession, and practised for some time at Leeds, where he published *Physical Education* (1837) and a work on *Railway*

Property, its Conditions and Prospects (1849). After holding the editorship of the *Leeds Mercury*, he became secretary to the Leeds and Thirsk Railway in 1845, and transferred his services about 1852 to the South-Eastern Railway, from which he retired in 1866. His principal works are—*Life of George Stephenson* (1859); *Self Help* (1860); *Workmen's Earnings; Strikes and Wages* (1861); *Lives of the Engineers* (4 vols. 1862; new ed. 5 vols. 1875); *Industrial Biography* (1863); *Lives of Boulton and Watt* (1865); *The Huguenots; their Settlements, Churches, and Industries in England and Ireland* (1867); *Character* (1871); *The Huguenots in France after the Revocation of the Edict of Nantes* (1874); *Thrift* (1875); *Life of a Scotch Naturalist* (Robert Edwards; 1876), and *George Moore, Merchant and Philanthropist* (1878). These works, written in a simple, attractive style, are a mine of information on matters relating to trade and industry. They are characterised by a high moral tone, and a sound knowledge of the workings of economic science. Many of them have been translated into various European languages, *e.g.*, a Spanish ed. of *Self Help* appeared in 1878. S. received the degree of LL.D. from Edinburgh University in 1878.

Smith, Adam, born at Kirkcaldy, 5th June 1723, was the posthumous son of a comptroller of customs. He received a rudimentary education in his native town, and in 1737 passed to the University of Glasgow, which he left three years later with the Snell Exhibition for Balliol College, Oxford. Oxford was then at its worst, and S. gained little from its teachers. These even to some extent debarred him from private study, and reprimanded him for reading Hume's essays; yet he spent seven years at Oxford, and returned with a good store of Greek, of which few of his Scotch contemporaries possessed more than a smattering. He then abandoned the intention once entertained of entering the Church, and after a period of study began to lecture on rhetoric in Edinburgh in 1748, under the patronage of Lord Kames. In 1751 he was appointed Professor of Logic in Glasgow College, and in 1752 Professor of Moral Philosophy. The thirteen years here spent, S. ever after talked of as the happiest in his life. His lectures drew large bodies of students, and took so wide a sweep as to include a history of 'the general principles of law and government, and of the different revolutions which they have undergone in the different ages and periods of society.' Much of the matter of these lectures was embodied in his *Theory of Moral Sentiments* (1759), the first of his writings, with the exception of two unimportant review articles. This *Theory* attempted to account for morals without so imperious and strange a monitor as conscience, and founded all on sympathy. According to S., we do not approve or disapprove actions because we know the intentions of the agent and the consequences of such actions. Before we reach moral judgment, a further process is gone through: we picture to ourselves the feelings of the agent along with those of the persons whom his actions affect. If we feel in sympathy with the supposed motives of the agent, and with the responsive state of mind—say, gratitude—which he calls up in those affected, only then do we accord approval. In regard to our own conduct, by a still more complicated act of imagination we contemplate others sympathising with us, or dissenting from us; and according as we in turn agree with their sympathy or their dissent do we judge ourselves. Whatever its philosophic value, this book was remarkable in an age of slipshod English for beauty and richness of illustration, and a style in the literature of philosophy only second to Berkeley's. In March 1764, S., having resigned his professorship, set out for the Continent as tutor to the young Duke of Buccleuch, and after a prolonged tour through France and Switzerland, he and his charge settled in Paris for nearly the whole of 1766. There, amid many notables, he met Quesnay, the man who most of all influenced his economic views. On his return, the duke settled on S. an annuity of £300 a year. In the end of 1766 he was once more at Kirkcaldy, where he remained in studious seclusion engaged on his great work, the *Inquiry into the Nature and Causes of the Wealth of Nations* (1776; supp. 1784). During these ten years Hume had been accusing his friend of idleness; but immediately on the publication of the *Wealth of Nations* he was able to write to Kirkcaldy that it was everywhere talked of. In a year or two it had worked a very considerable part of the revolution in economics that is due to it. Its influence is dealt with in the article POLITICAL ECONOMY. Suffice it here to say that its chief characteristic was the transference of attention from material wealth, considered as wealth, and considered as the object of labour, to labour itself, as the measure of wealth. This standard, however, S. does not consistently maintain. For two years after the publication of his book he resided in London; and in 1778 he returned to Edinburgh as a commissioner of customs. No more ridiculous commissioner of customs could have been found, for he was an absent-minded man, utterly devoid of business habits, as many curious stories attest. In 1787 the shy scholar was chosen Lord Rector of the University of Glasgow. Amid a circle of chosen friends, such as Stewart and Robertson, he passed serenely into old age; but the deaths of his mother and his cousin broke his health, and his life of beneficence ended July 17, 1790. Two pieces of S.'s seldom mentioned are *The Rights of Great Britain asserted against the Claims of America* (Glasg. 1776), and his *Letter to Mr. Strahan on the Last Illness of David Hume* (Lond. 1777). His posthumous *Essays on Philosophical Subjects* were edited by Black and Hutton in 1795. The best edition of the *Wealth of Nations* is that of M'Culloch (1839). The French have a very accurate translation of the *Wealth of Nations* by Garnier, with the notes of Buchanan, Garnier, M'Culloch, Malthus, Mill, Ricardo, Sismondi, J. B. Say, and Blanqui. See Dugald Stewart's *Account of A. S. and his Writings*, prefixed to the complete edition of his works (5 vols. Edinb. 1812); M'Culloch's *Sketch of the Life and Writings of A. S.* (*ib.* 1855); Von Inama-Sternegg's *A. S. und die Bedeutung seines Wealth of Nations für die Moderne Nationalsökonomie* (Innsbruck 1876), and Oncken's *A. S. und Immanuel Kant* (Leip. 1877).

Smith, Alexander, was born at Kilmarnock, Ayrshire, 31st December 1830. There, at Paisley, and at Glasgow he passed his childhood, and, destined for the ministry, received the usual Scottish schooling; but circumstances forbade his entrance at the university, and while still a boy he took up his father's calling of pattern-designer to a Glasgow firm. He wrote, like threescore comrades, boyish verses, but, unlike them, chose for his models Keats, Wordsworth, Tennyson, rather than Burns and Tannahill; the merit of some of his pieces was recognised by the late George Gilfillan, and through him they found their way into London journals, where Herbert Spencer noticed and praised them. This partly paved the way for the ovation that greeted his *Life Drama, and Other Poems* (1853), which sold by thousands, drew forth an article in the *Revue des deux Mondes*, and earned their author the post of secretary to Edinburgh University (1854). At Edinburgh, amongst new friends, he met Sydney Dobell (q. v.), with whom he produced *War Sonnets* (1855); two years later appeared his *City Poems*, which critics of the baser sort, ashamed of their late furore, united to assail, though it contains his finest, most artistic, and most original work. There were 'stars' in Milton, and 'stars' in *The City Poems*, the plagiarism was glaring; both here and in *The Life Drama* allusions to Cleopatra—fie on such poor invention! The Northumbrian epic, *Edwin of Deira* (1861) fared only better in that it passed unheeded, and from poetry S. turned to half-poetic prose, in 1863 publishing some collected essays under the title *Dreamthorp*, and in 1865 *A Summer in Skye*, where fancies are piled as high, sometimes as beautiful, as the island rocks themselves. Last came the simple, touching tale, *Alfred Hagart's Household* (1866), with its memories of the writer's early home, touching because on 8th January 1867 the writer died at Wardie in his thirty-seventh year. He belonged, of course, to the 'Spasmodic School,' and it is ill pleading for a criminal gibbeted by an evil name; yet 'purple patches' of the rarest beauty are not unfrequent in his half-forgotten poems. See Brisbane's *Early Years of Alexander S.* (Lond. 1869) and the Memoir by Alexander prefixed to S.'s *Last Leaves* (Lond. 1869).

Smith, George, the Assyriologist, was born at Chelsea, March 26, 1840, and taking an early interest in Assyrian researches, commenced in 1857 the study of Accadian. He was appointed Keeper of Antiquities at the British Museum (1865), on the recommendation of Sir Henry Rawlinson, whom he helped in the third volume of his *Cuneiform Inscriptions of Western Asia* (1867), and himself published in 1871 a masterly handbook on the *Phonetic Value of the Cuneiform Syllabary* and a *History of Assur-bani-pal*, in which 3000 lines of inscriptions in the British Museum relating to Sardanapalus are transcribed, transliterated, and translated. His discovery (1872) of a tablet containing the

Chaldean account of the Deluge awakened general interest, and the proprietors of the *Daily Telegraph* advanced £1000 towards the expenses of excavations on the site of Nineveh. Accordingly in January 1873 he quitted England, reached Mosul in March, and having made important excavations at Kouyunjik and paid a flying visit to the sites of Babylon and other buried cities, returned to England in the following autumn. Next year a second expedition, undertaken this time on behalf of the British Museum, was interrupted by the expiry of his *firman*, which the Turkish authorities refused to renew. However, in these two expeditions, with barely four months' actual work, he had fixed the date (860 B.C.) of the S.E. palace at Nimrûd, discovered a fragment of a crystal throne, a *stylus*, marble lintel, &c., and secured for the nation nearly 3000 tablets, described in his *Assyrian Discoveries* (1875). In March 1876 he started once more for the East, and during a stay in Syria established the site of Carchemish, the Hittite capital, at the modern Jerablûs (Gr. *Hierapolis*). The plague-stricken and unsettled state of the country stood in the way of excavations, and he was on his homeward way when he died at Aleppo, August 19, 1876. His works further include *The Assyrian Eponym Canon* (1875), *Ancient History from the Monuments—Assyria* (1875), *The Chaldean Account of Genesis* (1876), and the posthumous *Ancient History of Babylonia from the Monuments* (1877), and *History of Sennacherib* (1878), both edited by Mr. A. H. Sayce.

Smith, Gerrit, an American philanthropist, was born in Utica, New York, 6th March 1797. He inherited large landed estates from his father, an old partner with J. J. Astor (q. v.) in the fur-trade. He gifted away nearly the whole of his property to negroes—as much as from 40 to 60 acres of freehold to 3000 persons in the single year 1846. He was an eccentric advocate of vegetarian diet and teetotalism, and in a literal sense kept an open 'tavernous' house. His charities were estimated at £10,000 a year. He contributed largely to the expenses of the Civil War in the interest of the Union, but joined Horace Greeley in signing the bail-bond of Jefferson Davis in 1867. His published works are *Speeches in Congress* (1855), *Sermons and Speeches* (1861), *The Theologies* (1866), &c. S. died in New York city, 28th December 1874. See his *Life* by O. B. Frothingham (New York 1878).

Smith, Goldwin, LL.D., born at Reading, August 13, 1823, passed from Eton to Oxford, where he gained a Magdalen demyship, the Ireland and Hertford scholarships, and the Chancellor's prize for Latin verse. Having taken his B.A. (1845), he was elected Fellow of University College, in 1847 was called to the bar at Lincoln's Inn, served as secretary to two university commissions, and was a member of the Education Commission (1859–60). He held the regius professorship of modern history (1858–66), during the American Civil War supported the Federal cause in various pamphlets, and having made a lecturing tour through the United States in 1864, published on his return a lecture *On England and America* (1865), and *The Civil War in America* (1866). In 1868 he accepted a call to the chair of English History in Cornell University, but resigning in 1871 removed to Toronto, where he became a member of the University Senate, and edited the *Canadian Monthly* (1872–74). In the spring of 1877 he was pursuing historical investigations at Rome, on the conclusion of which he spent some months in London, having in the previous year been elected an honorary member of the Reform Club. Amongst his writings—keen, eloquent expressions of ultra-liberal thought—are *Lectures on Modern History* (1861), *Irish History and Irish Character* (1861), *The Empire: a Series of Letters* (1863), *Speeches and Letters on the Rebellion* (2 vols. New York 1865), *Three English Statesmen: Pym, Cromwell, and Pitt* (1867), and *A Short History of England down to the Reformation* (1869).

Smith, James and Horace, princes of parody, were born in London, the former 10th February 1775, the latter 31st December 1779. James, articled to his father, became his partner, and succeeded him as Solicitor to the Board of Ordnance, dying in London, 24th September 1839; while Horace, making a fortune on the Stock Exchange, retired to Brighton, and died at Tunbridge Wells, 12th July 1849. Both had contributed to the *Pic-Nic* (1802), the *Mirror* (1807–10), and other journals, when an advertisement in 1812 offering a prize of £20 for an address to be spoken at the reopening of Drury Lane, suggested the notion of a series of *Rejected Addresses*, supposed to be written by the great poets of the day. Within six weeks a little volume, first literally rejected by Murray, was published by Miller on the condition that the brothers were to receive one-half the profits, if any: in seven years' time it reached its sixteenth edition, and Murray was glad to buy the copyright. Of its nineteen parodies eight were by James, besides the first stanza of that on Byron; but which of the brothers bears away the palm it is hard to say, since James's 'Crabbe' is 'admirably done,' to use Crabbe's words, whilst Horace's 'Scott' called from Sir Walter the remark: 'I must have done this myself, although I forget on what occasion.' A splendidly illustrated edition was published at New York in 1869. James also wrote eight of Charles Matthews' Entertainments, receiving for the same £1000; and Horace from 1807 to 1845 produced over twenty novels, long since forgotten, but of his *Tin Trumpet, or Heads and Tails* (1836), a new edition appeared in 1869.

Smith, John Pye, born at Sheffield, May 25, 1774, was from 1800 to 1850 successively classical tutor, divinity lecturer, and principal of the Independent College at Homerton, where he was also for forty-three years pastor of the 'Old Gravel Pits Chapel.' He died at Guildford, Surrey, February 5, 1851. S. wrote *The Scripture Testimony to the Messiah* (2 vols. 1818–21, 4th ed. 1847), *Four Discourses on the Sacrifice and Priesthood of Christ* (1828, 3d ed. 1847), *Principles of Interpretation as applied to the Prophecies of Scripture* (1829, 2d ed. 1831), and *The Relation between Holy Scripture and some parts of Geological Science* (1839, 4th ed. 1848). See J. Medway, *Memoirs of the Life and Writings of J. P. S.* (1853).

Smith, Joseph. See MORMONS.

Smith, Sydney, born at Woodford, Essex, 3d June 1768, rose to be captain of Winchester School, and after a six months' stay at Mont Villiers, Normandy, was elected first scholar, then fellow of New College, Oxford (1790). His father, a clever, eccentric man, now left him to his own resources, and these being insufficient for the Bar, he was ordained to the curacy of Netherhavon. Two years he spent upon Salisbury Plain, when the village squire engaged him to accompany his son to Weimar; but Germany was disturbed by war, and in stress of politics he put into Edinburgh (1797), his home for the next five years. There he officiated at the Episcopal chapel, married in 1799, and in 1802 founded, with Jeffrey, Brougham, and others of Edinburgh's Augustan Age, the *Edinburgh Review* (q. v.), contributing to its first number seven out of nine-and-twenty articles. Coming to London (1803), he gained the entrée of Holland House, lectured on moral philosophy at the Royal Institution (1804–06) to crowded benches, and preached to as crowded pews till 1806, when Erskine gave him the little Yorkshire living of Foston-le-Clay. Having built himself the ugliest house in all the country, he for twenty-two years was 'village parson, village doctor, village comforter, village magistrate, and Edinburgh Reviewer' at Foston, which Lyndhurst, the Tory Chancellor, enabled him to exchange for Combe Florey, Somerset (1828), at the same time giving him a Bristol stall. From the Whigs he at length received a prebend of St. Paul's (1831), and thenceforth lived chiefly in London, where he died, 22d February 1845. More by his witticisms and clever nonsense is S. remembered than by his writings, yet these were neither few nor unimportant. His own edition of his collected works (3 vols. 1839) includes *Edinburgh* essays on Education, University and Church Reform, the Game and Poor Laws, &c., *Peter Plymley's Letters* (1807), supporting Catholic Emancipation, and other tracts, none of them reaching over 50 pp. All are distinguished by strong good sense, by cogent reasoning, and infinite humour—excellences sometimes dashed by a straining at effect, misplaced if good-natured personalities, and a love of outlandish words, such as *anserous*, *holoplexia*, or *sudarium*. See the Life by his daughter, Lady Holland, with selections from his letters by Mrs. Austin (2 vols. Lond. 1855), and vol. i. of Hayward's *Biographical and Critical Essays* (Lond. 1858).

Smith, Sir Thomas, born at Saffron Walden, Essex, 1512, at fourteen entered Queen's College, Cambridge. He early distinguished himself as a Grecian, was made fellow of his college in 1531, and two years later became a public lecturer. He and his friend Cheke attacked the prevailing mode of pronouncing Greek, which differed widely from that now in use. At first strenuously opposed, S. and his colleague by patience conquered all the authorities except Gardiner, Bishop of Winchester. In 1539 S. travelled on the Continent, taking a doctor's degree at Padua;

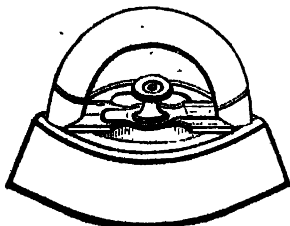
and on his return he became professor of civil law at Cambridge. Under Edward VI. he became a secretary of state (1548), and was knighted. While his patron Somerset was in office, he was employed as ambassador to Belgium and France. At the accession of Mary he lost all honours, only retaining a pension of £100 a year; but in Elizabeth's reign he again became a secretary of state, Chancellor of the Order of the Garter, and ambassador to France. S.'s works are two inconsiderable tracts, *De Recta et Emendata Linguæ Græcæ Pronunciatione*, and *De Recta et Emendata Linguæ Anglicanæ Scriptione Dialogus* (both 1568), and the better-known *De Republica Anglorum; the Maner of Government, or Policie of the Realme of England* (1583). He died in 1577. His *Life* by Strype was reprinted by the Clarendon Press (Oxf. 1820).

Smith'field, the famous London live-cattle market, lying to the N. of Newgate and a little W. of Aldersgate, was once a place of recreation outside the city walls. Here Sir William Wallace was executed in 1305, and Wat Tyler met his death in 1381. The scene of several noted tournaments, it became in the reign of Mary the place for the execution of martyrs. Bartholomew Fair (q. v.) was held regularly at S. till 1853. S. is first mentioned as the site of a cattle-market by Fitz Stephen in 1150. The corporation acquired in 1345 the official control over the market, which they retained for upwards of five hundred years. The space devoted to the market was enlarged from 3 acres to 4½, and in 1834 to 6¼. The ancient regulations were called the 'Statutes of S.' In the later days of the market there sometimes assembled 4000 cattle and 30,000 sheep; the annual amount of the sales was £7,000,000. In 1846 there were sold 226,132 cattle, 1,593,270 sheep and lambs, 26,356 calves, and 33,531 pigs. Owing to the want of space and the vicinity of slaughterhouses, an Act was passed in 1851 appointing metropolitan commissioners with powers to provide a new market, slaughterhouses, &c., and S. was used for the last time on the 11th June 1855. The new market at Copenhagen Fields, erected from designs by Messrs Browne and Robinson at a cost of £134,460, was opened to the public 1st December 1868. The S. Club, to promote improvement in cattle-breeding, was established in 1798, and now holds its annual cattle shows in the Agricultural Hall, Islington.

Smithso'nian Institu'tion, The, an establishment for the 'increase and diffusion of knowledge among men,' was founded at Washington, United States, in 1846, with funds left for that purpose by James Lewis Macie Smithson (1765-1829), a distinguished English chemist, who was a natural son of the third Duke of Northumberland, by Elizabeth Macie, a niece of the Duke of Somerset. The institution derived altogether about £108,275 from its bequest. By its constitution the President of the United States is *ex officio* the presiding officer, and it is governed by a board of thirteen regents under him. It is in no sense a university or teaching institution, but confines itself to the encouragement of scientific research and the diffusion of its results. Besides an annual *Report*, it has published twenty-one quarto volumes of *Contributions to Knowledge*, and twelve octavo volumes of *Miscellaneous Collections*. It has established a system of exchanges of publications with 2200 foreign scientific societies, and its library of 75,000 volumes is now amalgamated with the Congress library. The building, which is in the Romanesque style of architecture, and one of the finest in the United States, was partially destroyed by fire in 1865, but has since been entirely rebuilt. Besides a lecture-hall, theatre, &c., it contains several scientific collections, among them the National Museum. See the *Report of the Board of Directors of the S. I.* (Washington and Lond. 1878).

Smoke, Consumption of. Smoke arises from the imperfect combustion of fuel, and is composed of minute particles of carbon mechanically suspended in gaseous hydrocarbons, which gases are of themselves invisible. In manufacturing centres, where much coal is consumed, the smoke therefrom when allowed to escape into the atmosphere becomes an unmitigated nuisance. In the metropolis and in Scotland, manufacturers and others are compelled by law under penalty of a fine to construct their furnaces so as to consume smoke; and where the law is stringently enforced public health and comfort are promoted, and in most instances economy of fuel is effected. A principle common to many of the numerous smoke-consuming arrangements that have been devised, is that of leading a supply of air into a 'combustion chamber' constructed behind the 'bridge' of the furnace, where the combustible gases evolved from the fuel commingle with it, and are thoroughly burned up before reaching the flues. This plan is followed in the smoke-consuming furnaces of Mr. C. W. Williams and others. 'The air must be admitted in volumes sufficient to ensure perfect combustion. If the supply be deficient, the evil intended to be remedied will be intensified with bituminous coal; while with anthracitic fuel 'the carbon will be taken up by carbonic acid forming carbonic oxide, a process which, although it consumes the soot, consumes at least one-third of the heat previously given out in the formation of the carbonic acid thus converted, and cools the fire to this extent.' Thus it is possible to get rid of the smoke at a ruinous expense of fuel. The admission of an excess of air has also the disadvantage of cooling the furnace, often below the temperature—about 800° F.—required for the ignition of the carbon contained in the gases. The *dead-plate* system is very efficient in reducing smoke to an inappreciable quantity. Instead of throwing large quantities of coal carelessly over a fire, small supplies are heaped on a plate in front, to be coked by the heat, and the gases expelled in the process pass over the incandescent fuel within, and are completely consumed. The coke is then pushed into the furnace and the dead-plate replenished. Mechanical feeders have been applied to some dead-plate furnaces. Other noteworthy contrivances are the revolving-grate furnaces of several inventors, and the ingenious self-ventilating smoke-consumer of Mr. Wright, in which a heated jet of steam is blown upon the incandescent fuel, exciting a draught and protecting the boiler-plates from the injurious action of cold air. Siemens' regenerative gas furnace is also a thorough smoke-consumer.

Smoke-Stack, a term applied to the chimney of a locomotive and to the funnel of a steam-ship as seen above deck. The funnels of war vessels are made *telescopic*, so as to be drawn down and protected during action.



Smolensk', a government of European Russia, lying to the W. of the government of Moscow. Area 21,637 sq. miles; pop. (1876) 1,193,287. The surface is undulating and for the most part fertile. Rye is produced in large quantities, but hemp, flax, tobacco, and hops are also grown. The forests are valuable. The Dnieper and the Dwina, the former flowing into the Black Sea and the latter into the Baltic, both have their source in the government of S.—**S.**, a city of European Russia, capital of the government of the same name, on the Dnieper about 240 miles W.S.W. of Moscow by rail. It has a strong citadel, and is surrounded by walls 4½ miles long, with twenty-one Gothic towers. S. has a splendid cathedral, twenty-four churches, and three monasteries, a Cadet Academy and five schools. Manufactures of leather, silk, and soap are carried on, and there is a great grain trade. It is one of the oldest cities in Russia, being mentioned as early as the 9th c., and is said to have had at one time 200,000 inhabitants. An iron monument 84 feet high has been erected in memory of the battle fought here in 1812, in which Napoleon defeated the Russians under Barclay de Tolly and Prince Bagration. Pop. (*St. Petersb. Cal.*, 1878) 24,332.

Smoll'ett, Tobias, was born of gentle parentage at Dalquhurn House, in the Vale of Leven, March 1721. Losing his father early, and having learnt the 'rudiments' at Dumbarton school, he served a four years' apprenticeship to a Glasgow surgeon while attending the university classes, then started for London with the inevitable tragedy in his pocket (1739). The *Regicide* shared the common fate, and its author, shipping as surgeon's mate on board the *Cumberland*, was present at Vernon's vain attack on Cartagena (1741), but quitted the service at Jamaica, where he met the Creole heiress, his future wife. In 1744 we see him a feeless London surgeon, writing ill-paying satires; in 1747 he married; a twelvemonth later appeared *Roderick Random*—the story partly of his own adventures—and straightway he leapt to fame. A visit to Paris brought him across Mark Akenside and a nameless affected painter, his prototypes for two characters in *Peregrine Pickle* (1751), which published, S. settled at Bath with an Aberdonian degree of M.D. A lack of sympathy for *malades imaginaires* soon made him resume the pen, and shifting his quarters to Chelsea, he drew in *Ferdinand Count Fathom* (1753) a scamp with none of his earlier heroes' better qualities, translated *Don Quixote* (1755), started the *Critical Review* (1756), and in fourteen months

dashed off a *History of England* (4 vols. 1758), ruining his health in the attempt. The *Critical* also proved a 'perpetual fountain of hot water,' a paragraph on Admiral Knowles bringing its editor three months' imprisonment in the King's Bench, with a fine of £100 (1739). Ill-health and debt, his daughter's death, and a quarrel on Bute's behalf with his old friend Wilkes, made S. glad to leave England for a time; Sterne tells how 'Smelfungus' travelled from Boulogne to Paris, from Paris to Rome (1762-65), and in *Travels through France and Italy* described the Pantheon as a 'cockpit,' the Venus de Medici as 'awkward and hideous,' the 'Last Judgment' of Michael Angelo as a 'mere mob.' Visits to Scotland and Bath (1766-67) furnished materials for *Humphrey Clinker*, written at Monte Novo, near Leghorn, which hardly was published when S. died, 16th October 1771. With little inventiveness but keen perception, the power of drawing from life but none of designing plots, the coarseness of the age but a humour all his own, England's Le Sage produced, says Thackeray, 'the most laughable story since novel-writing first began'—*Humphrey Clinker*. It and his two first novels rank far above the rest, *Sir Launcelot Greaves* (1760) and the political *Adventures of an Atom* (1769), being wholly unworthy the creator of 'Uncle Bowling,' 'Trunnion,' and 'Crabtree,' or the inimitable 'Lieutenant Lismahago.' The *Tears of Scotland* (1746) and *Ode to Leven Water* (1776), one mourning for, one glorying in, his native land, are the best of the poems in S.'s *Miscellaneous Works* (new ed. Lond. 1878), to which a Memoir by Roscoe is prefixed. See also the Life of him in Bickers' edition of his *Complete Works* (8 vols. Lond. 1873), R. Chambers' *S.* (Edinb. 1867), and Thackeray's *English Humourists* (Lond. 1858).

Smolt. See SALMON.

Smoothing-Irons are domestic implements of iron or steel with a flat face for smoothing linen, &c. There are many varieties which mainly differ in the modes of heating and nature and attachment of the handle. The common *sad-iron*, consisting of a solid triangular heater and handle of cast iron, remains in use notwithstanding the drawbacks of heating it before a fire and its hot handle. These are removed in many S. I. of recent introduction by making the body of the iron hollow, and heating it by incandescent charcoal, the flame of gas or a lamp, or a red-hot iron heater. A handle of wood or of perforated iron, which in some kinds is detachable, is also substituted for the solid cast-iron one. An ingenious cold-handled, double-pointed smoothing-iron of American invention is here shown. It is made of steel, lined with a non-conducting fire-cement, which heats quickly and remains hot for a long time. The handle is of wood and is removable, so that one handle only is required for a set of S. I. of the same kind.

Smoothing-Iron.

An *Italian Iron* for crimping and smoothing frills, &c., consists of a narrow hollow cylinder with one end closed and rounded and the other open. A tapering red-hot heater is introduced into it, and the articles to be ironed are pressed gently against the heated surface.

Smorza'to (It. 'extinguished'), a musical direction denoting that the sound is gradually to die away. In violin-playing this is achieved by drawing the bow to its full extent in gradually lighter style.

Smri'ti, 'that which is remembered and handed down by tradition.' The Sanskrit term for the whole of the Post-Vedic literature, which is believed to be founded on direct revelation, though delivered by human authors. It includes the Laws of Menu, the Mahabharata and Ramayana, the Puranas and Tantras. It is opposed to Sruti, or revelation.

Smuggling, according to the law of the United Kingdom, consists in importing or exporting prohibited goods, or goods without paying the custom or excise duties to which they are liable. The penalty is £100, or treble the value of the goods. Officers may search for smuggled goods anyone on board a vessel in any port of the United Kingdom, or anyone who has landed; and anyone obstructing an officer in execution of his duty is liable to a penalty of £100. But before a person is searched he may require the officer to take him before a justice, or superior officer of the customs, who shall determine whether there is reasonable ground for search. An officer misconducting himself in searching anyone is liable to a penalty of £10. In 1874, in the United Kingdom, 1157 seizures were made, and 1094 persons were convicted of S., the quantity of tobacco and cigars seized being 10,738 lbs., and of spirits 266 gallons.

Smut is a name given to a disease to which grasses, particularly cereals, are subject, from the attack of a fungus called *Ustilago carbo* or *segetum*, belonging to the section *Ustilagineæ* of the *Hypodermiæ* group. S. shows itself first in the organs of fructification, the epidermis of which is ruptured in a great number of places, a black soot-like dust then appearing through the slits. In colour and shape the S.-fungus resembles the bunt-fungus, but its spores are not half so large, and it possesses none of the disgusting odour that characterises the latter. For this reason, and further that the spores have generally been dispersed before the corn is cut, the disease is not so much dreaded as Bunt (q. v.), but it is sometimes very injurious by diminishing the produce. In wheat it is comparatively rare, whilst it is common in barley and more so in oats; rye hardly seems to be subject to it. The S. of maize and millet are of a similar character.

Smyr'na ('moss-rose'), a famous seaport of Ionia, on a bay of the Ægean Sea named after it, and at the mouth of the rivulet Meles, 40 miles N. of Ephesus. The origin of S. is lost in antiquity. After its destruction by the Lydians it lay four centuries in ruins, till the time of Alexander the Great, when it was rebuilt 2½ miles from its old site. Its trade increased rapidly, and under the first Roman Emperors it was one of the fairest and most populous cities of Asia. It proudly claimed to be the birthplace of Homer, named Melisigenes, from its river. It was partly destroyed by earthquakes in A.D. 178-80, but was restored by Marcus Aurelius Antoninus. About A.D. 68-69 a Christian Church arose in S., to which the Second Epistle of the Apocalypse is addressed. Almost a century later, Polycarp, supposed to be a pupil of the apostle John, here suffered martyrdom.—The modern S. (Turk. *Izmir*), 207 miles S.W. of Constantinople, extends 2 miles N. and S. along the sea-coast, which has been recently lined by a stone wharf. Its houses are mostly two-storied, built of wood cased in stone. S. is the seat of a Greek bishop, a Roman Catholic archbishop, and of consuls for most seafaring nations. There are several free hospitals belonging to different nations, three Greek and three Roman Catholic churches, four Protestant churches, an Armenian chapel, a synagogue, and numerous mosques, which are mostly ancient churches or *tekkes*. In 1878, S. has 18,750 houses and 6250 shops. The industry is unimportant, but the trade, both by caravans overland and by sea, is very large. S. is the chief mart for European commerce in Asia Minor. The imports, chiefly cotton goods and twist, glass, hardware, rice, coffee, copper, steel, silk velvet, and sugar, amounted in 1875 to £3,483,400; and exports, mainly valonea, raisins, figs, opium, cotton, carpets, sponges, gums, liquorice, cotton-seed, and wool, to £3,896,000. In the same year 1217 vessels of 775,445 tons entered the port of S.; cleared 1202, of 772,748 tons. Besides these, 2448 small Turkish and Greek vessels under 30 tons each entered, importing sundries to the value of £32,500, and cleared with European merchandise worth £25,000. The British steamship *Jura*, running fortnightly between S. and Adalia, imported goods worth £27,580, and exported goods worth £44,870. S. is defended by a battery on shore near its great military barracks, and by a ruinous castle at the entrance of the bay. With S. are connected the only railways of Asia Minor—one to Aidin, 83 miles; another to Philadelphia, 113 miles. Estimated pop. (1872) 180,000 (75,000 Greeks, 45,000 Turks, 15,000 Jews, 10,000 Catholics, 6000 Armenians). See General Consul C. v. Scherer, *S. mit besonderer Rücksicht auf die Geographischen, wirthschaftlichen und intellectuellen Verhältnisse von Vorder-Kleinasien* (Vien. 1873), and Lamec Saad, *Plan de S.* (Leip. 1877).

Smyr'na, Gulf of, an inlet of the Ægean Sea, at the head of which is situated the city of S. It is 40 miles in length by 20 in breadth, and affords excellent anchorage.

Snail, a common term applied to various species of *Pulmoniferous* or land *Gasteropoda* (q. v.). The typical snails form the family *Helicidæ*, in which there is a well-developed shell, but they have no *operculum* or horny plate. There are four tentacles, the larger pair bearing the eyes. The *foot* is well developed; as also is the *odontophore* or characteristic tongue. The S. is *hermaphrodite*, but the copulation of two such monœcious individuals is necessary to secure fertilisation of the eggs. Breathing is conducted in the S. by means of a lung-sac or pulmonary chamber, to which air is admitted by an aperture on the right side of the neck. The S. hibernates in winter, the mouth of the shell being closed by a plug of mucus known as the *epiphagus*. The common S. is the *Helix aspersa*. Equally well known is the *H. pomatia*, or edible snail of the Continent, which also occurs in the S. of England. Its shell is of a dirty-white hue, marked by four dark bands. The Roman epicures were fond of this mollusc, the best snails, according to Pliny, being imported from the Balearic Isles and Sicily. *H. nemoralis* is an edible Italian species; and the *H. vermiculata*, common at Montpelier, is also an article of luxury. The pond S. belongs to the family *Lymnæidæ*, which has a large, thin, sharp-lipped shell. *L. stagnalis* is the common water S. Equally well known is the *Planorbis corneus*, with its flattened discoidal shell. Other genera of water-snails are *Physa* and *Ancylus*.

Snake, a term often used synonymously with 'Serpent' (q. v.), but frequently restricted to denote the smaller and more common members of the Ophidian group. The common British S. (*Coluber*, or *Tropidonotus natrix*), also named the Grass S. and Ringed S., is a good example of a familiar S. This S. is common in many parts of Britain. It may attain a length of from 2 to 3 or 4 feet, and is of a greyish-brown hue tinted with green. Two crescentic spots of yellow are found at the back of the head, and two rows of black spots run down the length of the back, while the sides are also spotted. This S. is thoroughly harmless. The viper (*Pelias berus*), the only poisonous British S., is distinguished from the common S. by the zig-zag black marking which runs along the back, while the sides are spotted with triangular markings. A third species of S. (*Coronella austiaca* or *lævis*) occurs in Britain, but is extremely rare. It is, however, common on the Continent. It is of a brown colour spotted with black, but wants the zig-zag dorsal mark of the viper. The S. hybernates during winter, and large numbers are often to be found in manure-heaps in a torpid condition. See SERPENT.

Snake'-Bird. See DARTER.

Snake'-Eel, a term applied to certain species of *Teleostean* fishes allied to the family *Murænidæ*, of which the famous *Murana Helena* or Italian eel is the type. The name S.-E. originated in their serpentine appearance, which is increased by the tail-fin being rudimentary. The *Ophisurus serpens* is a common Mediterranean species.

Snake' River, or **Lewis River**, a tributary of the Columbia, over 1000 miles in length, and of great size, rises at an elevation of 7792 feet, in the national Park, Wyoming, and flows first S. then N.W. through Idaho, then N., forming the boundary between Idaho and Oregon, and lastly S. and S.W. till it joins the Columbia. The great cataract in Idaho is said to rival Niagara in grandeur as it exceeds it in height.

Snake'-root. See ARISTOLOCHIA and SENEGA.

Snake'-Stones are stones or other hard substances popularly believed to be efficacious in curing the bites of snakes, by placing them in contact with the wound. The many miraculous cures which are recorded can hardly be wholly without truth; and probably the explanation is to be looked for in the porosity of the substance used, in virtue of which the poisoned blood is drawn out before it has had time to permeate the whole body.

Snake'-weed, so called from its writhed roots, is Bistort (q. v.).

Snake'-wood. See LETTER-WOOD.

Snapdrag'on (*Antirrhinum*), both names being derived from the corolla resembling the *snap* or snout of some animal, is a genus of *Scrophulariaceæ*, comprising eleven species of annual or perennial herbs spread through Europe, W. Asia, and reaching N. Africa. *A. majus*, a native of Europe from Holland southwards, has long been a garden favourite in Britain, and many choice and handsome varieties are now to be seen. It has also become naturalised on old walls, railway cuttings, &c. In Russia an oil is extracted from the seeds, and the plant has bitter and stimulant properties. *A. Orontium*, a corn-field weed in England, is also a pretty plant.

Sneehætt'a, the highest peak of the Dovre chain, in Norway, rises from a mass of similar heights, a torn pyramid of mica-slate intersected with quartz, 7333 feet above the sea. Before the discovery of the Jotunfjelde, S. was regarded as the loftiest summit of Norway (q. v.).

Sneek, a handsome and prosperous town of Holland, province of Friesland, 12 miles S.S.W. of Leeuwarden. It is surrounded by fertile meadows, and has a large trade in butter, cheese, and cattle. Pop. (1877) 9990.

Sneeze-wood (*Ptæroxylon*) is a tree about 30 feet high belonging to *Sapindaceæ* (q. v.), and native of the forests of Uitenhage, Cape of Good Hope. The wood is valuable, said even to equal mahogany, and being of an exceedingly inflammable nature even when green, is eagerly sought by out-spanners for their fires. It excites sneezing when worked, hence the Dutch name Nieshout, and its English equivalent.

Sneez'ing consists in a violent and spasmodic action of the respiratory muscles. A deep inspiration is first taken, and the air is then forced violently through the nose, the mouth being closed, and the effort shaking the entire frame. The common cause of S. is irritation of the pohneiderian membrane of the Nose (q. v.), while in other cases S. may be excited even through the sense of sight and from irritation of the eye, through the sympathy which exists between the sense of sight and that of smell. Occasionally S. is excited by internal nervous causes, and independently of outward irritation of the nose or air-passages, and affections of the stomach or bowels are occasionally said to produce this effect. The custom of blessing a sneezing person has been long in vogue, and was practised by the ancients. Its origin is unknown, but in classical times S. during worship or sacrifice was regarded as a good omen.

Snia'tyn, a town of Austria, in the crown-land of Galicia, on the Pruth, 30½ miles S.E. of Lemberg by rail, has large tanneries and a trade in horses and cattle. Pop. (1869) 10,305.

Snig, a species of Eel (q. v.) found in many parts of England, and known by the olive-green colour of its back, the under parts being a golden yellow. The term, however, like that of 'Grig,' is employed by fishermen in a vague and loose way.

Snipe (*Gallinago*), a genus of wading birds, in some systems of classification named *Scolopax*. The Woodcock (q. v.) is now usually regarded as belonging to the latter genus. The S. has oval nostrils, and the first and second quills are longest. The thigh is unfeathered above the knee, and the claw of the hind toe is very long and curved. The common S. (*G. gallinula*) is plentiful in marshy districts. It attains a length of 10 inches, and is of a general brown colour with darker markings, the lower parts being white, whilst some of the wing-feathers have white tips. The eggs number four, and are of an olive-white hue, spotted with brown. The great or solitary S. (*G. major*) attains a length of 12 inches. It is not so common as the previous species, and whilst in general colour it resembles the common S., its under parts are darker, and its tail in flight is spread out like a fan. The *G. media*, or Jack S., occurs in Britain chiefly as a winter visitant. It is also named the 'Judcock,' and is the smallest of the British snipes. A common American S. is the *G. grisea* or red-breasted species; *G. Brehmi*, Brehm's S., and Sabine's S. (*G. Sabinii*), being rare in Britain. The sea S. is the *Tringa cinchus* or Dunlin (q. v.), and the summer S. is the Sandpiper (q. v.). Snipes are active, wary birds, counterfeiting lameness to lead observers away from their nests. They feed on worms, crustaceans, &c.

Snipe'-Fish. See TRUMPET-FISH.

Sniz'ort, Loch, a large inlet of the sea in the N.W. of Skye, between Vaternish and Trotternish, picturesquely studded with islands in its upper part. Length 16 miles; greatest breadth about 9.

Snorri Sturlason, the Icelandic poet and historian, born 1178 at Hvami in the Dala district of Iceland, was the son of Sturla Thordsson, the founder of the powerful family of the Sturlungs. At three years of age he became a foster-son of Jon Loptsson, grandson of Sæmund, author of the *Elder Edda*, then the most influential and gifted man in Iceland, and after his death (1197) S. remained at Odda with his son Sæmund, and by his marriage, first with Herdys (1199), and after her death with Hallveg Ormsdatter, gained great possessions, sometimes appearing at the Althing with a following of 800 to 900 men. Twice was he appointed 'Laugmand' (1219-23, and 1226-36). In 1218 S. travelled to Norway, where he gained great favour with Duke Skuli, returning to Iceland in 1220. In 1237 he was obliged to fly to Norway in consequence of a league formed against him by his brother Sighvat and his nephew Sturla. Here by his poetical powers he aided his patron Skuli in his war against King Hacon, but was in consequence, on his return to Iceland, pursued by the hatred of the king, and murdered through his influence by his sons-in-law at Reykholt, September 22, 1241. S. was the last and one of the greatest of the northern Skalds. He wrote many panegyrics and heroic songs, and is believed to have been the author of part of the *Younger Edda*. His principal work is the *Heimskringla* ('ring of the world'), a collection of Sagas on the ancient history of Norway. It was translated into Danish by Claussen in 1559, but not published until 1697 by Peringskjold (Stockholm). The best edition is that published with a Danish translation by Schöning and Werlauff (Copenhagen 1777-1826). It was translated into English by Samuel Laing (Lond. 3 vols. 1844), and German translations of parts have been published by Wachter (2 vols. Leip. 1835-37), and Mohnik (Strals. 1835).

Snow is the form of water in which the moisture of the air is precipitated when the condensation takes place at a temperature below the freezing point. Each flake which falls is composed of a number of minute crystals of ice, which present countless modifications of the hexagonal system in which this mineral crystallises. These crystals adhere together to form an irregular cluster; and consequently the incident rays of light, which are refracted and reflected so as to present *individually* the prismatic colours, are scattered after reflection in all directions, and combine to give to the eye the colour sensation of white. By the application of sufficient pressure the slightly adhering crystals may be brought into true *molecular* contact, when the S. loses its white colour and assumes the form of ice. This transformation is constantly taking place in the formation of glaciers, whose deep-blue ice is traceable through imperceptible gradations to the eternal snow which caps the mountain summits. The height above the sea-level at and above which lies the region of perpetual S. depends mainly upon the latitude of the place, though it is considerably influenced by the surface configuration and by the nature of the prevalent winds. Thus, on the southern slope of the Himalayas in 28° N. latitude, the *S.-line*, or lower limit of perpetual S., is 15,800 feet above the sea-level; while on the northern slope, which looks over the dry plateau of Thibet, it rises to 17,400 feet. A similar phenomenon is shown in the Cordilleras of Bolivia in S. America (14°-18° S. latitude), on the western range of which the S.-line is at a height of 18,500, while on the eastern range, which is exposed to the moist easterly trade-winds from the Atlantic, it is 2600 feet lower. At Quito, on the equator, the S.-line is 15,620 feet, which may be taken as a fair average of the S.-line in the tropics. In these warm regions S. does not fall at low altitudes. 30° N. latitude is about the southern limit of snowfall at the sea-level in the northern hemisphere. The bad conducting power of S. for heat checks the earth's radiation, protecting the sprouting herb from the nipping frost, and affording the Eskimo material to construct a warm shelter from the inclement winter.

Snow'berry is a name given, from the white colour and snow-like pulp of its fruit, to *Symphoricarpus racemosus*, a N. American shrub belonging to the honeysuckle family. It is of common cultivation in shrubberies. The name is also given to the white-fruited *Chiococca racemosa* (*Rubiaceæ*), the root of which, although a violent emetic and cathartic, is administered in Brazil as a certain remedy for snake-bites.

Snow' Bunting, also named **Lap'land Bunting** and **Snow Fleck**, is the *Plectrophanes nivalis* of ornithologists, and belongs to the order Insessores and to the *Emberizinæ* or Bunting family. The bill is short, and the second and third quills are longest. The hinder claw is long and straight. This bird occurs plentifully in Britain in winter, but usually passes to the N. in summer. The male is pure white in winter, the back and wings being of dark brown. In summer the plumage is a tawny brown, variegated with white spots. The average length is 7 inches. In Lapland the bird is snared for food.—The **Snow Bird** is a name given to the *Fringilla hymenalis* of America, a species of finch widely distributed over the New World.

Snow'don (an Eng. trans. of the Welsh name *Creigiawr*, 'snowy hill'), a mountain-range in N. Wales, extending through Carnarvonshire, from the coast near Nevin in the S.W. to Pen-maen-mawr, near Conway, in the N.E. The name is also applied to the loftiest elevation in the middle of the range, 3571 feet in height, known as Y Wyddfa ('the conspicuous'). Carnedd Llewelyn ranks second, being 3469 feet high. The ascent to the summit of S. is made from Beddgelert on the S., Llyn-Cwellyn on the W., Capel Curig on the E., and Llanberis on the N. The last, being the easiest, is the usual route for tourists, for whom a house has been erected on the summit.

Snow'drop (*Galanthus*, Gr. 'milk flower') is a genus of three species of *Amaryllidaceæ* (q. v.), of which the common S. is indigenous through Europe from Holland southwards, reaching also W. Asia. It is possibly a native of a few English counties, but as generally seen beyond garden bounds originates either through actual planting, or as an accidental escape from cultivation. Gerard had it in his garden in 1596, and calls it 'a lesser sort of early bulbous stocke gilloflower.' The affix 'drop' refers to the large pendants used by the ladies as ear-rings, &c., in the 16th and 17th centuries. *G. plicata* (the Crimean S.) is similar, but larger and handsomer.

Snow-Shoe, a light flat frame worn in northern latitudes for walking on snow. It is formed of a boat-like hoop, usually 4 feet long by 16 inches broad, of elastic wood, filled with a webbing of interlaced thongs or wicker-work on which the foot rests.

Snuff, a fragrant powdered preparation of tobacco inhaled through the nose. It is made by grinding, in conical mortars or 'mills' worked by power, the chopped leaves and stalks of tobacco in which fermentation has been induced by moisture and warmth in closed rooms. There are numerous varieties of S. Some, like the rappees, are moist; others, for example the Irish and Welsh, are highly dried. A roasted Irish S. called 'Lundy Foot,' or 'Irish Blackguard,' has wide repute for excellence. The admixture of different flavouring agents and delicate scents also gives rise to fanciful names for snuffs having exactly the same modes of preparation. French rappee is superior to all others, and its manufacture has been brought to high perfection at the French Government Factory. The tobacco is subjected to two processes of fermentation, whereby aroma and strength are acquired, and the nicotine and organic acids removed. The leaves and stalks, moistened with *salt water* (to prevent putrefaction), are pressed into cakes and sliced, and left in open chambers for five or six months to ferment and develop aroma. After that time the tobacco is ground in mills out of contact with air, in order to preserve the aroma, and the powder, *rapé sec*, is, after damping, conducted to closed wooden chambers to undergo during ten months the second fermentation, which imparts strength to the S. Finally, the S. is gathered from the fermenting-rooms into one large chamber, where it matures for one month; it is then ready for stamping into casks. The machinery used in the French factory is almost wholly automatic. S. is very commonly adulterated in order to increase its bulk or pungency. The consumption of S. in the British Isles has been estimated to amount to 500 tons annually. The practice of S.-taking was introduced from America into France in the 16th c., and in the middle of the following century it was very general throughout Europe. The consumption of S. greatly increased in England during the reigns of William and Anne, and S.-boxes of gold, silver, precious stone, and enamels were then not uncommon.

Sny'ders, François, an animal-painter of the Flemish school, was born at Antwerp in 1579. He studied under the younger Breughel and Henri van Balen, and worked for

Rubens in conjunction with Jordaens. Several of his paintings were executed for Philip III. of Spain and the Archduke Albert, at that time governor of the Netherlands. At first he painted many flower and fruit pieces, but latterly confined himself wholly to animals, whose animated action he depicted with great accuracy. None of his pictures are to be found in London galleries, but many of the Continental musées possess them, the largest number being in Madrid and St. Petersburg. S. died at Antwerp in 1657. See Deschamps' *Vies des Peintres Flammands* (1753-63).

Soap, in chemistry, includes all combinations of the fatty acids with alkaline or metallic salts; but only such soaps as are soluble in water are of value for detergent purposes, and of these only compounds with potash and soda are commercially recognised under the name of S. There are two distinct varieties of S. generally recognised—*hard or soda S.* and *soft or potash S.* The materials used in the manufacture of hard S. are tallow, palm-oil, cocoanut-oil, rosin, and caustic soda. The theory of the formation of S. from these materials is that substances like potash and soda break up the chemical combinations existing in oils and fats, and take the place of glycerine, of which, with certain fatty acids, these bodies are composed. Thus taking, for example, a palm-oil S., we have—

Palm Oil. Soda. Palm Soap. Glycerine.

$$(C_{16}H_{31}O)_3C_3H_5O_3 + 3NaHO) = 3C_{16}H_{31}ONaO + C_3H_5 3HO.$$

The process by which S. is made from these substances is briefly as follows:—A quantity of any of the above oils is introduced into an enormous pan (some are made to contain as much as 30 tons of finished S.), which is made of boiler plate and heated either by direct fire, by a coil of steam pipes within it, or by a steam jacket surrounding it. To the oil in the pan is added a ley or solution of caustic soda. More caustic ley of increasing strength is by degrees added until an excess of alkali is indicated, after which an additional quantity of oil is placed in the pan, and the adding of alkali is again repeated, and so on, till the pan is filled. The S. is now 'salted out' by throwing into the pan about 10 lbs. of common salt for every 100 lbs. of fatty matter used, the effect being that the S. is rendered insoluble in the strongly-salted liquid, and rises in an almost pure condition to the surface. The watery substratum is drawn off, and the solid S. left in the pan is again heated up with a quantity of weak ley whereby the S. is consolidated into a homogeneous mass. After allowing the 'boiling' to settle for some time, the uncombined liquid is drawn off and the S. is cast into iron frames or moulds. When it has cooled the S. is cut up into bars by a strongly framed apparatus on which thin strong wires are strung at equal intervals. Pure pale or curd S. ought to contain when newly made about 7 per cent. of soda, 63 of fatty matter, and 30 of water, and by keeping in a comparatively dry atmosphere it parts with water, thereby becoming harder and so much more valuable. S. can be made to take up a large amount of water, and yet preserve a firm, solid appearance, and sophistication in this direction is very common. In addition to pale or curd S., the following other kinds of hard S. may be enumerated:—Yellow S., into which rosin enters; mottled S., the mottling being sometimes due to the addition of Prussian blue, and sometimes to iron present; Castile S., which is very hard, and ought to be prepared from olive-oil; silicated S., prepared by the addition of silicate of soda, by a patent method introduced by Mr. William Gossage of Widnes. Fancy or toilet soaps are made mostly from a basis of pure curd S., which may be dyed, perfumed, and moulded into various forms. Transparent S. is made by dissolving ordinary S. in spirit, and distilling off the greater part of the spirit from the solution. Special kinds of S. are prepared for use by calico-printers, turkey-red dyers, bleachers, tweed finishers, scourers, &c. The quantity of S. manufactured in Great Britain in 1872 was estimated at about 205,000,000 lbs., 13,200,000 lbs. of which were soft and silicated S., the remainder being hard, and at the present time the amount made has not in all probability very greatly increased.

Medicinal Properties of S.—*Sapo animalis*, or hard S., is described in the British Pharmacopœia as a soda S. made with purified animal fat, consisting principally of stearin. It is soluble in water or spirit, slightly alkaline, but not greasy, and is the basis of all toilet soaps. *Sapo durus*, hard or white Castile S., is soluble in rectified spirit. S. is prescribed in medicine as a laxative, antacid and antilithic, and for removing gall-stones. In combination with rhubarb it is administered in cases of constipation with torpid liver. S., when prescribed by itself, may be easily swallowed, wrapped in wafer paper.

The pharmaceutical preparations of S. are *Emplastrum cerati saponis* and *Emplastrum saponis*, used chiefly as a protective. *Linimentum saponis*, or S. Liniment, is prepared with S., camphor, oil of rosemary, rectified spirit and water, and forms the basis of numerous liniments. *Pilula saponis composita* contains opium powder in the proportion of one grain in six nearly. *Medicated* S. is largely prescribed in skin diseases, and of this there are many varieties, such as juniper tar S., oxide of zinc S., carbolic acid S., &c. *Sapo mollis*, or *soft* S., is made with olive oil and potash, and is soluble in rectified spirit, not imparting an oily stain to paper. *Soft* S. is contained in *Linimentum Terebinthinæ*.

Soap'berry (*Sapindus Saponaria*) of the W. Indies is a small tree with pinnate leaves, numerous small, white, crowded flowers, and a berry about the size of a cherry. The fleshy covering of the seeds, and in a less degree the root, make a lather in water, and serve all purposes of soap. It has been observed, however, that if used for washing cloth the texture is thereby injured. The seeds possess medicinal properties; they are also made into ornaments. *P. detergens*, a larger and handsomer tree, is cultivated in India for the saponaceous pulp of the fruit, which is an important article of trade in the Punjaub and North-West Provinces under the name of *Ritha*. The generic name *Sapindus* is an abbreviation of *Sapo-Indicus*, Indian S. See SAPINDACEÆ and SAPONIN.

Soap-Stone. See STEATITE.

Soap'wort (*Saponaria*), a genus of *Caryophyllaceæ*, natives of Europe and temperate Asia, numbering about thirty species of annual or perennial herbs. The radical leaves are spathulate, those of the stem narrower; the flowers in cymes, white, lilac, red, or yellow; the calyx five-toothed and tubular; there are five petals, ten stamens, two styles, an oblong capsule, two-celled at the base, and four-valved at the top. The common S. (*S. officinalis*) was formerly grown in England for its saponaceous properties, still locally remaining as a naturalised plant in the vicinity of old villages in the S.W. counties and N. Wales. A double-flowered form is seen in cottage gardens. The white, creeping, fleshy, stoloniferous rootstock and the leaves bruised in water forms the required lather for washing and scouring purposes. *S. vaccaria* is also called, and serves as S.; and the root of the allied *Gypsophila struthium*, known as Egyptian soap-root, is extensively used in Spain, &c. See SAPONIN. In Chili the bark of *Quillaia saponaria*, named quillia or soap-bark, is a common substitute for soap for washing clothes, 2 oz. of the bark being sufficient to cleanse a dress, besides imparting a remarkable lustre to wool fabrics, and removing spots and stains.

Sobb'ing, a convulsive respiratory act, depending on nervous irritation, and caused by spasmodic movements of the *diaphragm* or *midriff*. The glottis is temporarily closed, and thus prevents entrance of air into the lungs in S.

Sobra'on, a village in the district of Ferozpur, Punjaub, British India, on the left bank of the Sutlej. It is celebrated for the battle fought here, 10th February 1846, by Lord Gough, in which the Sikh entrenchments were stormed with great loss, and the enemy driven into the river. The loss of the Sikhs, in killed, wounded, and drowned, was 13,000. This victory terminated the first Sikh war.

Soc'age or **Socc'age** is defined by Stubbs in the 'Glossary' to his *Select Charters Illustrative of English Constitutional History*, as 'a tenure of land on condition of fixed and determinate services, especially that of suit to the lord's court or *soken*' ('jurisdiction'). It thus differed both from knight-service and from villenage. By an Act passed during the Commonwealth and confirmed by 12 Car. II. c. 24, all tenure by knight-service was abolished, and all real property in England and Ireland was directed to be held by S. tenure, except church lands held in free alms.

So'cialism, a term which, as now used, is practically synonymous with Communism, though strictly speaking there is a distinction between the two words, which is explained in the

article COMMUNISM (q. v.). Socialistic theories are common in works of imagination, such as Plato's *Republic*, More's *Utopia*, Harrington's *Oceana*, and others of the same type, but it was not until the middle of the 18th c. that S. began to take practical form. Two Frenchmen, Morelly (whose *Code de la Nature* appeared in 1755) and Mably (1709–85), published Socialist schemes which attracted some attention in the times of intellectual ferment which preceded the Revolution. The conspiracy of Babœuf, too, by which the Directory was menaced in 1797, was avowedly communistic in its objects. In the first half of the present c. S. assumed widely divergent forms in the speculations and experiments of St. Simon (q. v.), Owen (q. v.), Fourier (q. v.), Louis Blanc (q. v.), and Proudhon (q. v.). Its most recent and probably its most important development, however, is in the S. of Germany, where it has attained gigantic proportions within the past twenty years. Perhaps the first of the Socialist thinkers in Germany was Herr Karl Grün, who in his book, *Die Soziale Bewegung in Frankreich u. Belgien* (Darmstadt, 1845), advocated violent revolutionary theories. The two undoubted leaders of the party, however, are Karl Marx (q. v.), and Ferdinand Lassalle (1825-64). The latter is one of the most extraordinary characters in modern German history. Born, like Marx, of a Jewish family, he early distinguished himself by his profligacy and his brilliancy, being particularly known as an enthusiastic Hegelian. In Paris in 1845 he made the acquaintance of Heine, who describes him as possessing 'the widest knowledge and the deepest penetration' he had ever met with. In Berlin he was known in the highest literary circles as *das Wunderkind.* Having taken an active part in the revolutionary disturbances of 1848, he was arrested and tried, defending himself in a speech which concluded with these remarkable words:—'I neither wish nor deserve to be acquitted unless it is recognised that an appeal to arms is the right and duty of the people.' Strange to say, he was acquitted! It was in the last three years of his life that his most active and successful exertions in the cause of S. were made, and since his death, which took place in a duel at Geneva, he has been looked upon as the protomartyr of German S., his birthday being celebrated as a solemn feast by Socialists throughout the country. His principles may be gathered from his two great aphorisms—'The brazen wages-law is invincibly opposed to the amelioration of the workman's lot.' 'The time of the Fourth Order has arrived—the Estate of the Workmen must replace the Estate of the Citizens.' Though the systems of Lassalle and Marx are not identical, they agree in demanding revolutionary change, and in opposing the peaceful theories of co-operation and 'self-help,' whose great apostle is the benevolent Schulze-Delitzsch, and which are regarded with favour by the *Fortschritt* party in general. A Socialist Congress is held every year in Gotha, by which a Propaganda Committee is appointed, which again has in its employment more than a hundred preachers and literary expounders of S. A Socialist review is about to be (1878) established, and there are already 34 Socialist newspapers, the principal being the *Vorwarts*, published at Leipzig under the direction of Messrs. Liebknecht and Hasenklever. There has been a proposal to establish a Socialist University, but it has not yet been adopted. The leading Socialist organisation is *Socialistische Arbeiterpartei Deutschlands*, formed in 1871 by the fusion of the *Allegemeine Deutsche Arbeiterverein* founded by Lassalle in N. Germany, and the *Democratische Arbeiterverein* founded by Marx in the S. The last elections (July-August, 1878) have resulted in the return of nine Socialists to the German Parliament. The former Parliament contained twelve, but it is to be noted that although the number of Socialists elected is smaller, the aggregate number of votes obtained by them has very much increased. The attempts of Hödel and Nöbiling to assassinate the Emperor Wilhelm have led to the promulgation of a very severe law against the Social-Democrats as they are technically termed. The police are empowered to suppress Socialist papers, and forbid Socialist meetings, while fines and imprisonment can be imposed on those who disregard the restrictions. Altogether, the question of S. is the most difficult and dangerous in the internal politics of modern Germany. In other countries, such as Russia, Belgium, and Denmark, S. has also manifested itself more or less actively. In the United States it has begun to create some anxiety, as it appears to be spreading among the vast proletariat of the country principally through the influence of German propagandists. See Schäffle's great work, *S.* (translated by Kaufmann, Lond. 1878); Von Sybel's *Die Lehren des heutigen Socialismus* (Bonn 1872); Jäger's *Der Moderne Socialismus* (Berlin 1873); Becker's *Geschichte der Arbeiter-Agitation F. Lasalle's* (Brauns. 1874); Noyes, *Hist. of American S.* (1870); Le Play, *L'Organisation du Travail* (Par. 1871), and *La Reforme Sociale en France* (1872); Nordhoff, *Communistic Societies of the United States* (1875); Van Mehring, *Die Deutsche Socialdemocratie: ihre Geschichte und ihre Lehre* (Brem. 1877); Cohen's *Études sur l'Empire d'Allemagne* (Par. 1878).

Soc'iety Islands, an archipelago in the S. Pacific, lying between 16°–18° S. lat., and 148°–155° W. long. There are thirteen principal islands, besides numerous islets, and the total area of the group is estimated at 734 sq. miles, with a pop. of about 24,000. The chief islands are Tahiti (q.v.), Eimeo, Huahine, Raiatea (pop. 1200 in 1875), Tahaa (pop. 900), and Bora-Bora. The S. I. are of basaltic formation, and abound in lofty and precipitous mountains, usually fringed by a belt of flat land. Two peaks in Tahiti are respectively 7000 and 8700 feet high. Coral reefs are very abundant round all the islands. The soil being extremely fertile and water plentiful, the vegetation of the islands is most luxuriant. The climate is healthy, but enervating, and terrible hurricanes occur from time to time. The inhabitants belong to the Polynesian race (see POLYNESIA), and are handsome, brave, and intelligent, but indolent, fickle, immoral, and passionately fond of ardent spirits. On account of their indolence, Chinese and Hervey Islanders are imported to work the cotton plantations. The people of Huahine, however, are enterprising traders, and their flag is seen as far away as San Francisco. The chief exports from the islands are cotton, cocoa-nut oil, copra, pearl shell, and oranges. The S. I. were discovered by De Quiros in 1606, but were first made known to the world by Cook, who visited them in 1769, and named them after the Royal Society, at whose recommendation the expedition which he commanded was fitted out. They have been the scene of missionary labours since 1797, and have for many years been entirely Christian. Taking advantage of a quarrel between the Protestant and Roman Catholic missionaries, the French espoused the cause of the latter, who were the last in the field, and seized the islands in 1844. In 1847 they were expelled by the natives from Huahine, Raiatea, and Bora-Bora, which, with small dependencies, are now ruled by their own sovereigns. Over the remainder of the group the French exercise a protectorate, tantamount to possession. The nominal sovereign, Pomare, Queen of Tahiti, died 17th September 1877. See *Queen Pomare and her Country*, by the Rev. G. Pritchard (1878).

Soci'nus, Lælius (Lelio Sozzini), was born at Sienna in 1525 of a good Italian family. His father was a lawyer, but the young man seems early to have turned his attention to theology. In 1547 he left Italy, and after wandering over a considerable part of Europe finally settled at Zürich, where he continued till his death in 1562, except for two short visits to Poland, in 1551, and again in 1558. He lived on terms of intimacy with most of the leading theologians of the time, being on one occasion strongly reproved by Calvin for spending so much of his energies on '*illa quæstionum portenta;*' but although he early adopted views almost equally at variance with the doctrines of the Reformers and of the Romish Church, he did not attempt to propagate them, except by letter among his relatives. Some small tracts attributed to him are published in the *Bibliotheca Fratrum Polonorum.*—**Faustus S.** (Fausto Sozzini), nephew of the preceding, was born at Sienna in Tuscany, December 6, 1539. His father, Alexander S., was for some years professor in Padua, but died early, and the young Faustus was brought up by one of his uncles, to whose carelessness it is probably due that the future heresiarch was miserably grounded in all branches of learning, literary, philosophical, and theological. In 1559 his family got into difficulty with the Inquisition, and S. retired to Lyon, from which the news of his uncle's death called him to Zürich. Shortly after this he returned to Italy under the protection of the Grand Duke of Tuscany, and spent the next twelve years in dilettante politics. Growing disgusted at last with this life of theological inaction, in 1574 he left Florence and betook himself to Basel, where he remained three years, and wrote his treatise *De Servatore.* Thence he went to Transylvania, and in 1579 to Cracov in Poland; but not agreeing with the Unitarians of those countries on some points

of doctrine; he took up his residence with a Polish noble, Christopher Morsztyn, one of his most devoted disciples, whose daughter he married in 1586. The death of this lady in the following year, and the loss of his Italian estates confiscated by the Church, seem to have driven him again to Cracov. In 1588 he was present at the Synod of Unitarians in Brzesc; but ten years afterwards he had again become so unpopular that he was with difficulty rescued from the hands of a Cracov mob, and had a second time to take refuge in privacy, a Polish knight, named Abraham Blouski, offering him an asylum in the little village of Luclav, 9 miles from Cracov, where he died, March 3, 1604. He left one daughter, Agnes, who married Stanislas Witzowatz. In personal appearance S. was tall and slender, with a dignified but vigorous expression. His works, to which Przipcov has prefixed a biography of S., form the first two volumes of the *Bibliotheca Fratrum Polonorum*, published at Amsterdam in 1656 in eight folio volumes. The principal are *Auctoritas Sacræ Scripturæ* (Racov 1588); *De Jesu Christo Servatore* (Basel 1594); *Christianæ Religionis brevissima Institutio* (Basel 1604).

Faustus S. is looked upon as the chief founder of the sect of the **Socinians**, though there is no doubt that he himself derived almost all his theological views from his uncle Lælius. The Socinians rose into importance in Poland, but spread gradually during the 17th c. into Prussia, England, and the Netherlands, gaining most adherents in the last-mentioned country. It is customary to speak of the S. body of doctrine as scanty, but it is so only as containing few of the doctrines found by other Christians in the Word of God; really it is as comprehensive as any orthodox creed, inasmuch as it contains a system of positive opinions on all these doctrines. Socinians deny that the books of the Bible were written under infallible supernatural guidance, and lay down as a fundamental principle of interpretation that nothing contrary to human reason can be contained in a revelation from God, in the application of which they are in the habit of arguing that since a particular text may possibly not have the meaning usually assigned to it, therefore it cannot bear that meaning. In speaking of God, they dwell on His goodness and mercy, practically excluding His holiness, and recognise only obscurely His omniscience. Man, they hold, has no natural proneness either to good or evil, and his sin is forgiven because God's nature leads Him to forgive, man's moral constitution needing no change. The death of Christ is not a satisfaction for sin to divine justice, but the necessary preliminary for His resurrection, whereby He established the doctrine of immortality, and so induced men to exercise their natural powers into such action as would secure for them eternal life. Jesus Christ therefore was a mere man, specially appointed by God to convey His will to men, and, as being only a teacher of righteousness, can in no true sense be called a Redeemer. The first synopsis of Socinian doctrine seems to have been a *Compendium Socinianismi*, published by Ostorodus and Voidovius in 1598; but their authoritative symbolical treatise is the *Racovian Catechism*, first published in 1609, with a dedication to our King James I. A corrected and revised edition appeared in 1684. See *Bibliotheca Fratrum Polonorum*; *Memoirs of Faustus S.*, by Joshua Toulmin (Lond. 1777); *Der Socinianismus* (Fock, Kiel, 1847).

Socle, or **Zocle**, a plain block or plinth, forming a low pedestal to a statue or column. The term is used only in reference to classical architecture.

Soco'tra (Sansk. *Dwipa-Sukadara*, 'the island of bliss'), an island off the E. coast of Africa, 148 miles N.E. of Cape Guardafui. It is 82 miles long and 20 wide, with an area of 1520 sq. miles. A plain from 2 to 4 miles wide extends round the coast, rising precipitously to a limestone plateau from 700 to 1900 feet high. In the N. is a range of granite mountains, whose loftiest peak is 4656 feet in height. Few of the streams being permanent, the island is comparatively barren, though capable of easy artificial irrigation. The inhabitants, who are Mohammedans of mixed Arabian and African descent, keep sheep, goats, and cattle, and asses roam wild. Aloes, dragon's blood, tanned hides, and pearls are exported. Tamarida, the chief settlement, is but an insignificant village. The island is ruled by a Sultan, who in 1876 concluded a treaty by which he became a feudatory of Britain, to which S. is only important from its proximity to the Red Sea entrance. See Royal Geographical Society's *Journal* (vol. v. 1835); *Geographical Magazine* (vol. iii. 1876); *Journal of the Anthropological Society* (vol. vii. 1878).

Soc'rates, one of the greatest of ancient philosophers, was born at Athens about 469 B.C. Sophroniscus, a statuary, was his father; Phænareté, a midwife, his mother. We have no accurate information regarding his early years, but he seems to have followed the ordinary Athenian course of instruction, to have practised his father's calling for some time, and finally, urged by that divine call which all great moral reformers have felt—the voice of the God, he said, impelled him—to have taken upon himself the improvement of the citizens. He never committed his precepts to writing, but frequented the chief resorts of men in the city, where he gathered a crowd of disciples round him, and then discussed with them what was temperance, what virtue, and questions of a like nature.

The external personality of S. was striking rather than imposing. According to all accounts he was exceedingly ugly. He was a large, strong man, with a protuberant stomach. His eyes were crab-like, his mouth very large, his lips thick, his nose flat, his nostrils broad and open. He was scantily and shabbily clothed, and he went barefooted even in the coldest weather. Yet when he spoke all these eccentricities were forgotten. As Plato makes Alcibiades say, his figure was but the mask of Silenus that concealed the image of the God. His voice was sweeter than the Siren's song, and it charmed men to virtue. His conduct was in keeping with his precepts. He was perfectly courageous. At the risk of his life he disobeyed the thirty tyrants when they commanded him to act unjustly, and this is but one of several cases. But he was no sour Pharisee; he was as much at home at a revel as at a philosophic discussion. In the inimitable picture of a classical carousal given in the banquet of Plato, S. is the central figure. His nature had no trace of bitterness in it, and when Aristophanes gave in the 'Clouds' a highly amusing though glaringly unjust picture of the philosopher, S. attended the representation and laughed heartily at the points. Such is an outline of that strange personality—the sphinx of philosophy, as he has been called—who remains, after all, such a puzzle to us. We have only a few positive philosophical precepts on which his teaching was founded. These were preceded by a method; and this has two sides—1st, negative; 2d, positive. 1. As to the negative, it was a confession, partly real partly pretended, of ignorance. 'S.,' says Aristotle, 'asked questions, but he did not answer them, for he professed not to know.' Here too we have the famous Socratic irony. S. would interrogate some official or specialist as to his peculiar subject, and profess himself eagerly desirous of information. This would be readily given; but it would lead to questions, and these to others, till it was found that the pretended knowledge was no knowledge at all. Thus men were convinced of their own ignorance. 2, Positive.—Here we have his method of induction and definition. Suppose, for instance, temperance was the subject under discussion. He would collect a number of instances of temperance, and then examining what was common to the whole of them, he would state this as a definition of the notion of temperance. The range of his inquiries did not extend beyond moral subjects. The science and philosophy of his day were but a metaphysical explanation of nature, and of no value; and we cannot blame S. for neglecting them, and for making the questions of moral conduct and of a moral life sole subjects of his inquiry.

The central doctrine of his philosophy was 'Virtue is knowledge.' The good and prudent man is the one who will do that which is best for him; but virtuous conduct is really that which is best for every man. Vice, then, is ignorance. But from this readily follows another Socratic doctrine, 'No man is willingly vicious,' because a man will do that which he thinks best for himself; but virtue being that which is best, if he do it not it is simply from ignorance. Nay, even he, if we can imagine such a thing, who knowingly does wrong is better than he who ignorantly does right. In the one case we have the knowledge, and that will at last assert its supremacy. In the other case we have simply meaningless action. Thus there is something higher in the conscious wrong-doing of a man than in the unconscious well-doing of a brute. From these principles another famous Socratic position, the unity and identity of all the virtues, clearly follows; for if virtue be knowledge, then the virtues are simply the applications of knowledge in the various spheres of human life.

Connected rather with his personality than his philosophy was the 'demonic' element in him. He announced that an inner voice warned and admonished him on all important occasions, and this voice he believed it to be his duty to obey. When he said it was a spirit that addressed him, he was probably speaking in a figure; rather 'it was the fine, deep, discerning tact and instinct of a pure soul that saw clearly into life, and involuntarily presaged the good and the consequent everywhere, even in the most individual emergency.' After a life spent in teaching the citizens, S. was accused of neglecting the established divinities, introducing new ones, and corrupting the youth. He was found guilty, condemned, and executed 399 B.C. The causes of his accusation, trial, and condemnation were, (1) that he had enraged the citizens by his criticisms on their forms of government; (2) his fearless speech had made him many enemies; (3) a numerous party confounded him with the Sophists (q.v.), and considered him a dangerous innovator. The majority for condemnation was a small one, and if he had condescended to humble himself before his judges, he would certainly have escaped the capital penalty. This he resolutely refused to do, and the Athenians were thus step by step driven to the commission of a deed of which they afterwards bitterly repented.

S. is as important to philosophy through his personality as through his doctrines. Powerful, indeed, must have been the personal influence of the man who attracted to himself the wayward, brilliant, vicious Alcibiades, the plain blunt soldier Xenophon, and the lofty-minded Plato. The last two are our chief authorities regarding S. The former in a matter-of-fact way gives us jottings of the conversations or memorable sayings (*Memorabilia*) of S. The latter has made him the central figure of nearly all his Dialogues, and probably the early ones (certainly not the later) contain true pictures of the life and teaching of the master. In the *Phædo* the death-scene is described with unsurpassable pathos and beauty, and the *Apology* is the defence of S. to all time—the appeal to posterity from a narrow and bigoted tribunal. For later accounts the histories of philosophy may be consulted. See the authorities cited under Plato; the best work in English on the subject is Zeller's *S.* (2d ed. 1859; Eng. trans. by Reichel; Lond. 1868, 2d ed. 1877); and Jowett's ed. of the *Dialogues of Plato* (2d ed. 5 vols. 1876).

Soc'rates (*Scholasticus*) was a barrister at Constantinople during the first half of the 5th c., who wrote (in Greek) a history of the Church from the reign of Constantine, or from the point at which that of Eusebius (q. v.) stops (324) to 439. The history is very valuable for the time it covers, as it was written for the most part by a contemporary, and is remarkably impartial. The best editions are those of Reading (Cambridge), and Hussey (3 vols. Oxf. Clar. Press, 1853). An English translation was made at Cambridge, 1683, and others have since been published by Bagster and Bohn.

So'da Manufac'ture. In one form or other soda occurs in the greatest abundance throughout the world; but the sources whence it has at any time been obtained for manufacturing purposes are not numerous. Previous to the year 1793 the whole supply of the raw materials of the S. M. was obtained from the ashes of certain marine plants. The principal material was barilla, a crude sodic carbonate obtained by the incineration of marine plants, principally of the genus *Salsola*, and which formed at one time a valuable industry in Spain, Sicily, &c. In Great Britain a similar product was obtained by the treatment of seaweed, which was and is known as Kelp (q. v.). The use of these materials as a source of soda was entirely superseded by the introduction of the famous process of Leblanc, an invention which marked a great epoch in industrial chemistry. At the Revolution in 1793, France was cut off from all external sources of raw soda, and the National Convention appealed to the nation for the suggestion of sources within their own limits. Among the proposals submitted was Leblanc's process, already in practical operation, which gradually revolutionised the whole industry. For a long time after its introduction into England, however, its development was seriously retarded by the excise duties on common salt.

In the soda process, which, though modified and improved, is essentially that first devised by Leblanc, there are three distinct stages:—1st, Decomposition of common salt by means of sulphuric acid, with the formation of salt cake (sodic sulphate) and the evolution of chlorine; 2d, Decomposition of the salt cake by charcoal and lime, resulting in the formation of black ash (crude sodic carbonate); and 3d, Separation of soda ash (common alkali) by lixiviation of the black ash. The essential raw materials for these processes are common salt, sulphuric acid, coal, and lime; but in practice alkali manufacturers prepare from pyrites their own sulphuric acid, which in the case of cupreous pyrites, after burning or exhaustion of the sulphurous constituents, are always passed on to the copper-works for treatment by the wet or Henderson process for copper extraction (see COPPER). With these materials, the following are the products of the manufacture in its extended sense—*i.e.*, tracing each raw material to its ultimate product. *Products.*—Iron, COPPER, silver, gold, SULPHURIC ACID, HYDROCHLORIC ACID, BLEACHING POWDER, chlorate of potash, calcic chloride, SULPHATE OF SODA, CARBONATE AND BICARBONATE OF SODA, CAUSTIC SODA, hyposulphite of sodium, phosphate of sodium, Epsom salts, SULPHUR, sulphate of copper. *Regenerated Products.*—MANGANESE, SULPHUR (partly), nitre, used in acid manufacture (part of). *Waste Products.*—Chloride of calcium, lime, sulphur (partly). The important and leading alkali trade-products in this list are printed in capitals.

Decomposition of Salt.—Sulphuric acid, acting on common salt with the aid of heat, decomposes the salt with the evolution of chlorine, and entering into combination with the soda, forms sodic sulphate or salt cake. The reaction is represented thus:—

$$\underset{\text{Sulphuric Acid.}}{H_2SO_4} + \underset{\text{Salt.}}{2NaCl} = \underset{\text{Sodic Sulphate.}}{Na_2SO_4} + \underset{\text{Hydrochloric Acid.}}{2HCl}$$

The hydrochloric acid fumes, which were originally allowed to escape into the air, and thus permitted to work havoc with surrounding vegetation, are saved for use in the bleaching powder manufacture. Indeed, alkali-works are now compelled by Act of Parliament to condense the whole of their hydrochloric acid fumes. The decomposition of the salt is effected in two stages. The charge of salt and sulphuric acid is introduced into an iron pot, covered so as to keep the product free from the action of atmospheric air, over and around which the fire from a furnace plays. By this means about two-thirds of the hydrochloric acid are driven off, and pass on to the condensing towers. The pot cover has two openings, one for charging, and the other for passing on the charge to the muffle or roaster, in which the remainder of the chlorine is expelled, and the formation of the salt cake completed. The muffle is an oblong chamber, over the roof of which the furnace fire plays, and passes round and under the bed on which the charge is placed. The charge of a salt-cake furnace varies from 5 to 18 cwts. of salt, about half a ton being a convenient amount, and the quantity of sulphuric acid used weighs only a little less. From 100 parts of salt about 62 parts of dry hydrochloric acid and 116 parts of salt cake are obtained. Within the past few years an important modified process of producing salt cake has been introduced by Mr. Hargreaves of Widnes, in which the direct use of sulphuric acid is dispensed with. By means of sulphurous acid obtained by burning pyrites, together with air and steam acting on salt kneaded into small cakes with a little water, the salt cake is produced direct at a temperature of 800° or 900° F.

Formation of Black Ash.—For this, the second stage, the salt cake is mixed with the same weight of lime, and half as much of small coal. The decomposition of these materials resulting in the formation of the crude sodic carbonate, with sulphide and carbonate of lime, &c., was formerly conducted in ordinary reverberatory furnaces; but now revolving furnaces in the form of huge brick-lined iron cylinders, turning on bearing-wheels, are generally employed. The first successful form was devised by Messrs. Elliot and Russell, but it has been subsequently much improved by Mr. James Mactear of St. Rollox, Glasgow. In the 'balling,' as this process is termed, Mr. Mactear has introduced other very important improvements. By adding to the furnaces before the completion of the process a quantity of caustic lime in small fragments, a larger proportion of caustic soda in the finished balls is obtained, the yield of soda is increased, and the total amount of lime used and the consequent waste are much lessened.

Separation of Soda Ash.—The black ash or ball soda obtained in the previous process is a very mixed substance, its principal constituents being sodic carbonate and caustic soda, with sulphide and carbonate of lime and caustic lime, unburnt coal, and other impurities. From this the soda compounds are separated

by taking advantage of their solubility in water. The balls, when cool, are broken into large pieces and placed in vats, where, when water is added, they disintegrate and yield up their solid constituents. The resulting liquid is of a dirty greenish-blue colour, and the residue when thoroughly exhausted forms soda waste, of which enormous heaps surround every long-established alkali-work. The liquor is evaporated to dryness, and the residue, calcined in a furnace, forms crude soda ash, containing proportions of caustic soda and sulphate of soda, which are eliminated by a process termed calking or carbonating. The crude ash is mixed with about its own weight of sawdust or small coal, and recalcined in a reverberatory furnace, when the sulphur is burned off and a large proportion of the caustic soda is carbonated. Continual stirring is required in this process, and by means of a rotary furnace invented by Mr. Mactear this laborious manual operation is superseded by mechanical stirrers, and at the same time a superior 'finished ash' is produced. White ash is obtained by again dissolving and evaporating the finished ash.

Soda Crystals and Bicarbonate.—Though a considerable proportion of the product of the S. M. is sold and used in the form of 'ash' or alkali for many purposes, the manufacture has to be carried further and presented in different forms. To obtain soda crystals (ordinary washing soda) the white ash is dissolved in nearly boiling water, and the strong solution is filtered through calico into settling vats, where a little lime and bleaching powder are added. After settling and cooling to 92° F., it is run into iron coolers, where the crystals form on the surface. From this they are taken, broken up, dried, and packed in barrels, and the remaining mother liquor yields, on evaporation, a weak ash. From soda crystals, bicarbonate (known vulgarly as baking soda) is prepared by exposure to an atmosphere of carbonic acid.

Caustic Soda.—This substance, now largely employed in the paper manufacture, is made principally by boiling and evaporating weak *vat liquors* (*i.e.* black-ash solutions) with caustic lime. As the evaporation proceeds, various salts precipitate and are removed, and at a certain stage, if *cream* or *unfused* caustic is desired, the evaporation is stopped. If, however, *white* or *fused* caustic is desired, the evaporation is completed, and the caustic soda presents itself in the form of a red-hot molten mass, which is ladled into iron drums, and soldered up to exclude all air. A certain amount of caustic is also obtained from 'red liquor,' the drainings from soda ash which in its preparation have not been evaporated to dryness.

Various other methods for preparing sodic carbonate have been suggested, and some of them have been carried out on a manufacturing scale. Among them the most important is the ammonia process, in which the action of ammonia and carbonic acid on a concentrated brine of common salt produces decomposition, resulting in the formation of sodic carbonate and chloride of ammonium (see AMMONIAC). Soda has also been prepared from the mineral cryolite (a compound fluoride of aluminium and sodium), and from sodic nitrate (common nitre).

Waste and Bye-Products.—The most important collateral product of the S. M. is Bleaching Powder (q. v.), in the preparation of which a great proportion of the hydrochloric acid evolved in the S. M. is utilised. But since manufacturers have been compelled by law to save all their hydrochloric acid, much difficulty has been experienced in finding a use for the whole of that material; and the enormous accumulations of soda waste have also created serious troubles. The waste-heaps contain practically all the sulphur used in the manufacture, and the sulphuretted hydrogen evolved from the heaps gives out an almost intolerable stench. To recover that sulphur has long been an object of much importance, from an economical as well as a sanitary point of view, and the first really successful plan for accomplishing that object was devised by Ludwig Mond, but it has since been much improved by Mr. Mactear. The process essentially consists in treating the liquor which drains from the waste-heaps with hydrochloric acid while hot, whereby pure sulphur separates from it in a finely divided condition, and the waste substance left—a solution of chloride of calcium—is quite harmless.

So'da-Wa'ter. See ÆRATED WATERS.

So'dium (Na=23), the most widely distributed of the metals of the alkalies, occurs as a constituent in many of our most important chemical compounds, such as common salt, caustic soda, carbonate of soda (popularly known as soda), &c. In rock-salt, sea-water, salt-springs, &c., large quantities of the chloride or common salt exist; and though sulphates, carbonates, borates, and silicates occur as minerals or in solution, this is the great source of the various compounds of S. used in the arts. Evaporation of sea-water is one of the chief methods for separating the salt in the form of crystals. Prepared in this way, various impurities, such as the chlorides of potassium, calcium, and magnesium, &c., exist in the resulting solid; and to the presence of these the deliquescence of table-salt is largely due. The chemical operations by which common salt is utilised for the production of the other compounds of S. are noticed under SODA MANUFACTURE.

Metallic S. is a soft silver-white metal resembling potassium in many of its properties. It melts at 97°·6C, and rapidly oxidises when exposed to the air at ordinary temperatures. It is lighter than water (specific gravity ·972), and when placed on the surface of this liquid, it decomposes it with great violence, forming caustic soda and evolving hydrogen. It does not take fire, however, unless its motions are restrained or the water is hot. It burns in air with a characteristic yellow flame, common to most of its compounds. Two *oxides*, the monoxide and dioxide, are known, and are produced simultaneously when the metal is burned in air. The dioxide (Na_2O_2), obtained separately by exposing S. to a current of dry air at a temperature of 200° C., is of small interest. It is white when pure, dissolves in water without decomposition, and crystallises by evaporation from solution of eight molecules of water. When exposed to a high temperature it loses oxygen and becomes transformed into the monoxide (Na_2O), which is a grey solid melting at a red heat and hardly volatilisable. This anhydrous oxide is a powerful base, and unites with water to form a soluble hydrate (NaOH) which cannot be decomposed by heat. This hydrate or caustic soda, however, is usually prepared as described under SODA MANUFACTURE. For long it was believed to be an elementary substance, and it was by electrolytic decomposition of this compound that Davy first obtained S. in the metallic state, shortly after he had similarly effected the decomposition of caustic potash (see POTASSIUM). Caustic soda is highly alkaline, and in solution is a powerful solvent for animal matter. It is of great importance in the manufacture of Soap (q. v.). The *chloride* (NaCl) or common salt is familiar to all. It is very soluble in water, and its solubility is little affected by temperature; it is slightly soluble in spirits of wine, but insoluble in pure alcohol. The *nitrate* ($NaNO_3$), known as cubic nitre or Chili saltpetre, occurs native and in enormous quantities at Tarapaca in Northern Peru (see NITRE). The carbonates are noticed under SODA MANUFACTURE. The *sulphate* or Glauber's salt ($Na_2SO_4 10H_2O$) is an intermediate product in the preparation of the carbonate, from which it may be obtained directly by the action of dilute sulphuric acid. It crystallises in rhombic prisms, and is present in certain mineral waters, such as those of Cheltenham. Borax (q. v.) is the *borate* of S. The other compounds, the phosphates, sulphites, &c., are all obtained as bye-products in the manufacture of the carbonate, and possess little general interest save as medicinal preparations.

Medicinal properties of Soda Compounds.—*Caustic* soda is used in medicine as a caustic for the destruction of tumours and ulcerating sores. *Liquor* soda is prescribed in preference to potash in certain affections of the stomach, in doses of ½ to 1 drachm. *Tartrate* of soda and *potash*, or *Rochelle salt*, is a mild, cooling purgative, and is given in doses from 2 to 4 drachms (see SEIDLITZ POWDERS). *Arseniate* of soda resembles arsenite of potash or Fowler's solution in its properties, and is prescribed as an antiperiodic and in skin diseases; dose $\frac{1}{16}$ to $\frac{1}{12}$ of a grain (see ARSENIOUS ACID). *Biborate* of soda, or Borax (q. v.), is employed as a refrigerant and diuretic, and as an emmenagogue, in combination with Ergot (q. v.). It is also applied externally in skin diseases, and especially in pityriasis versicolor; dose 5 to 30 grains.

The *Bicarbonate* is employed as an antacid and alterative; dose, from 10 to 30 grains. A saturated solution is an excellent application to the stings of wasps and gnats. *Carbonate* of soda is antacid, antilithic, and resolvent, and is given in such diseases as gout and dyspepsia, in doses of from 10 to 30 grains in bitter infusion. *Solution of Chlorinated* soda is used internally in cases of typhus, scarlatina, dysentery, dyspepsia, and also in glandular

enlargement and chronic mucous discharges. Externally, it is applied as an antiseptic, and as a gargle in the proportion of 4 to 6 drms. in 12 oz. of water. It is a powerful disinfecting agent, and is used in preference to chloride of lime; dose, from 10 to 20 minims. Soda *Hypophosphis* is given in doses of 5 to 10 grains as a nervine tonic. *Phosphate* of soda, sometimes called *tasteless aperient salt*, is a mild purgative, and is adapted to children and those of a delicate stomach; dose, ½ to 1 oz., in gruel or weak broth. *Sulphate* of soda, or Glauber's salt, is an excellent cooling aperient, and may be given in doses of ½ to 1 oz. *Sulphite* of soda is given in cases of *Sarcina Ventriculi* (q. v.), in doses of from 10 to 60 grains; and *Hyposulphite* of soda in similar doses for the same disease, also in scrofulous, syphilitic and rheumatic affections. Soda *Muriate*, or *common salt*, is best known for its antiseptic properties; dose, 10 to 60 grains as a tonic; 120 to 240 grains as a cathartic.

Sod'om (Heb., meaning unknown) **and Gomor'rah** (Heb. *g'morrah*, probably 'submersion') were the two principal cities of the five which at one time occupied the plain of Siddim, afterwards covered by the Dead Sea (Gen. xiv. 3). The account which is given of the destruction of those cities in Gen. xix. may be mixed with legendary matter, but there is probably preserved in it the tradition of a real catastrophe which overtook the region. The cities are elsewhere in the Bible spoken of as having been overwhelmed, as if by an earthquake (Jer. xx. 16, xlix. 18, l. 40), a phenomenon which was not unknown in Palestine (Amos i. 1; Zech. xiv. 5). As late as 1837 the town of Zidon or Saide was partially destroyed by an earthquake.

Sod'om, Apple of, is a gall formed on the twigs of (apparently) *Quercus cerris* (see OAK) by an hymenopterous insect, named by Westwood *Cynips insana*. The galls are rather more than an inch in diameter, of a varnished purple colour externally, with a soft spongy interior, and are stated by some writers to be the 'apples of S.' mentioned by Strabo, Josephus, and others, as tempting to the eye, but filling the mouth with bitter ashes if tasted. The name, together with that of Mad apple and Jew's apple, is also used for the fruit of several species of *Solanum* (q. v.).

Sod'omy, an unnatural crime receiving its name from the city of Sodom, whose inhabitants were apparently (Gen. xix.) addicted to it. It is punishable by the law of England with penal servitude for life; by the law of Scotland it is still a capital offence, though it is never punished except by penal servitude.

Soest, a town of the province of Westfalen, Prussia, 34 miles S.E. of Munster by rail, was once a Hanse town, and one of the most important places in Germany, with a population of between 30,000 and 40,000, but has declined since the Thirty Years' War. Its city law (*Jus Susatense*) was the model for that of many other cities, such as Hamburg, Lübeck, &c. The remains of its walls with their thirty-six towers are still to be seen. It has a great number of old churches, of which seven are now in use, the cathedral being Catholic and the remaining six Protestant. S. is the centre of a rich agricultural district, and has chemical works and extensive breweries. Pop. (1875) 13,122.

Sofa'la, a region in S.E. Africa, forming the southern half of the Portuguese colony of Mozambique (q. v.), and extending from the river Zambese to Delagoa Bay. Up the Zambese the Portuguese authority, such as it is, reaches as far as Zumbo, 400 miles from the mouth of the river, but the inland boundary of S. is elsewhere regarded as a mountain range running parallel to the coast at a distance of 100–150 miles. Practically, however, the Portuguese possess no authority beyond their settlements, though S., the oldest of these, dates from 1500. The chief settlements are:—Tete and Senna, on the Zambese; S., at the mouth of a river of the same name; Inhambane, on the coast, just outside the tropic of Capricorn; and Lourenço Marques, on Delagoa Bay. S. is a low, swampy, and densely-wooded region, with a very hot, moist, and pestiferous climate. Its productions are the same as those of Mozambique generally. Gold is no longer obtained, though in ancient times it was exported in large quantities, and some scholars claim for S. identity with the Ophir of Scripture. The prevalence of the tsetse fly renders cattle-rearing impossible, but elephants, hippopotami, and antelopes abound. The inhabitants are negroes, who gradually merge into the higher type of the Zulu in the S. None but a purely conjectural estimate can be formed of the pop. of the territory.

Sofi'a, or **Sophi'a** (Bulgar. *Triaditsa*, Turk. *Sofiá*), a fortified town of the principality of Bulgaria, of which it was formerly the capital, lies in a fertile plain on the upper waters of the Isker, an affluent of the Danube, to the N. of the Vitsch mountains, 75 miles N.W. of Philippopolis by rail. The seat of a Greek metropolitan and a Roman Catholic bishop, it has 44 mosques, 22 minarets, 15 Christian churches, 3 synagogues, &c. S. is the converging point of several important trade routes (three from the Balkans), and carries on considerable manufactures of cloth, silk wares, leather, and tobacco. S. is a fortress of great strength, but military opinion differs greatly as to its value as a check on the eastern passes of the Balkans. Pop. 18,000, mostly Bulgarians, Turks, Jews, and Gypsies. In the vicinity are celebrated hot springs, with a temperature of 48° C. S. occupies the site of old Sardica, which was built by Justinian. It was taken from the Byzantine emperor Basilios in 987 by the Bulgarians, who called it Triaditza, a name which gave place at the time of the Crusades to that of Stralitz or Sternitz. It fell to the Turks in 1382. During the Russo-Turkish war of 1877–78, the abandonment of S. became necessary as soon as a considerable Russian force had made its way S. of the Balkans, and the retreat was effected without loss. At the Congress of Berlin (July 1878), the English plenipotentiaries strove to join the town and district of S. to the province of Eastern Rumelia (q. v.), but they were eventually included in Bulgaria. On October 25, 1878, S. became the seat of government of Bulgaria.

Soft'as (Arab. 'burnt,' *i.e.*, with zeal for knowledge), a name given to the students in the Mohammedan colleges (*Medresse*), where they are taught theology and jurisprudence, and from which they pass into the Ulemas, taking their place among the imaums, muftis, or cadis. Their dress is a large white turban, and a long robe reaching nearly to the ground. In May 1876 a demonstration of these S. caused the downfall of the Grand Vizier Mahmoud Pasha, shortly followed by the deposition of Sultan Abdul Aziz; and after the outbreak of hostilities with Servia and Montenegro, they formed from among their own number a battalion of volunteers to take part in the 'holy' war.

Soft'ening. See RAMOLLISSEMENT.

Soft-Grass (*Holcus*), a genus of grasses of the tribe *Aveneæ* taking their name from the soft downy herbage of the common British species, *H. lanatus* and *H. mollis*. The first of these grows naturally in meadows, pastures, by waysides, &c., with a marked partiality for damp, peaty soil. It is of little value, however, for either hay or pasture, notwithstanding the large yield, as cattle and horses have a decided aversion to it. *H. mollis* is usually more slender, with a strong creeping root, and is a less frequent plant than the preceding. The only quality recommending it to cultivation is, that the roots serve to bind dry sandy slopes and embankments.

Soignies, a town of Belgium, province of Hainault, on the Senne, 22 miles S.W. of Brussels by rail, with a monastery dating from the 7th c. It has breweries and distilleries, and there are large quarries in its neighbourhood. Pop. (1870) 6873. To the N.E. is the forest of the same name (now a pleasure-ground for the inhabitants of Brussels), through which the British army marched to the field of Waterloo.

Soils consist of that part of the disintegrated surface of the earth's crust in which the roots of plants ramify, and from which growing plants derive the mineral substances necessary for their proper development. S. are formed by the disintegration of the rocks through the continued action of water and air at various temperatures, and by the accumulation of the decaying remains of vegetable organisms. In the process of disintegration water acts variously, as in the bursting action of frost, the gradual wear of running water, and the sawing, grinding, and dashing of the glacier and mountain torrent. The action of the atmosphere is dependent upon the carbonic acid which it contains. This acid is capable of decomposing the silicates of potash and soda, which form part of rocks, seizing the potash and soda, and converting the same into carbonates, which are subsequently washed out by water. Besides carbonic acid, chloride of sodium, or common salt, possesses a very powerful solvent action, having in solution the power of dissolving the phosphates of the alkaline earths. The tendency of water and atmosphere combined is to level the earth's surface by destroying eminences and filling up hollows. We often find, therefore, in the plains a soil differ-

ing widely from its underlying stratum, on account of its being a mixture of the deposits of streams and the debris of neighbouring or more distant mountains. On hills the soil is usually of the same nature as the subsoil. Organic matter comes first in the very humble form of lichens and other plants which obtain their nutriment almost entirely from the air, and in water-plants. As generations grow up and decay, the land slowly increases in organic matter. In proportion as this increase proceeds, the soil acquires the power of retaining those substances necessary for higher vegetable life which were before washed out; and when a soil once possesses the power of retaining all the soluble products of the decomposition of its mineral constituents, other circumstances being favourable, its advance in fertility is more rapid, as not only is the carbonic acid of the air still acting on the as yet undecomposed parts, but the decomposition of vegetable matter, besides keeping the soil in possession of its power of retaining the parts rendered soluble, furnishes a constant supply of carbonic acid within the soil, thereby accelerating decomposition. Thus land left to itself would eventually be covered with a luxuriant vegetation in the form of forests and prairies, through which animals would multiply and increase; and far from the soil becoming poorer, it would become more and more fertile; for in death and decay both animals and vegetables would return to the soil all they had taken from it, in a form more suited for assimilation by plants.

The nature of S. in old civilised countries depends—1, On the character of the rocks from which they were formed; 2, the nature and direction of the waters that may have flowed over them; 3, the amount of weathering they have received; and, 4, the length of time they have been under cultivation, and the nature of that cultivation. A soil may be unproductive through being of such a physical character as not to suit the roots of those plants which we wish to cultivate; through not being able to retain sufficient water for the requirements of plants during drought; through containing principles injurious to the health of plants; through its pores being stopped by water, thereby preventing the entrance of air and carbonic acid; and through not containing a sufficient quantity of those mineral constituents which the plant requires, in a form adapted for assimilation.

S. may be characterised by their prevailing primitive earths: hence, they are reduced to sands and gravels, clays, chalky and limestone S., alluvial S., and peat-bogs. *Sandy* S. are loose, never present a firm surface, and from being without cohesion are incapable of retaining moisture. Being readily permeable by both water and air, they powerfully promote the decomposition of organic matter, whilst they as readily permit it to be washed away by rains, or to escape in the form of gas. One great advantage they possess is their natural warmth; and being loose and friable on the surface, they are well adapted for the germination of seeds. To be made to approach alluvial S., clay and calcareous earth must be added. *Gravelly* S. are more readily penetrated by rain, and more readily dried by filtration and evaporation, than sands. They may be improved in the same manner. *Clayey* soil, relatively to water, is the very reverse of sand; relatively to heat, clays do not admit the atmosphere between their particles, and an unimproved clay soil is therefore a cold one. The obvious way to improve such is by the addition of sand and gravel, and, when the clay does not contain lime, by the addition of that material. *Lime and chalk* soil is much less common than either sand or clay. It may be improved by the laying on of these in sufficient quantity to destroy the tenacity and compactness of its texture. *Alluvial* S. are composed of very fine particles of the debris of several kinds of rocks, which have been held in suspension by water, and deposited in plains or along the banks of rivers, along with organic matter also held in suspension. The earthy character of this soil must necessarily always partake of the character of the rocks of the country in which it is found. *Peat* or *bog* is composed of partially decayed vegetable matter, soft, light, and spongy to the touch. It holds water like a sponge, so that in its natural state it is quite unfit for the growth of crops. *Carbon* in soils is found in various states of decomposition, from recent woody fibre to *humus*, which is woody fibre in a state of decay. *Magnesia* is not very common in soils. *Iron* is present in almost all soils, but is never very abundant in those naturally fertile. The proportion of *organic matter* varies exceedingly in different soils. The mixture of various earths and humus, termed *loams*, constitutes the best of soils. These are classified according to the earths which prevail in them, as a sandy loam, &c.; according to their degree of friability, as a free loam, a stiff loam, &c.; or according to both, as a free calcareous loam, &c. They are generally laid on the sides of valleys, along the bases of hills or mountains, or on the banks of upland rivers. In general, much more depends on the texture of a soil, and on its capacity for retaining or parting with water and heat, than on its chemical composition. Next in importance to the texture of a soil is the nature of the *subsoil* or substratum on which it rests. The best subsoils are those of clay resting on gravel or porous rock; the worst are those of clay kept moist by subterraneous water. The surface of the soil, in its level or incline, in its aspect and in its colour, has necessarily considerable influence on its fertility, and its maturing power of the produce which grows on it. S. are improved by draining, irrigation, manuring, pulverising, burning, fallowing, resting, and the order in which crops succeed each other. See MANURE AND ROTATION OF CROPS.

Soissons (Lat. *Noviodunum*, afterwards *Augusta Suessionum*), a town of northern France, department of Aisne, on the river Aisne, 65 miles N.E. of Paris by rail. It is strongly fortified, and is regarded as the key of Paris. It is the seat of a bishop, and has a fine cathedral, completed in 1212. In its neighbourhood there is a large Deaf and Dumb Institute. S. has breweries and manufactures of linen, cotton, and woollen goods, potash, and chocolate. Here Clovis struck the last blow at the Roman power in Gaul by his victory over Syagrius in 486. After a short siege, October 1870, it was taken by the Germans on their march to Paris. Pop. (1876) 10,089.

So'koto, a kingdom of the Sudan, Africa, between Gando (q. v.) and Bornu (q. v.). It has an area of 117,000 sq. miles, and is fertile and populous, but unhealthy. The capital, also called S., is situated in the N.W., in the Houssa (q. v.) territory. It has 22,000 inhabitants, and an extensive trade in salt, silk, cotton goods, and leather manufactures. The important town of Kano (q. v.) is situated 200 miles S.E. of the town of S.

Solana'ceæ, or **Sola'neæ**, is a large order of monopetalous dicotyledons with exstipulate leaves; flowers regular, large, or small; calyx 5-fid; corolla 5-lobed, imbricate, plaited, or valvate in bud; stamens 5, often cohering; ovary 2-celled; ovules many, axile; fruit a capsule or berry. The properties are contradictory—the tribe *S.* containing many plants which yield valuable food products; and *Atropeæ*, a number of highly poisonous species. In some cases, certain parts of the plant have poisonous properties, while other parts are innocuous. Of the poisonous and narcotic category, the most important will be found detailed in articles BELLADONNA, HENBANE, MANDRAKE, THORN-APPLE, and TOBACCO. For some that possess a bitter principle like quinine see CESTRUM. For the pungent and stimulant group see CAPSICUM. For such as supply articles of diet, the Potato (q. v.) is by far the most important; see also EGG-APPLE, KANGAROO-APPLE, NIGHTSHADE, PHYSALIS, SOLANUM, and TOMATO. Of ornamental plants, Lycium, Petunia (q. v.), and Solandra are examples. S. comprises 60 genera and upwards of 1000 species of herbs, shrubs, or very rarely trees; natives of all tropical countries—more especially America—and a few reaching temperate climates. Three genera and 4 species are represented in the British flora.

So'lan Goose. See GANNET.

Sola'num, the type genus of *Solanaceæ*, consists of numerous species diffused over the globe, but especially prominent in the flora of S. America. Most are herbs or shrubs, a few only attaining to small trees; many are beset with sharp prickles. All are easily recognised by the rotate corolla and anthers opening by pores; the fruit is a berry with numerous seeds. For the most important species see POTATO, and for various others the articles BITTERSWEET, EGG-APPLE, KANGAROO-APPLE, and NIGHTSHADE. In addition to these, *S. Æthiopicum* is cultivated in tropical Africa and elsewhere for its edible fruit; *S. gilo* in tropical America for a like purpose; *S. Quitoense* of Ecuador and Peru produces a berry resembling a small orange in colour and taste; the large red spherical fruit of *S. Uporo* is used in many islands of the Pacific; and *S. vescum* is the 'Gunyang' of S.E. Australia. The berries of *S. Guinense* of the tropics of both hemispheres furnish a dye, particularly violet,

for silk; and *S. indigoferum* is cultivated in Brazil as a dye-shrub. The fruits of *S. saponaceum* are used in Peru as a substitute for soap, and *S. marginatum* has tanning properties. Many species are highly curious and ornamental. The Tomato (q. v.) was formerly called *S. Lycopersicum.*

So'lar Cy'cle is a period of twenty-eight years within which the first day of the years passes successively through the same sequence of week days. If there were no leap years, each new-year day would be a day later than the preceding one, and the S. C. would be simply seven years; but since every fourth year there is a break in the succession and one day is missed, twenty-eight or four times seven years must elapse before the successive new years begin to occur upon the same sequence of days. In the Gregorian calendar a break occurs in the S. C., since only the centuries which are divisible by 400 are leap years.

So'lar Mi'croscope. See MICROSCOPE.

So'lar Sys'tem is the material system of which the sun is the centre. To it belong the planets, planetoids, satellites, comets, and meteorites, which all directly or indirectly revolve round the central sun, the whole being bound together by the mutual attractions of the several parts. The telescope has revealed the S. S. to be a far more complex structure than was ever dreamed by astronomers of the last century. The larger planets now number nine, if we include the still doubtful Vulcan, and the most important of these are in themselves systems of great complexity, and yearly are asteroids being discovered and added to the catalogue of now close upon 200, while myriads of meteorites and comets stream round the sun, ultimately to be utilised as fuel to the great source of light and life. See ASTEROIDS, COMETS, PLANETS, SUN, &c.

Solas'ter, or Sun-Star. See STARFISH.

Sola'tium in Scotch law means compensation for wounded feelings, and is regarded as something distinct from mere pecuniary loss or damage. S. is not *formally* acknowledged as a ground of damages in English law.

Sol'der, an alloy used for uniting metals. It must be rather more fusible than the metals to be joined; consequently there are many different kinds of solders, the nature and relative proportions of whose constituents vary greatly. *Hard* solders are less fusible than *soft* solders, and are employed to join the more refractory metals. Silver 4 parts, and copper 1 part, fused together, form a very hard S. suitable for silver-work, gold, steel, and gun-metal. Tin and lead in equal parts make common soft S. for plumber's use. Borax, sal-ammoniac, chloride of zinc, or rosin, is always used with S. as a flux.

Sol'dier (French and German, *soldat*), in the common meaning of the term, one belonging to an organised body of troops in the military service of a government. Originally the name of S. was only applied to hired troops, as in Froissart's *Chronicles,* where it refers to the hired troops of France and Germany. The derivation is variously attributed to *soldurius* (Cæsar's *De Bello Gallico,* iii. 22), *solidus,* a Roman coin, which may have been a soldier's wages, and the French *soudoyer,* stipendiary. The word came into use in England in the reign of Edward I.

Soldier-Crab'. See HERMIT-CRAB.

Sole (*Solea*), a genus of *Pleuronectidæ* (q. v.) or flat fishes, in which the eyes and mouth are twisted to one side. The lower jaw is hidden by the skin, and there are several rows of teeth. The eyes and mouth are on the right side, which is the dark-coloured and uppermost surface. The scales are small and *placoid.* The common S. (*S. vulgaris*) is abundant on the British coasts, and is largely fished. The spawning season extends from February to the end of March, when the flesh becomes less palatable. The dorsal or anal fins are distinct from the tail-fin. Other species of S. are the *S. pegusa,* or Lemon French S., and the Little S. (*Monochirus linguatulus*). The Variegated S. (*S. variegata*) has a reddish-brown hue marked by darker bands. The transparent S. (*Achirus pellucidus*) is a Pacific species, in which pectoral fins are wanting. The Zebra S. of Japan (*S.* or *Brachirus Zebra*) is a species in which the body is very distinctly striped.

Sol'ecism, a term applied to violations of syntax or the laws of thought, and said to be derived from Soli, a city of Cilicia, whose Greek inhabitants, from their intercourse with the natives, had adopted many barbarisms into their speech (Diog. Laert. i. 2, § 4).

So'len, a genus of *Lamellibranchiate* molluscs notable for the length of the shells, whence the name 'razor-shells.' The *S. ensis* and *S. siliqua* are common species; the former is curved like a sword, the latter is straight. In the family *Solenidæ,* to which these molluscs belong, the shell gapes at either extremity. The ligament is external, and the hinge teeth number two or three. The siphons are short and united, and the foot is very large and powerful. The S. use the foot as a burrowing organ, and by its means descend in the sand so swiftly that their capture is a matter of extreme difficulty.

Solenho'fen Slate, an extremely fine-grained deposit, referable to the age of the Upper Oolite, and largely quarried near Aichstadt in Bavaria for lithographic purposes. It is of great scientific interest on account of the numerous and beautifully preserved fossils it has yielded: the latter include numerous insects, crustacea, fish, and saurians, and about eight species of pterodactyls, or flying reptiles. The most extraordinary fossil, however, is the wonderful bird *Archæopteryx macrura,* of which a fine specimen, found in 1862, is now in the British Museum. This, the oldest indication of bird-life with the exception of the ornithic footprints in the Trias of Connecticut, approaches the reptiles in many important characters; *e.g.,* in the possession of a long tail of twenty free vertebræ, each supporting a pair of quill-feathers.

So'lent, an arm of the sea separating the Isle of Wight on the N.W. from the mainland, where in August 1875 the *Mistletoe* was accidentally run down by H.M. private yacht *Alberta.* Breadth at the S.W. entrance, opposite Hurst Castle, less than a mile, elsewhere from 1½ to 2½ miles.

Soleure' (Ger. *Solothurn*), a canton of northern Switzerland, bounded on the S. and W. by Bern, on the E. by Aargau, and on the N. by Basel. It joined the Swiss Confederation in 1481, and its government consists of a Grand Council of 106 members chosen directly by the people, which again elects an executive of 5 members. The whole body of the people has also a veto on the acts of the Council. The area of S. is 353 sq. miles, and its pop. (1876) 77,803, mostly Roman Catholics. More than two-thirds of its surface belongs to the broken mountain-land of the Jura, but affords excellent pasturage. The arable land is very fertile, S. being one of the three cantons which grow more grain than they consume. The grape is also considerably cultivated, and there is a great trade in cherry-brandy. Flax and cotton are grown, and there are manufactures of iron, glass, watches, &c. S. has valuable marble and limestone quarries.—**S.,** capital of the canton of the same name, in Switzerland, on the river Aar, 25 miles N.N.E. of Bern by rail. It is one of the oldest towns in Switzerland. Its cathedral of St. Urs and Victor was completed in 1773. S. has a museum of natural history, a fine library, several art collections, and numerous higher schools, secular and ecclesiastical, and has an old armoury on the Weissenstein Mountain. It is a great centre of Swiss trade; in its neighbourhood is a well-known watering-place. Pop. (1870) 7054.

Solfa'taras (Ital.) are crevices or fissures in the earth from which gases are exhaled. They occur in volcanic regions, such as the S. of Italy, the Antilles, and the island of Java; and the exhalations are chiefly sulphuretted hydrogen together with traces of hydrochloric acid and chloride of ammonium.

Solfeggio (Ital.), a musical exercise on the notes of the musical scale, as represented by the syllables *do, re, mi, fa, so, la,* and *si.* The scale of C, requiring no alteration by sharps or flats on the pianoforte, gives the notes C, D, E, F, G, A, and B, as the equivalents to *do, re,* &c., respectively. According to modern practice, however, *do* may form the key-note of any scale, *re* forming the second note, and the other notes in order. In Mr. J. Curwen's Tonic Solfa System (see NOTATION, MUSICAL) the notes in all the scales starting from any one of the twelve semitones are called *doh, ray, me, fah, sole, lah,* and *te,* an English spelling being here introduced to correspond to the Italian pronunciation, and *si* being altered to *te* to prevent the repetition of the initial *d* used for *doh.* Many children are now taught singing according to this method, which has the advantage of overcoming some rudimentary difficulties, but which prevents

any acquaintance with the great range of musical literature. The intervals are taught from a musical chart called the Modulator. Monosyllables to represent the notes of the scale were first used by Guido d'Arezzo, a Benedictine monk born about 990, who was also the inventor of the horizontal lines forming the staff. The six notes he used were *ut*, *re*, *mi*, *fa*, *sol*, *la*, the first consonants of each line of an ecclesiastical hymn to St. John the Baptist—

'*Ut* queant laxis
*Re*sonare febris
*Mi*ra gestorum
*Fa*muli tuorum
*Sol*ve polluti
*La*bii reatum.'

The additional note *si* was introduced by Le Maire, a singing-master of Paris, about 1660, and the Italians for the greater sweetness changed the name of the first note *ut* into *do*.

Solferi'no, small village of Northern Italy, province of Mantua, 20 miles N.W. of Mantua, notable for the victories gained there by the French over the Austrians in 1796, and again under Napoleon III. on the 24th June 1859.

Soli'citor-Gen'eral of England is a law officer of the Crown, whose function it is to assist the Attorney-General (q. v.), the two having equal authority. The S.-G. of Scotland has the same function relative to the Lord Advocate. See ADVOCATE, LORD.

Soli'citor to the Treasury, in the United Kingdom, is an officer who acts as attorney for the Government in all legal proceedings, and for all the departments of Government for which no special solicitor has been appointed.

Soli'citors. See ATTORNEYS AND SOLICITORS.

Solidun'gula, or **Solipe'da.** See EQUIDÆ.

Sol'idus. See SOU.

Sol'ingen, a town of Rhenish Prussia, 19 miles N. of Köln by rail. Since early in the Middle Ages it has been famous for its hardware manufactures, especially for its swords. In its district there are over 2700 workshops, with 10,000 hands, in which are produced yearly about half a million sword-blades, two million dozen knives, a million dozen scissors, and numerous revolvers, iron tools, &c. Dam-~ening is very skilfully done here. Pop. (1875) 14,040.

Sol'is y Ribadeneira, Antonio de, born at Alcàlà de Henares, 18th July 1610, studied law and theology at Salamanca, and in his eighteenth year produced a comedy, *Amor y Obligacion*. Its success gained him a patron in the Count de Oropesa, Viceroy of Navarre and Valencia, from whose service he passed to the court of Madrid (1654). Here the Queen-Mother made him *Cronista Mayor* (1666); as such he wrote his *Historia de la Conquista de la America Septentrional* (Madr. 1684), whose 'copious and sustained eloquence places him,' says Ticknor, 'by the side of Mendoza and Mariana,' though in boldness and dignity their inferior. Among his comedies, *La Gitanilla de Madrid*, *Triumfos de Amor y Fortuna*, and *El Alcazar del Secreto*, are counted his masterpieces. Having taken the tonsure (1667), S. died at Madrid, 19th April 1686. There are French, Italian, and German versions of his *Historia*, and an English one by T. Townsend (Lond. 1824). See Ticknor's *History of Spanish Literature* (4th ed. 1871).

Solitaire', a game played by one person with marbles arranged geometrically in hollows on a board. One marble is removed from the board, and the empty hollow so made enables pieces to be captured singly after the manner of draughts. The object of the game is to 'take' the pieces in such an order that eventually only one piece will remain.

Sol'itaire (*Pezophaps*), a species of Rasorial birds, formerly inhabiting the islands of Bourbon and Rodriguez, but which has been exterminated by man within the past 300 years. The S. had rudimentary wings, and hence fell an easy prey to the early voyagers who visited these islands. Leguat, a French traveller, who gives an account of the bird, named it the 'S.' He states that some of the males weighed 45 lbs., and their plumage is described as darker than that of the females. The Dodo (q. v.) is an example of a nearly allied bird which was similarly exterminated in Mauritius.

Solmisa'tion, the art of giving the proper sound or pitch to the seven notes of the musical scale. See SOLFEGGIO.

So'lo (Ital. 'alone'), a musical movement in which only one voice or instrument is employed, or where other voices or instruments are only introduced for the sake of accompaniment.

Sol'omon (New Test. Greek, from Heb. *Shelomoh*, 'the peaceful one'), king of Israel, was the youngest son of David and Bathsheba (1 Chron. iii. 5). His education seems to have been entrusted to Nathan the prophet (2 Sam. xii. 25, the true reading of which is, 'And he (David) entrusted him to Nathan the prophet, who called him Jedidjah,' &c.). Although he was not properly David's heir, his mother used her influence with David, after the revolt and death of Absalom, to induce him to appoint S. his successor on the throne, to which the king consented (1 Kings i. 11-14). The plan was not carried out, however, without opposition, for not long before David's death, Adonijah, who was properly his heir, formed a conspiracy with Abiathar the high priest and Joab the commander-in-chief of the forces to seize the throne. But Bathsheba and her party, which included Zadok the other chief priest, Benaiah the rival of Joab, and Nathan, frustrated the plot by getting David to have S. crowned as his successor at once (1 Kings i. 5-40). This was about B.C. 1015, and the death of David followed immediately after.

S. is chiefly remarkable for three things: his great wealth, his wisdom, and the building of the Temple. 1. Anything like an exact estimate of his wealth is impossible, especially as any figures that are given are contradictory and evidently exaggerated (*e.g.*, the sum collected by David for the building of the Temple is called in one place (1 Chron. xxix. 4) 3000 talents of gold and 7000 of silver, and in another (xxii. 14) 100,000 talents of gold and 1,000,000 of silver), but a consideration of the sources from which it was derived will show how great it must have been. He inherited immense wealth from his father, which had been accumulated for the building of the Temple. The natural productions of the country were very valuable: cattle (reared in the rich trans-Jordanic pastures), grain, timber, stone, and probably the useful metals; and from those S. doubtless derived large revenues. He certainly did so from the commerce with other countries—Phœnicia, Egypt, Arabia, Babylonia, and Ophir (q. v.)—which he encouraged, and a great part of which seems to have been a monopoly in his own hands. It is said that besides other profits from this trade, and revenues from the provinces, there came into the king's treasury annually 666 talents' weight of gold (which was equal to at least £3,646,000 sterling), while silver was thought no more of in Jerusalem than stones, or cedar than the commonest timber (1 Kings x. 14-27). 2. S. was not more celebrated for his wealth than for his wisdom (1 Kings x.). According to 1 Kings iii., that wisdom was of a distinctly religious type, and was closely connected with the worship of Jehovah and obedience to his commandments; but this may have been the idea of a later time, as the writer of Kings lived many centuries after S. In the time of S., Wisdom meant every kind of penetration, or even cunning (*cf.* 2 Sam. xiii. 3, xiv. 2, xx. 16; 1 Kings ii. 6, 9). There was a class of men in Israel called 'sages,' who made riddles and proverbs, and, sitting in the gate, gave advice and uttered warnings and lessons of practical wisdom. These justly regarded S. as their great prototype. 3. But that which raised S. so high in the eyes of posterity was undoubtedly his building the Temple, which was begun in the fourth year of his reign, and completed in seven and a half years. Some think that his motive for executing this work was not merely a desire to honour the pure worship of Jehovah. Political reasons—*e.g.*, his foreseeing that a concourse of pilgrims to the capital three times a year would strengthen the unity of his kingdom—probably also mingled with the religious motive. Other magnificent buildings erected by him were a palace on Mount Zion; an audience-hall, built chiefly of cedar, and hence called 'the house of Lebanon;' a palace for his principal wife, who was a daughter of the king of Egypt; sanctuaries for the deities worshipped by the surrounding nations; &c. The furnishing of these buildings was on an equally magnificent scale. But all this magnificence cost the people dear in the shape of taxes and unrequited labour, and bred a great deal of discontent (1 Kings v. 13-16). This gave rise to a threatened rebellion of the northern tribes; a disaster which was averted at this time, but after the death of S. led to

the disruption of the kingdom. The historian represents this, as well as the attacks of Hadad the son of the last king of Edom, and of Rezon king of Syria, as a punishment for the king's toleration of idolatry in his old age. But there were sufficiently powerful natural causes at work to produce the internal disaffection (*cf.* 1 Kings xii. 1-17), while Hadad and Rezon had caused him trouble from the beginning of his reign (*cf.* 1 Kings xi. 21-25). His reign lasted forty years. Hardly any monarch in history has a more splendid fame than S., yet it is clear as noonday that his magnificence was a curse to his country, and that he himself had no political insight, nor the faintest comprehension of the means by which national welfare is nurtured and maintained. He does not, therefore, belong to the truly great rulers of mankind. We must go to the East for his counterpart, and we find it there in sovereigns like Harun-al-Raschid, Shan Jehan, and Aurungzib. He had a rich, glowing, sensuous, Oriental genius, and lived the best part of his life in luxurious and debasing joys, but in those hours saved from the distractions of the state and the pleasures of the harem, his deeper nature found a remorseful vent in a wisdom that is sometimes cynical, and often sad. Yet he is never irreligious. He does not, like some baser spirits of modern times, make his own vices and errors the ground for blasphemously challenging the Divine Righteousness; on the contrary, these seem to awaken in him a mournful sense of lost ideals which he feels himself impelled to cherish and commend.

Sol'omon Islands, a chain of magnificent but little-known islands in Melanesia, stretching S.E. from New Britain to the Santa Cruz group, between 4°30′ and 11°30′ S. lat. The islands number about 140, and some of them are from 50 to 80 miles long. Area, 12,157 sq. miles. They are mountainous, densely wooded, and populous, but the natives are cannibals, and very hostile to strangers. The S. I. were discovered by Mendana in 1567, and owe their name to the belief of the Spaniards that it was from them that Solomon fetched gold to adorn the Temple at Jerusalem.

Sol'omon's Seal, a name given to *Polygonatum multiflorum* from the scars upon its rootstock resembling a six-pointed star, the S. S. of Oriental tales; it is now used as the English name for this genus of the tribe *Asparagineæ* of *Liliaceæ*. The genus is closely allied to *Convallaria* (see LILY OF THE VALLEY), differing therefrom in the stem being leafy, and the six-cleft flower being tubular instead of globose. There are about twenty species, occurring in Europe, N. Asia, Himalaya, and N. America. Of these, three are British, but *P. officinalis* and *P. verticillata* are respectively rare, and very rare. The above-mentioned *P. multiflorum* is found in woods, more particularly in the southern half of England. Its rhizome grated or scraped into a pulp is a provincial application to black eyes and other bruises to remove discoloration.

So'lon, the greatest of Athenian legislators, and one of the seven wise men of Greece, was the son of Execestides, and was born, probably at Athens, in 638 B.C. His father's extravagance and his own love of adventure induced him to travel as a foreign trader for some years. When a youth he began to write poetry, at first of an amatory nature, but latterly more philosophical. His earliest public appearance was on the Agora, where he recited a poem protesting to his townsmen against the abandonment of their claim to Salamis. Supported by Peisistratos, then his friend, S. captured the town of Salamis, and, soon after, Sparta; made arbitrator between Megara and Athens, awarded the island to the latter, S. interpolating a line in the *Iliad* to make good his claim. For some time he continued to rise in public favour, and declaimed in his poems, with impartial anxiety, against the divisions of the city and the state of the Attic peasantry, who were crushed with debt. In 594 he was made Archon, with extraordinary powers, and entrusted with the introduction of reforms. Disdaining to seize the despotism, he enacted the *Seisachtheia*, or 'Disburthening Ordinance,' to relieve the poor from the pressure of debt. It forbad the pledging of person, family, or lands as security for debts; cancelled contracts in which this had been done, and freed debtors then in exile or slavery. Its other provisions are less clearly known; some say it fixed a legal maximum rate of interest. S. accompanied it with a debasement of the coinage, to aid wealthy debtors whom it did not reach. The effects of these measures were immediate, extensive, and permanent, and S. was therefore entrusted with the readjustment of political power. For the Eupatrids or hereditary nobility, who had hitherto exercised supreme authority, he substituted a plutocracy. The whole state was divided into four classes—(1) those with incomes of 500 drachmæ (or medimni in grain); (2) those with incomes of between 500 and 300; (3) those with incomes between 200 and 300; (4) the rest. There were proportionate burdens and rights to each class. To check the newly-formed democracy, S. increased the powers of the previously existing aristocratic 'Senate of the Areopagus.' He also instituted a new council of 400—elected by the people—called the Boulē. The object of this new council is much disputed; some view it as the regulator, others as but a tool, of the great body of Athenian electors. S. also drew up an extensive code of laws. After completing his task, he left Athens for ten years' travel, visiting Egypt and Cyprus. Herodotus gives a dramatic but improbable story of a visit he paid to Crœsus. On his return disputes had broken out afresh among the citizens, and his quondam friend Peisistratos managed to make himself tyrant, thus breaking the Solonian constitution. Yet many of S.'s beneficent laws long continued in force, as his rearrangement of the calendar, his imposition of mutual obligations on parents and children, his various restrictions on public morality, and his protective regulations. S. died about 558 B.C., and his ashes were, according to his wish, scattered round the island of Salamis. According to Grote, 'S. represents the best tendencies of his age combined with much that is personally excellent; the improved ethical sensibility; the thirst for enlarged knowledge and observation, . . . the conception of regularised popular institutions, . . . a genuine and reflecting sympathy with the mass of the poor, . . . lastly, during his temporary possession of a power altogether arbitrary, . . . an absence of all selfish ambition, and 'a rare discretion in seizing the mean between conflicting exigencies.' See Plutarch's and Diogenes' Lives; and Thirlwall's and Grote's Histories. His poetical fragments are collected in Bergk's *Poetæ Lyrici Græci* (1866).

Solor' Islands, a group of four E. Indian islands, lying E. of Flores (q. v.). The chief are—S., area, 105 sq. miles; pop. 15,000; Adanara (or Adonare), area, 302 sq. miles, pop. 36,000; Lomblem, area, 520 sq. miles, pop. 120,000; Pantar, area, 275 sq. miles, pop. 60,000. The first three are inhabited by Malays, most of whom are Mohammedans; Pantar, by Papuans. Adonare is independent; the Dutch hold the others. The islands are fertile and their scenery picturesque. The natives on the coast engage much in fishing.

Sol'stice (Lat. *solstitium*, from *Sol*, 'the sun,' and *sto*, 'I stand') is the point in the ecliptic at which the sun is furthest from the equator. See ECLIPTIC.

Solu'tion. When by contact with a liquid the particles which compose a solid are drawn asunder and separated from each other so as no longer to be distinctly visible, the solid is said to be dissolved and a S. formed. The liquid which affects the transformation is called the solvent. The most important solvent we possess is water, which almost always contains foreign substances dissolved in it. Mineral springs, rivers, lakes, seas, the ocean itself, all are true solutions. Experiment proves that the less of a given solid which a solvent contains in S. the more rapidly will it dissolve more of the same; and that this dissolving action will go on until the S. is of a certain definite strength. Such a S., which has dissolved the greatest quantity of the solid possible in the circumstances, is said to be *saturated*. As a general rule, the powers of a liquid as a solvent increase with temperature, though to this there are some important exceptions, *e.g.*, the solutions of lime and its salts in water. Consequently, boiling usually hastens the process by which the solid is dissolved, and as the S. so prepared cools it may be unable to hold all the solid present in the dissolved state, when a precipitate at once appears. This *precipitation from cooling* is an important artifice in many chemical operations. In certain circumstances, however, it is possible to force a solvent to hold in S. a greater quantity than it naturally can. For instance, if a saturated S. of sulphate of soda be boiled so that part of the solvent is driven off, the S. still remains clear because of its high temperature. If the mouth of the vessel is stopped with some cotton wool, and the S. then allowed to cool, no precipitation takes place, and the S. is *supersaturated.* It is, how-

ever, essentially unstable, for if the cotton wool be removed and a crystal of sulphate of soda introduced, or even a particle of dust, at once crystallisation begins round the introduced crystal, and extends in all directions till the whole liquid becomes solidified. The action is accompanied with the evolution of heat. The various supersaturated solutions which have been investigated present remarkable differences as to their degree of instability; indeed, the whole subject of solutions is still very obscure. In certain cases of S. there is unquestionably a chemical action, the formation of a new compound, and when it is remembered that the chemical reactions of acids, bases, and salts, usually require these substances to be in a state of S., the importance of the subject from a purely chemical view-point can hardly be overestimated. It is one of the chief defects of the modern theories of chemical action that the influence of the solvent is in most cases entirely overlooked, when there can be no doubt that it is the presence of the solvent which renders the action possible. Zinc decomposes sulphuric acid only when the latter is more or less dilute, and the most important and strongest acids (nitric, hydrochloric, &c.) act but feebly when pure, and probably would not act at all if they could be obtained perfectly pure. For a thorough comprehension of the nature of solutions, the kinetic theory of gases must be greatly developed, and some clearer notion of the molecular constitution of bodies obtained than is at present possible.

Sol'vent. See SOLUTION.

Sol'way Firth, an arm of the Irish Sea, separating in one part England from Scotland, and extending inland in an easterly direction for 40 miles, with a breadth diminishing from 20 miles at its opening to 2 miles at the mouth of the Annan. It receives from the Scottish side the Urr, Dee, Nith, and Annan, and the Esk, with its feeder the Liddel; from the English, the Eden, Wampool, Ellen, and Derwent. Broad sands, dry at low water, occupy a large portion of the S. F., over which the tides ebb and flow with remarkable rapidity, sometimes advancing with a head 4-6 feet high at the rate of 8 or 10 miles an hour. —**S. Moss**, a district about 7 miles in circumference, belonging to Cumberland, lying W. of Longtown, and adjoining the Scottish border. Here the Scottish army of James V. was defeated by the English in 1542.

Sol'yman (Suleiman) **II.**, surnamed by the Turks Kanuni ('legislator'), and by Western writers 'The Magnificent,' the tenth and greatest of the Ottoman sultans, was born in 1495. The only son of Selim I., he had, unlike most Turkish princes, been early initiated into 'policy and war, and on his accession to the throne (September 1520) he hastened to carry out his ambitious schemes of conquest. In 1521 he invaded Hungary, and captured Belgrade, and the year after wrested Rhodes from the Knights of St. John. The next three years were occupied in suppressing a rebellion in Egypt and a revolt of the janissaries, but in 1526 he again overran Hungary, defeating its armies in the battle of Mohacz, in which King Lewis II. and 20,000 men were slain. S. now conferred the crown upon John Zapolya, the rival of Ferdinand of Austria, whose dominions he invaded in 1529, taking Buda and laying siege to Vienna, from which, however, he was obliged to retire after twenty unsuccessful assaults. He next carried his arms against Persia, and subdued in 1534 Armenia and Irak, with the cities of Tabriz and Bagdad. On his return to Constantinople in 1535 he concluded a treaty with François I., which gave the French the monopoly of commerce in the Levant. This alliance was cemented in consequence of the expeditions of Karl V. to Africa in 1535 and 1541, and the fleet of S., under the famous corsair Khair-ed-din, or Barbarossa, uniting with that of the French, swept the Mediterranean, ravaged the coasts of Italy, and pillaged Nice (1542). In 1547, S. concluded peace with Karl V. and Ferdinand, and next year led his army once more against Persia, while his lieutenants conquered Gozzo and Tripoli. In 1551 he acquired the Banat of Temesvar, after which he engaged in a third war with Persia, which was concluded by a peace in 1554. In 1553 his son Mustapha was sacrificed to the intrigues of his favourite wife Roxolana, whose son Bajazet fell a victim to his own ambition in 1559. In 1561 S. gained a brilliant naval victory over the Knights of St. John and the Spaniards, but failed in 1565 to take Malta after a siege of five months. In 1566 he led a final expedition against Hungary, and died during the night of the 5th September, while besieging the town of Szegedin, three days before its surrender. He was succeeded by his only surviving son, Selim II. See Ancillon, *Histoire de la Vie de S.* (Par. 1702); Von Hammer, *Geschichte des Osmanischen Reichs* (10 vols. Pesth, 1827-34); and Creasy's *History of the Ottoman Turks* (new ed. Lond. 1877).

Somâ'li Land, a little-known maritime region of E. Africa, forming a triangle of which Cape Guardafui is the apex. Its western boundary, dividing S. L. from Shoa and the Galla country, is uncertain, but is generally regarded as being formed by a line drawn from Zeyla on the Gulf of Aden to the head-waters of the river Jub, or Juba, and thence by the course of that stream to its mouth, on the equator. The coast usually consists of a belt of low flat land, which rises inland in terraces to a plateau from 4000 to 6000 feet high, which is in turn succeeded by mountains reaching a height of 9500 feet. The country is for the most part grassy and open, and abounds with elephants, giraffes, rhinoceroses, zebras, antelopes, ostriches, &c. The inhabitants, who are extremely fierce and uncivilised, are of mixed Abyssinian and Arab descent, and have a dark-brown complexion and fine physique. They are pastoral nomads, but their country possesses great undeveloped resources of coffee, cotton, gums, spices, hides, ivory, and ostrich feathers. The chief trading ports are Berberah and Zeyla, both on the Gulf of Aden, but the largest town is Harar (pop. 35,000), 175 miles S.W. of Zeyla. Berberah has an extensive annual fair, of very ancient date. Since 1873, at the request of the local chiefs, Egypt has exercised a protectorate over Berberah, and now claims possession of the country as far as 10° N. lat. The Mushah Islands, at the N. extremity of the Somâli coast, were ceded to Britain in 1840, and in 1862 the French purchased the neighbouring port of Obokh.

Sombrere'te, a town of Mexico, state of Zacatecas, 65 miles N.W. of the town of that name, is the centre of a silver-mining district, said to have contained the richest metallic veins ever discovered, but now almost worked out. Pop. 14,000.

Som'ers, John, Baron S. of Evesham, a celebrated English statesman, was born, probably 4th March 1652, at Worcester, where his father was an attorney. It was at first intended that he should adopt his father's profession, but in 1667 he entered Trinity College, Oxford, and in 1669 became a fellow of the Middle Temple, being called to the bar in 1676. He soon became known as a rising young lawyer and Whig politician. It was the Revolution which first brought him into real prominence. The Declaration of Rights was drawn up and presented by him, and he was a leading member of the convention Parliament. Under William III. he became successively Solicitor-General and Attorney-General, and in 1693 Lord Keeper of the Great Seal. In 1697 he was raised to the peerage, and made Lord Chancellor; but when the Tory influence shortly afterwards preponderated he was deprived of the seals (1700) and impeached by the House of Commons (1701), but ultimately acquitted by the House of Lords. The Whig reaction which followed Marlborough's first victories restored him to power, and he was instrumental in bringing about the union of England and Scotland in 1707. In 1710 he finally retired from office, and died 26th April 1716. Besides being a statesman of unusual acuteness and integrity, S. was a great orator, a sound lawyer, and a distinguished patron of literary men, such as Newton, Locke, Bayle, and Addison, the last of whom dedicated to him the first volume of the *Spectator*. S. was one of the first Englishmen to appreciate and assert the sovereign genius of Milton. A collection of state papers, from originals in his library, was edited under the title of the *S. Tracts* (1748-52), and a new edition was published by Sir Walter Scott (1809-15).

Som'erset Her'ald, one of the six heralds, composing, with the three Kings-of-Arms and the four Pursuivants, the Heralds' College of England.

Som'erset House, a fine quadrangular building in the Strand, London, the S. front with a noble façade facing the Victoria Embankment, used for various civil departments of the Government. It was erected in 1776-86, on the site of a palace of the Protector Somerset, from the designs of Sir William Chambers. There are 3600 windows in the building. About 600 Government officials are employed here daily, at an annual cost of £275,000. The principal departments accommodated are the Inland Revenue Office, the Registrar-General's Office,

the Audit Office, and the offices connected with Doctors' Commons. Postage-stamps, stamps on country bank-notes, and medicine-labels are printed in the establishment. The Royal and most of the other learned societies now accommodated at Burlington House had formerly their rooms here. The E. wing of the building is occupied by King's College.

Som'ersetshire, a county in the W. of England, on the S. side of the Bristol Channel. Area, 1641 sq. miles, or 1,049,815 acres; pop. (1871) 463,483. The Quantock, Polden, and Mendip Hills (q. v.) cross the country from S.E. to N.W. To the W. of the Quantocks is the hilly district which contains Brendon Hill and Exmoor (with Dunkery Beacon, 1668 feet high). Between the Quantocks and Polden Hill is the valley which the Tone and Parret drain into Bridgewater Bay, while E. of Polden the valley containing Sedgemoor is drained by the Ax and the Brue. N. of the Mendips are the Yeo and Avon, with its tributary the Frome. Excepting the slates and red sandstones of the Devonian which prevail W. of the Quantock Hills, and the various members of the Carboniferous group which crop out here and there along the flanks of the Mendip and Polden Hills, the surface rocks and sea cliffs are mainly of Secondary Formation. The Trias of the S. portion is succeeded towards the N. and E. by the Lias and Oolites so characteristic of the country round Bath and Bristol. In the N.E. extensive collieries are in operation, and the quarrying of 'Bath' stone in the N., and of freestone and slate in the S., are important industries. In the valleys of the Yeo and the Brue are extensive meadow below sea-level, and protected by embankments. The soil of the valleys is fertile, and agriculture is in an advanced state. In 1876, of the 839,731 acres in cultivation, 144,294 were under corn-crops, 65,460 under green-crops, and 550,503 were permanent pasture (exclusive of heath or mountain land). There was also about 20,000 acres of forest. In that year the county contained 32,631 horses used for agricultural purposes, 201,472 cattle, 677,765 sheep, and 89,272 pigs. In 1876 there were raised in S. 650,415 tons of coal (from the forty-five collieries), 44,299 tons of iron (value £31,110), and (from the two lead mines) 578 tons of lead ore, producing 301 of lead. Calamine and zinc are also wrought. In 1870 the value of assessed property was £2,204,407. The Romans have left numerous camps and indications of an amphitheatre at Bath. Traits of the original Celtic occupation are noticeable in the population, and the topography is in some respects strongly Celtic; but the district was firmly grasped by the W. Saxons, and became one of their most important settlements. It early embraced Christianity, and the Abbey of Glastonbury (q. v.) and the Cathedral of Wells testify to its ecclesiastical antiquity and renown. Many interesting relics of medieval ecclesiastical sculpture are described in *An Historical and Descriptive Account of the Old Stone Crosses of S.* by Charles Pooley, F.S.A. (Lond. 1877).

Som'erville, Mrs. Mary, born in Roxburghshire, Scotland, December 26, 1780, was the daughter of Vice-Admiral Sir William George Fairfax, who served at Camperdown as Lord Duncan's flag captain. Her love of study and high intellectual capacity were early perceived by her uncle, afterwards her father-in-law, Dr. S. of Jedburgh; but in her literary or scientific studies she received anything but encouragement from her father or her first husband, Mr. Samuel Greig, whom she married in 1804. This latter event, however, brought the beautiful but diffident 'Rose of Jedwood' to London, where she was left very much alone, and found leisure to carry out a systematic study of the mathematical sciences, sketched out for her by Professor Wallace of Edinburgh. In 1807 she returned to her father's house at Burntisland, a widow with two sons. Several years later she married her cousin William S., in whom she found a real intellectual helpmate, and through whom she gained access to the brilliant scientific society of which she soon became a distinguished member. With the chief scientists of the day she formed an intimate friendship—Laplace, Arago, Cuvier, Gay-Lussac, Herschel, Whewell, Babbage, &c. She was the first to whom Wollaston showed the dark lines across the solar spectrum—a discovery which laid the foundation of Spectrum Analysis (q. v.). In 1827 she was induced by Lord Brougham to undertake a popular exposition of Laplace's *Mécanique Céleste*, and the publication of the *Mechanism of the Heavens* in 1831 gained her a reputation which has never faded. Testimonials and honours showered upon her from societies at home and abroad; her bust was set in the hall of the Royal Society, and from Government she received an annual pension of £200, afterwards increased to £300. Her *Connection of the Physical Sciences* (1834) has passed through nine editions, and contains the first conception of the mutual transformability of the various 'forces' of nature—a conception which has now ripened into the theory of Energy (q. v.); her *Physical Geography* (1849) was the first systematic treatment of phenomena which still lack the broad binding principles that science requires; and her *Microscopic and Molecular Science* (1860) attests the singular vigour of intellect which Mrs. S. long enjoyed. After her husband's death in 1860, she retired to Naples, where she died, November 29, 1872. Though she has left behind her nothing of great originality, she easily followed where others led, fully mastering even in her advanced age the modern developments of quaternions and the higher algebra. See *Personal Recollections from Early Life to Old Age of Mary S., with Selections from her Correspondence*, edited by her daughter, Martha S. (Lond. 1873).

Som'erville, William, born at Edstone, Warwickshire, in 1692, from Winchester passed to New College, Oxford, but left the university without a degree, and settled on his ancestral property. Here, open-handed and extravagant, the 'squire poet' involved himself in debt, and 'latterly,' says his friend Shenstone, 'was forced to drink himself into pains of the body to get rid of the pains of the mind.' He died at Edstone, 14th July 1743. Addison he pronounced to be 'with equal genius but superior art' to Shakespeare; but his own poems, mostly on country life, are better than his estimate of others' poetry. They include *The Two Springs, a Fable* (1725), *Occasional Poems* (1727), and the blank-verse *Chase* (1735), his finest work.

Sometsu'ki Ware, a species of Japanese porcelain decorated under the glaze with ornaments in a blue pigment obtained from cobalt ore. It is made principally for domestic use. Another kind, manufactured at Hizen for the foreign market, bears coloured enamels fused on the glaze.

Somme (Lat. *Samara*), a river of France, rises in the department of Aisne, near St. Quentin, flows S.S.W. for 20 miles, then enters the department of S., and after a bend northwards to Peronne, flows N.W. to the English Channel. Length, 116 miles. It is navigable to Amiens, above which place a lateral canal connects its basin with the canal of St. Quentin, and hence with the whole river system of France.

Somme, a department in the N. of France, between Seine-Inférieure and Pas de Calais. Area, 2378 sq. miles; pop. (1877) 556,641. Its soil is argillaceous sand, and its surface an undulating plain interspersed with slight chalk hills. A large tract in the N. has been reclaimed from the sea. Agriculture, the chief occupation, is in a state of high advancement. In 1876 the 225,000 acres under wheat produced 4,248,000 bushels. Cattle, horses, and poultry abound, and much cider is made. There are considerable textile industries and chemical works. The chief town is Amiens (q. v.).

Somnam'bulism (Lat. 'sleep-walking') is the name given to a peculiar condition wherein during profound sleep certain actions are performed. S. may be said to resemble an acted dream. The sleep-walker may rise from his bed, and may in safety proceed along the most perilous places, such as the ledge of a house-roof. In other instances difficult problems have been known to be solved during S. or an allied state, the person awaking in the morning utterly unconscious of having left his couch during the night. Dr. Carpenter says that in S. 'the controlling power of the will over the current of thought is entirely suspended,' and 'all the actions are directly prompted by the ideas which possess the mind.' Ordinary *abstraction* is allied to S., since in a fit of abstraction a person will automatically perform many acts requiring care or skill, the mind dealing with some utterly different matter.

Artificial S. is induced in mesmerism, and the consciousness is for the time entirely absorbed by one set of ideas.

Somnauth Pattan ('the town of the lord of the moon'), a town on the S.W. coast of the peninsula of Kattywar, India, in the petty native state of Soreth, 210 miles S.W. of Ahmedabad, and 163 W. of Surat. It is celebrated as one of the twelve original seats of Siva worship in India, and for the temple

destroyed by Mahmud of Ghuzni in 1025. The town is still strongly fortified, and chiefly inhabited by Mohammedans, who have erected many mosques. The ruins of the great temple indicate its former grandeur, and the spot has recently revived as a place of pilgrimage. The name is known in modern history on account of the proposal of Lord Ellenborough in 1842 to restore the sandalwood gates of Somnauth from the tomb of the conqueror of Ghuzni, 'avenging the insult of 800 years.' Certain gates were actually carried from Afghanistan to Agra, where they now lie, as their progress was stopped by order of the home government. That they are the original gates of Somnauth, however, has been strongly denied.

Sona'ta (Ital. *sonare*, 'to sound'), a free musical composition for one or more instruments, similar to the cantata for the voice. When for three instruments it is called a trio, when for four a quartett, and so on, the S. form being, however, retained. A symphony is a S. for the entire orchestra.

The compositions known as sonatas at the beginning of the 17th c. had only one movement. Lully, Purcell, and Corelli are among the most remarkable of the old S. composers. Through Haydn, Mozart, and Beethoven it has been brought to a perfection which has scarcely been equalled since, even by such fine composers as Dussek, Weber, Onslow, Field, and Schubert. Before the time of Beethoven it usually consisted of three movements—an andante, a minuet, and an allegro. Beethoven introduced the scherzo in the S. which he used sometimes to supersede, and sometimes in addition to the minuet. There is now a broad general plan according to which all sonatas are composed.

A modern S. in four movements consists usually of (1) an allegro, (2) an adagio or andante, (3) a scherzo or minuet, and (4) an allegro forming the finale. In the first movement, which has sometimes an introduction and a coda, there are two leading themes of varied character, one grave and serious, the other spirited and lively. The second part of the first movement forms a kind of free fantasia. The andante, which forms the second movement, should be in broad contrast to the opening allegro. A trio is [illegible]ally appended to the minuet. If the scherzo be used, it [illegible]s a vehicle for quaint fantastic thought and odd outbursts o[illegible]mour. The closing allegro is brilliant and triumphant, and [illegible] usually composed in rondo form. The first and last move[illegible] of the S. have the same tonic which gives its name to the [illegible], as S. in A major, &c.; but the first may be in the majo[illegible]d the last in the minor mode, or *vice versa*. The other m[illegible]ments are generally in different, but in nearly related keys.

Son'chus. Se[illegible] THISTLE.

Sondeli (*Sorex* [illegible]*nus*), a species of shrew-mice (see SOREX), also named the M[illegible]uron, and musk-rat of India. It exudes a strong odour of [illegible] from the inguinal or abdominal glands. Although named [illegible]sk-rat,' it is not a true rat, belonging to the order *Insecti*[illegible] yet it is rat-like in form and size. Its fur is a chestnut hu[illegible]ve and grey beneath.

Son'derbu[illegible] fortified town of Prussia, province of Schleswig-Holstein, [illegible]he W. coast of the island of Alsen. It was in great part [illegible]yed by the Prussian batteries April 5, 1864, and its fine o[illegible]tle is now converted into a Prussian barrack. Pop. (1875) 58[illegible]

Son'dersha[illegible], capital of the principality of Schwarzburg-S., Germany, o[illegible] Bebra-Wipper, 31⅜ miles N.N.W. of Erfurt by rail. It ha[illegible]ne schloss and considerable trade. Pop. (1875) 5723.

Sone or **So**[illegible] a large river of Central India, rising in the native state [illegible]ewah, only a few miles from the sources of the Nerbudda a[illegible] Byturni, and flowing N.E. joins the Ganges about 17 miles [illegible]e Patna city, after a total course of 465 miles. It has b[illegible]entified with the *Eranoboas* of the Greek geographers, an[illegible]e is little doubt that its former junction with the Gange[illegible] at Patna itself, exactly opposite the confluence of the [illegible] For 350 miles it runs through a hilly tract, and for 10[illegible]s through the plains of S. Behar; but it has throughout [illegible]aracter of a mountain-torrent, and is useless for navigati[illegible] Immense quantities, however, of bamboos are floated dow[illegible]he sandy bed is in some places 3 miles wide, and is en[illegible] filled by floods during the rainy season; but in the summ[illegible] stream dwindles to 100 yards wide, and is fordable. It abounds with excellent fish. At Koelwar, where it is joined by its chief tributary, the Koel, it is crossed by the E. Indian Railway, on a lattice girder bridge.

The S. canal system was commenced in 1869, to irrigate the districts S. of the Ganges under the hills from Mirzapore to Monghyr, and also for navigation. The water is taken off by an *anicut* or weir at Dehri, where there is fixed a large engineering establishment. Up to January 1875, £800,000 had been expended in Shahabad district alone, where there are three independent canals. In 1873-74, the year of scarcity, the incomplete channels were used to irrigate 160,000 acres, and gave employment to 40,000 persons

Song (Old. Eng. *sang*, Ger. *gesang*), a little poem intended to be sung or uttered with musical modulations, and usually divided into verses, with a refrain frequently sung in chorus. Almost every country has its national, war, patriotic, love, and convivial songs, which, even if lacking cultivation, are often superior to those of greater poetical and musical pretensions, on account of their native strength and simplicity, and their depth of genuine sentiment and fine natural passion. The *lieder* of German composers take the highest rank among studied compositions of this nature, but Italy, France, and England have in the present century produced many fine S.-writers. A S. in its highest form, when beautiful music and words are united, is a dual product of art to which there are few parallels. In the music the sentiment of the words should be reflected and the gradations of feeling and emotions carefully and faithfully expressed. A hymn is a S. of a religious character. The ballad, a favourite class of S., usually takes a narrative form, relating a short story of action, amour, or adventure, and partaking, as the case may be, of a sentimental, serious, or humorous character. When songs are composed for two voices they are called duets; for three voices trios, and so on; and when for a large number of voices in harmony, Part Songs (q. v.).

Songhay', a region of the Sudan, Africa, on both banks of the Niger, below the great bend of that river in 17° 10' N. lat. For several centuries it was the seat of a powerful Negro empire, which at one time extended from Houssa (q. v.) to Morocco. In 1607 it was conquered by the Moors, who were unable to hold it, and it is at the present time split up into a number of petty sovereignties. The chief towns are Gogo, Darghol, and Kulman.

Sonn'et, The, was invented early in the 13th c. by Peter de Vinea, chancellor to the emperor Friedrich II. It is a poem consisting of fourteen iambic decasyllabic or hendecasyllabic lines. The first eight form two quatrains, the rhymes of the first quatrain always alternating. The leading thought is expressed by these quatrains, and is enlarged in the remainder of the poem, which falls into two terzettes. Here, although there are but six lines, there must be three rhymes, never to be arranged in couplets. Wyatt was the first to write English sonnets according to rigid rules; and its masters in our literature are Surrey, Spenser, Shakespeare, Milton, Wordsworth, and Keats. Drummond of Hawthornden deserves remembrance, though he cannot claim distinction. Shakespeare's sonnets, however, are not strictly in form, but consist of three four-lined stanzas, of alternate rhymes, with a couplet added. See Tomlinson, *The Sonnet; its Origin, Structure, and Place in Poetry* (Lond. 1878).

Son of God is the name applied to Christ as the Second Person of the Godhead. It was applied to Him first as the Messiah (q. v.). According to the Jews, God held intercourse with men by His Memra (Word), by His Sophia (Wisdom), or by His angel or messenger. Later Jewish thought personified this Divine Wisdom, and identified it with the Messiah. In Alexandria speculation on the subject approached nearer to that of Plato (B.C. 400), who taught that the Universe was fashioned by the Logos or active thought of the one Supreme God. This modification of the conception of Deity is the key to all the allegorising conceptions of Philo (q. v.), whose theology is founded on a combination of Jewish-Platonic and Neo-Platonic conceptions. It was, by the Platonic Logos, 'the pattern,' and 'first-born of God,' the 'S. of G.,' &c., that the Supreme Being acted on the world. In the New Testament (John's Gospel), the Logos is identified with Jesus Christ. The idea which the earlier Christian Fathers attached to the term Logos was indefinite. According-

to some it meant the personal existence of Christ before the incarnation; to others it was an abstraction—idea, reason, word, revelation, &c. Accordingly Origen (q. v.) adopted the phrase S. of G. as a more definite expression for the personality of the Logos, whom he held to have been begotten from all eternity. See CHRISTOLOGY.

Sono'ra, a state of the Mexican Confederation, bounded W. by the Gulf of California, and N. by the United States Territory of Arizona. Area, 123,466 sq. miles. Among the spurs of the Sierra Madre on the E. there are many very fertile valleys, and much of the plain country in the W. and N. is also highly productive, though there are numerous stretches of arid sandy soil. The principal products are wheat, maize, sugar, rice, cotton, tobacco, and tropical fruits, two crops annually being produced in some districts. The mineral wealth is said to be considerable, but it has not been developed. Of the population of about 147,000 no less than 100,000 are nomadic Indians. The civilised Indians are said to be the most industrious section of the community, the inhabitants of European descent being indolent and lawless.

Sonthals (*Santáls*), an aboriginal hill tribe found in S. Bengal, India, who have attracted considerable attention. Their physiognomy is distinctly of a negroid type, but their philological and ethnical affinities have not been definitely ascertained. The S. are a nomad race, with little affection for home, but a strong reverence for mountains and rivers. They supply a large portion of the hired labour of the plains, especially in indigo factories. In 1855, owing to the exactions of Hindu landlords and money-lenders, they broke into an armed rebellion, which required to be repressed by vigorous measures. At the same time the tract where they are most numerous was formed into a new district, with exceptional regulations, called the Sonthal Pergunnahs. Area, 5488 sq. miles; pop. (1872) 1,259,287, of whom 850,000 are in British territory. The *district* of the S. covers the Rajmehal hills, and is also peopled by another aboriginal tribe of Pahariya Mals. The chief towns are Sahibgunje and Rajmehal, both on the Ganges, where the river traffic is transferred to and from the railway. The capital is Dumka. In the last few years the S. have shown a tendency to adopt Hinduism in its entirety. A few are Christians. See *Annals of Rural Bengal*, by Dr. W. W. Hunter (1st ed. Lond. 1868); Colonel Dalton's *Descriptive Ethnology of Bengal* (Calcutta 1872).

Soo'soo (*Platanista Gangeticus*), otherwise known as the Gangetic Dolphin, is a species of *Cetacea* (q. v.) belonging to the dolphin family. It differs from other members of its group in inhabiting fresh waters, being found in the Ganges. It attains a length of 10 or 12 feet, has a very prominent and slender muzzle, armed with numerous teeth, has small eyes, and a blow-hole in the form of a vertical slit. The flesh of the S. is described as palatable. It is not eaten in India, but the fat is in repute for its medicinal qualities.

Soot, a carbonaceous powder, condensed from the smoke of coal or wood. S. from pit-coal contains salts of ammonia, and hence possesses manurial value. It is applied sparsely as a top-dressing for grass. Gardeners employ it as an insecticide. Wood-S. was formerly an esteemed vermifuge and antiseptic.

Sophi'a, a town of Bulgaria. See SOFIA.

Sophi'a, St. (Turk. *Aya Sofia*), the name of the famous church built at Constantinople by Constantine on the translation thither of the seat of empire (325-6 A.D.). It was dedicated to the *Hagia Sophia* ('holy wisdom,' *i.e.*, the Logos or second person of the Trinity), and was rebuilt and extended by Constantine in 360. Destroyed by fire in 404, it was rebuilt by Theodosius the Younger in 415, to be again reduced to ashes during the *Nikē* ('Battle') of the Blue and Green factions (532). Forty days later Justinian set about its re-erection with all the ardour of piety. The design was formed by Anthemius, whose genius directed the hands of ten thousand workmen, and within six years the mighty church was consecrated, and Justinian exclaimed during the solemn festival, 'Glory be to God, who hath thought me worthy to accomplish so great a work: I have vanquished thee, O Solomon!' Before twenty years had elapsed, an earthquake overthrew part of the dome, but the damage was repaired, and in the thirty-sixth year of his reign Justinian celebrated the second dedication of the temple, which remains after twelve centuries a stately monument of his fame. St. S. is 269 feet long by 243 broad, and its famous dome, lighted by forty windows, has a diameter of 115 feet, and rises, with a slight curve, to a height from the pavement of 180 feet. The peculiar feature of the church is the placing of the dome, not upon piers and arches on every side, but upon semi-domes E. and W., by which means is obtained a vast space, over 200 feet long by 100 wide, unencumbered by columns. The whole frame of the edifice is constructed of bricks, but the baser material is concealed by a crust of marble, and the interior, comprising the cupola, the two large and six smaller semi-domes, the hundred columns, the pavement, and the walls with their mosaics, presents the appearance of a glowing, harmonious picture. 'The Triumph of Christ was adorned with the last spoils of paganism' (Gibbon). The gold cross which formerly surmounted the dome weighed 75 lbs. The altar and the holy vases and vestments were of purest gold, enriched with priceless gems. According to ancient authorities, the total cost of the structure amounted to 320,000 *pounds* (of silver or gold?), equivalent, at the lowest computation, to one million sterling. As a work of art, St. S. is spoken of disparagingly by Gibbon, but M. Fossati, who was employed by the Sultan to restore part of the building, asserts that he 'knows not any other monument in the world the proportions of which are so vast and majestic.' Fergusson says that it has the finest domical interior of ancient or modern times, both for appropriateness and beauty; adding that for the purposes of Protestant worship it affords an infinitely better model for imitation than anything our own mediæval architects ever produced. (See BYZANTINE ARCHITECTURE.) On the occupation of Constantinople by the Turks (1343), St. S. was converted into a mosque, the Christian emblems being either removed or defaced, and the mosaic pictures hidden under a coating of plaster. Selim II. added four minarets to the building in 1566. Abdul Medjid (1822-61), who in 1847 ordered a complete restoration of St. S., authorised copies of the newly-revealed mosaics to be taken by German artists, and these were subsequently published at the cost of the Prussian Government. The decorations, however, have again been plastered over. See Neale, *Eastern Church* (Lond. 1850, vol. i., p. 237); G. Fossati, *Aya Sofia, as Recently Restored by Order of Abdul Medjid* (Lond. 1852); W. Salzenburg, *Alt-Christliche Bau-denkmale von Konstantinopel, vom 5 bis 12 Jahrh.* (Berl. 1854); Haghes, *Aya Sofia* (Lond. 1856; Fergusson, *Handbook of Architecture* (new ed. 1870); and A. de Amicis, *Constantinople* (Eng. trans. by Tilton, Lond. 1878).

Sophi'a Dorothe'a, Electoral Princess of Hanover, known as the Princess of Ahlden, was born September 15, 1666, the daughter and heiress of Georg Wilhelm Duke of Braunschweig-Lüneberg-Celle. She was married, in spite of her extreme repugnance, in 1682 to her cousin, Georg Ludwig, Electoral Prince Hanover, afterwards George I. of England, and was the mother of King George II. and of Sophia Dorothea, the wife of Friedrich Wilhelm I. of Prussia. The severity of the treatment she experienced from her morose husband drove her to desperation, and she determined to fly with Graf Philipp Christoph von Königsmarck to Wolfenbüttel; but the intrigue having been discovered by the Grafin von Platen, the Graf was slain by the electoral guards as he came from the chamber of the princess, July 1, 1694, and S., after having been divorced, December 28, 1694, was imprisoned in the old castle of Ahlden, where she died, November 13, 1726. See *Die Herzogin von Ahlden* (Leip. 1852).

Soph'ists, The, were a race of philosophers, thinkers, and teachers, who flourished in Greece during the 4th and 5th centuries B.C. While there is no body of systematic doctrine to which they all adhered, yet their tendency was the same. This tendency may be thus briefly indicated. Early Hellenic Philosophy (q. v.) had entirely occupied itself with speculations regarding the origin and nature of the material universe. The theories thus originated were crude and contradictory, as might be expected when we consider that physical science was in its infancy. The inquiring Greek intellect became dissatisfied with such results, and the centre of gravity, so to speak, was changed—man himself became the object of philosophy. But at first man as an individual only was considered. The old, fair, simple, Hellenic life had become a thing of the past. 'What was established and had come down so, had lost its authority; political regulation appeared as arbitrary restriction; moral principle as a result of calculated political

training; faith in the gods as human invention for the intimidation of free effort; piety as a statute of human origin, which every man had a right to alter by the art of persuasion.' To an age believing such things, the S. came preaching that what to each man seemed good was good for him, and that save the individual consciousness there was no standard of right or wrong,—in short, 'man is the measure of all things.' But the S., moreover, were teachers for money of the most various subjects—morals, rhetoric, politics, grammar, etymology, mathematics, the art of war, &c. Many of them travelled from place to place, and made it their boast that they could, without notice, discourse properly on any given subject. This picture is dark enough, but it has its bright side. They were the founders of the proper treatment of many branches of pure and applied philosophy, they brought Attic prose to a high state of perfection, and they widely diffused knowledge, and created a desire for learning which was fruitful of good results. Besides this, many of them, as Prodicus of Ceos, were men of an elevated moral character. The chief S. were Protagoras of Abdera, Gorgias of Leontini, and Hippias of Elis. The later S. were a more degenerate race than their predecessors. Thrasymachus, Euthydemus, and Dionysodorus may be mentioned.

The doctrines of the S. were combated by the life of Socrates and the writings of Plato—it is from the latter, indeed, that we derive our chief knowledge of them. From the lofty standpoint of the Platonic philosophy the S. appear at a great disadvantage, but on the whole Plato, while condemning their doctrines, sees in them the representatives of certain bad principles of human nature, and regards them as men called forth by the circumstances of the time. In accordance with the principles of the Platonic dialogues, the S. who therein appear often take a share in the development of the argument, and much of the truth Plato means to convey is put into their mouths—see, for instance, the *Protagoras*.

It was long the fashion to treat the S. as mere quacks and charlatans. Mr. Grote (*History of Greece*, vii. 474-544) took quite the opposite view, and vindicated their position as philosophers, and their character as men. The generally-received modern opinion, as stated above, lies somewhere between these two extremes. Besides the books referred to above, excellent accounts of the S. are given in the Histories of Philosophy by Zeller, Schwegler, and Ueberweg.

Soph'ocles, born at Colonus, a mile to the N. of Athens, in 495 B.C., was for his beauty and rare accomplishments chosen to lead the choir that sang the triumph of Salamis (480). He gained the first tragic prize at the Great Dionysia with his *Triptolemus* (468), and Æschylus, mortified, withdrew to Sicily; in 441 S. was himself vanquished by Euripides, but a twelvemonth later retrieved the defeat by his *Antigone*. With Pericles he was one of the ten *strategi* in the Samian War (440-439), and in 413, on the destruction of the Syracusan Expedition, he is thought to have been elected one of ten *probuli*, or guardians of the public safety. The story runs that in extreme old age he asserted his mental vigour, impeached by the jealous Iophon, his only legitimate son, by quoting before the *phratores* the matchless chorus, 'Stranger, thou art standing now,' out of the then unfinished *Œdipus Coloneus*. This his latest work was brought out by the younger S., the second of two natural sons, in 401, that is five years after the poet's death (406). Such are the meagre incidents recorded by antiquity of the great Greek dramatist, seven only of whose hundred tragedies have come down to us—the *Antigone* (440), *Electra*, *Trachiniæ*, *Œdipus Tyranus*, *Ajax*, *Philoctetes* (409), and *Œdipus Coloneus*. No one of these bears traces of the Æschylean style ascribed to his earlier plays. Titans in them give place to men, Nemesis to retribution, fantastic imagery to skilfully-woven plot and subtle analysis of the human mind. The same strong piety that quickened Pheidias' hand is strangely blended with pity for mortals' blindness; and passages lauding the one omnipresent Zeus alternate with instances of 'tragic irony.' Thus here we mark the enormous progress of Athenian thought no less than in the transition from Herodotus to Thucydides; while by their harmony and absolute truth to nature these dramas rank in the world's literature second alone to Shakespeare's. And in the mechanical branches of his art S. made a great advance, by raising the number of actors from two to three, by introducing richer 'properties,' and by increasing the strength of the chorus. Of numerous complete editions the best are Dindorf's (3d ed. 2 vols. Oxf. Clar. Press, 1860) and Schneidewin's (Berl. 1873). Jebb has edited the *Electra* (1867) and *Ajax* (1868); Linwood the *Theban Trilogy*, *i.e.* the *Œdipus Tyranus*, *Œdipus Coloneus*, and *Antigone* (1877), as also Campbell in 1872; Blaydes the *Philoctetes* (1870); Pretor the *Trachiniæ* (1877); and Palmer the *Ajax* (1878). See the introduction to Plumptre's scholarly verse translation (2d ed. 1871); Collins' *S.* in *Ancient Classics for English Readers* (1871), and the Lives by Lessing (Berl. 1790) and Schröll (2d ed. Prague, 1870).

Sopra'no, in music, the treble or highest quality of voice only possessed by females or boys. A S. voice of good range extends from to and sometimes considerably higher. It is the most flexible of human voices, is eminently suited for the joyous, bright, and passionate moods of song and for the expression of lofty and inspiring feelings. The next highest class of voice is called mezzo-S.

So'ra, a town of S. Italy, province of Caserta, on the Garigliano, 37 miles N.N.W. of Gaëta, with considerable manufactures of woollens and paper. Pop. (1874) 12,074.

Sor'au, a town of Prussia, province of Brandenburg, 64 miles S.S.E. of Frankfurt-on-the-Oder by rail, with extensive cloth manufactures, bleaching-fields, print and colour works. Pop. (1875) 13,183.

Sorbonne', an establishment founded at Paris in 1253 by Robert de Sorbon, chaplain to St. Louis, for certain secular priests, who should devote themselves to the study of and gratuitous instruction in theology. Directed by its founder, who also compiled the statutes, it bore at first the title of *Collegium seu Congregatio pauperum Magistrorum Studentium*, and comprised two kinds of members—foundationers, with the right of residence and a vote in the management of the college, and hospitallers or mere associates. It dispensed the three degrees of bachelor, licentiate, and doctor, a candidate for the last of which must for ten years have held various disputations, including a final one maintained without food or rest against twenty opponents from six in the morning till seven o'clock at night. The celebrity of its doctors, the crowds of scholars who sought its degrees, gave the S. a European fame, which steadily grew from the 14th to the 17th c.; from a branch of the theological faculty, it became the faculty itself; its voice was paramount in matters of faith. But after the deathblow dealt it by Jansenism (q. v.) its only sign of life was vain anathemas hurled against the philosophers of the 18th c.; and in 1789 it was suppressed with the other ecclesiastical foundations. The buildings, enlarged and beautified in 1629 by Richelieu, who is buried in the S. Chapel, are at present occupied by the Académie Universitaire de Paris, and by the faculties of letters, sciences, and theology. See PARIS, UNIVERSITY OF, and the works there cited.

Sordi'no (Ital.) in music, a mute used in musical instruments to damp or deaden the sound. When the mutes are to be used, the musical direction is *con sordini*, and when not *senza sordini*.

Sor'ex, a genus of *Insectivorous* quadrupeds, including the various species of Shrew-Mice (q. v.). In this genus—the species of which are to be carefully distinguished from ordinary mice—the upper incisors number six, and the lower incisors four. The upper incisors are very long, and are curved and notched at their bases, and the lower incisors project horizontally. There are no canines, and the molars number eight above and six below. The muzzle is very large and acute, and the feet are provided each with five toes. The limbs are not disproportionate, and the tail is of moderate length.

Sor'gho Grass and **Sor'ghum** is a genus of grasses of the tribe *Andropogoneæ*. By some, however, it is considered a subgenus only of *Andropogon*, and by others it has been placed to *Holcus*. *S. vulgare*, including therein several climatological varieties or allied species, ranks as the most important representative. As a wet crop it is more cultivated than any other grain in India (where it is called Cholum or Jowaree), forming in

some parts the principal support of man and beast; it is also equally appreciated in Africa. The very white flour can be made into bread, porridge, and other food-preparations; the panicles are used for carpet brooms; the fibrous-roots for velvet brushes; a kind of beer is made from the seed; and the thick culms with the foliage form an excellent green fodder. It is also a very prolific grass, a single plant having been noticed to produce 12,700 seeds. In the perennial variety (or species) *S. cernuum*, the stem attains a height of 15 feet, with leaves over a yard long. The grain is imported into Europe for feeding cattle, poultry, &c., and is known commercially as Durra, Guinea corn, and Indian Millet (q. v.). *S. saccharatum*, a tall annual species, native of tropical Asia, is a splendid fodder-grass. From the saccharine juice sugar is obtainable; and in the United States treacle is made from it in large quantity. The stem is also used as a culinary vegetable. A variety or closely allied species, *S. Caffrorum*, is extensively cultivated in S. Africa both by natives and colonists, its produce being known as Kaffir corn.

Soroca'ba, a town in the province of São Paulo, southern Brazil. There are rich iron mines in the vicinity. Pop. 12,000.

Sorr'el (Fr. *surelle*, a diminutive of Low Ger. *suur*, 'sour'), a name given to sundry species of *Rumex* (see DOCK) of the section *Acetosa*. Their acid leaves are used for salad and culinary purposes, particularly in French cookery, and are both agreeable and wholesome. Two species are cultivated, namely, *R. scutatus* and *R. acetosa*, but in Britain, as in comparison with most other European countries, they are scarcely grown as a market vegetable. *R. scutatus* (French or Roman S.) is the most esteemed, the leaves being more succulent and less acid. It is a native of France and Italy, and exists as a semi-naturalised plant about the sites of some old gardens in the United Kingdom. *R. acetosa* is a common British plant of open woods and meadows, extending through the N. temperate zone. Of the garden varieties, the large-leaved 'de Belleville' is the best. *Oxyria raniformis*, of mountain rocks and stream sides, called mountain S., is an excellent pot-herb and antiscorbutic. *R. acetosella*, or sheep's S., so plentiful on dry gravelly ground, is worthless. For wood S. see OXALIDACEÆ. S. contains acid oxalate of potassium, tartaric acid, and tannic acid.

Sor'rel Tree of N. America is *Eubotrys arborea* (formerly *Lyonia* and *Andromeda*), a beautiful ericaceous tree of 40–50 feet high, occurring in the valleys of the Alleghany Mountains from Pennsylvania to Florida. The ovoid-cylindrical white flowers are arranged in large terminal panicles, and the oval-oblong leaves are large, smooth, and shining, with a very pleasant acid taste. They 'are frequently made use of by hunters in the mountains to alleviate thirst' (*Michaux*).

Sorren'to (Lat. *Surrentum*), a small town of S. Italy, on a little bay of the same name near the S. extremity of the Golfo di Napoli, 7 miles S.W. of the railway station of Castellamare. It has a cathedral and a few ruins of doubtful antiquity; manufactures silk goods and articles of inlaid wood (*tarsia*), and is a favourite summer resort. S. is the birthplace of Torquato Tasso (q. v.), a marble statue of whom was erected here in 1873. In its immediate neighbourhood to the N.E. is the Piano di S., one of the most fertile parts of Italy. Pop. (1874) 7194.

Sor'tie (Fr. 'a going out'), an attack by the besieged in a beleaguered place upon the investing army.

Sor'tes Bib'licæ. See BIBLIOMANCY.

Sostenu'to, or **Sostenen'do** (It. 'sustaining'), a word in music denoting that the notes to which it is affixed are to be steadily sustained during their full duration.

Soth'ern, Edward Askew, a successful modern comedian, was born in Liverpool, April 1, 1830. His earliest engagement on the stage was at the National Theatre, Boston, U.S., in 1852. For the next six years he played at Wallack's and Keene's theatres, New York. In 1858 he appeared at the latter theatre as 'Lord Dundreary,' in the play of *Our American Cousin*, a perfect piece of caricature which immediately hit the public fancy. It is to this exquisite piece of acting that Mr. S. owes most of his popularity. During the last twenty years he has repeated it many thousands of times in America, at the Haymarket Theatre, London, and in the English provinces. Perhaps his next best character is 'David Garrick' in T. W. Robertson's play of that name.

Sotteville-lès-Rouen, a town in France, department of Seine-Inférieure, on the Seine, with cotton spinning and weaving, and manufactures of soap and chemicals. Pop. (1876) 11,278.

Sou, or **Sol**, a French coin of 5 centimes value, or $\frac{1}{20}$th of a franc, derived from the Roman *solidus*, the name by which the old 'aureus' was known after the time of Alexander Severus, in whose reign coins of one-half and one-third the value of the 'aureus' were introduced. The coin continued to be used by the Franks, but it was suppressed by Pippin, who introduced the *solidus argenteus*, equal in value to $\frac{1}{20}$th of a pound, or libra. The old *soldo* of N. and Central Italy corresponded to the S. of France.

Soubise', the name of an old French noble family, which brought all its titles and possessions into the family of Rohan by the marriage in 1557 of its last heiress with René II., Vicomte de Rohan.—**Benjamin de Rohan, Seigneur de S.**, second son of René II., was born at La Rochelle in 1583, and early distinguished himself in the Huguenot cause. On the fall of La Rochelle he retired to London, where he died, October 9, 1642.—**Charles de Rohan, Prince de S.**, with whom the family died out, was born at Paris, July 16, 1715. He early became a favourite of Louis XV., and accompanied him as aide-de-camp in his campaigns (1744–48). In 1748 he became lieutenant-general, and in 1751, by the influence of Mme. de Pompadour, governor of Flanders. On the outbreak of the Seven Years' War in 1756 he received the command of one of the two French armies, but after some successes he was disastrously defeated by Friedrich of Prussia at Rossbach, November 5, 1757, on which he returned to Paris, the subject of a thousand epigrams. In 1758 he led a new army to Germany, and, with the aid of the Duc de Broglie, achieved successes at Sondershausen (July 23) and Lützelburg (October 10). S. was now made a marshal, and in spite of several reverses kept the command until the peace, February 15, 1763. He now returned to court, where, after the death of Pompadour, he became the favourite of Dubarry. He was the only courtier who followed to the tomb the body of the king, and his devotion induced Louis XVI. to request him to retain his place as minister. S. died at Paris, July 4, 1787. Carlyle, in his *History of Friedrich*, sketches him contemptuously; 'a frivolous insignificant being, now pretty much a blank to everybody.'

Soudan'. See SUDAN.

Soufflé (Fr.), a light delicacy made in various ways. Eggs whipped to a froth are the chief ingredient, and in one variety of S. these are stirred up with a stew of ground rice, milk, sugar, and flavouring agents; the whole is then baked in a mould, and sent quickly to table.

Soul. A belief in the existence of something distinct from the body, called the S., and which survives after the death of the body, has prevailed almost universally in all time. According to Herodotus, the ancient Egyptians were the first to maintain the doctrine that the S. of man is immortal; although it appears from the context that he refers only to the more peculiar doctrine of Transmigration (q. v.), which is held by the Hindus to the present day. Among the Egyptians, man was believed to consist of body, S., and spirit; the S. being of a very refined substance, in the form of the body. Among the Hindus, the S. is of two kinds: the supreme S., and the individual S. of living beings, both of which are eternal. The Buddhistic view of the nature and duration of the S. is a point regarding which we are still in doubt.

The doctrine of the immortality of the S. is now one of the first principles of Christianity, although it is nowhere explicitly stated in the Bible. Some of the early Christian Fathers, especially those of the Alexandrian school, adopted a threefold division of man into body, S., and spirit, which afterwards gave place to the twofold division into body and S. When the Gnostic theory of emanations was developed, the Church maintained that the S. is derived from God. This was held for a time by most to be *per traducem*, *i.e.*, by natural generation from the parents, in the same way as the body. But this theory also gave place to another—Creationism (q. v.), according to which each S. was specially created and united with the body in the womb. Some of the early Greek theologians held that the S. was immortal only by its connection with the Spirit, and the theory found supporters in the Eastern Church in later times. In the West, the Schoolmen taught the immortality of the S. as a theolo-

gical truth, and the doctrine was finally declared to be an article of faith by the Lateran Council (1513).

The principal arguments adduced in proof of the immortality of the S., as opposed to materialism, which regards the S. or mind as simply a function of the brain, are these:—1. The relation of the S. to God as moral governor is held to imply and necessitate an eternal duration of being. 2. The whole analogy of nature is opposed to the idea of the destruction of substance, and therefore, it is argued, the S. must be immortal. 3. The goodness of God seems to require it: (1) because it is improbable that he would annihilate his noblest work, after the greater part of its life has been spent in the acquisition of faculties which cannot be used for want of time; and (2) because it is specially improbable that he would have implanted in us an instinctive desire for eternal life and doomed that desire to complete disappointment. See Bonwick, *Egyptian Belief and Modern Thought* (Lond. 1878); M. Williams, *Hinduism* (Lond. 1877); E. White, *Life in Christ* (2d. ed. Lond. 1876); Hagenbach, *Lehrbuch der Dogmengeschichte* (Eng. trans. Edin. 1847).

Soulié, Mechior-Frédéric, a French novelist and playwright, was born at Foix, 23d December 1800, and educated at Nantes and Poitiers. Shut out from the bar by his political opinions, he turned to literature, and in 1824 published a volume of poems, *Les Amours Françaises*. His five-act tragedy, *Roméo et Juliette* (1828) was a great success; a metrical drama, *Christine à Fontainebleau* (1829), an almost greater failure. Nothing daunted, its author sent fifty 'hands'—he had lately established a saw-mill near the Jardin des Plantes—to applaud the *Christine* of his friend and rival Dumas, and the saw-mill proving a loss, produced in eighteen years 150 novels and hardly fewer plays. Of the latter, *La Closerie des Genêts* (1846) still holds its own; amongst his novels—most of them *feuilletons*, marred by the haste and piled-up incidents of their kind—two are remarkable, *Le Mémoires du Diable* (8 vols. 1837-38) for dramatic, inventive brilliancy, *Le Lion Amoureux* (1839) for psychological insight and studied elaboration. S. died at Paris, September 23, 1847. See Champion, *Frédéric S., sa Vie et ses Ouvrages* (Par. 1847).

Soulouque'. See FAUSTINUS.

Souls, Cure of (Lat. 'care'), according to the Episcopal theory, is vested primarily in the bishop, and every priest to whom it is intrusted acts as his deputy. This trust can properly be given only to priests who have received institution to a benefice—rectors and vicars, to whom, therefore, the term curate strictly belongs. In modern times, however, the term has been extended, and even specially applied to priests and deacons acting as deputies for the incumbents.

Soult, Nicolas Jean de Dieu, Duc de Dalmatie, was born March 29, 1769, at Saint-Amans la Bastide (department of Tarn), where his father was a notary. Entering the Royal Infantry as a private in 1785, in less than ten years (1794) he had risen to the rank of General of Brigade, in 1799 he attained that of General of Division, and in 1804 he was made a Marshal of the Empire. His first achievements were on the E. frontier, and in Switzerland under Massena, but from 1805 to 1807 he served under Napoleon's own eye in Germany, and received the title of Duc de Dalmatie for his exertions in carrying out the provisions of the Treaty of Tilsit. Having been sent to Spain in 1808, S., though defeated at Coruña, compelled the English to evacuate the country, and forthwith overran Portugal, where he made the only mistake of his life in delaying so long at Oporto that the sudden advance of Wellesley and Beresford found him unprepared, and he was forced to retreat to Galicia. Quickly rallying, however, he gained several victories, but finding the British lines inexpugnable, he conceived the bold plan of transferring the scene of war to Andalusia, on the rejection of which, due to the jealousy of Joseph Bonaparte, he demanded and obtained his recall. Scarcely had he joined the Grand Army at Lützen, when the disaster of Vittoria showed how little he could be spared from Spain, and he at once returned with full powers; but though his check of Wellington's advance from October 1813 to April 1814 was one of the finest exploits of modern warfare, it could not avert the inevitable downfall of the Empire. On Napoleon's escape from Elba, S., although he had embraced with ardour the cause of Louis XVIII., could not resist the solicitations of his old general, and fought at Waterloo on the Imperialist side. When peace had again been restored, not even abject submission could save S. from banishment, the sentence of which was passed on him on January 12, 1816. In three years, however, he was recalled from his retirement at Berg, and devoted himself from that time to politics and the improvement of the domestic condition of the country. In 1838 S. was sent to England as Envoy Extraordinary on the occasion of Queen Victoria's coronation, and was received with great cordiality by his old antagonist Wellington, and by the whole nation. In 1847 he retired from public life with the honorary title of Marshal-General, and on November 26, 1851, died at his residence, Soultberg, in his native town. He left two children, Napoleon-Hector, Duc de Dalmatie, and Hortense, Marquise de Mornay. See *S.'s Mémoires* (Part I. published 1854); Napier, *History of the Peninsular War*; Salle, *Vie Politique de S.*; Combro, *Vie, &c.* (Par. 1871).

Sound (Dan., Ger., and Old Eng. *Sund*, derived from the root of *swim*), generally a narrow strait separating an island from the mainland or joining two seas. The name is specially given to the strait (Dan. *Öresund*, 'ear-sound') which connects the Cattegat with the Baltic, and lies between Sweden and the Danish island of Sjælland. The dues which were long levied upon ships passing through the channel were abolished on March 14, 1857, by agreement between Denmark and the interested powers. A pecuniary compensation of £3,937,500, of which Great Britain contributed about a third, was paid to the Danish government, which became bound to maintain the lighthouses and superintend the navigation of the strait. See ELSINORE.

Sound is strictly the sensation which results from the stimulating action of atmospheric or other vibrations upon the aural nerves. Beyond ourselves it has no existence, it is purely subjective, and as a sensation must be carefully distinguished from the vibratory motion which is one of the necessary conditions of its existence. Further, the existence of this vibratory motion is itself conditioned by two things—a disturbing cause, and a suitable medium for transmitting the disturbance to the ear. The study of these in all their possible relations constitutes the science or theory of S. As far as the physics of the subject is concerned it is immaterial what the nature of the medium is, provided it is elastic enough to vibrate; physiology, however, demands that the medium be fluid, otherwise the transmission of the vibrations to the organs of hearing would be impossible. Sounds are usually classified under the two heads of Noises and Musical Sounds. A musical S. is caused by a regular series of exactly similar disturbances or pulses succeeding each other at precisely equal intervals of time; if these conditions are not fulfilled, the S. is a noise. Where law does not rule phenomena no theory can be established; and accordingly we exclude the consideration of all but musical sounds. The nature of these is best studied by considering such a simple case as the note emitted by a tuning-fork. Here, in virtue of the elasticity of the metal, the prongs when displaced from their mean position vibrate about that position according to the simple harmonic law (see HARMONIC MOTION). But the tuning-fork vibrates in the air, a viscous fluid, and as the to-and-fro motion of a board in water gives rise to a series of waves isochronous with the reciprocating motion of the board, in exactly the same way does the fork transfer its vibrations to the particles of air in its immediate vicinity. These similarly affect the next set of particles, and so on. The result, therefore, is true wave motion—the propagation, namely, of a certain *configuration* or grouping among a series of particles. In the case of S., this configuration is a condensation which passes on and is followed by a rarefaction, and the vibrating tuning-fork throws off growing spheres of condensation and rarefaction, just as when a stone is dropped into a pool of water the surface is rippled in concentric circles which spread out from the point where the object has disappeared. See WAVES.

As far as our experience goes, motion in space can only be accomplished through time. We should naturally expect, therefore, that S. requires a definite time to pass from one point in space to another; and all experiments agree in fixing the velocity of S. in dry air at about 332 metres, or 1056 feet per second. This velocity is modified by such causes as the wind, and is affected by the temperature, pressure, and humidity of the air at the time. Assuming Boyle's Law (q. v.), Newton in 1687 calculated from theory the velocity of S., giving for it the expression $\sqrt{\frac{p}{\rho}}$, where p is the pressure and ρ the density of the air at the earth's surface—an expression whose value is 279·95

metres, a sixth smaller than the result given by experiment. This discrepancy was explained by Laplace, who pointed out that there was no account taken of the changes of temperature which occur when air is suddenly compressed and dilated. Thus corrected, theory gives a value differing from the experimental value by less than ½ per cent. S. travels faster in liquids than in gases, and still faster in solids. The experiments at the Lake of Geneva gave 1435 metres per second for the velocity of S. in water at temperature 8° C. According to Wertheim, the velocities in gold, silver, copper, and iron at 20° C. are respectively 1740, 2610, 3560, and 5130 metres per second. The same physicist extended his researches to different kinds of wood, establishing that in all cases the velocity is greatest along the fibre. His values for the velocities along the fibre in pine, beech, birch, and aspen, are respectively 3320, 3340, 4420, and 5080 metres per second.

Passing now to the differences which exist between sounds, we observe that notes may differ in *intensity*, in *pitch*, and in *quality*. Intensity depends upon the amplitude of the vibrations; the longer the vibration path of each particle, the more marked is the difference between the condensation and succeeding rarefaction, the louder the note. Pitch depends upon the number of vibrations in a stated time, or the number of *crests* which impinge upon any stationary object in that time; the shorter the period of each vibration, the greater is the number of vibrations per second, the higher the pitch. Both of these note-characteristics are limited as far as hearing is concerned. A S. may be too weak to be heard; a too intense S. would probably result in the destruction of some part of our organs of hearing. Similarly there are limits of audibility as regards *pitch*—limits which differ for different persons. The vibration numbers of audible notes, however, may be stated as lying between 20 and 38,000. Notes of very high pitch are very painful to the listener, but a note which is excruciating to one may be quite inaudible to another. The third characteristic, *quality* or *character*, corresponding to the French *timbre* and the German *klangfarbe*, 'tone-colour,' depends upon the configuration or internal structure of the individual waves. According to Fourier's theorem (see PERIOD), any periodic function can be expressed in terms of a series of simple harmonic functions, whose periods are 0, 1, ½, ⅓, ¼, ⅕, &c., times the period of the complete function. Now, all musical notes are periodic functions, and, as indicated above, the note given by a tuning-fork is very approximately simple harmonic, and is therefore called a *simple tone*. Not so, however, with the really useful notes in music, such as those given by an organ, a trumpet, a violin, or the human voice. Such notes are *compound tones*, and may be represented as the superposition of a series of simple tones whose periods are related as Fourier's theorem requires. Thus in a violin note of 100 vibrations per second, not only is there the simple harmonic of 100 vibrations which gives the note its pitch, but there are also the simple tones of 200, 300, 400, &c., vibrations, all combining to give a sustained and apparently single sound. These overtones or upper partial tones, as they are frequently called, have no effect upon the pitch, but they decide the quality.

As long as two notes, which are sounded together, are the lower members of the same harmonic scale, they blend together and form what is called a chord. Thus the notes of frequencies 300 and 400, sound agreeably together, being separated from one another by the musical interval known as the *fourth*. When, however, the notes of frequencies 800 and 900 are sounded together, a new phenomenon comes in, which falls next to be considered. Suppose two notes of 100 and 101 vibrations per second respectively to be sounding together. Then the resultant sound-wave will be represented by the superposition of the representative wave-forms of these notes. Once every second the crests are coincident; but between the seconds the one crest is gaining upon the other, until at the end of the second it has gained one whole vibration, and is again coincident. Half-way, therefore, the crest of the one will fill up the trough of the other; and this will have the necessary effect of diminishing the resultant vibration at that instant. Consequently the *intensity* of the sound will then be at a minimum, half a second later at a maximum; and this alternation in intensity will continue as long as the notes are sounded together. To the ear there will seem to be a rise and fall in the intensity occurring every second—in other words, the notes are said to *beat* once in a second. Similarly the notes of frequencies 100 and 102 beat twice in a second; and, in general, the number of beats given by two beating notes is the difference of their vibration numbers. When the notes are very nearly in tune, the beating is slow; and the greater the interval between the notes, the faster the beating, so that if the notes are too distant no distinct beating is heard. The mind, indeed, cannot follow these beats when they occur over 30 times a second; their presence is still evident, however, by the roughness which accompanies the sustained sound. For the ordinary musical scale, notes within a tone of each other have this accompanying roughness, which for semitones becomes very disagreeable, and hence the discordant nature of the chord formed by two successive notes of a diatonic scale. Helmholtz points out that this disagreeable sensation is similar in character to that produced upon the retina by a fluttering light. Beating, however, may take place between notes so far apart that it cannot be due to the cause simply as stated above; and the explanation of this, which is not the least of the services rendered by Helmholtz to our knowledge of the physical basis of music, brings us to the consideration of the *interference* of sounds. It has been implicitly assumed that in dealing with two sets of vibrations we may simply superpose them to get the resultant vibration. Mathematical analysis shows, however, that when two notes of given frequencies are sounded together, additional notes arise whose frequencies are the doubles and the sum and difference of those of the primaries. Hence if we take two notes a fifth apart, say with vibration numbers 400 and 600, the difference tone (200) and the combinational tone (1000) are introduced. The latter cannot always be distinguished, but the former is easily heard as being an octave lower than the lower note of the chord. This low combinational tone was discovered by Tartini (born 1692, died 1770), after whom it is known as *Tartini's beat*. Suppose now that the fifth is slightly out of tune, say 400 and 601 instead of 400 and 600. The first combinational tone has 201 vibrations. In conjunction with the lower primary, this first combinational tone produces a second combinational tone of frequency 199, and these two combinational tones evidently beat, giving two beats per second. This beating of the combinational tones is readily heard upon the harmonium and organ, whose notes are not tuned in perfect intervals but upon the equal temperament system. For the full discussion of these mutual relations of notes, for their connection with the characters of the major and minor chords, and for their bearing upon the development of modern music, the reader is referred to Helmholtz's *Tonempfindungen* (1862, 2d ed. 1870, trans. into English by A. J. Ellis, 1875).

The material systems which by their vibrations affect the atmosphere so as to give rise to these S.-waves, must themselves vibrate in as complex a manner. Indeed, only the simpler cases have as yet been brought within the range of analysis; and the most instructive of these is, perhaps, the stretched uniform cord, such as we have in the piano, harp, violin, &c. If a pulse or wave be sent along such a string, it must be reflected, so to speak, when it comes to the fixed end, and propagated in the reverse direction; and this is what is continually occurring when a stretched cord is vibrating, either as a whole or in two, three, four, or more segments. Two series of equal pulses are propagated along the string in *opposite* directions, and as a necessary consequence certain definite points on the string, mutually equidistant from each other and from the extremities, become stationary, their resultant amplitude being *always* zero. These points, the number of which depends upon the relation which the velocity of the propagated wave has to the length of the string, are called the *nodes*. Including the extremities, the number of nodes is one greater than the number of segments in which the string vibrates. If the string vibrates in two segments, the vibrations are *twice* as fast as those of the same string vibrating as a whole; or, if the fundamental note of the string has 100 vibrations per second, the vibration-number of the note of the doubly-segmented string is 200, that of the trebly-segmented 300, and so on. Thus it is possible to produce from the same string a series of notes harmonically related; not only so, but the string may be made to vibrate in several of these different ways at once, thus giving rise to a *compound* tone. The longer the string the deeper the note, and the greater the number of harmonics which are practically possible. Upon a pianoforte wire these harmonics are easily recognised, and if the dampers are raised, the other wires whose notes correspond to these harmonics are also set in vibration. It is upon this

sympathy between two systems which vibrate in the same times that the phenomena of resonance depend. Every cavity has one or more tones of a certain definite pitch to which it resounds; that is to say, certain tones which, if sounded near or in front of it, will be reinforced in intensity. It is to effect this reinforcement that tuning-forks are mounted upon resonance boxes. Any particular vowel-S. also owes its distinctive quality to the resonance of the mouth-cavity which is necessary for its production. The S. in passing through the mouth has such of its harmonics reinforced which correspond or approximate in pitch to the proper tones of the cavity. Such is the theory of Helmholtz, established upon experiments of Willis and Donders, supplemented by his own—a theory which has been corroborated and extended by the recent researches of Professors Jenkin and Ewing into the nature of vowel sounds by analysis of the impressions upon the tin-foil of a phonograph, which were magnified and transferred to paper by an ingenious mechanical device. See *Transactions of the Royal Society of Edinburgh* for 1877-78; also *Nature*, vol. xviii. pp. 340, 394 (1878).

The vibration of bars, plates, and membranes offers increasing difficulties to the mathematician, but experimentally many interesting facts have been established which serve as landmarks to the analyst. Chladni's figures, produced by bowing a metal plate, two points of which are fixed, and over which minute particles of sand or other powder have been sprinkled, are familiar to many. The plate is set vibrating in segments, and along the nodal lines the particles settle, being tossed from the intermediate portions by the force of the vibrations. The theory of the vibration of membranes has acquired a greater interest since the invention of the phonograph. Sedley Taylor has taken advantage of the laws of interference of light in his phoneidoscope, in which the nodal lines of a vibrating soap-film are shown by the contours of coloured bands, which are viewed by reflected light.

The reflection and refraction of S. in air have many important practical bearings, some of which are considered under ACOUSTICS and ECHO. In a homogeneous atmosphere S. travels in straight lines; but in certain circumstances heterogeneity of the air may occasion considerable deviation of a sonorous ray from its rectilinear course. According to Professor Osborne Reynolds, the diminution of temperature of the air as we ascend must produce upon the S.-rays an effect analogous to the optical phenomenon of the mirage. In other words, the rays are bent upwards, so that the S. may be quite inaudible at a place not very distant from the source of S. On a bright sunny day the vertical variation of temperature is much more rapid than upon a dull or rainy day —consequently the bending of the once horizontal ray is greater, and audibility at a distance diminished. This is the explanation which Reynolds offers of the interesting experiments of Tyndall upon fog-signals, which were worst heard upon clear warm days. See *Philosophical Transactions* for 1874. It is probably the true theory, though Tyndall's own explanation that the sounds were stopped, reflected, and broken up by the flocculent condition of the atmosphere arising from unequal heating or moisture, may also hold in certain cases, and undoubtedly gives a reason for the continued and diminishing echo which followed the blast of a siren, 'when the sea was of glassy smoothness,' and the air apparently clear. The first really scientific treatises upon the subject were the works of Chladni (q. v.), who collected all that was known up to his time, and added much that was new. Savart, Mersenne, Laplace, Lissajoux, Duhamel, Trevelyan, Seebeck, Cagniard de la Tour, and others, made important additions both to the theory and methods of experiment (see SIREN, TREVELYAN, EXPERIMENT, &c.); but not till the appearance of Herschel's article in the *Encyclopædia Metropolitana* was there any systematic treatment of the subject. Airy's small treatise (1869) is a valuable compendium of the mathematics of vibrations. Helmholtz's *Tonempfindungen*, already mentioned, threw a flood of light upon many doubtful points, combining with rare skill the scattered work of his predecessors, and establishing harmony upon a real scientific basis. Sedley Taylor's *S. and Music* (1871) is a popular exposition of many of these discoveries. Mayer's *S.* (1878) is an elementary introduction to the science. The standard treatise upon the subject is Lord Rayleigh's *Theory of S.* (3 vols. 1877-79), which besides developing the theory systematically by the aid of the most powerful methods of modern analysis, contains descriptions and gives the results of the scattered experiments of many generations.

Sound'ing, the operation by which the depth of water in sea, lake, or river is ascertained. Every sea-going vessel is provided with such an apparatus, which consists usually of a 'line and lead.' The lead is lowered till it reaches the bottom, a circumstance indicated by the slackening of the line, the length of which run out gives the approximate depth. As a general rule, soundings are taken only when a vessel is near a coast or reef; and for such shallow depths the ordinary apparatus is sufficient, and such possible sources of error as may arise from currents or from the motion of the ship itself are of little consequence. When, however, soundings are being taken around a coast with a view to the construction of a chart, greater precautions must be taken. Within recent years, the thirst after accurate knowledge regarding the configuration and constitution of the bed of the ocean has resulted in the development of what is significantly called 'deep-sea S.' The great depths to which the line must be run out necessitates the use of a heavier lead, otherwise the motion would get so slow as the bottom was approached that there would be great difficulty noting the exact time at which the bottom was really reached. There is also a limit to the weight which can be used, if it is purposed to pull it up again—a limit fixed by the strength of the rope. Now, however, in all deep-sea soundings the apparatus is so constructed that the weight is disengaged at the moment it reaches the bottom, and only that part drawn up which is intended to bring up a sample of the gravel, sand, mud, or ooze which covers the bottom. The first contrivance of this nature was invented by J. M. Brooke, a midshipman in the United States Navy, about the year 1852, and was successfully employed by the brig *Dolphin* in measuring depths and bringing up specimens from a depth exceeding 200 fathoms. The bull-dog apparatus invented by Steil, the assistant-engineer on board H.M.S. *Bull-Dog* during her famous S. expedition in 1860, was so constructed that when the weight was disengaged two scoops or jaws closed and retained in their grasp a considerable quantity of the substance at the bottom. The apparatus used successfully on board the *Porcupine* in the summers of 1868-69-70 was a modification of Brooke's, and was specially constructed with a view to the more thorough investigation of the nature of the sea-bottom. For a description of it see *The Depths of the Sea*, by Sir C. Wyville Thomson (1873). One great source of error in registering depths by S. is the uncertainty as to the line being quite straight and vertical. Not only do the various undercurrents make bights and bends upon the line, but the motion of the ship must have a serious effect, especially when it is remembered that except in very special cases soundings are taken when the vessel is under some way. Various attempts have been made to devise an instrument which will register only *vertical* descent. The most successful of these hitherto has been 'Massey's Fly,' which is attached above the lead. A modified screw of four brass vanes is set in rotation by the relative up-rush of water as the weight descends, making so many revolutions for a definite descent—revolutions which are registered upon a dial. At great depths, however, its action is somewhat unsatisfactory. Of late years Sir W. Thomson has suggested the use of pianoforte wire instead of rope, and has justified this suggestion by extensive experiments. He has also invented a self-registering S. apparatus, which gives the depth reached by the compression of air in a tube under action of the increased pressure of the water at the depth attained. Siemens' bathometer is a very delicate instrument for indicating slight variations in the force of gravitation, and thus indirectly gives a fairly accurate estimate of the *average* depth of the sea under the spot where the bathometer is.

Sounding-Board, in a pianoforte, a piece of wood, usually the best Swiss fir, placed behind the strings in order that the resonance may be increased. Its edges are attached to the framing, leaving the central part to vibrate freely under the strings when they are struck. The term is also applied to a wood screen placed behind a speaker in halls and churches for acoustic purposes.

Soup is a culinary preparation of the highest value, and in one or other of its endless forms is in almost universal use. The basis of nearly all soups is the juices and soluble portions of animal food obtained by boiling the meat in water, but there are kinds of S. in use in which vegetable matter alone enters. As in the making of S. all edible varieties of animal food—beef, mutton, pork, venison, game, fowls, turtle and terrapin, fish

and molluscs—enter, and as these are variously treated with all known kinds of spices, culinary herbs, vegetables, cereal grains, flours and feculas, it is obvious that the kinds of S. exceed enumeration, and are as variable as the ingenuity and tastes of the cooking and eating public. What is termed *stock* is used for the preparation of all kinds of meat S., the stock being prepared by boiling down in a stock-pot all fragments and remains of meat, fowl, and ham, and in this way much meat not ordinarily presentable at the table is utilised. Soups may be classified under these heads—clear meat S., gravy S., turtle S., game S., poultry S., vegetable S., and broth and fish S. As an example of a most economical, palatable, and nutritious diet the following recipe for pea S. may be quoted: Split pease and meat, 1 lb. of each; pot barley, 1 oz.; salt, 1½ oz.; onions, 1½ oz.; black pepper, $\frac{1}{16}$ oz.; and water, 4 quarts. The pease should be steeped in cold water for twelve hours before boiling. The meat is to be boiled in five pints of water for three hours, and in the resulting stock the pease are to be boiled one hour, after which the S. is passed through a strainer. The salt, pepper, onions, and barley are then added, and boiled for an hour, the water being made up to the four quarts. The addition of fresh vegetables to S. is to be recommended both on the score of health and economy, and the following ingredients go to form a soup used by the Parisian *Administration de l'Assistance Publique*, under the advice of eminent physiologists and physicians. Water, 4 pints; meat with bone, 2 lbs.; carrots, turnips, and other vegetables, 6 oz.; salt, ⅗ oz.; roast onion, ¼ oz. To make S. and broth prepared with meat nutritious, it is necessary to boil slowly, but in such a case the boiled meat becomes perfectly useless for eating. Slow boiling further prevents injurious coagulation of the finely divided albumen and fibrin contained in the S., and it also retards the solution of the gelatinous matter in the meat, a substance of doubtful nutritive value.

South, Robert, a London merchant's son, was born at Hackney in 1633, and educated at Westminster under Dr. Busby. He gained a Christ Church studentship (1651), is said to have been ordained by a deprived bishop (1658), and was appointed Public Orator of Oxford (1660) in reward for a sermon before the king's commissioners against the 'quacks and mountebanks of the late troublous times.' As such he delivered orations at Clarendon's installation in the chancellorship, the double obsequies of Laud and Juxon, the foundation and opening of the Sheldonian Theatre, the conferring of degrees on the Dukes of Monmouth and York and the Princes of Orange and Tuscany. Clarendon made him his domestic chaplain; by 1670 he was a canon of both Westminster and Christ Church; and in 1677 he attended as chaplain Laurence Hyde, the future Earl of Rochester, on his embassy to the Polish court. A curious narrative of his travels, in a letter to Pococke, is given on p. 20 of his *Posthumous Works*. On his return he became rector of Islip and chaplain-in-ordinary to the king, and a sermon where Cromwell figures as a 'bankrupt, beggarly fellow,' is said to have drawn from Charles the offer of a bishopric, which S. declined. Unluckily this sermon is dated a fortnight later than Charles's death, so whether S. had really occasion *nolle episcopari* is hard to say. He loved a Papist scarce better than a Puritan, though passive obedience stayed him from onslaughts on James's measures; but William, whose rule S. simply 'acquiesced in,' found him a warm opponent to comprehensive and toleration schemes. The renegade Sherlock he crushed with Swift-like wit and fury in their great battle on the Trinity (1695); high-church Sacheverell he ardently supported; and he had lately voted for a brother of the attainted Duke of Ormond, when he died, 8th July 1716, and was buried in Westminster Abbey. The 'last great divine of the 16th c.,' as others called him, the 'preacher of the old Cavaliers,' as he called himself, S. was a vehement churchman, a painful scholar, a master of racy yet stately prose. A thinker and theologian of pre-Baconian type, he sneers at the New Philosophy and Royal Society, mentions Descartes but once, and speaks of Milton as 'that blind adder who has spit poison on the King's person and cause.' His *Opera Posthuma Latina* and *Posthumous Works* appeared in 1717, the latter with a Memoir prefixed; his *Sermons Preached upon Several Occasions* have been printed at the Clarendon Press (4 vols. 1842).

Southamp'ton, a seaport, town, and county of itself in Hampshire, England, 78¾ miles W.S.W. from London by rail, stands on a peninsula at the head of S. Water, between the Itchen on the E. and Test or Anton on the W. There are still standing considerable remains of the ancient walls and three of the gates, of which the Bar Gate, with its huge effigies of Bevis and Ascupart, is the most important; but the two-towered building near the East Gate's site, long used as a prison, was partly restored in 1876. On 12th August 1878 the Prince of Wales laid the dedication-stone of St. Mary's, now building as a memorial to Bishop Wilberforce. The new church, as designed by Mr. Street in Early English style, will be 168 feet long by 80 feet wide, with a noble spire 204 feet high; and its total cost is estimated at £18,000. Among the fifteen other churches are the ancient St. Michael's, Holy Rood, and St. Laurence; All Saints', a Grecian structure (restored 1872), St. Luke's (1853-73), St. Matthew's (1869-74), St. Denys', Portswood, designed by the late Sir G. G. Scott (1868), and the French Protestant St. Julien's or God's House. S. has besides twenty-one chapels, and its public buildings include the Hartley Institute (1862-72), with a school of science, museum, and art gallery, the Watts Memorial Hall (1876), the Philharmonic Rooms (1865); the Royal S. Hants Infirmary (1838-68), the headquarters of the Ordnance Survey (1857), and King Edward VI. Grammar-School (1553, rebuilt 1873), which in November 1878 had 9 masters and 70 boys. The Common Fields (60 acres), laid out as an arboretum, contain monuments to Richard Andrews and Isaac Watts, and a Prince-Consort Memorial was erected near the East Gate above-mentioned (1877). New public offices and a sea-wall are about to be erected, and 6 miles of tramway will be completed by the end of 1878. The docks, opened in 1842, cover 28 acres, and include four graving-docks. The income of the dockyard in 1877 was £112,222. In 1877 there entered 4808 vessels of 1,088,579 tons, and cleared 4867 of 855,102 tons. The exports amounted to £8,665,078, the imports to £9,055,179, the customs to £53,597; and on December 31 of that year 306 vessels of 68,369 tons were registered as belonging to S., besides 176 fishing-boats. Shipbuilding is the leading industry, 16 British vessels of 10,520 tons being turned off the stocks in 1877. S. publishes two weekly and two bi-weekly newspapers, and returns two members to Parliament. Pop. (1801) 7913, (1871) 53,741. Founded by Saxons near the site of the Roman *Clausentum*, S. suffered much from the Danes, was a favourite residence of Cnut, and was the port whence Edward III. set sail (1346) and Henry V. (1415). An attack by the French (1377), the landing of Philip of Spain (1554), and the ravages of the Plague (1665), make up the chief points of the history of S. down to the sudden growth in the present century, due to its selection as the mail-packet station for the E. and W. Indies, the Brazils, the Cape, &c. See Sir H. Englefield's *Walk through S.* (South. 1805).

S. Water, an inlet 11 miles long by 2 miles broad, runs inland from the Solent in a north-westerly direction, and, almost entirely landlocked, is one of the safest harbours on our coasts.

South Austra'lia. The British colony thus misleadingly named occupies the central portion of the Australian continent, stretching across its entire breadth, and separating W. Australia from Queensland, New S. Wales, and Victoria. The original colony of S. A. comprised the tract lying to the S. of the parallel of 26° S. lat., and between the meridians of 132° and 141° E. long., an area of 300,000 sq. miles. In 1861 the western boundary was changed to the meridian of 129° E. long., and a region known as 'No Man's Land,' with an area of 83,328 sq. miles, was added to the colony. In 1862 the portion of the continent to the N. of the parallel 26° S. lat., and between the meridians 129° and 138° E. long., was also added to S. A. This last region is known as the Northern Territory, and has an area (exclusive of the islands on its coast) of 531,402 sq. miles, making the total area of the colony 914,730 sq. miles, or 7½ times that of the United Kingdom.

The southern coast of S. A. is penetrated by two long arms of the sea, named respectively Spencer and St. Vincent Gulfs, and the northern coast is broken by bays and lined by islands. Nevertheless good harbours are scarce; the best being those of Port Darwin in the Northern Territory, and Port Adelaide on St. Vincent Gulf, the latter being largely artificial. By far the greater part of the surface of the country consists of level open plains, which in some parts are fertile, in others fairly grassed, and in others again are dreary wastes of sand and stones.

The mountains are few and unimportant, the principal chain, being the Flinder's Range, stretching N.N.E. from the head of St. Vincent Gulf, and attaining in three or four of its summits a height of 3000 feet. Mount Lofty, near Adelaide, is 2334 feet high. Detached ranges of low elevation are found in various parts, and succeed one another half-way across the continent, near the heart of which are Mounts Conway and Charles, estimated to be 4000 feet in height. This central region is found to be much less hopelessly desert than it was at one time believed to be, and many extensive districts within it will support cattle and sheep. Much of this region, however, still remains to be explored. The interior of the Northern Territory is a table-land, with an average height of 300 to 900 feet, between which and the coast there intervenes a low, level tract of alluvial soil, from 30 to 100 miles wide, much of which is overflowed in the rainy season. The only river of any size in S. A. proper is the Murray (see AUSTRALIA), whose lower course lies within the colony; but in the Northern Territory, which enjoys a tropical rainfall, there are several large streams, navigable for seagoing vessels for distances varying from 40 to 100 miles. The chief of these rivers are the Roper, Liverpool, S. Alligator, Adelaide, and Victoria. S. A. possesses a number of large shallow lakes, most of which are salt or brackish, the chief being Lakes Gairdner, Torrens, Eyre, Frame, and Amadeus. Most of these vary much in size according to the dryness of the season, Lakes Eyre and Torrens in particular varying from seas to mere lagoons. From the nature of the drainage, the existence of other large lakes in the unexplored interior is suspected.

The climate of a country stretching, as S. A. does, over 27° of latitude, is necessarily varied. That of the Northern Territory, except on its southern border, is of the ordinary tropical character, with a wet and a dry season, while that of the central region, S. of the tropic, is extremely dry and hot. In the southern districts of the colony the heat for four months is excessive, and scorching winds blowing from the interior frequently raise the temperature to 105° or 110° in the shade. During the remaining eight months the weather, though warm, is very enjoyable, and there is no winter to speak of. Owing to the dryness of the climate the heat is not deleterious to Europeans, who work in it without injury, and the colony is remarkably free from deadly fevers. At Adelaide the mean annual rainfall is 21 inches, and the mean annual temperature 63°.

The fauna and flora of S. A. are much the same as those of Australia generally (see AUSTRALIA). Where rain is sufficiently abundant, the soil is fertile, and produces wheat of the finest quality. In 1878 there were 1,163,646 acres under this crop, and the average yield was nearly 8 bushels per acre. The vine is also largely cultivated, and many excellent wines are made. A commencement has also been made with the drying of raisins and currants, and the cultivation of the almond and olive. The pastoral equals the agricultural interest in importance, and in 1875 there were in the colony 6,120,211 sheep, 185,342 cattle, and 93,122 horses. The breeding of buffaloes has lately been begun on a large scale in the Northern Territory.

The mineral wealth of S. A. is very great. By far the most important item in it is copper, the first discovery of which was made at Kapunda in 1843, and was followed by the discoveries of the far richer deposits at Burra Burra in 1845, Wallaroo in 1860, and Moonta in 1861. The Moonta mines alone have paid over £1,000,000 in dividends, while not a penny of capital was subscribed to work them. Copper is known to exist over a wide area of country at the head of St. Vincent Gulf, and iron is also plentiful in many places, but is not yet wrought. Gold is obtained in the Northern Territory, where deposits of copper, lead, and iron are also known to exist. No coal is found in S. A., but it is brought from New South Wales.

In 1877 the total value of the import trade of S. A. was £4,177,927, and that of the export trade £3,608,667. According to the statistics for 1875, the relative percentages of the staple exports to the total was as follows:—Wool, 42 per cent.; breadstuffs, 36 per cent.; copper, 18 per cent.; miscellaneous, 4 per cent. In 1876 there were 328 miles of railway open, and 512 miles under construction. A line of telegraph stretching across the continent was completed in 1872, and connects the colony by submarine cable with the telegraphic systems of the world generally. In 1875 there were 268 schools, with 16,765 pupils. The pop. of S. A. in 1877 was officially estimated at 230,900, exclusive of the aborigines, whose estimated number in the settled districts was (1871) 3369. The debt of the colony in 1877 was £4,784,000, or £20, 14s. 4½d. per head.

The first settlement in S. A. was made at Glenelg, on 28th December 1836, under the auspices of the South Australian Colonisation Association, acting under powers obtained from the Imperial Government. In 1851 the colony received its first Constitution, which was considerably modified in 1856. At the present time the government is administered by a Governor appointed by the crown, and assisted by an Executive Council responsible to Parliament. The latter is composed of a Legislative Council and a Legislative Assembly, with 18 and 46 members respectively. The government of the Northern Territory is administered by a Resident, stationed at Palmerston, and instructed by telegraph from Adelaide. The chief towns in the colony are:—Adelaide (q. v.), the capital; Port Adelaide, Kapunda, Gawler, Glenelg, Wallaroo, and Moonta; and in the Northern Territory, Palmerston and Southport. See Harcus' *S. A.* (Lond. 1876); *The Australian Handbook for* 1878 (Lond. 1878), and Blue-Books.

South Bend, a town of the State of Indiana, U.S., near the St. Joseph River, 85 miles E. of Chicago by rail. It has 12 churches, 4 newspapers, and several higher educational institutions, besides the government schools. Its manufactures are principally of hardware, carriages, and waggons. Pop. (1870) 7206.

South'cott, Joanna, a religious visionary, was born in Devonshire, 1750. Without any education, she was employed as a domestic servant at Exeter, where she joined the Methodist Church in 1790, and became acquainted with a man named Sanderson, who claimed prophetic powers. In 1792 she announced herself as a prophetess, and began to write and dictate prophecies in prose and rhymed doggerel. Soon afterwards she declared herself to be the woman spoken of in Rev. xii., and issued sealed papers to her followers which she promised would assure the salvation of the purchasers. She attracted many followers, and came to London on the invitation of Sharp the engraver, where in 1803 were published *A Warning to the whole World from the sealed Prophecies of J. S., and other Communications given since the Writings were opened on the 12th of January* 1803; in 1804, *Copies and Parts of Copies of Letters and Communications written from J. S. and transmitted by Miss Townley to Mr. W. Sharp in London*; in 1813-14, *The Book of Wonders in Five Parts*; in 1814, *Prophecies concerning the Birth of the Prince of Peace, extracted from the Works of J. S.* She announced that she would be delivered of the Prince of Peace at midnight on the 19th October 1814, and a disease under which she suffered favouring the delusion, many persons anxiously awaited the event, and large sums were contributed beforehand. However, she fell merely into a trance, and died December 27 of the same year, with the declaration that, 'if she was deceived, she was at all events misled by some spirit, either good or evil.' Dr. Reece, her medical attendant, published *A Correct Statement of the 'Circumstances that attended the Last Illness and Death of Mrs. S.* (Lond. 1815). In 1851 there were in England four congregations of her followers, comprising 198 persons, and a community was founded at Wenthorp in 1857.

South'ern Alps, the name given to the central and loftiest portion of the great dividing range of the S. Island of New Zealand. Many of the peaks are perpetually snow-capped, the highest being Mount Cook (13,200 feet). The glaciers of the S. A. rival those of the Swiss Alps in magnitude, and on the W. side extend to within a few hundred feet of the sea-level.

South'ey, Robert, born at Bristol, 12th August 1774, after four years' experience of a public school, was expelled from Westminster for satirising corporal punishment (1792), but a twelvemonth later went up to Balliol. At Oxford he met with Coleridge; and the two, both visionaries, both red republicans, began by planning a New World, 'pantisocracy,' and ended by their marrying two Miss Frickers (1795). In a six months' visit to his uncle, a Lisbon chaplain, S. learnt Spanish and Portuguese, and returning found that his *Joan of Arc*—saved from an *auto-da-fé* of 15,000 boyish verses by a publisher's offer of £50—was making its way to fame. He first tried medicine, 'the study of all others most unfavourable to the moral sense;' then law, 'detestable!' and finally, after shifting from Westbury to Wales, and from London to Ireland, settled at Keswick (1804), his

home for forty years. *Thalaba* had appeared in 1803, and from Greta Hall came *Madoc* (1805), *The Curse of Kehama* (1810), and *Don Roderick* (1815), in prose the Lives of Nelson (1813), Wesley (1820), Bunyan (1830), and Cowper (1837), the histories of Brazil (3 vols. 1810-19) and the Peninsular War (3 vols. 1822-32), the *Book of the Church* (1824), and *Doctor* (5 vols. 1834-37). Some fifty volumes more and fivescore *Quarterly* articles make up the tale; but his charities almost outran the income derived from writing, from a pension of £100 (1807—£300 since 1835), and from the poet-laureateship (1813). A High-Church Tory now, he passed a studious, domestic life, varied by rare excursions to the Continent, cheered by the friendship of his neighbour Wordsworth, darkened by his first wife's insanity, and latterly by the failure of his own strong mind. He died at Keswick, 21st March 1843. Strangely has time reversed his own and his compeers' verdicts. Those epics, 'the best that have left the press since *Paradise Lost*,' which Scott read four times through, are tedious monuments of misplaced learning to the generation that with Forster pronounces his self-scorned ballads to be 'masterpieces of fantastic beauty.' To Brazil, possibly, S. is 'as Herodotus to Europe;' with us his fame as a master of simple, graceful prose rests on the Lives of Nelson and Wesley, which but for publishers' law he had made ten times as long. His bulkier works sleep well, along with the fittingly voluminous *Life and Correspondence of Robert S.*, by his son (6 vols. Lond. 1850).

South Mol'ton, a market-town of Devonshire, England, on the Mole, 26 miles N.N.W. of Exeter, has a Perpendicular parish church (restored 1865), a spacious market-house in Italian style (1864), a guild-hall, literary institute, &c. Pop. (1871) 3978.

South Norwalk, a seaport of Connecticut, U.S., on Long Island Sound, 42 miles by rail N.E. of New York, has 4 churches, 1 newspaper, and varied hardware manufactures. Pop. 5000.

South Polar Research. Exploration in the strictly S. Polar region is of comparatively recent date. After the discovery of America, many expeditions, first Spanish and then Dutch, set out in search of a southern continent, which was generally regarded as the necessary counterpart of the northern lands. The search for this *Terra Australis incognita* led to the discovery of New Holland (Australia, q. v.), and many of the Oceanic islands. At the close of the 16th c. a Mappemonde by Judocius Hondius, in a Dutch account of Drake's *Voyage Round the World* (reprinted by Hakluyt Society, 1854), illustrates the prevailing belief in an immense *Terra Australis*, extending from the S. pole into the Atlantic beyond the Antarctic circle, and as far as the tropic of Capricorn in the Pacific, embracing in its area Australia, and separated only by Torres Strait from New Guinea. Subsequently for some two centuries little was actually added to European knowledge of the region, and no attempt was made to penetrate towards the Antarctic circle. The first navigator known to have passed within the circle is Captain Cook (q. v.). During his voyages in 1772-74 and 1775 he entered the circle in three different quarters, but after reaching 71° 10′ on the 107th meridian, his progress was arrested by firm fields of ice. Though he saw no land S. of Sandwich Land or Southern Thule, in 59° and 60° lat., or only a short way beyond the parallel of Cape Horn, he inclined to the belief that there was 'a large tract of land near the pole.' The Russian Bellinghausen discovered Petra and Alexandra Islands in 1821, and two years later Weddell advanced three degrees beyond the points reached by Cook. Enderly and Kemp Islands, both crossing the circle between 45° and 60° E. long., were discovered by Biscoe in 1831-33, and Sabina Land, further E. but in the same latitude, by Balleny in 1839. In 1840, D'Urville coasted Adelie and Clarie Lands, and Captain Wilkes, of the United States Navy, extended these discoveries on the same parallel, and thus proved that there was a chain of islands, just without the Antarctic circle, usually connected by an ice-barrier, extending from the 95th to 150th meridian. During the years 1839-43, Captain (afterwards Sir James) Clark Ross (q. v.), accompanied by Captain Crozier, made the important discovery of Victoria Land (q. v.), on the meridian of New Zealand, and in tracing its coast carried the *Erebus* and *Terror* to the highest southern lat. ever attained—78° 10′. Greatly retarded by a strong northerly current, the expedition passed along the E. side of Victoria to Cape Crozier, whence the coast takes a sudden easterly bend, continuing in that direction as far as it was traced, or for 33° E. long. The coast of Victoria is flanked by a lofty chain of mountains, the Admiralty Range, comprising Mount Sabine (10,000 feet high), Mount Herschel (12,000 feet), Mount Erebus (an active volcano, 12,362 feet), and Mount Terror (10,884 feet). The Parry Mountains, another lofty chain, run S. and inland from the vicinity of Franklin Island, which is 12 miles long and wholly composed of igneous rocks. The whole coast is bound by an ice-belt presenting to the sea a vertical face from 200 to 300 feet high, beyond which the surface presents the appearance of a vast plain of frosted silver. Ross, while regarding the islands discovered by D'Urville as of inconsiderable size, expressed the belief that the enormous mass of ice which bound the discoverer's view was a range of mountain-land covered by snow. The expedition led by Ross is one of the most remarkable and successful on record; it not only determined the position of the magnetic pole in 75° 5′ S. lat., and 154° 8′ E. long., but amid manifold perils ascertained the course of currents, the temperature and pressure of the atmosphere, the geological character of the new lands, and the extent of the distribution of plants and animals. In 1845 the *Pagoda*, commanded by Captain Moore, advanced by order of the Admiralty into the Antarctic seas for the purpose of extending Ross's magnetic observations. In 39° 30′ E. long., 68° S. lat., the vessel was stopped by pack-ice, but after changing her course she got beyond lat. 73°. Little resulted from the voyage, and the task of exploration was abandoned. Captain George Nares, with the experience gained in the N. Polar Expedition of 1876, took the command (1878) of the *Alert* and *Discovery*, bound for the southern seas. For a comparison of Arctic and Antarctic phenomena, see POLAR EXPEDITIONS. See also *Early Voyages to Terra Australis*, by B. H. Major (Hakluyt Soc. 1859); Cook's *Second Voyage Round the World* (1779); D'Urville, *Voyage au Pôle Sud* (1840); Ross, *Southern Seas* (1847); and Stoddard, *South-Sea Cruises* (1874).

South'port, a watering-place of Lancashire, incorporated in 1867, stands on the southern shore of the Ribble estuary, 17½ miles N. of Liverpool by rail. A fine promenade extends for 960 yards along the spacious sands, and from this projects a pier (1859-64) 24 feet wide by 1465 yards long, and traversed by a tramway. Including St. Luke's, now (1878) in course of erection, S. has six churches, and several of its chapels are fine edifices. Other buildings are a Grecian townhall (1853), the Cambridge Hall (1873) with an assembly room 120 by 50 feet, the Atkinson Free Public Library and Art Gallery (1878), a 'Glaciarium,' or skating-rink of real ice in Queen Anne style (1878), the Victoria Baths, erected at a cost of over £30,000. A handsome new market is (1878) being built, and an elaborate system of sewerage has just been completed at a cost of over £100,000. There are winter gardens (1874), with an aquarium and a band pavilion seating 2000 persons; botanic gardens (1876), covering upwards of 20 acres, and containing a museum; and the Hesketh Public Park (1868) of 30 acres, with a meteorological institute. S. publishes 1 daily and 1 tri-weekly newspaper. Pop. (1851) 4765; (1871) 18,086. A small fishing-village at the commencement of the present century, S. is now a favourite winter resort for the surrounding manufacturing centres. Hawthorne, who resided here in 1856, describes it in vol. iii. of his *English Note-Books* (Lond. 1870).

South-Sea Bubble, the name given to the disastrous financial speculation which arose in England contemporary with the French Mississippi Scheme (q. v.). In 1711, Harley, Earl of Oxford, established the S.-Sea Company for the purpose of restoring the national credit, shaken by the downfall of the Whigs. Its privileges of trading in the S. Seas, although restricted by the Peace of Utrecht and interrupted by hostilities with Spain, appeared such as to make it a formidable rival of the Bank of England and the new E. India Company, which had obtained their privileges from the Whig government in exchange for large loans. In confronting with the then popular policy of reducing the national debt by incorporating it with the stocks of flourishing companies, an Act of 1717 allowed certain short annuities, with twenty-three years to run, to be transferred into S.-Sea stock, and this, added to advances, raised the company's capital to £11,746,844. But just as Law's scheme was at the height of prosperity, the S.-Sea Company enormously increased its scope.

A proposal to take over the entire public debt of £30,981,712, on consideration of 5 per cent., was accepted (2d February 1720) on a vote of the House of Commons, but only after the keen competition of the Bank had forced the company wildly to raise its terms, and to offer an advance of £7,567,000. Walpole, in supporting the Bank, warned the country against the 'dangerous lure to decoy the unwary to their ruin in the pursuit of imaginary wealth.' But the voice was unheeded, and the spirit of reckless speculation which had been spreading through England ever since the Revolution, found vent in this and the hundreds of mad schemes it drew in its train. Companies were formed for suppressing piracy, making quicksilver malleable, distilling oil from sunflowers, working a perpetual-motion wheel, &c. Two millions were solicited for floating a lucrative scheme, the nature of which was to be 'revealed hereafter.' The company's stock, originally 77½ per cent., rose from 126 in December 1719 to 890 on 2d June, and by midsummer had reached its maximum of 1000. Other stocks were similarly inflated by all the devices of stock-jobbing, and the advance on the stock of the three great corporations has been computed at 500 millions sterling, or five times all the cash in Europe. All at home scrambled helter-skelter after 'the vision of ingots.' Many foreigners followed the example, and the Canton of Bern speculated largely in the stock. The City was mobbed by the crowd of gamblers; the streets about 'Change Alley' were lined with desks, and in the wild confusion stock was sold at the same instant for 10 per cent. more at one end of the Alley than at the other. At last the crash came. The company, by *Scire Facias*, had swept away 86 of the more preposterous minor swindles, but instead of restoring credit this step helped only to precipitate the evil day. Stock fell faster than it had risen, dreams of El Dorado vanished, and ruin followed panic from one end of the land to the other. Public indignation burst forth; meetings in every considerable town petitioned the legislature for vengeance on the directors. The schism of the Whig party (1717) freed Walpole and those who were out with him from all responsibility for the disaster; had it been otherwise, a purely Jacobite party might have risen to power. Walpole, the chief critic of the company, applied the estates of the directors to the mitigation of distress. The whole sum of £7,000,000 which the company had engaged to pay the public, was remitted ultimately. A division of stock was made among all proprietors, and it produced a dividend of £33, 6s. 8d. per cent. Among the chief promoters of the company were Aislabie, the Chancellor of the Exchequer; Stanhope, the Secretary of State; and the two Craggs. Among the host of honest speculators, Pope, Walpole, Gay, Bingham, and Chandler. See Sinclair's *History of the Revenue* (vol. i. p. 488); Macfarren's *Annals of Commerce* (vol. iii.); Mackay's *Popular Delusions* (Lond. 1852); and Lecky's *Hist. of the 18th C.* (Lond. 1878).

South Shet'land, or **New South Shetland**, an island group in the Antarctic Ocean, 600 miles S. of Cape Horn (q. v.). The islands, lofty, rugged, and devoid of all vegetation save moss, are separated by a wide channel called Bransfield Strait from the Antarctic continent, here called Louis Philippe Land.

South'wark, a parliamentary borough in Surrey, and one of the great divisions of the Metropolis, extends along the S. bank of the Thames nearly opposite the City of London. For certain purposes it is within the city jurisdiction, and is presided over by an alderman. It returns two members to Parliament. Among its principal buildings are St. Saviour's Church, the third in importance of the metropolitan churches, Guy's Hospital, Bethlehem Hospital for Lunatics, Leather and Borough markets, and the termini of the London, Brighton, and S. Coast Railway, and the S.-Eastern Railway. The Surrey Commercial Docks and many manufactories of various kinds are in the borough. Pop. (1871) 208,725. See Rendle's *Old S. and its People* (Lond. 1878).

South'well, a market-town of Nottinghamshire, England, 8 miles W. of Newark by rail. Its noble cruciform minster, larger than many cathedrals, is 306 feet long by 60 broad, and 121 across the transepts. The Norman nave (1110), Early English choir (1233), and Decorated chapter-house (1294), have all been carefully restored during the last ten years, and £20,000 is still to be expended on raising the roofs to their original pitch and replacing the spires of the three Norman towers, 'whose grouping,' says Freeman, 'is as perfect as well can be.' £4000 has further been raised towards the erection of S. into a see, as proposed in the Bishoprics' Bill (1878). Pop. (1871) 3205.

South'well, Robert, born at St. Faith's, Norfolk, in 1560, was educated at Douay, became a Jesuit at Rome in his sixteenth year, and in 1583 was appointed rector of the English Jesuit College there. Next year he undertook a mission to England, and became chaplain to the Arundels. For alleged complicity in a plot against Elizabeth he was sent to the Tower in 1592, where he was confined three years, and put to the rack ten times. Finally he was condemned to death February 20th, 1595, and on the following day was hanged, drawn, and quartered. His literary compositions, chiefly poetical, and all on moral and religious subjects, have ever been in favour with Catholics. The chief are—*A Supplication to Queen Elizabeth* (1593); *Marie Magdalen's Funerall Teares* (1594); *Saint Peter's Complaynt* (1595); *Mæoniæ* (1595); *Triumphs Over Death* (1595); and *A Short Rule of Good Life*. His complete Prose Works appeared in 1828, and his Poetical Works in 1858. See Bishop Challoner's *Martyrs to the Catholic Faith* (new ed. Edin. 1878).

Souval'ki, a government of Russian Poland, bounded W. by E. Prussia, S. by Grodno, and separated by the Niemen on the N. from Kovno, on the E. from Wilna. Area, 4846 sq. miles; pop. (1870) 524,489. The surface is mountainous in the W. and S., and ⅛th is in swamp. Timber and grain are produced.—**S.**, the capital, is situated on the Hancza, 65 miles S.W. of Kovno. In 1872 the factories produced goods to the value of £91,320. Pop. (*St. Petersb. Cal.* for 1878) 15,585.

Souvestre, Émile, a popular French novelist, was born at Morlaix, in Britanny, April 15, 1806. Educated at the College of Pontivy on the death of his father in 1823, he studied law, and was received as an advocate at Rennes in 1827. Soon afterwards he went to Paris with a drama in verse, *Le Siége de Missolonghi*, which, however, was so severely treated by the censor that S. left the capital, becoming a salesman in a book-shop at Nantes. In 1836 he returned to Paris, and until 1848 took an active part in the *Révue de Paris* and the *Révue des Deux Mondes*. In 1848 he was appointed by Carnot to a lectureship in one of the schools appointed for the civil service, and in the same year he delivered a series of evening lectures to working men. In the summer of 1853 he lectured to the working classes in the principal towns of Switzerland, but his health giving way, he died at Paris, July 5, 1854. S., though deficient in invention and originality, is one of the most pleasant of modern French novelists, and one of the few who have, without didactic pedantry and affectation, constantly inculcated a high morality. His best-known works are *Un Philosophe sous les Toits*, *Au Coin du Feu*, *Sous la Tonnelle*, and *Confessions d'un Ouvrier*, which appeared in the *Magazin Pittoresque*; *Les Derniers Bretons* (4 vols. Par. 1835–37); *L'Echelle des Femmes* (3 vols. Par. 1835); *Mémoires d'un Sansculotte Bas-Breton* (3 vols. Par. 1840); *Le Monde tel qu'il sera* (Par. 1845–46); *Le Roi du Monde* (2 vols. Par. 1852); *Causeries Historiques et Littéraires* (2 vols. Par. 1854).

Sov'ereign, the name of British gold coin of currency, valued at 20 shillings, or one pound sterling, and having a standard weight of 123·374 grs. The name was first used in the reign of Henry VII., but lasted only a short period. It was revived in 1817 under George III., and the new gold piece then issued was substituted for the guinea.

Sow'erby Bridge, a manufacturing town in the W. Riding of Yorkshire, 27 miles E. of Todmorden, and 4½ S.W. of Halifax by rail. It has grown up where the road from Halifax to the ancient village of S. crosses the Aire. In the parish church of St. George's is a monument to Archbishop Tillotson, who was born at S. There is a fine town-hall (1857), and a new railway station was opened in 1877. A railway from here to Rochdale is in course of construction, and plans are now (December 1878) being prepared for dealing with the sewage. Cotton-spinning, woollen manufacture, and dyeing and chemical works are the chief industries. Pop. (1871) 7041.

Sow'ing and Sowing-Machines. S. is the operation of scattering seed on the ground for propagation. Formerly seed, held in a basket or S.-sheet, was thrown broadcast from the hand, and this primitive method of S. is still practised in some parts of Scotland. Machines on the 'broadcast' and 'drill' principles are, however, rapidly superseding it, and on large farms in Britain they are universally employed. There are many forms of these S.-M., each of which presents some special advantage in simplicity, durability, economy, or efficiency in sowing certain or

all kinds of seeds, or adaptation to different kinds of land. Most of the cereal crops are sown by means of the broadcast machine in Scotland. In general construction this machine consists of a narrow seed-box 15 to 20 feet long, in one length, or in sections capable of being folded up for convenience in transport, mounted on a framework supported on two or three wheels. The box, or each of its sections, has a revolving spindle passing through it, which receives its motion from the wheels, and which carries a number of cog-wheels, discs, or brushes for discharging the seed through a like number of orifices at the bottom of the seed-box on to a distributing 'apron,' whence it falls to the ground. Covering slides are furnished for the orifices to reduce their number or their size, so as to secure the discharge of a required quantity of seed per acre. Some machines have a contrivance whereby a horizontal position is maintained while passing over hilly or uneven ground. The seed is covered with soil by subsequent harrowing. Ground intended to be sown by a drill S.-machine is carefully and evenly cultivated beforehand. The drill is supposed to have been invented in Italy in the 16th c. Jethro Tull constructed one in England in 1730, and since then the machine has been vastly improved. Sowing in drills is widely practised in England. It presents advantages over broadcast S. in the saving of seed, in the deposition of the seed at a uniform depth, and in the facilities offered for keeping down weeds. The common East Lothian drill S.-machine has a seed-chest with a revolving shaft and toothed wheels for driving the seed through orifices into hoppers which feed-tubes carried down to the drills. Six coulters depend from the bed-frame of the machine, and their lower ends are furnished with rivetted cheeks forming pointed sheaths which penetrate the ground and cut parallel rows or drills, and into these the seed is delivered by the tubes. There is considerable variety in drill S.-M. In the 'Suffolk Lever Corn-Drill,' extensively used in the eastern counties of England, the delivery of the seed is effected by a series of cups attached to a disc revolving in the seed-chamber. The cups empty the seed into shoots, which convey it to the coulters through tubes. Drill S.-M. have an arrangement in common whereby the delivery tubes and coulters may be raised or lowered and the seed-barrels thrown out of gear; and many are adapted for sowing all kinds of seeds at any required rate of distribution, and also for a simultaneous deposition of manure. *Dibbling* is a method of sowing beans or potatoes in holes.

Sow Thistle, the common *Sonchus oleraceus*, belongs to the natural order *Compositæ*. There are about 40 species widely diffused through the N. and S. temperate regions. Some are annual, others perennial. The leaves are toothed or pinnatifid; the flower-heads yellow; fruit truncate, compressed, with simple, silky pappus-hairs. *S. oleraceus*, and one or two other species, were formerly served as salad plants. Three species are natives of Britain, besides the handsome allied *Mulgedium alpinum* (or blue S. T.) of wet alpine rocks in Forfar and Aberdeen.

Soy, the Japanese name of a condiment in general esteem for flavouring purposes, and supposed to favour digestion. Its principal ingredient is the seed or 'bean' of *Glycine soja* (or *hispida*), a native and a cultivated annual of E. Asia. This seed resembles a small kidney bean, and is a very nutritive food—too rich to be used alone. The chief seat of cultivation is N. China and Japan, whence the seed is largely exported to the southern parts of the country: it is calculated that 3000 junks are employed in the trade. The process of making S. is to boil the beans with an equal quantity of barley or wheat, leaving the mixture for three months to ferment, adding salt and water, and then straining the liquid through a thick cotton bag. In 1874 the Japanese product of S. amounted to 1,506,402 hectolitres.

Spa, a famous watering-place in Belgium, province of Liège, in the beautiful valley of the Wayal, 27 miles S.E. of Liège by rail. It is well built, and contains a large number of fine hotels. An Anglican church was erected in 1875. Its chalybeate springs attract during the season (from May to October) many thousand strangers. The waters are full of carbonic acid gas, and contain carbonate of iron, soda, lime, and magnesia. The most frequented springs are—Pouhon, Sauvenière, and Groesbeck, 1½ miles distant; Geronstère, with a slight sulphur taste, 2 miles distant; Barisart, 1 mile; Tonneleto, 1 mile, and the two Prince de Condé springs, much frequented since 1863. The waters of the Condé and Pouhon springs are largely exported. S. manufactures wooden toys, which are stained brown in the mineral waters. Pop. 5881.

Space and Time have received almost as many philosophical definitions as there have been philosophers. The simplest definition is that of Leibnitz—that space is the order (or correlation) of things coexisting, and time the order of things successive. Another well-known definition of time makes it 'duration limited,' while Aristotle made it physically, rather than philosophically, 'the measure of motion.' Locke affirms that the idea of space is given by sensation, especially by the senses of touch and sight. Reid, Cousin, and Royer-Collard make it an *à priori* notion of the mind. With Kant, S. and T. are forms of sensibility. By means of external sense we represent to ourselves things as in space, and by means of internal sense things as related to each other in time. Thus they are made to be conditions of subjective sensibility, without any necessary objective reality.

Whatever the origin of the idea of space may be, its attributed properties are generalisations from experience. Thus to fix a point in space three numbers are necessary and sufficient (see CO-ORDINATES), and the volume of a given portion of space is measured by its extensions in any three arbitrary directions, chosen so as not to be in the same plane. This threefold character is essential, and consequently space, as we know it, is tri-dimensional. It is possible, however, and mathematically conceivable, that space may exist which has not these properties. For instance, mathematics deals with what is known as space of one dimension or of two dimensions. A given curved line is an example of the former, since to fix a point in it only *one* number is required, its distance along the curve from an arbitrarily chosen point. A surface again typifies space of two dimensions, since, to fix any point upon it, two numbers are necessary and sufficient. Now a solid is limited by surfaces, a surface by lines, a line by points. Hence generalising, we educe the proposition that space of three dimensions is bounded by space of two dimensions, space of two dimensions by space of one dimension, and space of one dimension by space of no dimensions. Reasoning in the other direction, we find that space of three dimensions may bound space of four dimensions, though to conceive of such a higher order of space is beyond our comprehension. Such speculations, though apparently wild and useless, may in the course of events touch us closely—and in other words, our system of worlds may come to a region of space, in which the properties of tridimensional space may be completely altered. Something may take place analogous to the crumpling or twisting of space of two dimensions in space of three dimensions, the properties being changed, and yet the space remaining of the same dimensions as before. The investigation of the necessary properties of four-dimensional space has occupied the attention of some of our first mathematicians, Riemann, Helmholtz, Clifford, and others.

Spade'-Husbandry is the culture of land by means of the spade and other manual implements. On account of its practice on cottage farms and the resemblance of its field operations to those of gardening (see HORTICULTURE), S.-H. is also known by the names of cottage-farming and field-gardening. Where steam and horse culture are impracticable S.-H. yields excellent results, and on small and even large farms whose soil admits of digging at all seasons it is the most profitable method of culture. Much waste land has been reclaimed by means of S.-H., notably in Cornwall and the Isle of Axholme, Lincolnshire. The spade possesses advantages over the plough for cultivation on account of the facility of replacing, by deep digging, an exhausted layer of soil by a subjacent layer, fresh and naturally rich, and made more so by manure applied above and washed down.

Spagnolett'o, Lo ('the Spaniard'), the name bestowed on José Ribera, the famous painter, during his residence in Italy, and that by which he is most widely known. Born at Jativa (San Felipe), in Valencia, 12th January 1588, he was a pupil of Ribalta, but passing early to Italy he entered the studio of Caravaggio, and later modified his style by study of Raphael and Correggio. About 1612 he settled in Naples, where he was made court-painter, and died about 1656. A painter solely of easel-pictures, S. is specially notable for a tendency to over-realism (as in 'The Flaying of St. Bartholomew'), coupled with masterly chiaroscuro and anatomy. 'Ixion on the Wheel,'

'Jacob's Dream,' and 'Adoration of the Shepherds', are among the chief of his works, many of which are at Naples, Madrid, Paris, Dresden, and Vienna. S. entertained Velasquez at Naples, and among his pupils were Giordano and Salvator Rosa.

Spa'hi, or Sipa'hi. See SEPOY.

Spain (Span. *España*), a kingdom of S.W. Europe, occupying five-sixths of the Iberian peninsula, bounded N. by the Bay of Biscay and the Pyrenees, E. by the Mediterranean, S. by the Mediterranean, the Straits of Gibraltar, and the Atlantic, and W. by Portugal and the Atlantic. Its extreme points are Cape Vares in the N., Cape Crens in the E., the Hermita de Santa Catalina in the S.; and Capes Toriñano and Finisterre in the W. The census of 31st December 1877 makes the pop. 17,000,900. The census of 1860, corrected by the returns of births and deaths from 1861 to 1870, is as follows:—

Physical Aspect.—S. may be described generally as a highland country, the centre of which is occupied by a great plateau of 42,500 sq. miles, sloping from E.N.E. to W.S.W., which is nearly equally divided by the Sierra Guadarama (8223 feet) and the Sierra de Gredos (8725 feet) into a N. table-land, comprising the highlands of Old Castile and Leon, and a S. embracing New Castile and Estremadura. The N. plateau, averaging 2723 feet in height, is composed of the grass-grown terrace of Reinosa (3280 feet), the barren but populous plateau of Soria (3610 feet), the level and fertile Bureba, the hill-country of Burgos and Lerma, the treeless corn-lands called the 'Tierras de Campos,' and the rich but little-cultivated plain of Old Castile; while the S. plateau, averaging 2230 feet in height, embraces the basins of the Tajo and Guadiana, parted by the Sierra de Toledo (4264 feet) and the Cabeza del Moro (5110 feet), and made up of the table-lands of Setiles and Siguenza to 3936 feet in the N.E., the barren plain of Madrid, the fertile lands of Alcarria and Requina; in the S.W. the 'Dehesas de la Sierra,' and in the N.W. the oak woods and heaths of Upper Estremadura. These table-lands, the largest and loftiest in Europe, are for the most part dreary, treeless flats, which justify the epithet of 'tawny S.,' and explain the saying that 'Africa begins at the Pyrenees.' The N. boundary of the great central plateau of S. is the Cantabri-Asturian range, which begins at the frontier-stream of Bidassoa, and, running due W. parallel with the N. coasts for 260 miles, terminates in great mountain masses in the kingdom of Galicia. Its E. boundary is the great Iberian system, a mass of chains, groups, and single peaks, separated by table-lands and wide valleys including all Valencia and S. Catalonia, and the E. part of both Castiles, an area of 30,800 sq. miles. To the N.E. is the Ebro basin (12,700 sq. miles), embracing part of Alava, S. Navarra, and Lower Aragon, and bordering on the N. and N.E. on the mountains of Navarra, Upper Aragon, and Catalonia, which run nearly parallel to the Pyrenees (q. v.). Its S. limit is the Sierra Morena, which separates it from the mountains of Granada and Andalusia, and the basin of the Guadalquivir (6400 sq. miles); on the W. it slopes to the plains and valleys of Portugal. Upper Andalusia is filled by the Sierra Nevada (q. v.), to the W., N., and N.E. of which lie the plateaux Ronda, Granada, Baza, Huesca, and Murcia. A coast range stretches from Cape de Gata to near the Straits of Gibraltar. Of the five great rivers of S., the Douro, Tagus, Guadiana, Guadalquivir, and Ebro, only the last three are navigable. All the rivers are rapid, and vary greatly in volume. For irrigation the numerous coast streams are peculiarly valuable. There are many fine natural harbours. The number of small salt lakes in S. is very great, and the mineral wells are estimated at 1500.

Geology and Mineralogy.—The extreme N.W. of S. consists of masses of granite, gneiss, and other igneous rocks. These are succeeded in the E. by Silurian strata, stretching first S., then E., and inclosing the extensive Tertiary formations that cover the greater part of the central plateau. The N. boundary of this plateau is partly Carboniferous, partly Jurassic, but the latter is more characteristic of its E. boundary, which divides the basins of the Ebro and Duero. The Ebro basin is mainly Miocene, but older formations crop up on the flanks of the Pyrenees and along the coast to the mouth of the river. To the S. of the Guadalquivir the formations, save the Silurians of the Sierra Nevada, belong to the Secondary groups of the central plateau. The great mineral wealth of S. is out of all proportion to the mining industry. Of the few ironworks, La Felguerra, in the Asturias, the most important, in 1876 employed 1992 workmen, and along with the Vega works had 39 steam-engines, and turned out 20,700 tons of pig and 14,000 tons of rolled wrought iron. In March 1876 King Alfonso found 100,000 tons of iron ready for transport at the Goldames mines. S. in 1877 produced 560,000 tons of coal, of which the Asturian mines yielded 400,000 tons. Considerable beds of coal were discovered in 1878 near Puerto Llano, about 25 miles from Ciudad-Real. The output of the Rio Tinto cupreous sulphur ore mines was in 1877 estimated at 660,000 tons. These mines, which employ 5000 men, and are connected with Huelva by a railway 52 miles long, were in 1873 bought from the Government by an Anglo-German company for £3,850,000. From the Buitron and Poderosa mines were shipped, in 1876, 51,872 tons of copper ore. The quicksilver mines of S., now in the hands of Messrs. Rothschild, produce annually 40,000 flasks. The other chief minerals are silver, arsenic, lead, zinc, manganese, alum, vitriol, sulphur, and salt.

Climate, Botany, and Zoology.—While the S.E. coast on the Mediterranean, protected by the mountains of Upper Andalusia, has an average temperature of 68° F., the climate of the highest mountain-land answers to that of the polar zone, that of the Pyrenean and Asturian districts to the N. temperate, and that of the rest of the country to the S. temperate. Andalusia, almost tropical, is exposed to the *Solano*, a withering, fever-laden wind of Africa. But several towns on the Mediterranean, particularly Valencia and Malaga, are favourite winter-resorts of invalids. On the plateaux a thunderstorm sometimes causes a fall of from 86° to 48° F. The sudden changes of temperature account for the aristocratic *capa* and the plebeian *manta* in general use throughout S. The great desideratum of the interior is moisture. The luxuriant coast-strip from Murcia up to Catalonia, called 'the garden of S.,' is almost equalled in fertility by the narrower strip from Murcia to Malaga. The Cantabri-Asturian chain is the region of the oak, chestnut, beech, apple, wild rose, hawthorn, blackberry, carob, and Spanish cane. The Pyrenees present coniferæ, and Alpine shrubs and herbs. The central plateaux are covered with rosemary, lavender, and *Ericaceæ*, and the mountain-lands that skirt them with forests of the cork-tree, pine, fir, juniper, chestnut, ash, and ilex. In the E. the plains bear the *Gypsophyla hispanica*, *Helianthemums*, and *Ericaceæ*, and the mountains are clad with the oak, beech, ash, alder, box, and pine trees. In the S. flourish the cork-tree, the orange, the sugar-cane, cotton, opuntia-cactus, banana, indigo, coffee-plant, and several fruit-bearing palms. The forests in S. cover (1878) 21,335,156 acres, of which 16,691,453 are crown property. Besides the deer, the wolf, and the bear, the wild animals of S. include the chamois, mountain-goat, lynx, wild-cat, fox, wild-boar, rabbit, squirrel, and marmot. Well-watered districts abound with ducks, geese, swans, storks, cranes, flamingoes, &c.

There are great swarms of grasshoppers, and on the Mediterranean coast occurs the false cochineal insect. The Spanish fly is an article of commerce. Sardines and tunny-fish are caught on the coast, oysters at Agamonte, and a coral-fishery is carried on along the coast of Andalusia.

Industry and Trade.—Wherever the requisite moisture is present, wheat, wine, and oil are produced, but irrigation is sadly defective. Only 44¾ per cent. of the surface is under cultivation, 26$\frac{1}{10}$ per cent. being tilled or gardenland, 2¾ vineyards, 1$\frac{7}{10}$ olive groves, 13$\frac{7}{10}$ meadow or pasture. The annual production of wheat, rye, barley, oats, buckwheat, millet, maize, and rice is about 31,000,000 quarters. There is the greatest variety of garden fruits and vegetables, including grapes, apricots, peaches, figs, almonds, pomegranates, melons and tomatoes, the white mulberry and the sugar-cane, of which last the yield in 1877 was estimated at 44,000,000 lbs. As many as 16,500 lbs. of strawberries are sometimes brought to the Barcelona market on a single day. Hemp, flax, madder, woad, saffron, cummin, liquorice, and rape are largely cultivated. Esparto grass grows wild in the south. S. is only second to Italy among the silk-producing countries of Europe. In 1876, the raw silk produced in S. was 188,100 lbs. S. had, in 1873, 680,373 horses, 2,319,846 mules and asses, 2,967,303 head of cattle (780,000 were in 1878 in the Asturias and Galicia alone), 22,468,969 sheep, and 4,351,736 swine. The abolition of bull-fights, which yearly destroy 3000 to 4000 horses, was recommended by the Cortes of 1878. Small black swine are largely reared in Andalusia, and goats (about 3,000,000) in Valencia, and on the Sierra Nevada and the Pyrenees. The chief manufactures are iron and copper wares, stoneware, fayence, lace, woollens, linens, and machinery. Shipbuilding is carried on at the large seaports. The tobacco manufacture, a state monopoly, is restricted to seven great factories. The chief occupation in the interior is the rearing of enormous flocks of the valuable merino sheep. The failure in recent years of the vine crop has led to the experiment of making wine of oranges, and the first yield of the new product was favourably reported on at Valencia in November 1878. From 1867 to 1876 the exports of S. averaged £16,000,000 annually, the imports £12,000,000. The imports of S. from the United Kingdom in 1877 amounted to £4,267,214, chiefly linen-yarn, linens, cottons, woollens, iron, coal, and machinery. The exports to the United Kingdom amounted to £10,842,097, and comprised wine (white, 5,542,986 gals. = £1,855,212; red, 1,260,808 gals. = £151,900), pyrites of iron and copper (£1,177,621), copper ore and regulus (£467,802), iron ore (£983,561), oranges and lemons (£857,977), raisins (£623,950), almonds (£64,401), nuts (£174,956), and other fruits (£255,480), esparto (£429,647), silver ore (£414,075), wheat (£316,586), wheaten flour (£403,896), cork (£95,307), olive-oil (£55,289). The export of iron to Tyne and Tees ports in 1876 was 64,707 tons. The merchant navy of S. consisted, on January 1, 1877, of 2915 vessels of 557,320 tons, including 230 steamers, of 176,520 tons. Madrid, the capital, is far excelled in trade and industry by Barcelona, the 'Spanish Manchester.' Seville, which has the largest tobacco-factory in Europe, is world-famous for its oranges as Malaga is for its wines and raisins.

Constitution, Finances, Railways, &c.—By decree of June 30, 1876, S. is a constitutional monarchy. The legislative power is vested in the King and a Cortes of two houses. The Senate is made up of three classes, each limited to 180: (1) princes of the blood, the grandees, and chief functionaries; (2) life senators appointed by the Crown; (3) members elected by the corporations and leading citizens; the Chamber of Deputies is elected for five years in the proportion of two to every 50,000 inhabitants. The Executive is vested in a council of nine responsible ministers. The budget for the year ending June 30, 1878, showed a revenue of £29,434,746, and an expenditure of £29,431,007. The total public debt on the 30th June 1876 was £486,341,102, the interest on which amounted to £11,116,092. On January 1, 1876, the total length of railways was 3810 miles (1264 miles being in course of construction); and of the lines of telegraphs 7610 miles. An extradition treaty with Britain came into effect 9th December 1878.

Army and Navy.—By the law of 1872 there is universal obligation to military service after the age of twenty. The service extends over 8 years in S., and 4 in the colonies. The strength of the army in 1877 was 151,668. In 1844-45 was organised the *guardias civiles* (20,000 foot and 5000 horsemen), through whose exertions brigandage has almost disappeared. In June 1877 the navy consisted of 81 steam-vessels of 800 guns, and 8 sailing-vessels of 122 guns, manned by 9750 sailors and 5550 marines. For the colonies S. maintains a fleet of 35 gun-boats.

Ethnography, &c.—The Spanish nation is formed chiefly of Castilians, Murcians, and Andalusians. The direct descendants of the Moriscos or Modejares are reckoned at 60,000. The Basques, with a distinct language, are about 500,000. The Galegos, in Galicia, speaking a dialect liker Portuguese than Spanish, number 2,000,000. In the heart of the country are 40,000 gipsies. The nation is socially divided into five classes—nobles, clergy, burgesses (one-seventh of the whole), farmers, and day-labourers. The higher nobility include the 'grandees' and the 'Titulados del Reino,' the lower one the 'Hidalgos,' a numerous but impoverished class. The Basques and Asturians generally designate themselves 'Nobles.' S. is pre-eminently the land where 'manners makyth man,' for there civility and ceremony are dear alike to beggar and grandee. Characteristic also is the wide prevalence of almsgiving, the nurse of idleness and beggary.

Religion and Education.—The established religion is the Roman Catholic, professed by all the people save 60,000. Other religions are nominally tolerated. There are nine bishops, 45 suffragan bishops, 40,000 secular clergy, 719 monks, and 12,990 nuns. Before 1841, when most of the monasteries were confiscated, the monks numbered 30,000. Thirty years ago there were in S. scarcely 1000 schools. Primary education was in 1869 made free and compulsory. In 1872 there were in S. 22,625 public primary schools, with 1,187,459 pupils, besides 5135 private schools, with 194,519 pupils; 31 teachers' training-schools, 63 *institutos de segunda ensenanza*, with 30,000 pupils, and 1327 pupils in special practical schools. There are 10 universities, Barcelona, Granada, Madrid, Oviedo, Saragossa, Salamanca, Santiago, Seville, Valencia, and Valladolid. In 1878 there were in all 414 professors (76 at Madrid) and 15,000 students.

Colonies.—Besides the Balearic Islands, the Canaries, and the penal establishments ('Presidios') in N. Africa, S. possesses in Africa the islands Fernando Po, Corioco, Elobey or Morisco, Annobon, and the territory at Cape San Juan; in America, Cuba and Porto Rico; in the Pacific, the Philippine Islands, Caroline, Pelew Islands, and Marianne or Ladrone Islands. S., alone of European states, still tolerates slavery in its colonies.

History.—The peninsula known to the Greeks as Iberia, and to the Romans as Hispania (q. v.), has been subject to a greater number of revolutions affecting the dominant race than any other country of modern Europe. The primitive *Iberi* or Basques (q. v.) were in part driven into the mountains by an invasion of Celts, and in part were assimilated by their conquerors. This mixed Celt-Iberian race occupied the whole peninsula when it first becomes known in history. The Phœnicians, lured hither by the precious metals which early made S. the El Dorado of the ancient world, settled in considerable numbers round the coast, and their language and manners penetrated far into the interior. But the conquest of S. was reserved for the Cathaginians, who long maintained a strong military force in Gadeira (Cadiz), and after the First Punic War began the work of subjugation. (See HAMILCAR and the HASDRUBALS.) A treaty of peace between the Romans and Hasdrubal, son-in-law of Hamilcar, stipulated that the Carthaginians should neither molest Saguntum nor cross the Iberus (Ebro). Hannibal (q.v.), violating these conditions, precipitated the Second Punic War, in which the military genius of Scipio (q.v.) effected the expulsion of the Carthaginians from Europe in 206 B.C. Although the Romans chose to regard the whole land as conquered, their power was not confirmed till after a protracted struggle of two centuries. The southern region was early reclaimed to Roman civilisation, and mixed colonies rapidly springing up, the union of Rome with this its richest province became eventually more complete than with any other. As no other province contributed so much to the material resources of the empire, so none received so liberal a share of power and dignity. The first foreign consul was Balbus of Cadiz; the first foreign emperor, Trajan, a native of Italia, near Seville. The grand remains of amphitheatres, aqueducts, bridges, &c., attest the development of the country which furnished Rome with treasure of gold and silver as well as with vast grain supplies. From Constantine's death (337) the general prosperity began to wane.

Christianity had been introduced by the 2d c., and its gradual diffusion hastened the decay of Roman authority. In the beginning of the 5th c. took place the great irruption of the Northern barbarians. First the Vandals, then the Alans and Sueves passing the Pyrenees, carried throughout S. bloodshed and pillage. The Vandals crossing into Africa (412), were succeeded by the West Goths, who had already been converted to Christianity (see GOTHS). The Gothic monarchy is interesting mainly as the primary source of the constitution of Castile. Succession was not hereditary but elective; laws enacted in national councils of prelates and nobility were sometimes even ratified by public assembly. Civil liberty was enjoyed in a greater degree by the Romanised inhabitants than under the other barbarians of the North. After three centuries of Gothic rule, S. fell suddenly under the yoke of the Arabs. Roderic (q. v.) risked his kingdom on a single battle, and three years from their victory at Xeres (711) the Arabs and the Moors (q. v.) had reduced the whole of S. except the mountainous N.W., the retreat of Pelayo and a large body of Christians. Military success heralded brilliant progress in refinement and culture. From about 750 till its re-conquest by the Christians, Cordova (q. v.), identified with the names of Avicenna and Averroes, was the brightest intellectual centre of Europe. Later it was surpassed by the kingdom of Granada (q. v.), if not in literary and scientific fame, at least in splendour and luxury. Saracenic architecture, which found its grandest expression in the airy pile of the Alhambra (q. v.), left its traces on the ambitious structures of Venice and Lombardy. First held as a dependency of the Arab province of N. Africa, S. from 717 was ruled by emirs under the Calif of Damascus. In 756 Abderrahman, the last of the Ommiades (q. v.), made Cordova an independent Califate. Those of the native Christians (called Mozárabes) who continued to dwell among the conquerors were allowed to retain their religion and special tribunals, on the payment of double tribute and a tax on church property. Meantime the Arab rulers sank into effeminacy, forgetful of their hardy enemies in the Asturias (q. v.). Rebel governors dismembered their kingdom by forming the states of Toledo, Huesca, Saragossa, &c., and these in their internal contests occasionally sought the alliance of the Christian princes. On the S. slopes of the Pyrenees the kingdoms of Aragon (q. v.) and Navarre (q. v.) silently formed after the fashion of the Asturias. Leon (q. v.) in 914 had extended its frontier to the Duero, and even to the Guadarama range. In the beginning of the 11th c. Sancho the Great, King of Navarre and Aragon, placed over Castile (q.v.) his son, Ferdinand, who assumed the title of king, and by marriage temporarily added Leon to his possessions. The cessation of internal hostilities brought about by this union, enabled the Christian states to assail their enemies more vigorously. With valour inspired by the example of the Cid (q. v.). and ennobled by the customs of chivalry, the Spaniards were everywhere victorious, and by 1085 Alfonso VI. had recovered Toledo, the metropolis of the Gothic monarchy. Calamities scarcely inferior fell on the Moors in a different quarter. The kings of Aragon, beginning by successful attacks on their neighbours, gradually seized one after another of the Moorish towns, till in 1115 they crowned their conquests with the capture of Saragossa. The rapid progress of the Christian arms was partly due to the obligation of military service on chartered towns and communities, and partly to the power of the great military orders, notably those of St. John and the Knights Templar. Driven into narrow compass and exasperated by defeat, the Arabs sought the ready aid of their Moorish co-religionists across the straits. The Almoravides (q. v.) and Almohades (q. v.), fanatical, warlike sects, appeared successively first as the defenders and then as the masters of Mohammedan S. Under the Almohades the Moors sustained a tremendous defeat at Baños di Tolosa, near Baylen, in 1210, when, according to a letter from Alfonso, the victor, to Innocent III., the loss of the Infidels amounted to 180,000 men. In 1236, Ferdinand III., bursting into Andalusia, took Cordova, and a few years later Seville, the favourite region of the Moors on the Guadalquivir. Ferdinand, in 1238, reunited for ever the two branches of the Gothic monarchy, Leon and Castile. Jayme I. of Aragon, the Conqueror (1213-48), reduced the city and kingdom of Valencia, the Balearic Isles, and Murcia. But by the cession of Murcia to Castile, Aragon shut itself out from the possibility of extending its landward conquests. Its ambition was thenceforth diverted to objects beyond the Peninsula, and its dominion was extended to Sicily in 1282, to Corsica and Sardinia in 1297, and to Naples in 1442. After the fall of the Almohades, the king of Jaen founded (1235) the kingdom of Granada (q. v.), which shortly became tributary to Castile. From this period ended all fear of Moorish supremacy. But the Moors, retaining Gibraltar, Algeziras, Tariffa, and other strongholds, were abler to resist; the Castilians, gratified by success, sank into characteristic indolence. Disputed successions, court chicane, the ceaseless clang of civil arms, make up the history of Castile till the union of S. by the marriage of Isabella (q. v.) with Ferdinand (q. v.) the Catholic of Aragon in 1469. The same year saw the final overthrow of the Moors and the discovery of the New World. The latter event brought wealth and glory to S., and led to a mighty extension of her domain, but it also withdrew the ablest of her sons, who in the wild pursuit of an imaginary El Dorado left undeveloped the rich resources of the mother-country. Advised by Ximenes (q. v.), Ferdinand and Isabella centralised in the crown the judicial authority and the powerful religious orders of Alcantara, Compostella, and Calatrava. They supported the Inquisition and the Hermandad (q. v.), attempted the conversion of the Moors, and hurt the trade of S. by expelling the Jews, guided by the desire to make the Church the basis of the throne. A policy which ended by bringing S. more completely under papal control than any other state, for the time gave her the semblance at least of vigour and solidity. Juana, the only surviving child of Isabella, and the wife of Philip the Handsome, son of the Emperor Maximilian I., succeeded to Castile in 1504. On the death of Ferdinand in 1516, Charles I. (Karl V.) became the first king of all S., which during his long reign attained the height of her outward prosperity. Through his father, Philip, Charles inherited the Netherlands and Franche-Comté, and his dominion was further increased by the conquest of Mexico and Peru. He was elected Emperor in 1519, and directed his arms successfully against the French, the German Protestants, and the Turks. The champion of the Roman Catholic faith, S. was now the enemy of civil and religious liberty. Spanish cities were stript of their rights, the whole kingdom was burdened with taxes, science and literature were paralysed, and death was the award of heresy. Already had the decline of S. begun when Philip II. (q. v.) received the crown in 1556. Wealth derived from the vast American possessions, Philip squandered in promoting the true faith by hapless military enterprise. He united Portugal to S., but in spite of the ability of Alba (q. v.) he lost the N. provinces of the Netherlands (1579). His war against Henri II. and the Protestant Bourbon (see HENRI IV.) were barren of gain, and the 'Invincible' Armada (q. v.) became a monument of national folly. The gloomy despotism of Philip was followed by the ruinous reign of the weak Philip III. (1599-1621), which witnessed the expulsion of the Moriscoes, comprising over a million of the most industrious inhabitants of S., and the subversion of every interest to that of the clergy. Philip IV. (1621-68), the tool of Olivarez (q. v.), lost Portugal in 1640, and Franche-Comté, 1669, and was forced to own the independence of the Netherlands. English and Dutch buccaneers swept Spanish trade from the seas, the finances were thrown into confusion, and civil war raged in Catalonia, Andalusia, and Naples. Under Charles II. (1668-1701) S. had sunk to the lowest ebb, and the very existence of her people was threatened by famine. The death of Charles, last of the Hapsburg dynasty, without heir, led to the Succession War (q. v.), which ended (1713) in the recognition of Philip V., the first of the Bourbons, and the cession of Naples, Sardinia, Milan, the Spanish Netherlands, Sicily, and Gibraltar. Counselled by the daring Alberoni (q. v.), Philip formed a league with Peter the Great and Karl XII. of Sweden against England, but the disclosure of the plot was followed by the Quadruple alliance (1718). The revival of trade and industry, begun under Philip, took a fresh impulse from Charles III. (1759-88), who restrained the Inquisition, expelled the Jesuits (1767), induced immigration, and concluded peace with the African corsairs. Godroy (see ALCUDIA) is mainly responsible for the inglorious conduct of Charles IV., by which S. became one of Napoleon's reserves. The proposed partition of Portugal (1807) called forth the Prince of the Asturias as a rival to Charles, and Napoleon, arbitrating at Bayonne, set aside both claimants in favour of his brother Joseph Bonaparte. On the rising of the people, who sided with the Prince of the Asturias' as Ferdinand VII., Joseph fled from Madrid, but only to return, backed by Napoleon (q. v.) with a large army.

England joined the patriots in the Peninsular War (1808), in which the French victories of Medellin and Cadiz were more than counterbalanced by those of the allies at Vimiero, Talavera, Salamanca, and Vittoria. Wellington (q. v.) having driven Soult (q. v.) into France, the Treaty of Valençay was concluded 11th December 1813. Napoleon relinquished S., and Ferdinand VII. (q. v.) began a reign of repression and bigotry. In 1820 an armed revolt procured the adoption of a liberal constitution, but a terrible reaction preceded the attempts to place Don Carlos (q. v.), Ferdinand's brother, on the throne. Maria Christina (q. v.), queen-regent, plunged S. into war with the Carlists, but in 1840 she resigned, and Espartero (q. v.) made an effort to revive the national life. Isabella (q. v.), declared of age 1843, adopted a policy of reaction, under guidance of one favourite after another—Serrano (q. v.), Narvaez (q. v.), Bravo, Murillo, &c. A revolt under O'Donnell (1854) induced Isabella to recall Espartero, and establish Christina beyond the frontier. The unsettled state of S. was reflected in her colonies; Peru achieved independence (1864–65), and Chili (1865). In 1868 Isabella was driven from Spain, Prim (q. v.), the Duc de Montpensier, and other exiles returned, an advanced liberal constitution was adopted by the Cortes, and Serrano acted as regent till the election of Amadeo (q. v.) as king in 1870. On the withdrawal of Amadeo, the Carlist insurrection spread rapidly, adding to the confusion into which S. was cast during the infirm tenure of the Republic of 1873 and the dictatorship of Emilio Castelar, the brilliant republican orator. Prince Alfonso (q. v.), son of Isabella, was proclaimed king in 1874, and succeeding in reconciling various parties, directed a superior force against the Carlists, whom he finally quelled in the spring of 1876. In January 1878, Alfonso married Maria de las Mercedes, daughter of the Duc de Montpensier, who died in June following. The peaceful state of S. has only been broken in the N. by the intrigues of the Zorilla republican party among the inhabitants aggrieved by the abolition of the Fueros (q. v.). In view of the spread of Socialism, all foreign members of the International were ordered to quit S. in December 1878. See Lafuente, *Historia General de España* (30 vols. 1850 *et seq.*); Prescott, *Ferdinand and Isabella* (new ed. 1862), and *Philip II.* (new ed. 1875); Dozy, *Histoire des Musulmans d'Espagne* (4 vols. 1864); Baumgarten, *Neuere Geschichte S.'s* (3 vols. 1867–71); Boehmer, *Bibliotheca* of Spanish Reformers (vol. i. 1874); the Calendar of State Papers relating to S. and England (3 vols. 1862–77); Hare's *Wanderings in S.* (1873); Thieblin's *S. and the Spaniards* (2 vols. Lond. 1874); and the Guide-Books of O'Shea (6th ed. 1878) and Ford (new ed. 1878).

Spal'atin, Georg, born in 1484 at Spalt in Bavaria, was originally named Burckart, but called himself S. from his native place. After studying at Nürnberg, Erfurt, and Wittenberg, he became (1507) pastor at the village of Hohenkirchen near Gotha. In 1512 he was appointed university librarian at Wittenberg, and in 1514 court chaplain and privy secretary at Dresden, in which position he had great political influence as the most trusted counsellor of the Elector. He greatly advanced the cause of the Reformation as 'superintendent' at Altenburg, where he died 16th January 1545. The chief works of S. are his biographies of Friedrich the Wise (new ed. by Neudecker and Preller, Jena 1851) and Johann the Constant, his *Christliche Religionshändel* (published as *Annales Reformationis*, Leip. 1718), his history of the popes and emperors of his time, and his letters. See the biographies of S. by Schlegel (Jena 1693), and Wagener (Altenb. 1830).

Spala'to, the largest and most beautiful town of Dalmatia, Austria, on a peninsula which on one side separates the Bay of S. from an inlet of the Adriatic, partly inclosed by Brazza, Solta, and other islands. It is mainly interesting as the place which Diocletian, the greatest of the Illyrian emperors, chose as his resting-place after the toils of government and warfare, and where he reared 'the vastest and noblest dwelling that ever arose at the bidding of a single man.' Near his own birthplace (Salona) he built this palace, *Salonæ Palatium*, 'which marks a still greater epoch in Roman art than his political changes mark in Roman polity.' The work of twelve years, it is remarkable in art as showing for the first time the true Roman use of columns, and forestalling the long arcades of the Christian basilica. In its wide circuit it included quarters for soldiers and various officials; the walls, towers, and gates were those of a city rather than a palace. After the death of the founder no emperor made it his residence, and while still new it seems to have become a cloth factory where women worked, and which therefore appears in the Notitia as a *gynæcium*. On the overthrow of Salona by the Avars in the 7th c. the inhabitants settled within the walls of the palace, and there grew up the modern city known first as Aspalathon, and subsequently as S. The stateliest parts of the palace still remain; the great open court, the peristyle with its arcades, is the public piazza, and the mausoleum (the so-called Temple of Jupiter) is the Christian *duomo*. S. itself, now desolate, was one of the greatest cities of the Roman world, and 'if it does not rank with Rome, old or new, with Ravenna and with Trier, it is because it never was, like them, an actual seat of empire.' The modern city, the seat of a bishop, has an active trade in grain, cattle, wine, fruit, rosoglis, &c. Pop. (1870) 15,784. See Freeman's *Hist. and Archit. Sketches* (1876).

Spal'ding, a market-town of Lincolnshire, England, on the Welland, 14½ miles S.S.W. of Boston, is an important railway centre. It has a fine Perpendicular church (restored 1860), a sessions-house (1840), Elizabethan corn exchange (1856), butter-market (1857), and a grammar-school founded in 1588. There are bone, flour, and saw mills, breweries and coach-factories, and an extensive trade by rail and river, the latter being navigable for vessels of 60 tons. S. publishes one weekly newspaper, and had a pop. (1871) of 9111.

Spallanza'ni, Lazaro, a famous Italian physicist, was born at Scandiano in Modena, 12th January 1729, studied at Bologna, took holy orders, and in 1755 was made professor of logic, rhetoric, and Greek at Reggio, but continued the study of physical science, and in 1768 obtained the chair of natural history at Pavia. In 1779 he travelled over Switzerland, and in 1785 accompanied the Viennese ambassador to Constantinople, visiting also Corfu and Cyprus. He died at Pavia, 12th February 1799. S. by careful study of the Infusoria defended the doctrine of biogenesis against Needham and Buffon, in his *Saggio di Osservazioni microscopiche concernenti il Sistema della Generazione di Needham e di Buffon* (1776). He greatly added to our knowledge of the circulation of the blood by his *Dissertazione di Fisica Animale e Vegetabile* (1780), replying in 1788 by his *Lettera Apologetica* to some strictures by Hunter. In 1792 appeared his six-volume *Viaggi alle due Sicilie ed al alcune parti dell' Apennino*. S. also enriched the museums of Pavia by the collections he made on his travels. He published upwards of twenty-five works, and his all but universal genius displayed equal power in the treatment of philosophy, languages, law, and natural science. His collected works, edited by Senebier, were published at Paris in 1787, and were included in the Milan *Classics* in 1825–26. Some have also been translated into German and English. See Tourdes, *Notice sur la Vie littéraire de S.* (Par. 1799); Pozzetti, *Elogio Storico di S.* (Parma 1800); and Brera, *Storia della Malattia e Morte di S.* (Pav. 1801).

Span, in ordinary language, means a measure of length taken between the tips of the thumb and middle finger when the hand is stretched its utmost. It averages about 9 inches.

Span'dau, a town and fortress of the first rank in the province of Brandenburg, Prussia, lies at the confluence of the Spree and Havel, 6¾ miles W. of Berlin by rail. It has a gymnasium (1862), the Juliusthurm, an important arsenal, one Catholic and two Evangelical churches, among which the Nikolaikirche is a fine edifice of the 16th c. There are considerable manufactures of cannon, gunpowder, thread, carpets, stockings, and tobacco. S. was walled in 1318, and first fortified in 1577–83. It was occupied by the Swedes in 1631–35, yielded to the French 23d August 1806, and from March 1813 was invested by the Russians, to whom the French garrison capitulated on the 21st April. Pop. (1875) without soldiers (530) and officials (222), 26,888.

Spangles are small, thin, circular plates of shining metal pierced with a hole in the centre to enable them to be attached to theatrical dresses, their chief use. Large S. were formerly employed to adorn horse-trappings.

Span'iel, a variety of the dog, exhibiting many sub-varieties which present marked differences in size and appearance. The common S. has large pendent ears covered with long hair; the texture of the coat is silky and fine. The colour is in general a

mixture of liver and white, but may be entirely white. The S. of old was used in pursuit of game; and one variety, the water-S., is noted for its daring and courage in the water. The King Charles S. is a small species, black and white in colour. The name indicates that the breed was believed to have been originally brought from Spain.

Span'ish Grass. See Esparto and Paper.

Span'ish Lang'uage and Lit'erature. Iberians were the first inhabitants of Hispania (q. v.), after them came the Celts, and from the fusion of both races sprang the Celtiberi. The Iberian language survives in Basque; but the Celtiberi, exposed to Phœnician and Carthaginian influences, at length adopted the speech of their Roman conquerors. To Latin literature Spain gave the famous writers Lucan, Martial, the Senecas, Columella, Silius Italicus, Quintilian, Juvencus (earliest of Christian poets), and Prudentius; but Spanish, like all the Romanic tongues, is a descendant, not of literary, but popular Latin—the *Lingua Romana Rustica.* The Gothic hordes, hastening the downfall of old inflections, replaced them by analytical forms, and in the hybrid idiom thus evolved Teutonic cement repaired the ruined torsos of antiquity. Next Arab conquest threatened to sweep away the Latin language. Alvarus Cordubensis (854) records how Christians acquired Arabic to such an extent that hardly one in a thousand could write a Latin letter; a bishop of Seville found he must render the Scriptures into Arabic; and Arabic is the language of more than 2000 documents in the cathedral archives of Toledo. Only in the Alpine Asturias the Christian remnant cherished its native speech, which with the flood of Christian reconquest spread slowly over the Peninsula again. Long as the strife of Cross and Crescent lasted, so long was the struggle of Aryan and Semitic speech for mastery; and as late as the 13th c. Christian monarchs struck coins with Arabic legends and founded Arabic schools; in the 14th, important documents still bore an Arabic signature. Spanish came forth the conqueror, and of its many dialects—Gallician, Catalan, Asturian, &c.—Castilian, the idiom of dominant Castile, acquired the literary pre-eminence. It is a noble aggregate, 'founded on Roman majesty, buttressed by Gothic force, enriched with Arabian filigree,' retaining the *pingue quiddam* that Cicero noticed, the same *os magna sonaturum* that makes the Don seem wiser than he is. Six-tenths of its vocabulary are of Latin, one-tenth of Teutonic, and one of Arabic origin; grammatically it is still purely Latin, 'the formations and inflections remaining,' says Diez, 'thoroughly Romanesque, more Latin-like even than in Italian.' The language of the entire Peninsula save Portugal and the Basque provinces, Spanish is also spoken with more or less dialectic variation in Cuba, Mexico, the greater part of S. America, &c. The Academia Española issued a Dictionary (6 vols. Madr. 1726-39; 9th ed. 1869) and a Grammar (1771; French ed. Par. 1874); of English-Spanish Dictionaries the best are Velasquez' (Lond. 1873) and Neumann and Baretti's (new ed. 2 vols. Lond. 1874). See the chapters devoted to the language in Clarus' and Ticknor's works, Diez's *Grammatik der Romanischen Sprachen* (4th ed. 3 vols. Bonn, 1876), and his *Etymologisches Wörterbuch der Rom. Spr.* (4th ed. Bonn, 1878).

The earliest Spanish monument of certain date is a dull charter confirmed by Alfonso VII. to the town of Avilès (1145), but to the same heroic age belongs the *Poema del Cid* (q. v.), that primitive epic in which the chivalrous side of the nation's character is mirrored as sharply as its devotional reverse in the three scarce later, also anonymous poems, *El Libro de los tres reyes d'Orient*, *La Vida de Santa Maria Egipciaca*, and *Los tres reyes magos.* The poet first known by name is the priest Gonzalo de Berceo (*circa* 1198-1260), author of 13,000 lines of religious *Prosas*, rightly so called; the creator of genuine prose was Alfonso X. (q. v.), whose *Siete Partidas* (1265), or Castilian code, modelled upon Justinian's, is far superior both to his own Gallician hymns and to the wearisome *Don Alexandre* of a clerkly contemporary, Lorenzo Segura. Don Juan Manuel, Alfonso's nephew (1282-1347), anticipated Boccaccio in *El Conde Lucanor*, a collection of Eastern ensamples; and Juan Ruiz, archpriest of Hita, by metrical apologues, not at all unlike the *Canterbury Tales*, founded the school of burlesque about 1340, the approximate date of a Spanish version of the *Dance of Death.* Much older probably than any *versos de arte mayor* were the ballads or *romanceros*, looked on by Conde as Arabic exotics, but self-proclaimed to be a native growth, come down from the Andalusian bards of Strabo (bk. iii.). In their most perfect cycle, that of the Cid, the scattered fragments of the complete *Poema* may be discerned. From ballads it was but a step to chronicles, the earlier of which are so poetical that the after age of the Sepulvedas restored to them metrical form with often the slightest change. Such were the chronicles of Alfonso X., of Villaizan (1379), and Ayala (q. v.), and such the records by loyal servitors of the deeds of their doughty masters, Pero Nino (1379-1453), Alvaro de Luna (1408-53), and Gonzalvo de Córdova, 'the Great Captain' (q. v.), to which may be added the chronicle of Ruy Gonsalez' embassy to Tamerlane (1403-7). But if the transition from Cid ballads to the prose Chronicle of the Cid was easy, equally so was that from the semi-fabulous Chronicle of Don Roderick to pure romances, like *Amadis* (q. v.), *Palmerin de Gaula*, and all the knight-errant train. These close the 'national' period of Spanish literature, which in the peaceful reign of Juan II. (1407-54) was permeated by Provençal and Italian influences. Enrique, Marques de Villena (1384-1434), wizard and epicure, translated Dante and the *Æneid*, whilst founding guilds of the '*gaya ciencia*;' his squire, Macias el Enamorado, lived, sang, and died a thorough troubadour. Lope de Mendoza, Marques de Santillana (1398-1458), wrote sonnets in the Italian, *serranillas* in the Provençal fashion; and the *Laberynto* of Mena (1412-56) is so far Dantesque that it opens in a wood. The Troubadour mania passed away, leaving behind it the courtly *cancioneros*, with their strange medley of pious and amorous strains; but many circumstances combined to tighten the connection of Spain and Italy—the spiritual dominion of the Papacy, the union of the Two Sicilies to the crown of Aragon, the attraction of Padua's learned halls to Spanish students, and the brief conquest of Rome itself. Eight centuries of Moorish warfare ended, Spain's bolder spirits turned to the unknown West; but in the East her scholars beheld and were entranced by the glory of the Renaissance. Boscan (q. v.) grafted the sonnet firmly upon his country's literature; his pupil Garcilasso (q. v.) added the pastoral eclogue, remarking that 'hardly any one had written in Spanish aught worthy of the trouble;' while for the pastoral romance Spain was indebted to a Portuguese, Jorge de Montemayor (q. v.). To the new school of 'Petrarquistas' belonged Acuña (1510-80), the versifier of Karl V.'s *Cavallero Determinado;* Fernando de Herrera (q. v.), whose pastoral romance *Diana* is spared by the Curate from the flames; and Ponce de Leon (q. v.), creator of the Spanish ode. Its great opponent was Castillejo (?1494-1596), who stuck to the *glosas* and *canciones* of the preceding mode; its ablest advocate, Hurtado de Mendoza (q. v.), master of two most opposite forms of composition, the 'picaresque' novel and dignified Sallustian annals. Of history Mendoza shares the honours with Oviedo (q. v.), Avila y Zuniga (q. v.), Las Casas (q. v.), Mariana (q. v.), Antonio de Herrera (q. v.), Garcilasso (q. v.), the brothers Lupercio and Bartolommeo Argensola (q. v.), and Antonio de Solis (q. v.); his *Lazarillo* (1553) gave birth to the *Guzman de Alfarache* (1599) of Mateo Aleman, and the *Gran Tacaño* (1627) of the great satirist Quevedo (q. v.), as these in turn to Scarron's *Roman Comique*, Le Sage's *Gil Blas*, and De Foe's, Fielding's, and Smollett's heroes. While, however, the *gusto picaresco* exerted a widespread influence on foreign writers, at home the works of chivalry, though government prohibited 'such shameful books' (1553), remained the only popular and fashionable reading till Cervantes (q. v.) dealt them their deathblow by his *Don Quixote* (1605), and gave to the world one of the world's few books. Yet, strange as it now may seem, Cervantes had a rival who far surpassed him in contemporary fame, the dramatist Lope de Vega (q. v.). Of the Drama (q. v.), developed in Spain as in other countries from medieval mysteries, our earliest specimens date from about 1472—the satire *Mingo Revulgo* and Royas' *Celestina*, a libertine prose tragi-comedy, or rather dramatised romance, not meant for representation, which, always immensely popular, has been the source of numberless later plays. The eleven 'eclogues'—six quasi-religious, five wholly secular—of Juan de la Enzina (1468-1534), regarded commonly as founder of the Castilian theatre, are rude and slight, but served as models to the Portuguese, Gil de Vicente (q. v.), who in his turn reacted powerfully upon the Spanish stage. A popular vein, first struck by the Seville gold-beater, Lope de Rueda (*flo.* 1544-67), whose comedies Ticknor compares to *Ralph Royster Doyster* and *Gammer Gurton's Needle*, was followed up by Cisneros, Alonso de la Vega, and Timoneda with high success. In vain the erudite

party strove to erect Spain's theatre on classic lines; not even Cervantes' Æschylean *Numantia* achieved the task. But Lope, the reputed author of 21,000,000 verses, wisely discarded unities for human interests, and wrote as a man for men, for Spanish men, one cause why his works are caviare beyond the Pyrenees. Calderon (q. v.), his only equal in the dramatic realm, less easy, natural, and realistic than Lope, was loftier and more refined than he: with Calderon the curtain fell. Of other playwrights —and their name is legion—need only be mentioned Guillen de Castro (1567–1631), from whose *Mocedades* Corneille borrowed his *Cid*; Gabriel Tellez (1585–1642), the hero of whose *Burlador de Sevilla* is the earliest distinct 'Don Juan' (q. v.); Montalvan (1602–38), Moreto (1603–69), and Solis. No Spanish epic has equalled or even approached the first—the *Cid*. The fragment *La Araucana* (1569) of Ercilla (q. v.) has the grand defect that it 'wants a hero,' and hardly justifies its author's title of the 'Castilian Homer' except in being a third as long as Homer's *Iliad*. Voltaire indeed praised, but then he had never read, the poem. The nation's pride more than the nation's genius inspired the *Caroleas*, *Austriadas*, *Lepantos*, and other countless 'epics' of the Blackmore type; 'four thousand poets,' said Lope, 'stand at each turning of the street.' And the religious narratives of Virues (1588), Bravo (1604), and Balbuena (1624), though best of their weary kind, are solely valuable as records of a fanatical faith, whose 'acts' were indeed a shining light. The land of the Inquisition has no Copernicus or Galileo, no Bacon or Descartes. Mystics there are in shoals, Avila (1500–69), Santa Teresa (q. v.), Ribadeneira (1527–1611), Molina (1535–1601), Suares (q. v.), &c., but no philosophers. Spain's *alma mater*, Salamanca, declared as late as 1771: 'Newton teaches us nothing that could make a good logician or metaphysician; Gassendi and Descartes do not agree so well with revealed truth as Aristotle.' In lyric poetry Gongora (q. v.) has at least the merit of inventing the vile *cultismo* known by his name, where tinsel conceits and euphuistic phrases are meant to conceal the poverty of thought; with the accession of the Bourbons (1701) invention of any sort came to an end. The Castilian muse changed her mantilla for Parisian modes, her dignified native speech for mincing Gallicisms. Amongst French copyists and translators the best, *i.e.*, most servile, are perhaps Ignacio de Luzan (1702–54), Velasques de Valdeflores (1722–72), Siscar and Amirola (both about 1750), and Moratin (q. v.). Far easier is it to enumerate the few opponents of these *Afrencesados*—Huerta (q. v.) and Hartzenbusch (q. v.), would-be revivers of a national stage; the Padre Isla (1703–81), who once more essayed the picaresque novel, in *Fray Gerundio* assailed the monks, and translating *Gil Blas* into Spanish, claimed it for Spain; and Melendez Valdez (1754–1817), Cervantes' follower at a distance. In 1790 the final volume appeared of a work that had exercised a singular influence on Spanish literature, the *Index Expurgatorius*; eighteen years later the French abolished the Inquisition. But with the Restoration it was again established, and the state of letters was worse than ever before. Imprisonment, death, or exile rewarded Quintana (q. v.), Valdes, Rosa, Moratin, nearly all Spain's authors—they were not many! That time of tyranny is past, its effects remain. The death (1877) of 'Fernan Caballero' (q. v.) has removed the one Spanish writer whom Europe knows. Of the Romanticists of 1830, from whom great things were hoped, Zorilla (born 1817) alone remains, and even his works are far less popular than the trivial *vers-de-société* of Grillo, Palacio's sonnets, and Querol's *rimas*, all copied from the French. Becquer (died 1871) and Ferrant, by way of change, have imitated Heine with some success; Campoamor, to quote a Spaniard, is 'one of Spain's few original writers.' The historians La Fuente, Arrangoiz, and Muro, antiquated in thought, have lost the old knack of prose; Gonzales, Valera, and Galdós look upon Dumas as the ideal novelist. At least it is comforting to find that on the stage Lope and Calderon still hold their own, and have been imitated not quite in vain by Zarate (born 1796), Breton de los Herreras (1796–1873), and other dramatists. See Bouterwek's *Geschichte der Spanischen Poesie und Beredsamkeit* (Gott. 1819); Sismondi's *Littérature du midi de l'Europe* (Par. 1819); Clarus, *Darstellung der Spanischen Literatur im Mittelalter* (2 vols. Mainz. 1846); Ticknor's *History of Spanish Literature* (3 vols. Lond. 1849; new ed. 1871), the standard work; Schack's *Geschichte der dramatischen Literatur und Kunst in Spanien* (2d ed. Frankf. 1854); Amador de los Rios' *Historia Critica de la Literatura Española* (2 vols. Madr. 1861–62); Mila's *Poesia heroico popular en Castilla* (Bar. 1872); and Hubbard's *Histoire de la Littérature contemporaine en Espagne* (Par. 1876).

Span'ish Main, a name commonly given in the 16th and 17th centuries to the mainland of S. America from the Isthmus of Darien to the mouth of the Orinoco.

Span'ish Town, the name of two towns in the W. Indies: (1) The former capital of Jamaica, on the Cobre, 10 miles W. of Kingston, a poorly-built place with a pop. of 7000. (2) The capital of Trinidad, has several hospitals and asylums and a good harbour. Pop. 13,000.

Spank'er (from vulg. *spank*, 'to move quickly'), the after-sail of a ship or barque, is a fore-and-aft sail attached to a gaff.

Spar, a term applied by mineralogists to a variety of minerals, Iceland S., fluor S., heavy S., &c., which seem to have little in common save their perfect crystalline character. The name is used by miners to designate any crystalline mineral.

Spar'idæ, a family of Teleostean fishes, belonging to the *Acanthopterous* section, and allied to the *Mullidæ* or mullets. The S. have long, compressed bodies, an unarmed tail, and from 5 to 7 branchiostegal rays. The teeth form a cutting series in front or prominent grinders to the back. There is one dorsal fin. The anal is 3-spined, and the ventral fins are on the chest. The Braize, Sea Bream, and Gilthead are typical representatives.

Sparks, Jared, an American biographer and historian, was born at Willington, Connecticut, on May 10, 1789. After studying at Harvard, where he was for some time mathematical tutor, he became pastor of a Unitarian church in Baltimore in 1819, and two years afterwards was chosen chaplain to the United States House of Representatives. In 1823 he retired from the church and settled at Boston, purchasing the *North American Review*, of which he was sole editor until 1830. S. had previously edited a Unitarian magazine and published numerous works of controversial theology. He now devoted himself to historical and biographical studies, visiting Europe in 1828 to make researches. In 1830 he founded the *American Almanac*. From 1839 to 1849 he was professor of history at Harvard, and from 1849 to 1853 president of the college. He died at Cambridge, Massachusetts, March 14, 1866. His principal works are a *Life of John Ledyard* (1828); *The Diplomatic Correspondence of the American Revolution* (12 vols. Bost. 1829–30); an edition of *The Writings of George Washington, with a Life of the Author* (1834–37); a *Life of Gouverneur Morris* (1832); and an edition of *The Works of Benjamin Franklin, with a Life of the Author* (1836–40). He also edited two series of *American Biography* (1834–38, 1844–48). See Ellis's *Memoir of J. S.* (1869).

Sparr'ow (*Passer*), a well-known genus and species of *Insessorial* birds, belonging to the family *Fringillidæ*, and to the *Conirostral* section of the order. The bill is broad at the base, and has its tip slightly hollowed. The second and third quills are the longest, and the tail is of moderate size. The colour of the common S. (*P. domesticus*) is grey on the top of the head and brown on the back, each feather having a black centre. The under parts are grey inclining to brown. The average length is 5 inches. The eggs, numbering 5 or 6, are of a dull white hue spotted with brown, and several broods may be produced in one year. The Hedge S. (q. v.) is an entirely different bird from the common S. The Tree S. (*P. montanus*), on the other hand, is allied to the common S. Its head is of chestnut colour, and there is a black triangular patch on each cheek, the under parts being brownish white. The nest is built in trees. The White-Throated S. of America is the *Zonotrichia albicollis* of ornithologists. It is a handsome bird, attaining a length of 6 inches, and inhabits the S. States of America. The head is striped white and black, the chin, breast, and belly are white, and the upper parts are a varying brown and black.

Sparr'ow-Hawk (*Accipiter nisus*), a species of Raptores (q. v.), belonging to a special sub-family (*Accipitrinæ*), in which the bill is strong and sharply arched, and the tarsi covered in front with scales of large size. The S.-H. attains a length of 12 inches. It is one of the commonest of hawks, and is represented in America by the *A. sparverius*. The S.-H. is dark brown above, and reddish brown below. The brown is varie-

gated with dark tints, and the tail and wing-coverts are barred with black. The plumage of the female, which is larger than the male, is diversified with white spots. The eggs are 3 or 4 in number, and are of a dirty white, marked with brown. The S.-H. is a bold active bird, frequently attacking other species of larger size than itself with success.

Spar'ta, called also Lacedæmon, the chief city of Laconia, and head of the Dorian confederation while the latter held the hegemony of Greece, was situated on the right bank of the Eurotas, at the foot of the mountain-ranges of Taÿgetus and Parnon. Owing to its impregnable situation S. was never fortified during the autonomy of Greece, the tyrant Nabis (B.C. 195) having been the first to build walls round it; and the houses of its inhabitants were for the most part small, lying snugly in the midst of gardens, and even the temple and state buildings were on a much less magnificent scale than those at Athens. The city lay partly on two low hills forming the southernmost spur of Taÿgetus, about 10 stadia below the junction of the Eurotas and Ornus, and partly on the fertile plain stretching S. from them along the course of the river. There is some doubt which of these hills formed the Acropolis, but Curtius is probably right in selecting that nearer the river, on the S.W. side of which also the theatre was excavated. The chief building on the Acropolis was the temple of Athene Chalciœcus, so called because covered by the architect Gitiadas with plates of bronze; below which to the E. was the Agora, containing the various public buildings, and especially the Persian Stoa built from the spoils obtained in the Persian wars, and adorned with figures of Persians in white marble upon the columns. S. beheld an enemy for the first time in B.C. 369, when Epaminondas invaded the Peloponnesus after the battle of Leuctra, and in B.C. 195 it was taken by the Romans under Flamininus. A small village called New Sparta is now built on the heights to the E. of the ancient city. In historical times the population of S. consisted of three elements; the Spartans proper, or governing class, descended from the original Dorian conquerors; the Periœci, the subject race who cultivated the land and carried on such trade as the principles of the state allowed, but though personally free had no political rights; and the Helots or slaves. The government, though nominally democratic, was really a close oligarchy, the popular assembly having no true power in the state, and even the kings having to submit to the dictates of the Ephors (q. v.). Still, in accordance with the laws of Lycurgus (q. v.), to the very end of Sparta's freedom, the whole machinery of a popular government was kept up, with the two Heracleid kings at its head. From their earliest youth the Spartans were brought up under strict military discipline, dining together at the public table (*syssition*), and utterly forbidden to take part in anything but military or predatory exploits. By this means they became the most perfect foot-soldiers Greece ever saw, but altogether destitute of refinement or liberal sentiment. The history of S. has been given under Hellas (q. v.); subsequent to the Dorian invasion—previous to which the names of Menelaus and Helen connect it with the Trojan War—it divides itself naturally into six periods, according to the various enemies against whom S. was contending, the Dorian, Persian, Athenian, Theban, Macedonian, and Roman. The first three S. conquered; to the last three she had to submit. On the topography of S. the best ancient authority is Pausanias (q. v.), among moderns Curtius' *Peloponnesus* (2 vols. 1852) is invaluable. For the history, besides the general works of Thirlwall, Grote, and Curtius, Müller's *Dorians* (2d ed. 2 vols. 1844) may be consulted. S. never having been destroyed, it is anticipated that research in the deep soil will bring to light many remains. Remarkable reliefs have been discovered within the last few years; *e.g.*, the relief-bearing four-sided pedestal, and the separate relief of Dionysos and Ariadne.

Spar'tacus, a shepherd of Thrace, who became a Roman auxiliary, but deserted as a bandit. Captured and sent to the training-school for gladiators at Capua, he persuaded seventy-four others to join him in attempting freedom (B.C. 73). They fought their way through the streets of the town, and escaped to the crater of Vesuvius, where many other slaves joined them. Led by S. and two Gauls—Crixus and Œnomaus—they plundered surrounding towns. C. Claudius Pulcher, with 3000 men, was sent to blockade them, but escaping, they fell on his rear and defeated him. S. now proclaimed freedom for all slaves, and hordes joined him. With an army of 70,000 he defeated Corsinus and the prætor Varinius Glaber. But seeing that numbers were demoralising his ranks, he proposed to force the Alpine passes and escape home. His troops, flushed with success, refused, and the war went on. In 72 he repeatedly defeated two consular armies operating against him in N. Italy, but retired south in winter. Pushing north next spring, he routed C. Cassius, Cn. Manlius, and Mummius, legates of Crassus, who now (71) as prætor had the conduct of the war. Crassus' energy was seconded by frequent desertion from S., whose diminished army was blockaded in Rhegium. Failing to cross to Sicily, S. faced round, forced the Roman lines after a bloody struggle, and marched on Rome. Suddenly his Gallic contingent, 30,000 strong, deserted. Thus weakened, he again strove to lead his army N., but they madly refused, and the final struggle took place soon after near the source of the Silarus. S. foreknew the certain issue. Stabbing his horse, he rushed into the thickest of the combat, fought with desperate valour, and fell 'like a free man and a brave soldier.' S. was the mightiest of guerilla captains. Resource, perseverance, prudence, clemency, and courage—such were the qualities which would have made him triumph had success been possible. See Mommsen's *Röm. Gesch.* (Eng. trans. 1864–66).

Spar'tel, Cape, the N.W. extremity of Africa, at the Atlantic entrance to the Strait of Gibraltar. It is a bold headland, with a range of basaltic columns like the Giant's Causeway (q. v).

Spasms (Gr. *spasmata* from *spaō*, 'I draw out'), are irregular and violent contractions of the muscular structures, but less violent than convulsions. S. are always involuntary, even when the voluntary muscles are concerned. There are two varieties of S., called tonic and clonic. *Tonic* S. (from Gr. *tonos*, a 'bracing up'), or *spastic contractions*, consist in contractions attended with rigidity or hardness of the muscles, as in common *cramps* and *tetanus*. *Clonic* S. (from Gr. *klonos*, an 'agitation') consist in rapidly alternating contraction and relaxation, as in *chorea*, *epilepsy*, and *convulsive hysteria*. S. constitute the more important symptoms in several diseases, as in spasmodic croup, and certain forms of retention of urine.

Medicines which are prescribed to allay irregular and inordinate muscular contractions or S., called antispasmodics, are the following:—Hydrocyanic acid, ether, ammonia, assafœtida, belladonna, cajuput, camphor, cannabis indica, castoreum, chloral hydrate, chloroform, conium, galbanum, hyoscyamus, lobelia, moschus, oils of peppermint and ruta, stramonium, sumbul, turpentine, valerian, and oxide of zinc.

Spathe or **Spath'a**, in botany, means a large bract or floral leaf enveloping the immature inflorescence of some monocotyledons, and so guarding it from injury. The enclosed inflorescence often consists of an axis bearing numerous closely-packed sessile flowers, arranged in a spike-like manner—this is termed a *spadix*. The genus *Arum* offers a good example of S. and spadix. In palms the spadix is frequently branched, the branches being subtended by secondary spathes.

Spa'vin, a disease affecting the ankle or hock-joint of the horse. In young horses of weakly constitution, which have been overworked, the joint inflames, and the synovial secretion is present in increased quantity, and is dark-coloured. This variety of the disease known as 'log,' or 'blood S.,' is treated by rest, wet bandaging, and aperients. The other form of the disease consists of a bony deposit in the joint, and is hence named 'bony S.' When the case is mild, it is treated by rest, fomentations, and blistering; but when aggravated it is hardly curable.

Spawn'ing of Fishes. In all Vertebrates the sexes are distinct, but impregnation in fishes is, as a rule, effected externally to the body of the female. In some fishes (*e.g.*, sharks) the male is provided with a pair of organs named claspers, and by means of these the male adheres to the female during the act of fecundation. Most fishes spawn by simply depositing their eggs, the male shedding the milt upon them. In some, *e.g.*, the blennies, the young are retained within the parent body until they are ready to swim. Impregnation in this case must be internal. The writer has removed over 100 young in a well-developed state from the abdominal cavity of a viviparous blenny. The eggs in some species (*e.g.*, dogfishes, rays, &c.) are enclosed in tough capsules named 'mermaids' purses.' The number of eggs produced is in some cases enormous: a single codfish has been known to produce over 3,000,000 eggs. The flounder and salmon are also exceedingly prolific.

Speak'er. See PARLIAMENT.

Speak'ing-Trumpet is a portable conical tube of metal or guttapercha with one end flaring, employed principally at sea to reinforce the sound of the human voice so that it may be heard at a great distance. According to Chappell (see *Nature*, November 7, 1878), who has noted two examples among the plates of Lepsius' work on ancient Egypt, the S.-T. is as old as the Pyramids; and one is said to have been used by Alexander the Great, 335 B.C. Saland constructed one in 1652 from a description by Athanasius Kircher, a Jesuit; but the first who philosophically explained it and brought it into notice was Sir Samuel Morland, master of mechanics to Charles II., who in 1670 constructed one of glass, a second of brass, and a third of copper. The last, which gave the best results, was recurved, 16 feet 8 inches long, 19 inches in diameter at flaring end, and 2 inches at lip-piece, and words spoken through it were audible at 1½ miles distance. Several instruments deriving their power from electricity have lately been devised for enabling vocal or other sounds to be heard at great distances. The inventions are yet in their infancy, but they are full of promise of great practical usefulness.

Spear, a weapon consisting of a sharp-pointed blade mounted on a long wooden shaft. Its use dates from a very remote period, and at the present time it continues the principal *missile* of many savage tribes. See LANCE and PIKE.

Spe'cial Ju'ries are juries of men of education presumably above an average, and who are therefore supposed to be specially qualified to judge in difficult questions. By the Jury Act, every man described in the jurors' book as an *esquire*, or person of high degree, or as a banker or merchant, is qualified to serve on a special jury. Special jurors may receive such payment, not exceeding one guinea, as the judge thinks reasonable. The same jury may, by consent of parties, try any number of cases.

Spe'cial Li'cense. In England a priest may lawfully perform marriage rites without publication of banns, by S. L. from an archbishop. S. L. also authorises a change from ordinary time and place. The stamp-duty is £5. See MARRIAGE.

Spe'cialty Debt. See DEBT.

Spe'cies, a term employed in biology to denote all those individual animals or plants, which from the persistence of similar characters might be presumed to be related together in the nearest ties of blood relationship, and as such to be fertile, *inter se*. As examples take the two known S. of elephants (African and Indian), or camels (dromedary and Bactrian). Each elephant reproduces its like; the progeny of the Indian invariably resembles all other Indian elephants, and of the African S. the same holds good. In no case do we find an Indian elephant producing the large ears, larger body, and other peculiarities of the African. Nor do we find a dromedary giving origin to a two-humped Bactrian camel. Hence this apparently well-founded characteristic, of each 'kind' of animal giving birth to progeny like itself, has always constituted the leading idea in the definition of a S. But for this transmitted likeness, the S. of animals or plants could never have continued in a stable form. Such an idea forms the basis of the definition of S. which in former biological periods were frequently constructed. By Rhymer Jones a S. is defined to be 'a number of animals, so closely resembling each other that they all might be supposed to be the offspring of the same parents, and in turn to give birth to progeny exactly resembling themselves.' By Buffon, S. was defined 'as a constant succession of individuals, similar to and capable of reproducing each other.' De Candolle affirmed a S. to be 'a collection of individuals resembling each other more than they do others, and able to produce their like; doing so by the ordinary process of generation, and so as to form grounds for belief that they originally descended from a single pair.' Woodward's definition is that a S. is formed by 'all the specimens or individuals, which are so much alike that we may reasonably believe them to have descended from a common stock.' Pritchard remarks of a S., that it is constituted by 'separate origin and distinctness of race, evinced by a constant transmission of some characteristic peculiarity of organisation.'

Such were the ideas that prevailed until a comparatively recent period. But a great change has taken place in our conceptions of S. since the publication of the theories of 'evolution' and 'transmutation,' associated with the names of Lamarck, Darwin, and Wallace. The old theory of the *special creation of animals and plants* necessarily assumed that each S. had descended from a primitive pair, and that the specific likeness originally stamped by the creative fiat upon the organism was capable of transmission and perpetuation throughout all time. Thus the rigidity and stability of S. was regarded as a corollary to the idea of their special creation. The progress of research showed, however, that a process of *variation* is continually represented, in greater or less degree, in all S. of living beings. No S. is free from variation, induced sometimes by causes capable of determination (such as change of food, climate, &c.), and often by causes of whose nature and extent we are absolutely ignorant. No fact is better established than that of *specific variation*, which may be regarded as the keynote of every theory of 'transmutation' or 'evolution.' As examples of variation produced by known causes, the various breeds of domestic animals may be instanced. It is an equally interesting fact, that in not a few S. of animals and plants there are two or three normally different and distinct genera included in one and the same S. Many butterflies exhibit this peculiarity, the female insects appearing normally in two or three distinctly different forms; many plants (*e.g.*, primrose) possess two different variations of arrangement of the flower-parts; and regarding some groups of plants, and notably the willows and brambles, no two botanists can agree upon which are to be regarded as *S.* and which as mere *varieties*.

The test of the rigidity and stability of a S., derived from the fact that individuals of different S. (*e.g.*, horse and ass) are sterile when crossed, or that their progeny (*e.g.*, the mule) at least is barren, is not satisfactory. Although some S. are barren when crossed, and others produce sterile progeny, this distinction is far from absolute; and in the case of some lower plants it has been proved that there are certain organisms which are more fertile if impregnated by a different S. than when fecundated by their own kind. Admitting the operation of the law of variation—the exact sway and boundaries of this law being as yet undetermined—naturalists have very generally given in their adherence to the idea that such variation implies a new relationship between S.; that animals and plants, instead of being the descendants of primitive pairs, may, as Darwin maintains, 'undergo modification,' and that 'the existing forms of life are the descendants by true generation of pre-existing forms.' Mr. Darwin and Mr. Wallace lay stress on the operation of *natural selection* in producing new S. According to this hypothesis S. are thus modified:—1. Every S. is subject to variations from, and modification of, the parent-type. 2. Variations are transmitted to offspring by heredity. 3. A selection of characters on the part of the parents (as in the case of sheep and cattle breeding) produces definite and known combinations of characters in the offspring, and varieties differing widely from the parents are thus produced. 4. External or physical conditions also undergo change, and favour variations through fluctuations of climate, food, land-surfaces, &c. 5. More young are produced by the S. of animals and plants than can possibly be preserved. 6. This excessive population is weeded out by nature; the weakest go to the wall; the strongest are those which *vary* from the type of the species. 7. Hence nature 'selects' varying individuals, and offers a premium in favour of producing further variation by inheritance. 8. Through the succession of varieties, new S. differing widely from the old are in time produced.

Many subsidiary causes, as Darwin shows, are brought into play in the evolution of new S. by 'natural selection.' The difficulty of supplying 'missing links,' *i.e.*, the transitional or intermediate forms between existing S., is due in greater part to what has been so succinctly named 'the imperfection of the geological record.' But in a few cases the gaps in this record have been supplied; *e.g.*, in the case of the horses where every gradation may be traced backwards in time, from the present existing one-toed horses to the four or five toed ancestors from which they have been derived. So also is it with the gaps between birds and reptiles which have been well-nigh filled up; and so with the Crocodilia, whose modifications from the Triassic period to the present day have been fully traced. See Darwin's *Origin of S.* (Lond. 1859) and *Animals and Plants under Domestication* (Lond. 1867; new ed. 1876); Wallace's *Contributions to the Theory of Natural Selection* (Lond. 1870).

Specif'ic Grav'ity of a substance is defined as the ratio of the mass of any given volume of the substance to the mass of an equal volume of some standard substance—usually water in the case of solids and liquids, or hydrogen or atmospheric air in the case of vapours and gases. To find this ratio experimentally for a solid substance, all that is necessary is to weigh it in air and in water, take the difference between the true mass as given by the former operation and the apparent mass as given by the latter, and finally divide the true mass by this difference, which, in accordance with hydrodynamic laws, is the measure of the mass of the volume of water equal to the volume of the substance under investigation. This ratio is the S. G. To find that of any liquid, it is sufficient to weigh in it a solid whose real mass and whose apparent mass in water are already known. The differences between the real mass and the two apparent masses are the measures of the masses of equal volumes of the given liquid and of water, and their ratio gives the required S. G. In these methods no account is usually taken of the mass of the air; but for purposes of great delicacy it is requisite to allow for this. The term 'S. G.' is a bad one—since the conception has nothing whatever to do with the force of gravity, which enters in only indirectly as affording the best means for determining the various measures of mass. It is really the ratio of the densities, and is therefore the measure of the density if the density of the standard substance is taken as unity.

Specif'ic Perform'ance. A court of law may order S. P. of a contract; that is, that the condition of the contract be carried out; but usually, in an action for breach of contract, if the plaintiff gain he is awarded money.

Spec'tacles are optical instruments for correcting defective sight. They consist of two oval or circular lenses of glass or rock-crystal ('pebble'), mounted in a light metal frame which is made up of the 'bows,' 'bridge,' and 'sides' or 'temples.' Steel of a blue or straw-colour, or gold, is now principally used for the frame; formerly tortoise-shell and silver were much in vogue. The frames of 'eye-glasses,' single or double, are still frequently made of tortoise-shell or horn. The most common lenses for S. are the *bi-convex* and *bi-concave*, which are employed to assist far-sight and short-sight respectively. Convex lenses remedy the defect of the eyes having too weak refracting power on the rays of light, while concave lenses counteract an excessive refracting power. Care should be exercised in the choice of S. to select such as have the least strength that answers each individual case, as the use of too powerful lenses tends to intensify the imperfection it is desired to remove. When imperfect eyes have not the same refracting power, S. with lenses of different focal length ought to be used. In 'divided S.' each lens is composed of two semicircles of different foci neatly united. *Periscopic* S., having menisci, or concavo-convex lenses, were designed by Dr. Wollaston to facilitate oblique vision. Green and blue-tinted S. are used to protect the eyes from a glare of light. S. were unknown to the nations of antiquity; yet, singular to say, they seem to have had some acquaintance with lenses. A plano-convex glass lens, focal length 4½ inches, was discovered at Nineveh by Layard, who believes it was employed as a magnifier for reading or in gem-engraving. Another convex lens was found at Pompeii in 1854, and is now in the Naples museum, but King (*Antique Gems and Rings*) gives it as his opinion that it is only a paste imitation of peridot, which was destined by a gem-engraver to receive an impression. It is said that Nero, being short-sighted, used a concave emerald, which was set open in a ring, to view the combats in the arena. S. are believed to have been known in China at a remote period; and their invention in Europe is ascribed, among others, to Alessandro de Spina, of Florence, about 1285 A.D. Roger Bacon, who died in 1292, alludes distinctly to them, and they were assuredly not uncommon in England in the 15th c.

Spec'tre Bat, the popular name of a species of bat belonging to the genus *Phyllostoma*. The nose has leaf-like appendages, which give the face a peculiar and weird appearance. The S. B. inhabits S. America.

Spec'trum Anal'ysis, a powerful and delicate method of distinguishing different kinds of matter by their properties in relation to light. When Newton, in his darkened chamber, extended the circular beam of white sunlight into the long strip of rainbow tints by refraction through a prism, he struck upon a totally new path, which within the last half-century has led us to the discovery of some of the grandest truths of cosmic science. His experiment demonstrated that different coloured rays of light had different refrangibilities, that white light consisted of a complete series of these coloured rays which when refracted formed a continuous spectrum or strip of colours passing by imperceptible gradations from red, the least refrangible, through yellow and green to violet, the most refrangible. By substituting for Newton's circular aperture a narrow slit through which the sunlight streamed, Wollaston in 1802 obtained a purer spectrum, freer from the overlapping of the different coloured images which was inevitable in Newton's original form of experiment. The spectrum thus improved was found to be no longer *continuous*, but to be crossed by a number of dark bands, each of which obviously indicated the absence or at least the relatively weaker intensity of the ray of corresponding colour and refrangibility. At the time Wollaston made his discovery very little attention was paid to it even by himself, and not till these lines were re-discovered, mapped, and named by Fraunhofer in 1814, did they become known to the scientific world at large. Accordingly, they are not infrequently called Fraunhofer's Lines. One of the most remarkable of these is the double line D, which appears double when viewed by superior instruments, and which lies in the boundary between the orange and the yellow of the spectrum. Now, Fraunhofer further discovered that when he viewed the spectrum of the flame of an ordinary tallow candle there appeared a pair of bright lines which, as far as his instruments enabled him to make out, occupied exactly the same position in the flame spectrum as the double D did in the solar spectrum. In other words, the candle-light had in excess one of the component rays in which the sunlight was wholly wanting. This exact coincidence was tested and verified by Professor Miller of Cambridge in 1849; and Professor Swan of St. Andrews had meanwhile shown the bright lines in the flame spectrum to be due to common salt, which pervades the air everywhere. Reasoning from these two facts, Stokes concluded that sodium vapour existed in the sun's atmosphere. The nature of his reasoning is best shown by his own analogy from the branch of physics which treats of sound. It is known by experiment that if a musical note is sounded in the neighbourhood of a tuning-fork or stretched cord which is tuned to that note, the fork or cord will take up the note and continue to sound it, even after the original note has been made to cease. Imagine then a room filled with pianoforte wires all tuned to exactly the same note—say, the treble C. A listener at one side of the room will hear any note sounded at the other side with intensity as strong or nearly so as if there were no obstacle in the way, *provided that note be not C*. If, however, the note sounded is C, then the wires will all take up the same note, a loss of energy inevitably ensue, and the sound be possibly completely frittered away in lost vibrations, so that the listener hears nothing. In any case the sound would be sensibly diminished, and thus the pianoforte wires act as an absorbing medium to that note, and only that note, to which they are tuned, and which they can give. In exactly a similar way, the molecules of glowing sodium vapour, which by their vibrations give forth rays of light of definite refrangibility and colour, absorb those particular rays when they are directed through the heated gas from some external source. The same curious phenomena of absorption which led Stokes about 1850 to his conclusion had also been observed by Foucault; and in 1853, the Swedish physicist Angström stated that an incandescent gas radiates light of the same refrangibility as that which it absorbs. Simultaneously, then, these three made the same great discovery, but Stokes alone applied it to solar physics. Sir William Thomson, deriving his knowledge directly from Stokes himself, regularly stated from 1852 onwards in his lectures to his Glasgow students that sodium vapour existed in the sun, and that to find the other constituents of solar and stellar atmospheres was simply a question of comparison of the line spectra of known substances with the absorption lines of the solar spectrum. Not till six or seven years later, however, did this grand truth become generally known, when other physicists, following in the same path, made the same discoveries. In 1858, Balfour Stewart extended Prevost's old law of the Theory of Exchanges, which Leslie and others had more recently developed, demonstrating that not only is a good radiator a good absorber, but that there is absolute equality between the radiating and absorbing powers of a substance for every definite ray. In 1859, Kirchhoff, working independently, came to the same theoretical

conclusion, that in all bodies the measure of the absorbing power for a particular ray is the measure of the radiating power for that ray. Hence a substance which under given conditions radiates only a few rays, as in general glowing gases do, can under the same conditions absorb only these rays. Carrying his experiments to sunlight, Kirchhoff introduced a new absorption line into the solar spectrum, by passing the ray through incandescent lithium vapour, which gives a very distinct red line in its spectrum. With this red line the new absorption line exactly corresponded. By gradually weakening the sunlight, the lithium absorption line appeared to grow brighter, till it was of the same intensity as the rest of the spectrum when it disappeared. A further diminution of solar light made the line to come out brighter than the darker background. In this and other ways he experimentally proved that absorption lines exist only when the incandescent source is at a higher temperature than the absorbing vapour. Such is the brief history of the birth of S. A., which under the fostering care of Bunsen, Huggins, Lockyer, Draper, Jannsen, and a host of others, has led to a knowledge of the composition of the sun, stars, nebulæ, and comets, to an estimation of the velocities of the stars relatively to our sun, to the discovery of new elements, and to a deeper insight into the molecular structure of bodies. Quite recently Lockyer, from certain modifications in the spectra of calcium and similar 'elements,' gives reason for believing them to be true compounds. In the preceding sketch only the sure steps of progress are given. Many facts which have an important bearing on the theory were discovered years before S. A. was developed.

A *continuous* spectrum, made up of all possible rays from red to violet, can be emitted only by bodies which absorb all rays, and must therefore belong to some dark or opaque body, intensely self-luminous. Such spectra are emitted by glowing solids or liquids, or highly compressed gases. Gases, under ordinary circumstances, have discontinuous spectra composed of bright lines or bands at definite intervals from each other; but by forcibly compressing these gases, the lines may be made to broaden out into bands, and the bands into broader bands until they meet and form an unbroken line. The explanation of this is, that the molecules of the gas when it is giving a line spectrum vibrate freely according to their peculiar law, and, transmitting these vibrations to the ether, radiate light of definite wave length, refrangibility, and colour. By compression the molecules are brought closer together, and no longer execute the simple vibrations they formerly did, until at length, when the gas is sufficiently condensed, the molecules are capable of throwing off rays of every wave-length, as the vibrating molecules of solids do. The bearing of these remarks upon the physical constitution of bodies which are far beyond our reach is noticed under the special headings, such as COMETS, NEBULÆ, STARS, SUN, &c.; and in the article STARS the nature of the reasoning by which we pass from the spectrum to a knowledge of the velocity with which a star is approaching or receding from us will be touched upon. Throughout the article it has been taken for granted that the spectrum is obtained by refraction through a prism or series of prisms; and such an apparatus, with telescope attached for viewing the rays as they emerge, is called a *spectroscope*. The greater the number of prisms, the greater is the dispersion, and the more widely separated will two contiguous lines appear; but a great loss of light necessarily accompanies the multiplication of prisms. Instead of a prism a diffraction-grating may be used (see DIFFRACTION), and this latter method gives a purer and more complete spectrum, since absorption of light by the glass is inevitable in the former case. It must be remembered that the spectrum is not limited to what we see. Below the red rays are the dark invisible heat-rays, while above the violet exist the actinic rays which are effectual in photography. The latter may be rendered visible by throwing them upon a surface which has been wetted with solution of quinine or other fluorescent substance (see FLUORESCENCE). The active rays are degraded to rays of a neutral violet tint; and in the solar spectrum, absorption lines are thus shown to exist among those rays of higher refrangibility which are too fine for our organs of vision to see directly. The chief books upon the subject are Schellen's *Spektralanalyse*, Roscoe's *S. A.*, and Lockyer's *The Spectroscope and its Applications*, and *Solar Physics*. No modern treatise upon the sun or astronomy in general can be complete without an account of the development of this branch of physics; and in Tait's *Recent Advances in Physical Science* will be found a thorough inquiry into its history and a comprehensive philosophical treatment of its principles.

Spec'ulum Metal, a hard steel-white alloy of copper and tin, usually in the proportions of two to one respectively. It is susceptible of a high polish, and for that reason is employed for the mirrors of reflecting telescopes.

Speech. See LANGUAGE, LETTERS, and SOUND.

Speed, John, born in 1555, at Farington in Cheshire, was an antiquarian of enormous industry. In 1608 and 1610 he printed fifty-four maps of England and Wales, and in 1611 appeared his *Chronicle*, published as *The History of Great Britaine under the Conquests of ye Romans, Saxons, Danes, and Normans*. This was the completest history of its day, and it was the first to disregard the mythical fabrications of chroniclers like Geoffrey of Monmouth. In the same year appeared his *Theatre of the Empire of Great Britaine*, and in 1616 he published a theological work entitled *A Cloud of Witnesses*. S. likewise wrote *A Prospect of the Most Famous Parts of the World* (1631). The sub-title of the last was *The Genealogies of Scripture*, and it was often bound up with Bibles. S. died in 1629.

Speed'well (*Veronica*), a large genus of *Scrophulariaceæ*, consisting of annual or perennial herbs and shrubs widely distributed through N. temperate regions, occurring also in Australia and New Zealand. The leaves are generally opposite; the flowers on axillary or terminal racemes, rarely solitary, usually blue; corolla rotate or sub-campanulate; limb 4-cleft; stamens 2; capsule usually compressed. Ten species are common or frequent English plants, some as weeds of cultivated or waste ground; others of hedge banks, woods, and copses; and others of bogs and watercourses. Of these the Germander S. (*V. Chamædrys*) with bright blue flowers is a general favourite. *V. saxatilis* of the Scotch Alps is one of the most beautiful of indigenous plants. Five other species are either rare or are colonists. A number of hardy perennial species are grown in gardens as ornamental border plants; while the handsome shrubby kinds from New Zealand have long been introduced into greenhouses. The properties are unimportant. *V. beccabunga* (British) is a reputed antiscorbutic (see BROOKLIME). An infusion of the astringent bitter leaves of *V. officinalis* (also British) is used as a 'herb-tea.'

Speiss, a compound of the arsenides and sulphides of nickel, iron, and copper, formed in the preparation of smalt from cobalt. It is one of the principal sources of nickel.

Speke and **Grant**, two names intimately associated in the history of African discovery.—**John Hanning S.** was born at Jordans, Somersetshire, May 4, 1827, and educated at the grammar-school of Barnstaple. When seventeen years of age he went to India, joined the native Bengal infantry, and served in the Punjaub. He rose to the rank of lieutenant, and during leave of absence in 1854 a chance encounter with Captain Burton (q. v.) at Aden, turned his mind to the perilous task of African discovery. He joined Burton and Lieutenants Herne and Stroyan in their expedition to Harrar and the Somali country. The exploit ended in disaster; the party was attacked after falling back to the coast; Stroyan was killed, and S. escaped with eleven wounds. In June 1857 S. and Burton again set out, directed by the Royal Geographical Society to search for the Nile source in the regions S. of the equator. Following the track of Krapf and Rebmann, they entered the country from the Zanzibar coast, and advancing boldly westwards, discovered the great lake Tanganyika (q. v.), and a crescent-shaped mountain mass overhanging the N. half of the lake, supposed by S. to be the true Mountains of the Moon. Burton fell sick, and remained to recruit on the shores of Tanganyika, while S. proceeded N. and discovered the S. end of Victoria Nyanza (q. v.), 3d August 1858. In his journal he wrote that he felt no doubt that the lake gave birth to the Nile, and the discoveries of Baker, Stanley, and others have confirmed the conjecture, the Shibiyu being rather a feeder of the lake than a continuation of the great river. In 1861 S. and **James Augustus G.** headed another expedition to the region of the great lakes.—G., the son of the Rev. James G. of Nairn, Scotland, was born in 1827, educated at Nairn and Marischal College, Aberdeen, and appointed to a cadetship in the Indian army in 1845. He served at both sieges of Mooltan, and received a medal for his conduct in the battle of Gujerat under Lord Gough. While commanding two companies of the 78th Highlanders at the relief of Lucknow

he was wounded, and subsequently retired with the rank of major in the Bengal army. The expedition in which he joined S. approached Victoria Nyanza from the E. coast, traced its W. side from the town of Mashonde northwards to the effluence of the Nile at the rapids, which the travellers named the 'Ripon Falls,' in honour of the president of the Geographical Society. Traversing the kingdoms of Karagwe and Uganda, on the W. and N. sides of the lake, they made their way to Gondokoro, where they were met by a relief expedition under Sir Samuel Baker (q. v.). S. and G. had heard of another great lake lying W. of their route, and Baker, taking up the search, discovered the Albert Nyanza (q. v.) 14th March 1864. S., who received gold medals from the Geographical Societies of Paris (1860) and London (1861), was the author of a *Journal of the Discovery of the Source of the Nile* (1863) and *What Led to the Discovery of the Source of the Nile* (1864). On the 15th September 1864 he was killed by a gun accident while out shooting in the vicinity of Bath, at which place he was to have met the British Association on the day following. G., who received the honour of C.B. in 1866, subsequently published *A Walk across Africa*, *A Summary of the S. and G. Expedition* (Royal Geograph. Journal, 1872), and *Botany of the S. and G. Expedition* (Linnæan Soc. Trans. 1872). In 1868 he was head of the Intelligence Department of the Abyssinian Expedition, and was made C.S.I. for his services. Since then, as a member of the Council of the Royal Geographical Society, he has continued to assist African exploration, and especially to organise the expedition under Mr. Keith Johnston which is now (1878–79) opening up the country between Lakes Nyassa and Tanganyika.

Spel'man, Sir Henry, born at Congham, Norfolk, in 1562, passed from Walsingham School to Trinity College, Cambridge, and thence to Lincoln's Inn (1580). He served as high sheriff of Norfolk (1604), as a commissioner for settling land-titles in Ireland, and for inquiring into the exaction of English fees; then, having been knighted about 1612, withdrew from public life and devoted himself to archæology and a study of the Old English tongue. He died in 1641, leaving unfinished his *Glossarium Archæologicum* (vol. i. 1626; vol. ii. completed by his son and Dugdale, 1664; 2d ed. 1 vol. 1687) and *Concilia, Decreta, Leges, Constitutiones in Re Ecclesiastica Orbis Britannici* (vol. i. 1639; vol. ii. by Dugdale, 1664). A Life by Bishop Gibson is prefixed to *Reliquiæ Spelmannianæ* (Oxf. 1698). His son, Sir John S., who died at Oxford, July 25, 1643, edited the *Saxon Psalter* (1641), and wrote a *Life of Alfred the Great* (Lat. trans. 1678; Eng. 1709).

Spen'cer, a Warwickshire family tracing its descent from a younger brother of the Hugh de Despencer who was justiciary of England in 1264. A Sir Robert S., raised to the peerage as Baron S. of Wormleighton, Warwickshire (1603), was grandfather of the first Earl of Sunderland (q. v.), and through him of the second Duke of Marlborough; and John, a grandson of the third Earl of Sunderland, was created first Earl S. (1765). His grandson, **John Charles S.**, born 30th May 1782, proceeded from Harrow to Trinity College, Cambridge, and took his M.A. (1802). As Viscount Althorp he entered Parliament for Okehampton in 1804, and sat for Northamptonshire from 1806 till his accession to the earldom (1834). During these thirty years he gained a foremost place in the Whig ranks by what Jeffrey styled his 'calm, clumsy, courageous, immutable probity and well-meaning.' The Reform Law (1832) and Poor Law Amendment Act (1834) owed much to his support, and he was Chancellor of the Exchequer and leader of the House of Commons (1830–34) under Lord Grey, who always spoke of Althorp as his 'right-hand man.' After his elevation to the Upper House he chiefly devoted himself to the advancement of agriculture, being president of the Royal Agricultural Society from its foundation at his suggestion in 1837. He died at Wiseton Hall in Nottinghamshire, 1st October 1845, and was succeeded by his brother, whose son, **John Poyntz S.** (born October 27, 1835), becoming fifth earl (1857), was Lord-Lieutenant of Ireland (1868–74).

Spen'cer Gulf, a large inlet on the S. coast of S. Australia. It is 180 miles long, with a breadth gradually decreasing northwards from 95 to 3 miles.

Spen'cer, Herbert, one of the most eminent of living philosophers, was born at Derby, 27th April 1820. At an early age he became a civil engineer, but quitted the profession about the time of the railway mania. He contributed to the *Civil Engineer* and *Architect's Journal*, and wrote a series of articles in the *Nonconformist* (1842) on 'The Proper Sphere of Government,' and shortly afterwards began to write regularly in the *Economist*. His first work of note was the *Social Statics* (1851), which was followed by the first edition of his *Principles of Psychology* (1855; 2d ed. 1870), pronounced by J. S. Mill 'the finest example we possess of psychological method in its full power.' In 1860 he announced a systematic series of philosophical treatises still in progress, beginning by the publication of his *First Principles* (1862). The series comprises, besides *First Principles*, vols. ii. and iii. 'Principles of Biology' (1867), iv. and v. 'Principles of Psychology' (1872), vi., vii., and viii., 'Principles of Sociology' (1877), ix. and x. 'Principles of Morality.' These volumes are still being issued from time to time, but the greater part of them have already appeared. S. does not profess to exhibit in them detailed treatises, but rather the first principles of each of the great departments of human knowledge.

There is an interesting sketch of S.'s system in Professor Ribot's *Contemporary English Psychology*. The distinguishing feature in S.'s system is the application of the doctrine of evolution to the departments of biology, psychology, and sociology. These he refuses to regard as distinct, asserting universal *continuity* in the phenomena of experience. His method has a double aspect, being analytical as well as synthetical. In that portion of his work which deals with psychology, he shows that the elements of which mind is composed are two, feelings and the relations between feelings, and that these are still further reducible to a succession of dissimilar nervous shocks, from which we pass into the psychological sphere. Evolution is defined to be the transition from the homogeneous and simple to the heterogeneous and composite, and in his various treatises S. exhibits the operation of this principle as the outcome of the doctrine of the persistence of force.

Spe'ner, Philipp Jakob, the founder of the German pietists of the 17th c., was born 28th January 1635 at Rappoltsweiler in Upper Elsass. He was from an early age destined for the church, and with this object studied at Strassburg, Basel, Tübingen, Freiburg, Geneva, and Lyon. At the last of these places his attention was for some time attracted by the science of heraldry, and he published several volumes exhibiting such research that he became one of the authorities on the subject. He then lectured at Strassburg, where he received in 1664 the degree of Doctor in Theology. In 1660 he was appointed chief clergyman at Frankfurt-on-the-Main, and here he gave himself entirely up to the proper work of his profession. The Lutheran Church of that period was under the dominion of a dead orthodoxy. S. said, 'We must have life as well as doctrine.' 'We must have the living faith of Luther as well as his orthodoxy,' and so by preaching, writing, and teaching, he unweariedly strove to infuse into others that evangelical ardour which glowed so brightly in his own mind. From 1686 to 1691 he was court preacher at Dresden, and here he formed and carried out many plans for the religious instruction of the young. His faithful dealing with George III., the ruling prince, led to his removal to Berlin. A subsequent reinstatement in office which was offered to him he declined. In 1695 the University of Wittenberg condemned 264 'errors' in his writings, but those whom he had inspired to earnest Christian effort gathered devotedly round him, and fresh adherents were added every year. Widely loved and regretted, he died at Berlin, 5th February 1705. See Hossbach, *Ph. J. S. und seiner Zeit.* (2 vols. Berl. 1828; 3d ed. 1861); Thilo, *S. als Katechet* (Stuttg. 1841); Wildenhalm, *P. J. S.* (Leip. 1842–47).

Spen'ser, Edmund, was born in London, in East Smithfield, probably in the year 1552. He entered as a sizar at Pembroke Hall, Cambridge, in 1569, became B.A. in 1573, and M.A. in 1576. In 1569 appeared a book 'devised' by S. John Vander Noodt, the title of which begins—*A Theatre wherein be represented as well the Miseries and Calamities that follow the Voluptuous Worldlings, as also the greate Joyes and Plesures which the Faithfull do enjoy*: this volume was prefaced by the first six of Petrarch's *Visions* done into verse styled 'Epigrams,' and 15 'Sonets,' which were published subsequently among S.'s works, in which publication they are said to have been 'formerly translated.' The poet left Cambridge for the north of Eng-

land, the dialect of which may be traced in his next published poem; his friend Gabriel Harvey, however, brought him south, and about the year 1578 introduced him to Sir Philip Sidney. To Sidney he dedicated *The Shepheardes Calendar* (1579), a set of pastorals only differing from the fashion of the times in giving honest rustic language instead of courtiers' phrases to the shepherd swains; and next year this patron's influence got S. the appointment of secretary to Lord Grey de Wilton, Lord-Lieutenant of Ireland. From that date till he visited England with Raleigh in 1589, it is probable that S. lived continuously in Ireland, gaining experience which was afterwards embodied in the *View of the State of Ireland*, presented to the Queen in 1596, but not printed till 1633. In 1589 he was visited by Raleigh at Kilcolman Castle, Cork county, where his friends obtained for him from Queen Elizabeth 3028 acres of land, the grant, which is extant, being dated October 26, 1591. The *Faerie Queene* was already begun in 1580, and three books were finished by the close of the year 1589. Raleigh was so much delighted with what S. showed him of his poem, that he carried him over to England, where it was printed. S. was also introduced to Elizabeth, who, a year after the publication of the *Faerie Queene* (1590), made him virtually her laureate with a pension of £50 a year. In the same year he returned to Ireland, and no sooner was his back turned on London than the publisher of the *Faerie Queene* gathered all scraps of his minor poems together and published them in a volume entitled *Complaints*, which include *The Ruines of Time, The Teares of the Muses, Virgil's Gnat, Mother Hubbard's Tale, The Ruines of Rome by Bellay, Muiopotmos, or The Tale of the Butterflie, Visions of the Worlds Vanitie, Bellayes* and *Petrarches Visions.* In 1592 he married a lady named Elizabeth, to whom his *Amoretti*, or *Sonnets* (1595), are addressed, and who is celebrated in his *Epithalamium*, 'the most perfect of all his poems, the most beautiful of all bridal songs.' He tells us that this wife, though beautiful, 'was certes but a countrey lasse.' At the same time as the *Amoretti* appeared *Colin Clouts come Home Againe;* and probably, at the close of the same year, S. returned to England to superintend the publication of books iv.-vi. of the *Faerie Queene.* During his stay in England he wrote the *Hymns to Heavenly Love and Heavenly Beauty* and the *Prothalamium*, his last works. In 1597 he returned to his quiet life at Kilcolman, but in the next year Tyrone's rebellion forced him to flee, for he represented government as clerk of the council of Munster, and was sheriff-designate of Cork. His house was burnt, and a child perished in the flames, according to a statement made by Ben Jonson to Drummond of Hawthornden. S. reached England broken-hearted, and died, January 16, 1599, in a tavern in King Street, Westminster, 'for lack of bread,' as Jonson told Drummond. This, however, must have been an exaggeration, for though S. returned 'inops,' according to Camden, he was still in receipt of a pension, and must still have had influential friends. He was buried near Chaucer in Westminster Abbey.

After Shakespeare, S. ranks with Chaucer and Milton. For pure beauty—whether as regards the subjects of his descriptions, or the rich harmony of their language—no poem compares with the *Faerie Queene.* Its aim is first of all religious. In the opening book we have the Red Cross Knight to represent the Christian, beloved of Una, the true Church, but beguiled into error by Duessa, or Popery. The knight is only restored to Una by the intervention of Prince Arthur, who is the leading character of the whole poem, and personifies 'magnificence' or magnanimity, 'which vertue is the perfection of all the rest, and containeth in it them all.' Book by book various virtues are personified; and the entire allegory is the splendid prototype of all such works as Bunyan's *Pilgrim's Progress.* But while the story of chivalry is sustained, and allegorises the history of the Christian Church, many other references are introduced into it, and these are all woven into each other with great skill. Thus the Faerie Queen represents at once Glory and Queen Elizabeth; Duessa represents Falsehood, Popery, and Mary of Scotland; Arthur represents chivalrous Magnanimity, Christ the Redeemer, and the Earl of Leicester. But all these are only the threads of the practical, on which is worked the richest of tapestry. Spenser never draws tears, never quickens the pulse, but he is the omnipotent king of fancy; and while he deals with Platonic virtues in a world of chivalrous romance, yet so exquisitely and naturally associates all with the fresh fair world around us that we believe him utterly. In Bunyan, the dramatically-embodied moral chiefly draws attention, and the merely mundane interest of the story is small; in S., the stern Puritanism underlying the allegory is hid to the careless reader, who is presented with ever-shifting pictures of the pure external world, and hears more of the dignity than of the misery of man. Another charm of the *Faerie Queene* is its 'Spenserian stanza.' This adds an Alexandrine to the eight-line stanza used by the old French poets, and even by Chaucer. The old form consisted of two quatrains of ten-syllabled lines, alternately rhyming, but the second rhyme of the first quatrain agreeing with the first rhyme of the second. S.'s last line rhymes with that preceding it, and by disappointing the sustained expectation of completed rhythm with two additional syllables, gives our verse one of its most majestic cadences. S. intended the *Faerie Queene* to occupy twelve books, of which six only were accomplished. S., while deeply impressed with the present, lived in a world that was departed, and consequently his poem took an antique cast, drawing its images, its manners, its scenery, and its very language from the past. 'He stands between two worlds: he belongs partly to the new time, partly to the old; he is the last of one age, he is the first of another; he stretches out one hand to Chaucer, the other rests upon the shoulder of Milton.' The chief editions are Upton's (2 vols. 1758), Todd's (8 vols. 1805), Pickering's Aldine (5 vols. 1825), Child (Bost. U.S. 1855), and Collier's (5 vols. 1862), and the Globe ed. by Morris, with Memoir by J. W. Hales (Lond. new ed. 1871). An edition of the first two books, by Kitchin, with glossary, forms two volumes of the Clar. Press series of school texts.

Spermace'ti, or **Ceta'ceum**, is a white concretion or waxy matter prepared from the oily matter in the head of the *Physeter macro-cephalus*, or sperm whale, inhabiting the Pacific and Indian Oceans. Cetine, nearly pure, is separated from the oil by cooling, filtration, and pressure. S. is used in medicine as an emollient and demulcent in chronic diarrhœa, in doses of 20 to 60 grains, boiled in milk, two or three times daily. The S. of commerce is a glittering pearly-white substance in thin plates or crystals, destitute of either odour or taste. Sperm candles made from S. with about 3 per cent. of wax yield a light of unequalled steadiness and brilliancy, and they are used as a standard of comparison of the illuminating power of all varieties of artificial light.

Spermatozo'a, the name given to the vibratile moving filaments observed in the *seminal fluid* of animals, and which appear to be essential for impregnation. The S. have been seen to penetrate the substance of the *ovum* or egg during impregnation —an act which consists in the contact of the S., or male element, with the ovum or female element. The S. of man have pear-shaped heads and vibratile tail-like filaments, and attain a length of the $\frac{1}{600}$th part of a line.

Sperm Whale. See WHALE.

Spes Successio'nis is, in Scotch law, the right or hope of succession. It may be sold, but it cannot be adjudged. In rights taken to parent and child, unless very explicit terms are used to limit the father's right to a liferent, he is understood to have the fee, and the child's right is merely a S. S. See FEE AND LIFERENT.

Spey, a river of Scotland rising in the Corrvarrick Hills, in Badenoch, 6 miles N.W. of Loch Laggan, flows N.E. through the counties of Inverness and Elgin, and falls into the Moray Firth after a course of 95 miles. The area of its basin is 1245 sq. miles. The S. has the swiftest current of any river in Great Britain, and is subject to sudden floods. Its salmon fisheries are worth £6000 a year.

Spey'er, or **Spei'er** (Fr. *Spires*), the capital of the Bavarian Palatinate and the seat of a bishop, lies on the Rhine, 14 miles S.W. of Heidelberg by rail. The most important buildings are the cathedral, the Hall of Antiquities, the Altpörtel, and the remains of the Retscher or imperial palace. The cathedral, reckoned the finest specimen of Romanesque architecture in Europe, was founded in 1030 by Konrad II. as a burial-place for himself and his successors, and completed in 1061 by his grandson Heinrich IV., the opponent of Pope Gregory the Great. On several occasions it suffered severely at the hands of the French, especially in 1794, when it was turned into a barn; but in 1822 it was re-consecrated, and in 1858 the work of restoration was completed. Its length is 485 feet, breadth of nave nearly

50 feet, height of the four towers 237 feet. The interior is richly decorated with some of the finest specimens of modern German art. S. has cigar and vinegar works, and does a little transit trade on the Rhine. Pop. (1875) 14,318. Under the Romans S. was known as Augusta Nemetum, and during the Middle Ages it was a place of considerable importance, twenty-nine imperial diets having been held within its walls, at one of which (1529) the Reformers offered the protest which procured for them the name of Protestants. During the wars of Louis XIV. in the Palatinate, S. was several times sacked by the French, and in 1689 the whole town was committed to the flames, the cathedral alone resisting the attempts of the French engineers to undermine it.

Spe'zia, the chief arsenal of the Italian kingdom, a station for ships of war, and a commercial port of some importance, is situated at the head of the Golfo della S., 57½ miles by rail S.E. of Genoa. The harbour (*Lunæ Portus* of the Romans) is formed by two spurs of the Apennines, and is one of the finest on the Mediterranean. Its safety has recently been increased by a breakwater 7150 feet long, built across the mouth. The naval arsenal, begun 1861, cost $9,000,000. The mildness of the climate and beauty of the environs attract numerous visitors to S. both in winter and summer. Its trade with Great Britain is chiefly in coal, and has decreased of late years. Tonnage in 1877, 13,835. Pop. (1876) 25,820.

Spezz'ia, or **Spetz'a,** a small rocky island off the coast of Argolis, at the entrance to the Gulf of Nauplia, with a town of the same name, containing (1871) 8443 inhabitants, was formerly a nest of pirates, but from about the commencement of this century has developed some small trade. Area of the island, 6¼ sq. miles; pop. 9400.

Sphærula'ria, a genus of *Nematode* worms, belonging to the order *Gordiacea*, and found inhabiting the bodies of humble bees. The female attains a length of ¾ inch, has its body studded over with minute button-like projections, but is destitute of a digestive system.

Sphag'num is the sole genus of the sub-class *Sphagnaceæ* of *Musci* or Mosses (q. v.). There are numerous species—all essentially aquatic plants, and found in all temperate climates of the world. From their usual habitat they have acquired the name of bog-mosses. In bogs they form compact beds of a whitish, yellowish, green, or lilac surface, presenting a fictitious appearance of firm ground. As decay takes place in the lower part of the plant, the upper parts maintain a vigorous life, drawing up water from below like a sponge. The substructure becomes denser in course of time, favouring thereby the growth of stronger vegetation, and ultimately the bog may become a peat-moss. Pulled and dried S. is, from its elasticity, an excellent material for packing plants; and when moistened cannot be surpassed for enveloping the roots of those plants that have to travel a long distance before they can be planted.

Spheg'idæ, a family of *Hymenopterous* insects, having 'the posterior margin of the thorax not prolonged backwards to the insertion of the wings, and anteriorly produced into a neck with the abdomen petiolated.' The burrowing legs are long and spiny, and the mandibles are large. The S. sting other insects, and lay them them up as food, the insects being only partially paralysed. The nests of the S. are built in the sand, or are made of mud daubed on to walls.

Sphe'noid Bone (Gr. *sphēn*, 'a wedge,' and *eidos*, 'shape'), an important bone of the skull, placed at the front part of the base, and articulating with all the other bones of the cranium. It consists of a *body*, two greater and two lesser wings or *alæ*, and two *pterygoid processes* projecting from its under surface. The *upper surface* bears the *ethmoidal spine* which articulates with the ethmoid bone; behind this spine are grooves for the *olfactory* and *optic nerves*. The *body* of the bone supports the *pars varolii*, and on each side of the body a deep groove (*cavernous groove*) lodges the *internal carotid artery* and the *cavernous sinus*. The *posterior surface* articulates with the basilar process of the occipital bone. The *front surface* of the S. B. assists in forming the septum of the nose, and on either side of the front surface are the *sphenoid cells* or *sinuses*. The *pterygoid processes* of the S. B. serve as points of attachment for important muscles.

Sphere, in geometry, is a surface every point of which is equidistant from a particular point known as the centre. Hence a straight line drawn through the centre and terminated at both ends by the surface is bisected at the centre. Such a line is called a *diameter*, and any line from the centre to the surface is a *radius*, exactly as in the case of a circle. Any orthogonal projection or perspective representation of a S. or any plane section of a S. is indeed a circle. If the cutting plane passes through the centre, the circle of section is called a *great circle*—the section by any other plane is known as a *small circle*. Conceive the cutting plane to move parallel to itself so that the circular section grows smaller and smaller, a point will at last be reached when the section shrinks into a point, becoming a circle of infinitely small radius. If the plane is moved back ever so little the section becomes a finite circle, if it is moved forward ever so little the section ceases to have real existence. Such a plane is termed a tangent plane, and, since three points determine a circle, may be defined analytically as the plane passing through three *coincident* points upon the surface. The tangent plane at any point is perpendicular to the radius to that point—a property which holds for a circle and its tangent line. From any point P outside a S. an infinite number of tangent planes can be drawn which touch the S. in a small circle. The plane of this circle is called the polar of the point P; and the lines drawn from P to the circumference form a cone of revolution which is a tangent-cone to the S. (see POLE AND POLAR). The surface of a S. is equal to the curved portion of the surface of the circumscribing cylinder, and its volume is equal to two-thirds of the volume of the same cylinder. The equation of a S. referred to rectangular axes though its centre is $x^2 + y^2 + z^2 = a^2$, a being the radius. A *sphero-conic* is the curve in which a S. intersects a quadric cone whose vertex is at the centre of the circle. Such a curve is not plane, but it possesses many properties analogous to those of plane quadric curves such as the ellipse and hyperbola. Sphero-conics were first systematically investigated by the French geometer Chasles, and they will be found discussed in considerable detail in Salmon's *Analytical Geometry of Three Dimensions*, where also the most important properties of the S. and its related quadric surfaces are fully treated.

Spheroid' is an Ellipsoid (q. v.) with two of its axes equal. Hence its equation to rectangular axes through the centre is $\frac{x^2}{a^2} + \frac{y^2 + z^2}{b^2} = 1$. Its section by the plane $yz(x=o)$ is evidently a circle; while the planes zx and xy cut the surface in equal ellipses. Consequently a S. may be regarded as the surface of revolution of an ellipse round either axis; and according as this axis is the minor or major the S. is *oblate* or *prolate*.

Spheroid'al State is the name given to an interesting phenomenon, generally ascribed to Leidenfrost, whose experiments were published in 1756. There is no doubt, however, that the phenomenon had been observed long before, and that ten years previously Eller had made it a subject of investigation. In the *Dublin Philosophical Journal* for 1826, a short account is given of several experiments of Perkins in relation to high-pressure engines, which anticipated many of the results given in Boutigny's *Etudes sur les Corps à l'Etat Sphéroidal* (1857), still the standard work upon the subject. The experiment is usually performed by placing a drop of water upon a red-hot metal dish, slightly concave, when the drop of water assumes a more or less flattened spheroidal form, like a drop of mercury upon a plane glass surface. There is no true contact between the liquid and the solid, which must be for water at a temperature above 171° C. It is possible, however, to allow the temperature of the plate to fall to 142° before true contact occurs; but this requires very delicate manipulation. The water in the S. S. is at a temperature of 97° C. Other liquids may be made to behave in the same way; and the lowest temperatures at which alcohol and ether assume the spheroidal states are respectively 134° and 61° C. The temperatures of the liquids themselves are 75° and 34° respectively. In all cases the temperature of the liquid is a few degrees lower than its boiling-point. The explanation of the phenomenon is that between the liquid and the solid a cushion of vapour is formed which prevents contact of the two, and at the same time, by the dance of molecules between the opposed surfaces, supports the mass of water some distance above the dish. The action is therefore the same as in Crookes' Radiometer (q. v.). If the dish be allowed to cool before the drop has evaporated—for slow

evaporation is always going on—a violent explosion occurs when the temperature is sufficiently low to permit the liquid to come into contact with the solid. Instead of a solid, the surface of a liquid, capable of being raised to a high temperature, may be used. A red-hot ball, when lowered into a vessel of water, glows for some time before the inevitable hissing is heard, there being formed round the ball a shell of water-vapour, through which conduction takes place slowly. Passing the moistened hand through molten lead is an example of the same phenomenon, the hand being protected by the film of vapour which forms round it.

Sphinc'ter Muscles (Gr. *sphinktēr*, 'what binds close'), the name applied to the muscles that surround the orifices of the body, and serve to close the apertures by their contraction, as the S. M. of the bladder, anus, and vagina.

Sphinx. See HAWK-MOTH.

Sphinx (Gr. 'throttler,' Egypt. *neb*, 'lord,' or *akar*, 'intelligence'), a mythical figure frequently met with in Egyptian art, with a lion's body and the head of a hawk (*hieracosphinx*), a ram (*criosphinx*), or oftener a human being (*andriosphinx*). In the latter case it variously represented several kings of the eighteenth dynasty, two queens, or the solar god Kar-em-achu (Horus); while as a hawk it stood for Mantu, another solar deity, as a ram for Xnum (Ammon). Of all the andriosphinxes the most renowned is that of Gizeh, 100 yards to the E. of the Second Pyramid, which, hewn from the living rock, is 51 feet high and 110 feet long. Travellers describe this S. as beautiful or sinister, mocking or passionless; in truth it is but a knob of stone, perched on a lengthy neck, shorn of its beard, which is now in the British Museum, with traces of red paint just indicating the eyebrows and right cheek, and its body buried in the desert sands. The excavations of Caviglia (1816) and Mariette (1852) have only proved it to be certainly older than the eighteenth dynasty, possibly as old as the fourth, *i.e.*, contemporaneous with Safra (Cheops), the builder of the adjacent pyramid. Statues of Safra, found close by, seem to connect it with that monarch; and tablets have been unearthed between the paws, recording its worship by Thothmes IV.—a worship which, lasting through the eighteenth dynasty, was revived in the days of the Roman empire. Other famous sphinxes are the red granite S. of Amenophis III., now at St. Petersburg; that of Menophtah, in the Louvre, and the S. avenues of Saccarah, Karnak, and the Wady Esseboua. Sphinxes figure in Assyrian, Phœnician, Etruscan, and Hellenic art. In the last they are always female and winged, while the S. in the Theban myth of Ædipus (q. v.) had also a serpent's tail.

Sphyg'mograph (Gr. 'pulse-writer'), a delicate combination of levers, used for graphically recording the action of the pulse by a representative wave-form. Its indications are of value in diagnosing certain diseases of the heart.

Sphyræ'nidæ, a family of Teleostean fishes allied to the Perch (q. v.), but having abnormal ventral fins. There are two dorsal fins, and the scales are cycloid. The teeth are numerous and sharp. The Barracouda Pike is a good example. This fish occurs in the Atlantic Ocean, and is a very formidable creature.

Spicca'to (Ital. 'detached'), a term used in music to indicate that the consecutive notes are to be played distinctly, and as though detached from each other. Such passages are commonly marked by dots placed over the notes.

Spice Islands. See MOLUCCAS.

Spi'ces (Lat. *species*, 'kinds' or 'sorts;' first applied in later Latin to any kind of goods; afterwards to the rare aromatic products of the East) embrace vegetable substances containing volatile oils having a certain pungency of taste and an agreeable aromatic odour, and used as adjuncts to food partly on account of their stimulating pungency, and partly from the pleasant flavour they communicate. The term is generally restricted to the flavouring substances used with sweetened articles of food, such as preparations of flour, starches, and the diet drinks, the term condiments being given to analogous substances which are eaten with animal foods and salted substances. The S. include ginger, cinnamon, cassia, nutmegs and mace, cloves, allspice or pimento, and caraway, coriander, &c., all of which are separately noticed. Many minor S. are also used, the value of which depends on the volatile oil which they contain.

Spich'eren, or **Spich'ern**, a village in the circle of Forbach, Elsass-Lothringen, 2½ miles S. of Saarbrucken, with 1000 inhabitants. During the Franco-German War the French strongly entrenched themselves on the S. Berg (875 feet), with its steep, scantily-wooded slopes, but after a sharp engagement, 6th August 1870, were obliged by the Prussians, under General von Goeben, to retreat though numerically superior.

Spi'der, the name given to animals belonging to the *Arthropodous* order *Arachnida* (q. v.). In this group the head and chest are united to form a segment known as a *cephalothorax*. The legs number eight, there are no antennæ or feelers, no wings are developed, and the breathing is inducted by means of pulmonary or lung-sacs. The abdomen is provided with three pairs of jointed organs named *spinnerets*, which are homologous with limbs. The nearest affinities of spiders are with the dipterous insects or flies. Such genera as Nycteribia amongst Diptera show affinities to Arachnida, and some of the lower Arachnidans (*e.g.*, mites) show affinities in their turn to Crustaceans. Packard says 'we must look upon the S. as a *hexapodous* insect, degraded, wingless, and partially *decephalised*.'

In some spiders the union of the head and chest is not so completely carried out as in others. The *mouth-parts* consist of a pair of large *mandibles* or jaws, which bear a movable limb or *fang*, communicating internally with a poison-gland. To the mandibles succeed a pair of *maxillæ*, or lesser jaws, having very large *palpi* or feelers in the males, these organs being used to apply the seminal fluid to the female generative organs. There is also a *labrum* or upper lip, and *labium* or lower lip. The *digestive system* includes a distinct stomach, produced at the sides with appendages. A *liver* exists, and also a renal organ. The *heart* lies dorsally, and consists of a single pulsating cavity, circulating pure blood headwards. The *breathing organs* in spiders are in the form of *pulmonary* or *lung-sacs*, usually numbering four on each side of the body. Each sac is merely an involution of the integument, opening externally by a distinct *stigmatic* aperture on the under surface of the abdomen. The inner surface of the sac is divided into a number of very thin *lamellæ* or plates, over which bloodvessels ramify, and thus expose their contained fluid to the air. In addition to these organs, breathing-tubes or *tracheæ*, similar to those seen in insects, occur in spiders. The *spinnerets* or silk-glands and weaving-organs are placed towards the extremity of the abdomen. Usually five silk-glands are developed, and the secretion of these is a fluid so long as it remains therein. On exposure to the air the silk becomes viscid, and is capable of being pressed out through the spinnerets into fine threads. Each thread used in making the web is composed of hundreds of different strands. The thread is guided by the hind feet in making the web. The *sexes* are distinct in the S., the female being the larger and more powerful. The two *ovaries* of the female open between the lung-sacs. The eggs are laid in June.

The S. belongs to the order *Araneinæ*, in which the mandibles are used for biting, the abdomen being unsegmented (and thus differing from that of the nearly allied Scorpions), whilst the maxillæ resemble the thoracic legs. The young do not undergo a *metamorphosis*. Latreille's classification includes the *Tetrapneumones*, or those (*e.g.*, *Mygale*) in which four lung-sacs are developed, whilst only two pairs of spinnerets are represented. To this group belong *Mygale avicularia*, the Bird S., *M. nidulans*, and other species of 'Trap-door' spiders. The *Dipneumones* have only two lung-sacs and three pairs of spinnerets. To this group belong the genera *Dysdera*; *Argyroneta aquatica*, the Water S.; *Tegenaria epeira* (with a globular abdomen), including the Garden S. (*E. diadema*); the Tarantula genus (*Lycosa*), including the famous tarantula (q. v.); the genus *Salticus* includes the 'Leaping S.', so named from their jumping gait.

Spider-Crab, the name given to various Crustacean genera included in the order *Decapoda*, and belonging for the most part to the family *Maiadæ*. The typical species *Maia Squinado* or spinous S. C., is four or five inches long; but the other forms so named are very much smaller.

Spider-Fly (*Chionea*), a genus of *Diptera*, or flies in which wings are wanting, and in which a close resemblance to spiders is seen. They belong to the family *Muscidæ*, are born alive, and have a nervous system as in spiders.

Spider-Monk'ey (*Ateles*), a genus of *Platyrhine* or New World apes, having broad or widely-separated nostrils, a prehensile tail, and long slender limbs, hence their popular name. They belong to the family *Cebidæ*, in which there are no cheek-pouches or callosities. The *A. paniscus* or *Coaita* and the Chameck (*A. chameck*) are familiar species.

Spiegelei'sen (Ger. 'mirror iron'), a peculiar variety of pig-iron in which a large proportion of carbon and of manganese is present. The name arises from the fracture of the material showing large smooth shining plates resembling mirror glass. S. is very largely used in the processes for making steel which have been introduced within recent years (see STEEL).

Spiel'hagen, Friedrich, a German novelist, was born at Magdeburg, 24th February 1829. Brought up at Stralsund, where his father was *baurath* from 1834, he studied at Berlin, Bonn, and Greifswald, and having successively been tutor, actor, and officer in the Landwehr, took finally to literature, settling at Berlin in 1862. His 'social' novels, most of which have been translated into English, are over-long and surcharged with invectives against the clergy and aristocracy, but their power is great, and from first to last they have steadily improved. The earliest, *Clara Vere* (1857), has been followed by *Problematische Naturen* (1861), *Durch Nacht zum Licht* (1862), *Die von Hohenstein* (1864), *In Reih und Glied* (1866), *Hammer und Amboss* (1868), *Deutsche Pionniere* (1870), *Die Sturmflut* (1877), &c. S. has also published many translations from French and English.

Spige'lia, a genus of *Loganiaceæ*, named in honour of Dr. Spigelius, who died 1625, and containing about 30 species of annual or perennial herbs of tropical and sub-tropical America. *S. marilandica*, with beautiful carmine funnel-shaped flowers, is the most important. It is called worm-seed and Caroline pink, and furnishes the Indian pink-root of the shops. This drug is officinal in the United States pharmacopœia as a vermifuge; it also has a stimulant action on the heart and arteries. *S. anthelmia*, an annual species of S. America, has similar properties.

Spike, in botany, is applied to an Inflorescence (q. v.), when the flowers are sessile along a simple undivided axis or rhachis, as for instance in the common plantain and the lavender. The *catkins* of many British trees, the *spadices* of arums, and the *ears* and *spikelets* of numerous grasses, are also forms of the S.

Spike'nard, or **Nard**, is a substance that has enjoyed celebrity from very early times. Through the exertions of Sir William Jones as a philologist and Dr. Royle as a botanist, the source of S. was traced to a fragrant-rooted perennial herb of the mountains of Bengal and Nepaul, called by the natives 'jatamansi' and 'bal-chur.' The plant, which proved to belong to the natural order *Valerianaceæ*, was named by De Candolle *Nardostachys jatamansi*. It is probably also the nard of Scripture. Two other kinds of S. are known to be the produce of plants of the same natural order as the above. The first is *Valeriana celtica* of botanists—a perennial species of the Alps of Europe, with a particularly aromatic root; and the second has received the name of *V. Phu*. Both are collected for transmission to the East, where they are highly prized for aromatising baths. In America, *Aralia racemosa* is called S.,—the root is strongly aromatic, and is used for medicinal purposes.

Spi'king, driving a spike or nail into the vent of a piece of ordnance so as to render it unserviceable. The common spike is 4 inches long, 27 inches in diameter at the head, and about 1 inch at the point. The spring spike is 17 inches in diameter, with a flat head and a spring 2 inches in length, which expands after being passed through the vent. Common nails or the points of bayonets may be used as spikes where no others are at hand, or a shot wrapped in a piece of cloth driven hard home with a rammer will render the gun useless. S. is often resorted to on the battlefield to injure guns abandoned to the enemy, or those captured from the enemy which cannot be removed.

Spi'na Bif'ida is a tumour formed by a congenital hernia of the spinal membranes through a cleft in the arches of the vertebræ by incomplete coalescence of their laminæ. It is often associated with other congenital deformities, and, as a general rule, children so affected do not long survive, though there are cases on record in which persons with S. B. have survived beyond middle life. When operation is deemed necessary, the tumour should be tapped with a fine trocar on one side, and the fluid should be drawn off sufficient to relieve the tension, and a few drops of the pure tincture of iodine injected into the remainder. A shield, or compress, of guttapercha well padded should then be applied. Professor Morton of Glasgow has successfully treated several cases of S. B. by the injection of iodo-glycerine. See his *Treatment of S. B. by a New Method* (Glasg. 1877).

Spin'ach, or **Spin'age**, is a wholesome although somewhat insipid vegetable, consisting of the leaves of *Spinacia oleracea*, a diœcious annual belonging to the natural order *Chenopodiaceæ*. It is a native of Siberia, whence it passed westward, reaching England more than three centuries ago. The fleshy leaves are somewhat triangular in outline, deep green in colour, and for table are generally served boiled and mashed, or as an ingredient in soups and stews. Three varieties are in cultivation—the round-seeded, the Flanders, and the prickly-seeded, which unitedly yield a continued supply from April to November, and to a moderate extent through winter and spring. The plant is of rapid growth, but that the leaves may be succulent and properly flavoured, the soil should be rich and the situation open and airy. *S. tetrandra*, from the Caucasus, an annual and unisexual herb, is of equal value to the preceding, though less known. The name S. has also been given to several plants not belonging to *Spinacia*. French S. (*Atriplex hortensis*) is referred to in article ORACHE. New Zealand S. is *Tetragonia expansa*, a trailing plant with thick succulent leaves, native of Australasia, S. America, and Japan. Patience S. (*Rumex patientia*) was formerly common in gardens. The Beet S. (*Beta cicla*), a native of the seashores in S. Europe, has long been grown for its leaves, which are dressed in the same manner as S.

Spi'nal Cord Medull'a, or **Spi'nal Marr'ow**, is the mass of nervous matter of vertebrates, ranking next in importance to the brain as a nerve-centre, and continued directly from the body of the first lumbar vertebra. In early fœtal life it is brain, being contained within and protected by the *spinal column*. The S. C. extends from the *foramen magnum*, or large aperture in the hinder part of the base of the skull, to as long as the vertebral column, but owing to the more rapid growth of the latter, the S. C. at birth is much shorter than its investing case. Above, the S. C. is continuous with the *medulla oblongata* of the brain. Below, it becomes a thin thread-like cord, the *filum terminale* contained within the central canal of the *sacrum*. The length of the S. C. varies from 15 to 18 inches. In form it may be described as approaching the cylindrical, but it is also flattened before and behind. At the third *cervical vertebra*, and from this point to the first dorsal, the S. C. shows an enlargement named the *brachial* or *cervical enlargement*, which gives origin to the nerves supplying the arms. A similar enlargement, named the *crural* or *lumbar enlargement*, at the level of the last dorsal vertebra, is the origin of the nerves of the lower limbs. The S. C. is almost divided longitudinally into two symmetrical right and left halves by two fissures, named the *anterior* and *posterior fissure*. These halves are, however, connected by the *anterior white commissure* and *posterior grey commissure* which lie at the bottom of these fissures. The fibres of the posterior commissure enclose a minute canal, known as the *central canal* of the S. C. This canal runs throughout the length of the S. C., and is lined by *ciliated epithelial cells*. Above, this canal becomes continuous with the cavity of the fourth ventricle of the brain. Each of the halves of the S. C. appears to be divided by two fissures into three *columns*, these depressions marking the places of exit of the Spinal Nerves (q. v.). The nervous substance of the S. C. is divisible into *white* and *grey matter*. The white matter forms the external layer of the S. C.; the grey matter is internal, a transverse section appearing in the form of a double crescent. The arrangement of the white and grey nerve-matter in the S. C. is exactly opposite to that in the brain (see NERVE); since the grey matter of the brain is external, and the white internal.

Respecting the *functions* of the S. C., the views of physiologists of late years have materially changed. Formerly it was thought that the S. C. was a mere *conductor* of impulses to or from the brain; now it is definitely known, both from experiment and from its microscopic structure, that the S. C. acts as a definite *nerve-centre*, and that accordingly it may not only *originate* impressions, but also *transmit* and *direct into other channels* the nerve-impulses which pass through it. Nerve-fibres are seen to arise from the cells of its grey matter, and these-

nerve fibres may either leave the cord as the roots of its nerves, or may become continuous with the brain above when forming the columns of the S. C. The anatomical investigation of the S. C., in short, shows that it is continuous with the brain on the one hand, and with the skin, muscular, and other tissues in which its nerves end. It appears to be proved that the S. C. is the seat and origin of many of those acts which, under the name of *Reflex Actions* (q. v.), may be performed unconsciously and without the direct intervention of consciousness—*i.e.*, of brain-action.

Diseases of the S. C.—The membranes of the S. C. are liable to inflammation, which may result in serous effusion and suppuration or softening. The effusion of serum may take place between the osseous structure and the *dura mater*, there being no communication with the cavity of the cranium. The spinal *arachnoid* and *pia mater* are liable to inflammation, as in the corresponding membranes of the brain, and there may be effusion of serum both into the cavity of the spinal arachnoid and between the dura mater and the pia mater of the cord, such effusion communicating freely with the cavity of the cranium. Suppurative inflammation may also occur in the cavity of the arachnoid, and when the inflammation is acute it is frequently associated with disease of the cerebellum, but when chronic with caries of the vertebræ. The symptoms of arachnitis, or meningitis of the spinal cord, are pains in the back, with affection of the muscles, and frequently retention of urine, and paralysis may occur from pressure produced by exudation of fluid, or by extension of inflammation to the substance of the cord.

Treatment.—Meningitis of the spinal cord is treated by local depletion over the seat of pain, and by mild purgatives, such as the sulphate of soda, or of magnesia, combined with an opiate. Ergot of rye, combined with iodide of potassium, has been recommended. The warm bath is also useful, and in the later or chronic stage counter-irritation. The external application of belladonna and chloroform will be found useful in diminishing the violent pain. Perfect rest should be enjoined, and abstinence from all animal diet throughout the course of the disease.

Spinal Nerves, the name applied to the paired nerves which arise from the *spinal cord*, and which are distributed to the various parts of the body. The S. N. are so named in contradistinction to the *cranial nerves* (see NERVE), or those which originate from the brain itself. Thirty-one pairs of S. N. arise from the spinal cord of man. They pass from the spinal cord and spine through the *intervertebral foramina*, or openings between the bodies of the vertebræ. Eight pairs are *cervical*; twelve are *dorsal* nerves, also named *thoracic*; five are *lumbar*, five *sacral*, and one *coccygeal*. Each spinal nerve arises by *two* roots, an anterior and posterior, from the spinal column. The posterior root has a nerve mass or *ganglion*, which is wanting in the anterior. The fibres of the anterior roots are *motor* in nature, *i.e.*, impulses travel by these roots outwards *from* the cord or brain to the body. The fibres of the posterior roots are *sensory*, *i.e.*, impulses are conveyed by these fibres to the cord or brain (see NERVE). The anterior and posterior fibres unite just beyond the nervous ganglion to form a single nerve-trunk, in which the two sets of fibres are indistinguishable.

Spinaz'zola, a town of S. Italy, province of Bari delle Puglie, 28 miles N.N.W. of Potenza. It is well built, has six churches, and is the seat of an active district trade. Pop. (1874) 10,078.

Spin'dle Tree (*Euonymus*), a genus of about 40 species of trees or shrubs, natives of the mountainous regions of tropical Asia (27 in India) and the Malayan Archipelago—also a few scattered over Europe and N. America. The common S. T. (*E. Europæus*), a glabrous fetid shrub or tree of about five to twenty feet, with cymes of greenish-white flowers succeeded by a four-lobed pale crimson capsular fruit containing seeds with a bright red arillode, is the only British representative. Its light yellow, hard and tough but easily worked wood is used for skewers or pins and spindles, hence the name S. T. and Prickwood; it is also preferred as charcoal for crayons and the finer sorts of gunpowder. The root of *E. atropurpureus*, the burning bush S. T. of N. America, is used there as a diuretic in dropsy. The order *Celastraceæ*, to which the S. T. belongs, consists of about 400 species.

Spine, Spi'nal Col'umn, Ver'tebral Col'umn, or Back-bone', is the chain of bones (*vertebræ*) in the dorsal or back region of *Vertebrate* animals. In some fishes (*e.g.*, lancelet, lepidosiren, &c.) the place of the spine is occupied by the *Notochord* (q. v.). In man the spine is composed of thirty-three bones, five of these fusing to form the *sacrum*, and four to form the *coccyx*. In mammals this number is usually exceeded. The various regions into which the spine may be divided are the *cervical* (neck), *dorsal* (back), *lumbar* (loins), *sacral*, and *caudal* (*coccygeal* in man) or tail. Each of the joints or *vertebræ* of the spine consists of a body and processes, and by their apposition they form the bony canal in which the *spinal cord* is protected. The *cervical* vertebræ, or those of the neck, number seven in man and in all quadrupeds save the three-toed sloth, which has nine vertebræ, and Hoffman's sloth and the manatee, which have six. The first cervical vertebra supports the head, and is called the *atlas*, the second being the *axis*. The *dorsal* or back vertebræ in man number twelve, and bear the ribs; those of the loins five; while, as already remarked, the sacrum includes five and the coccyx four modified vertebræ. The human spine attains an average length of 28 inches. It is widest at the base of the sacrum, and diminishes in calibre both upwards and downwards from that point. The hinder aspect of the S. shows a row of the prominent *spinous processes* of the vertebræ, its front aspect being smooth and convex. Two series of curves are seen in man's spine; these are respectively named *antero-posterior* and *lateral*. At birth the spine exhibits a concavity forwards in the sacral region, but is well-nigh straight elsewhere. A convexity forwards soon appears in the neck, and a similar curve appears in the loins. In man's spine alone do the lumbar vertebræ curve forwards. A lateral curve, convex to the right side, is observable in man's spine, opposite the third, fourth, and fifth dorsal vertebræ, and a compensating curve, convex to the left, occurs below and above this point. These curves are due to the greater use of the right arm over the left. The spine is the great centre or keel, so to speak, of the body, and serves not merely to support the head, but to give attachment to the limbs, and also as a point of attachment of many important muscles.

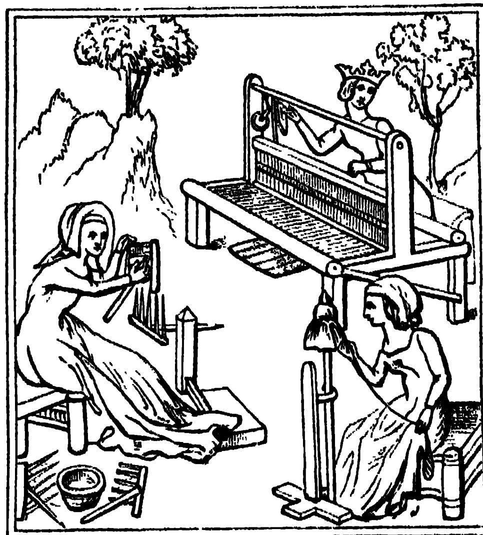
Diseases of the S.—Caries of the S. is of very frequent occurrence among strumous, delicate children, generally arising spontaneously, but frequently ascribed to slight accidents as its cause. The disease is identical with Caries (q. v.) in the osseous structure, but its symptoms are modified by the seat of the disease. Caries may affect any part of the S.; but it is more dangerous in the higher than in the lower part of the column.

The earliest symptoms of caries of the spine are pain in the back increased by movement and percussion, and confined to a fixed spot in the spinal column. Sometimes there is thickening or even increased temperature around the diseased bones. The affected part is kept rigid, and the attitude is characteristic when the disease is situated in the upper part of the neck. When abscess is perceptible, or when curvature exists, the diagnosis is obvious. In many cases of caries the inspissated remains of pus may be found; but in some cases the softened bone seems to have been absorbed without the formation of pus. Caries of the cervical portion is a more dangerous affection than caries of the lumbar or dorsal regions, and it usually at first simulates mere 'stiff-neck,' but in such cases often a slight tap on the head will produce pain. There is usually thickening around the affected vertebræ, often sinuses about the neck, and frequently post pharyngeal abscess, but very rarely curvature. The chief danger consists in softening of the cord, and in displacement of the odontoid process in disease of the two upper vertebræ, which by impinging on the medulla oblongata may produce instant death. When this portion of the spine is affected, the most rigid rest must be insisted on, and the head and neck ought to be confined in a case of guttapercha.

In *lateral* curvature of the S. the distortion is not usually confined to one side, but each vertebra is also somewhat rotated on that next to it, and the distortion is sometimes called 'rotation-curvature.' This lateral curvature is obviously in great measure caused by the action of the muscles inserted on the vertebræ. It is most frequently met with among delicate girls about the period of puberty, and anything which produces habitual inclination of the spine to one side may prove the starting-point to the deformity. Lateral curvature in the dorsal region causes a displacement of the ribs and scapula upwards on the convex side of the curve, raising that shoulder higher than the other. The thorax may be greatly altered in shape, the ribs being flattened, the intercostal spaces nearly obliterated, and the cavity of the lung greatly

narrowed, the reverse being the case on the upper side. In lateral curvature of the lumbar region, the distance between the last rib and the ilium is much increased on the convex side, while on the concave side the rib may impinge on the ilium. The hip is also raised, and prominent on the convex side of the curve.

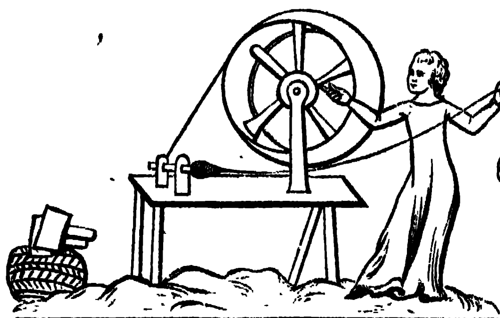
The other curvatures of the spine are kyphosis and lordosis. The term *kyphosis* is sometimes applied to all antero-posterior displacements. This curve is common in weakly children and in old people, and in early infancy it occurs from mere relaxation. The kyphosis of old age is also due to relaxation, and can hardly be mistaken. *Lordosis*, or saddleback, is caused chiefly by disease, or congenital dislocation of the hip, the backward displacement of the centre of gravity of the body and the forward inclination of the pelvis being caused by the dislocation. Ankylosis of the spine is common in old age, and is frequently associated with chronic rheumatic arthritis.



Treatment.—Dr. Lewis A. Sayre of New York has recently introduced a new method for the cure of curvature of the spine, which has been more successful than any other mode previously introduced. The clothing being removed, a thin closely woven vest without armlets is put on next the skin, and a large pad is placed over the abdomen under the vest. The child is then placed under a tripod stand, to the apex of which is attached a block-and-fall arrangement carrying a horizontal iron bar. A padded collar is then buckled round the head and chin, and padded stirrups are passed under the arms. Straps are then passed separately from the collar and arm stirrups to the iron bar above. By adjusting these straps the relative tension upon the head and arms is secured, and when thus suspended the spine becomes much straighter, and the diseased surfaces of the vertebræ are prevented from pressing upon one another. The patient is then directed to make a few deep inspirations. Plaster-of-Paris bandages are then applied round the body from the pelvis to the arms, and strips of thin perforated tin are placed by the sides of the spine, and a second layer of plaster bandages passed round the whole. The straps are then removed, the patient placed upon a mattress, and as soon as the case is dry the abdominal pad is withdrawn. In cases of caries of the cervical region a head-piece is adjusted to the body-case, by means of which the spine may be relieved of the weight of the head. In both forms of the disease, angular and lateral, after treatment by suspension and fixation, free exercise is allowed. After two or three months the case may be slit down the front and fastened with eyelits. See Sayre's *Lectures on Orthopedic Surgery* (Lond. 1876); *Medical Journal of Richmond and Louisville* (May 1877); the *American Practitioner* (June 1877); and Sayre's *Spinal Diseases and Curvature* (Lond. 1877).

Spine, or **Thorn**, in botany, is strictly the strongly pointed extremity of a branch or abortive petiole or peduncle. When stipules (as in *Robinia*), or the teeth of a leaf (as holly and thistle), or leaves (as in gooseberry and furze), or the involucre (as in some *Centauriæ*), or seed-vessels (as in *Medicago*), bear spines, the term spinous as applied to these parts is used in a more conventional sense than indicated above.

Spin'el, a mineral species which embraces the various forms of the much prized Ruby (q. v.). In addition to these varieties, S. includes stones of different colours, blue, green, yellow, brown, and black, and from being a compound of alumina and magnesia with a little iron, it passes into combinations in which iron, manganese, and lime or zinc largely or altogether supplant the magnesia.

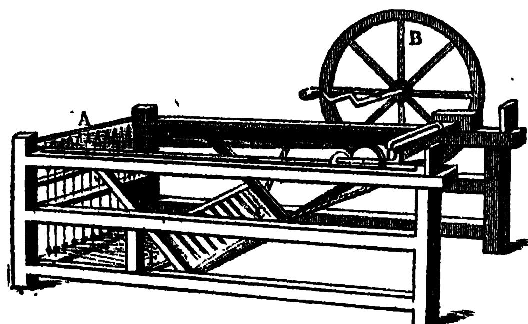


Spin'et, or **Couched Harp** (Ger. *spinett*, Ital. *spinetta*), a keyed musical instrument, closely resembling the virginal, but differing from the older virginals in being always triangular in shape. The strings, one of which went to each note, were set in vibration by jacks or quill plectra. The S. was the precursor of the harpsichord.

Spin'ning. The art of twisting fibres into a continuous thread or line being a fundamental operation in textile industries, the process of S. by which that is accomplished, is, as may be readily imagined, one of extreme antiquity. Abundant testimony is borne to this fact not only by the works of the most ancient writers, but also by the remains of S. whorls of stone and baked clay, and of woven fabrics themselves, found in prehistoric deposits. The implements used in connection with the art of S. from the earliest times, and throughout many ages, were of the simplest nature, and the occupation it afforded was entirely domestic and prosecuted by the women of the household. The S. implements were the distaff and the spindle, the former being merely a bar or short stick of wood, to the top of which the material to be spun was loosely attached, generally by being wrapped up as a soft ball into which the end of the distaff was inserted. The distaff was held under the left arm of the spinner, and with the right hand she drew out a uniform sliver of the fibre which was twisted by and wound on the spindle. In some cases the distaff was placed in an upright stand, as seen in the accompanying figure, extracted from a 15th c. MS., in

Textile Fabrics.

which the operations of S. and weaving are illustrated. The spindle was a stick 10 or 12 inches long, having at the top a slit or catch in which the thread was fixed, and as a makeweight on its lower end there was placed a stone whorl. The spindle was rotated with the right hand, and by its rotation and weight the thread was at once drawn out and twisted, and whenever it reached the ground the thread was lifted out of the slit, wound on the body of the spindle, and the operation again renewed. The use of these exceedingly simple implements continued till comparatively recent times, and the various forms of S. wheels did not altogether supplant them. From the illuminated MS. of the 14th c. in the British Museum, it is obvious that a kind of S. wheel was in use as early as that date. The wheel there illustrated (fig. 2) was only employed to turn a simple spindle



Textile Fabrics. (Fig. 2.)

mounted horizontally. The worker gave the wheel a violent turn with the hand, and then rushed backward, drawing out thread as long as the motion of the wheel kept up. In the improved forms of S. wheels which were to be seen in every rural household in Scotland throughout the earlier part of the present century, the wheel was rotated by the feet, thus leaving both the worker's hands free to attend to the S. operations, and generally in the wheel two separate spindles were mounted and worked simultaneously. The distaff or 'rock' was fixed on the wheel

frame, and the S. appliances consisted of a flyer and a bobbin or pirn, both mounted on the same spindle, the flyer consisting of two arms, which by their rotation twisted the thread and thereafter fed it on to the bobbin revolving within the arms.

A great revolution in the S. industry had its origin in the invention of the S.-jenny by Hargreaves about the year 1764.

Hargreaves' Jenny.

The S.-jenny consisted of a frame in which a series of erect spindles were placed, each of which spun and wound on itself a thread from separate bobbins of 'roving' or loose fibre mounted in a movable carriage, which in its motion away from the spindles drew out the fibre to the requisite degree of tenuity, which then were twisted and wound on the spindles as the carriane moved towards them. With the aid of this apparatus a single attendant was enabled to spin a number of threads in one operation. About the same period the still more famous water-twist frame of Arkwright was invented, an apparatus in which the fibres were drawn out to the requisite degree of tenuity by being passed between three successive pairs of rollers, each succeeding pair revolving with greater rapidity than those preceding them. This device, which is the most valuable of all the inventions which have ever been applied in the art of S., had originally been proposed and patented by Paul of Birmingham in 1738, but it was entirely lost sight of till rediscovered and practically introduced by Arkwright. From the drawing rollers in Arkwright's frame the attenuated fibre was led through eyelet hooks direct to the spindle flyers arranged in a slanting position on a horizontal bar, and, being twisted, the yarn was wound on a bobbin revolving within the flyer arms. Thus in Arkwright's frame the operation of S. was continuous and uninterrupted. In 1779 Crompton elaborated his mule, an apparatus so named on account of its combining in one the essential features of both Hargreaves' and Arkwright's machines, and in this combination are found the essential features of the modern S. frame. In the mule the successive pairs of drawing-rollers are employed, and in addition the drawn fibres are run out by a movable carriage, on which the spindles are arranged. When the carriage reaches the end of its course, the rollers cease to revolve, and as it runs in towards the rollers the spindles both twist and wind up the yarn twisted. It will thus be seen that the motion in the mule is, as was the case with Hargreaves' jenny, of the intermittent nature.

In a modern S.-mill all the range of operations from the raw fibre up to the yarn ready for weaving, knitting, or thread manufacture are embraced, and while the mechanical principles involved in the actual S. machines are the same, the range of processes and appliances required for flax, cotton, long and short wool, and indeed for most fibres, is wide and distinct from each other. In all cases the objects to be attained are to arrange the fibres parallel to each other, to draw them out into a continuous untwisted or lightly twisted cord or 'sliver' of uniform thickness, and finally to twist the yarn in an even and equal manner. The various forms of machine devoted to these purposes have now been brought to a state of extraordinary perfection, and the most delicate operations are performed with so great certainty by automatic machinery, that only the attendance of unskilled girls is required. See COTTON-SPINNING, and WOOLLEN AND WORSTED MANUFACTURE.

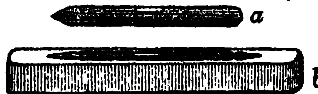
Spino'za, Baruch or **Benedictus de**, one of the greatest of modern philosophers, was born of Jewish parents at Amsterdam, 24th November 1632. He was at first educated for the Jewish priesthood, but his inquiring mind soon becoming dissatisfied with the doctrines of Judaism, he left the synagogue, from which, moreover, he was formally expelled by excommunication, and devoted himself to the study of philosophy. When twenty-eight years of age he left Amsterdam, and, after a brief residence at various places in Holland, finally settled at the Hague, where he earned his living by polishing optical glasses. He died 21st February 1677.

The chief works of S. are his *Ethica*, which contains his system of philosophy, presented in the form of geometrical demonstration; his *Tractatus Theologico-politicus*; a treatise on the interpretation of the Bible; and his *Tractatus Politicus* on government. S.'s system is a development and completion of that of Descartes. That philosopher defined substance to be 'that which for its existence stands in need of nothing else.' 'Then,' says S., 'there can only be one substance.' Here already he separates himself from his master. 'It must be absolutely infinite, and not only contain the last grounds of all existence, but must be All: this substance, infinite and eternal, is God.' Thus his philosophy assumes a Pantheistic form. All the (apparently various) forms of being are but the modes in which God's existence is manifested. Of these modes all that are known to us belong to two attributes of substance, thought and matter. These *modi*, as S. named the attributes, have no independent existence; though in one sense different, yet they are but different manifestations of the same substance. They are the special individual forms which constitute the universe as we know it, and are changeable and finite though the substance of which they are manifestations is unchangeable and infinite. They are related to it as the waves to the ocean. All their motions are absolutely necessary, and thus there is no free will. From this point of view the union of mind and body, which had been such a stumbling-block to the followers of Descartes, was easily explained, for their movements must correspond, since they were really movements of what was ultimately one and the same substance. In the more properly ethical part of S.'s philosophy we have the practical consequences of this system. There being no free will, men only believe they are free 'because they are conscious of their own acts, but not of the motives of them.' Good and bad are only relative, for God being all in all, nothing is really bad. The highest duty and highest good for man is one—to know and love God. Thus we learn the eternal fitness and necessity of all things, and are raised as on a rock from out the wild sea of vain human passion, and that state is the only true happiness. 'Felicity is not the reward of virtue; it is virtue itself.' In the *Tractatus Theologico-politicus* S. distinguishes between philosophy and religion—the former has for its object the discovery of intellectual truth, the latter is concerned with life and conduct. The Bible 'pretends not to reveal natural laws, but to exhibit laws of ethics.' Christ is undoubtedly the centre figure of the whole book, for he found the revelation of God in his own consciousness, and did not seek it, as Moses did, from an external source, and from this point of view only can we affirm that the Divine Word became man. But there is a distinction to be drawn between the moral truth of the Bible and the historical vehicle (viz., the various books) in which it is conveyed. These are proper subjects for historical criticism, which, assured that no imperfections in *them* can injure the moral truth they contain, must treat them on exactly the same principles as it would any other writings. Thus there must be in religious matters liberty to think and express what a man really believes; and in politics (such is the argument of the *Tractatus Politicus*), as far as regards thought at least, the rule of liberty also applies, for rulers 'are to bring the actions but not the convictions of men into harmony.' A republic, aristocratic in form, but with an admixture of the popular element, is the best form of government.

S.'s influence on later German philosophers, especially on Schelling and Hegel (q. v.), has been very great, and through his *Tractatus Theologico-politicus* he is the founder of that school of Rationalistic theology which has so long ruled the German Protestant Church, and which in our own time has had such a powerful and far-reaching influence. His character is perhaps still more remarkable than his works. He was absolutely indifferent to wealth, fame, or power. He steadily turned aside from everything that could in any way interfere with his freedom of thought. He was cheerful and contented while afflicted with great bodily weakness and in the midst of extreme poverty. Philosophy has no record of a purer life or a more elevated cha-

racter. The complete works of S. were edited by Paulus (Jena 1802-3), Gröfrer (Stuttg. 1830), C. H. Bruder (Leip. 1843-46). See also the German translation by B. Auerbach (5 vols. Stuttg. 1841), and the French translations by E. Saisset and J. G. Prat (Par. 1861 and 1863). In English the completest work on the subject is *Benedictus de S.*, by Dr. R. Wills (Trübner, Lond. 1870). For briefer accounts the reader may be referred to the Histories of Philosophy by Lewes, Schwegler, and Ueberweg.

Spiræ'a, a genus of *Rosaceæ*, numbering about 50 species of perennial shrubs, and distributed over the temperate and cold regions of the N. hemisphere. *S. ulmaria*—the meadow-sweet—is a common British representative. *S. filipendula*, a plant of dry pastures, is much less common. Several of the shrubby species are grown as garden and shrubbery ornaments, such as *S. salicifolia*, a European species now semi-naturalised in Britain; *S. bella* from Nepal, with rose-coloured flowers; *S. tomentosa*, the 'hard-hack' of N. America; *S. Fortunei* from China; the chaste *S. prunifolia* from Japan, and many others.



Spi'ral is a plane curve traced out by a point which moves along a line according to a fixed law, while that line rotates uniformly round a point in itself. To take the simplest case, the S. of Archimedes, suppose the point to move uniformly along the line. Then evidently the rate of increase of the radius vector is proportional to the rate of increase of the angle it makes with a fixed line, since both rates are constant; and hence, if both angle and radius start from zero, the length of radius is proportional to the size of angle. Consequently the polar equation may be written $\rho = a\theta$, where ρ and θ are the polar co-ordinates and a a constant. The general equation $\rho = a\theta^n$ includes this and the hyperbolic and parabolic spirals, whose equations are respectively $\rho = a\theta^{-1}$ and $\rho = a\theta^2$. The logarithmic S. is noted under LOGARITHM. See Salmon's *Higher Plane Curves*.

Spires, the slender, tapering superstructures of church towers, which, having their origin in the low pyramidal roofs—square, circular, or octagonal—of Norman turrets, and in Early English growing more lofty and acute, attained their perfection in the Decorated and Perpendicular styles, where they have gutters and parapets round their bases, and are enriched with crockets, pinnacles, niches, canopies, &c. Upon the Continent open-work S. are not unfrequent, and there the loftiest S. are those of Strassburg Cathedral (completed in 1439), 494 feet; Rouen Cathedral (1876), 487½ feet; St. Nicholas, Hamburg (1874), 486 feet; St. Martin's Landshut (1580), 468 feet; and St. Stephen's, Vienna (1864), 452 feet. In England we have the S. of Salisbury Cathedral (*circa* 1350), 404 feet; of Norwich (1361), 309 feet; and of St. Michael's, Coventry (*circa* 1380), 303 feet. In Scotland, Glasgow Cathedral (1195-1250) has a spire 225 feet high; and St. Mary's Cathedral, Edinburgh (1878), one of 275 feet. S. are usually of stone, but that of Rouen is of cast-iron, and timber covered with lead or shingles is also used. The spire and tower together are called a *steeple*.

Spir'it, or **Spirits**, a name which originated during the time of the alchemists, and which was applied to volatile fluid substances obtained by distillation. In this way we have still the names S. of turpentine, S. of salt, S. of hartshorn, and S. of wine, &c., but the term is now usually restricted to the various forms of distilled alcohol and its preparations for various purposes. The term thus includes the various forms of alcohol used for drinking—brandy, gin, rum, whisky, &c., the S. of the pharmacopœia, and those employed for industrial purposes. See METHYLATED SPIRIT, and FERMENTED AND DISTILLED DRINK, CONSUMPTION OF.

Spir'it Duck. See GARROT.

Spir'it Level. A S. L. consists essentially of a hermetically sealed slightly-curved glass tube (fig. *a*) nearly filled with alcohol, and containing a small bubble of air, which exactly occupies the middle point when the tube is perfectly horizontal. The tube is commonly mounted in a case of wood, faced with brass (fig. *b*), which is laid on the surface to be tested. Telescopes, theodolites, and other instruments of precision are provided with spirit levels.

Spirit Level.

Spir'itualism, or **Spir'itism**, as it might perhaps be more conveniently called, so as to distinguish it from the set of philosophical tenets to which the longer name has already been appropriated, is in its present development a species of religious belief, grounded upon the theory that certain physical and mental phenomena, alleged to be inexplicable under the laws of nature as at present understood, are the result of the direct intervention of incorporeal spirits. The phenomena in question are of every possible description, from old-fashioned 'second-sight' apparitions, through all the modern refinements of rapping, writing, and verse-making spirits, down to the latest phase of 'materialised spirit forms,' which can be felt, embraced, and even photographed. They are, indeed, so widespread and various that we cannot here attempt more than a sketch of their history, and a reference to a few of the very numerous works in which detailed descriptions and criticisms of them will be found.

The Hydesville rappings of 1848 are usually looked upon as the commencement of modern S. So, in a sense, they were; but Mr. W. Howitt, in his *History of the Supernatural in all Ages and Nations* (Lond. 1863), has proved that very similar phenomena, even in the detail of communication by rapping, were claimed to have taken place in Germany and elsewhere more than half a century earlier, the most notable case being that of the Seeress of Prevorst, minutely described by the well-known physician and poet, Dr. Kerner. Mr. Howitt's work is ill-arranged and feeble in argument, but is a rich storehouse of traditions and anecdotes bearing on the question of the possibility of spirit-communication. In R. Dale Owen's *Footfalls on the Boundaries of Another World* (Phil. 1860), there is also abundant proof that the alleged phenomena are far from being so entirely novel as is sometimes supposed, his account of the disturbances at Mr. Mompesson's house at Tedworth in 1661-63, and of the still more famous rappings in the Wesleys' home at Epworth Parsonage in 1716-17, being especially interesting. Nevertheless, S. in its modern form may be said to have originated at Hydesville, a village in the State of New York, U.S. Here, in 1848, lived a family named Fox, consisting of a father, mother, and two daughters—Margaretta and Catherine, aged respectively twelve and nine. For some months they had been annoyed by repeated and inexplicable knockings in the walls and furniture of their cottage. At last, on the night of the 31st of March, the little girl Kate happened to notice that the rappings seemed to reply to any noises made by the members of the family. 'Do as I do,' she said, snapping her fingers, and instantly the sounds responded. 'Count ten,' she said, and ten raps were given. 'How old is Margaret?' asked the mother, and twelve raps followed. 'And how old is Kate?'—nine raps. From these hints a system of communication was elaborated by which words were spelt out and questions were answered. Meanwhile the rappings went on vigorously. Miss Kate Fox, in whose presence they were strongest and most frequent, was sent on a visit to a married sister in Rochester; there the rappings followed her, though they did not cease at Hydesville, and several other families began to be disturbed by them. At length, on the 14th of November 1848, a public lecture was delivered on the subject, at which specimens of the rappings were given. The newspapers took up the matter, and spread the knowledge of it throughout the country. Persons in all parts of the States began to develop 'mediumistic' power, as it soon came to be called, and by 1850 S. had become a recognised institution throughout America, and began to be heard of, principally in the way of ridicule, in England and on the Continent. The way had been prepared for it in America by the mystical writings and addresses of Andrew Jackson Davis, 'the Poughkeepsie Seer,' which, under such titles as *The Principles of Nature*, *The Great Harmonia*, *The Magic Staff*, *&c.*, had obtained considerable currency. (For an account of these see *Edinburgh Review*, October 1865.) Gradually the doctrine attracted more and more attention. The Hon. John W. Edmonds, a judge of the New York Court of Appeals, and Robert Hare, M.D., Professor of Chemistry in the University of Pennsylvania, both undertook to investigate the matter and expose its delusions, and both ended by admitting their conviction of the genuineness of the facts; the former in his *S.* (10th ed. New York, 1854-55), and the latter in his *Experimental Investigation of the Spirit Manifestations* (5th ed. New York, 1858). Such men, too, as Horace Greeley and N. P. Tallmadge, governor of Wisconsin, bore testimony to the genuineness of some, at least, of the manifestations, which

assumed all forms, from the ordinary furniture-moving phenomena to clairvoyance, spirit-writing and drawing, playing on musical instruments, 'levitation' of the human body, untying of complicated rope-knottings, and even 'materialisation' or assumption of a tangible spirit-body. So early as 1852 a paper called the *Spiritual Telegraph* was published in New York, and in 1854 a 'Society for the Diffusion of Spiritual Knowledge' was founded in the same city. The American literature of S. is now enormous. The chief periodicals devoted to the subject are the Boston *Banner of Light* and the Chicago *Religio-Philosophic Journal.* But there are, or were until recently, other spiritual papers and magazines in Boston, New York, Philadelphia, New Orleans, San Francisco, Utica, N.Y., Springfield, and indeed in almost every city of any importance. The number of believers in S. in America was estimated by competent authorities in 1871 at about eleven millions; there were 125 Spiritualist societies and 207 professional lecturers. The leading American works on the subject, besides those already cited, are Adin Ballou's *Spirit Manifestations* (Liverpool 1853); E. W. Capren's *Modern S., its Facts and Fanaticisms* (Boston 1855); Hudson Tuttle's *Scenes in the Spirit World* (New York 1855); and his *Arcana of S.* (Lond. 1876); Judge Edmond's *Spiritual Tracts* (New York 1858-60); R. Dale Owen's *The Debateable Land between this World and the Next* (Lond. 1871); Olcott's *People from the Other World* (Hartf. 1875); N. B. Wolfe's *Startling Facts in Modern S.* (Cincinnati 1874); Epes Sargent's *Planchette, the Despair of Science* (Bost. 1869), and *Proof Palpable of Immortality* (Bost. 1875); and, most important of all, the voluminous but crude and incongest *History of Modern American S.* by Emma Hardinge (New York 1870).

One of the earliest Spiritualists who visited England was a Mrs. Hayden, who gave seances in London in 1853, but it was not until the arrival of Mr. Daniel Dunglass Home, in 1855, that the 'movement' began to excite general attention. This famous medium was born in Scotland in 1833, but went to America when a mere child. His specialty lay in the unusual strength of his manifestations, which were for the most part of the ordinary kind, such as rapping, turning and raising tables, &c., though he was now and then 'levitated,' *i.e.*, floated up to the ceiling, or out of the window and into the next room; and sometimes even elongated and contracted, it being on record that he at one time suddenly stretched to the height of nearly 7 feet, and then shrunk to several inches below his natural stature. Very soon after his arrival he was visited by Lord Brougham and Sir David Brewster, who seem to have been puzzled by his performance, but by no means converted. S., however, was gaining ground rapidly. Among its first converts was the venerable Robert Owen, whose son was afterwards one of its leading exponents. The eminent mathematician and logician, Professor De Morgan, was also an early adherent of the new doctrine, and published in conjunction with his wife a treatise called *From Matter to Spirit* (Lond. 1863). Many, on the other hand, adopted the theory that S. was an ingenious invention of the devil for the perversion of humanity, one of the most notable expositions of this view being the Rev. R. W. Dibdin's *Table-Turning* (Lond. 1853). Faraday attempted to explain table-turning by a theory of unconscious muscular action, which unfortunately was at best only applicable to a very small class of the alleged phenomena. On the Continent the question was discussed in De Gasparin's treatise *Des Tables Tournantes* (Par. 1854), and in a less scientific and more mystical spirit by the Marquis de Mirville in his voluminous *Pneumatologie* (Par. 1858). Home was meanwhile wandering through Europe, received with distinction at the courts of Paris, Berlin, and St. Petersburg, and making many converts, especially in the upper ranks of society. He it was who brought the subject under the notice of R. Dale Owen, then American minister at the court of Naples. For the rest of this gentleman's adventurous career, reference may be made to his autobiography, entitled *Incidents of my Life* (two series, Lond. 1863-72). In 1864 the famous Davenport Brothers paid their first visit to England. Born at Buffalo, New York, in 1839 and 1841 respectively, Ira and William Davenport had long been famous in the United States. In Europe they created a great sensation, and gave rise to endless controversy. They were exposed, vindicated, and re-exposed time after time, and their rope trick and cabinet performance have given the suggestion to all the most elaborate exhibitions of our modern conjurors. The years 1869-70 may be taken as a new point of departure in the history of S., as about this time the first genuinely-scientific researches into the subject were set on foot. In 1869 the London Dialectical Society appointed a large committee to examine into the phenomena, and from the *Report* which it published (Lond. 1871) it appears that its members were thoroughly convinced of the genuineness of many of the alleged manifestations, though the question of their spiritual origin was of course left entirely open. About this time, too, Mr. William Crookes, F.R.S., discoverer of the metal thallium, and editor of the *Quarterly Journal of Science*, undertook an independent investigation of the subject, Mr. Home and Miss Kate Fox (now Mrs. Jencken) being the mediums with whom most of his experiments were conducted. His researches, carried on in the most scientific spirit, led him first to the conclusion that a hitherto undiscovered force must exist, which he proposed to designate *psychic force*—a term also adopted by Serjeant Cox in his *S. Answered by Science* (2d. ed. Lond. 1872), and ultimately led him to a thorough belief in the Spiritual theory. His pamphlets, entitled *Psychic Force* and *Modern S.* (Lond. 1871-72-74), are certainly among the most valuable of extant works on the question. Mr. Alfred Russel Wallace, the well-known traveller and naturalist, looks at the question from a more *à priori* point of view in his *Scientific Aspects of the Supernatural* (Lond. 1866), enlarged into his *Miracles and Modern S.* (Lond. 1875). The latter is, however, by far the best popular discussion of the subject as yet published. In 1876 occurred the second Spiritualist *cause célèbre.* Dr. Slade, an American medium professing to obtain spirit-messages written on the surface of a slate held close against the lower side of an ordinary deal table, was prosecuted under the Vagrancy Act, at the instance of Professor Lankester and Dr. Donkin, who alleged that they had snatched the slate from his hand before it was placed under the table at all, and had found the writing already on it. The evidence was very extraordinary and conflicting, but the medium was ultimately sentenced to three months' imprisonment. On appeal, however, he was acquitted on a point of law, and had disappeared before a new warrant could be taken out against him. The most recent and most advanced forms of Spiritual manifestations are of the nature of 'materialisation,' with its concomitant 'spirit-photography.' Abundant accounts of these developments are to be found in the Spiritual periodicals, the *Medium and Daybreak* and the *Spiritualist* (weekly), and the *Spiritual Magazine* (ceased 1877) and *Human Nature* (monthly), all published in London. Among the more recent literature of the question in England may be noted Gerald Massey's *Concerning S.* (Lond. 1876); Maskelyne's *S., an Account of its Rise and Progress* (Lond. 1876); a flippant criticism of the movement by one of the clever firm of conjurors who for some years have carried on so-called *exposés* of S. at the Egyptian Hall, London; D. D. Home's *Lights and Shadows of S.* (Lond. 1877); and a work entitled *Psychography*, by 'M.A., Oxon' (Lond. 1878). On the Continent the most voluminous writer on S. is M. Léon H. D. Rivail, who under the name of 'Allan Kardec' has published a complete mystic system based upon S., which is, however, regarded by most English spiritualists as heterodox, except on the practical subject of mediumistic methods, &c. An English translation of his works is being carried out by Miss A. Blackwell, two volumes being already published, viz., *Experimental Spiritism* (Lond. 1876), and *Practical Spiritism* (Lond. 1878). To indicate the extent to which spiritualist doctrines are spread throughout the world, we may give the following statistics of spiritual periodicals:—In France there are at least 3; in Spain, 6; in Italy, 3; in Germany, 2; in Austro-Hungary, 3; in Belgium, 5; in Holland, 2; in Denmark, 1; in Switzerland, 1; in Turkey, 2; in Egypt, 1; in Mexico, 8; in Brazil, 4; in the Argentine Republic, 2; in Peru, Chili, Uruguay, and Columbia, 1 each; and 1 in Australia (Melbourne).

It will be noted that in the foregoing sketch we have merely stated facts and alleged facts, without discussing either their evidence or their intrinsic probability. The question is an extremely difficult one. A very slight acquaintance with the literature of S. is sufficient to create a hearty dislike for its general emptiness, aimlessness, and vulgarity. Exposures of trickery, too, have undoubtedly been numerous. On the other hand, many of the alleged facts are supported by evidence which, both as regards its quantity and its quality, it is extremely difficult to reject. The subject as a whole has not received

at the hands of modern scientists the treatment it deserves. Among the works almost essential to a thorough study of the question, especially in its relation to mesmerism, animal magnetism, and other kindred subjects, are: Ashburner's translation of Reichenbach's *Physico-Physiological Researches* (Lond. 1850–51); Gregory's *Abstract* of the same author's *Researches on Magnetism* (Lond. 1846); Bray's *On Force, its Mental and Moral Correlates* (Lond. 1866); Mayo's *On the Truths Contained in Popular Superstitions* (Edin. 1851); Serjeant Cox's *What am I?* (Lond. 1873); and *Mechanism of Man* (Lond. 1876); two articles in the *Quarterly Review*, understood to be by Dr. Carpenter, on *Electro-Biology and Mesmerism* (September 1853), and *S. and its Recent Converts* (October 1871); *Spirit-Rapping a Century Ago* in the *Fortnightly Review* (Feb. 1866), and an important article on *The Physics and Physiology of S.* in the *North American Review* (April 1870). On the supernatural in general, Mrs. Crowe's *Night Side of Nature* (Lond. 1848) and H. Welby's *Signs Before Death* (Lond. 1875) are useful collections of tales and legends. Zöllner's *Wissenschaftliche Abhandlungen* (2 vols. 1878) contains elaborate accounts of spiritualistic phenomena exhibited in the presence of Dr. Slade.

Spir'ula, a curious genus of cuttlefishes belonging to the *Dibranchiate* division of the Cephalopoda (q. v.), and distinguished by an internal chambered shell, the *septa* or partitions of which are perforated by a ventral tube or *ipuncle*. *S. Peronii* is the common species, the shells of which are cast up by thousands on the coasts of New Zealand, though, curiously enough, the living animal is rarely met with.

Spit'alfields, a parish of N.E. London, included in the Tower Hamlets, contains in its area of 73 acres 1966 houses, and a pop. (1871) of 20,783. The silk manufacture, established here by Huguenot refugees towards the close of the 17th c., has somewhat revived of recent years, but is now mainly confined to the production of rich furniture silks, both on the factory and home system, and velvets also are largely woven.

Spit'head, the famous English roadstead off the coast of Hampshire, forming the chief approach to Portsmouth and Southampton Water. It separates the Isle of Wight from the mainland in the E., and the corresponding channel on the W. is the Solent (q. v.), with a length of 14 miles, and an average breadth of 4; it is sheltered from all but south-easterly winds, and its security has procured it, among sailors, the name of 'the king's bedchamber.' Its proper name refers to the 'Spit' or sandbank which extends S. from the mainland for 3 miles. Its natural advantages for safe anchorage, and its vicinity to the great naval establishments of Portsmouth, have made it a favourite rendezvous of the British fleet, and consequently one of the most important points in the system of coast defence. Its fortification has been the subject of much care as well as controversy (see *Reports* of Commissioners on the Defence of the United Kingdom). It is now defended not only by the forts on the mainland and Isle of Wight, but by five iron-plated works, which are built from the bottom, and are among the most remarkable specimens of modern armoured fortifications. See IRON-PLATING.

Spitzberg'en (Russ. *Grumant*), a group of islands in the Arctic Sea, lying due N. of the North Cape between the parallels 176° 20′ and 80° 50′ N. lat. Altogether, according to Dunér and Nordenskjöld, they comprise an area of 22,844 sq. miles, of which S. proper contains 15,257. The larger islands have very broken coasts and deep fiords. The 'Ice Fiord,' along the shores of which rich coal-seams are found, affords a good anchorage for vessels. The interior is mountainous, attaining an elevation of 4100 feet, and covered with huge glaciers, whose lower fringes are washed by the waves. Here and there, during summer, exist patches of vegetation, mainly grasses, mosses, and lichens, affording pasturage to the reindeer, which abound. The polar bear, arctic fox, wild goose, eider duck, and other seafowl are in abundance, and the surrounding seas are rich in fish. Owing to the penetration of the Gulf Stream to these regions, the climate is not so rigorous as might be expected, the mean annual temperature being 16° F., or 16° below the freezing point of water. During the three summer months the mean temperature is about 37° F., and the maximum rarely reaches 60° F. S. was discovered in 1596 by the Dutch navigator Barents, who was searching for the N.-E. passage; and in the succeeding century the Dutch established in the north of the island a fishing station, Smeerenberg, which ceased to exist, however, when the whale-fisheries came to an end about 1820. Seal and walrus fishing are now carried on successfully by the Russians, and S. has recently acquired greater interest from the results of late scientific expeditions, and from the likelihood that it is the only possible path to the Pole. Numerous Swedish expeditions, from that of Otto Torell in 1861 to that of Nordenskjöld in 1873, have made the natural history of S. as well known as that of most European countries. Very important is the discovery of certain fossil plants in the Tertiary formations of S. that could not have grown under a climate less warm than that now found on the Mediterranean shores. S. was visited by Lord Dufferin in the *Foam* in 1867, and by the Dutch expedition in the *Willem Barents* in 1878.

Spleen, one of the abdominal *glands* at the left side of the body, close to the stomach and *pancreas*. It is somewhat oval-shaped and concave internally, where it is divided by a fissure named the *ilium*. Here bloodvessels enter and leave the organ, and the nerves also enter. The upper extremity of the S. is thick; the lower, which is in contact with the *colon* (see INTESTINE), is more pointed. The average length of the S. is 5 inches, its breadth 3 or 4 inches, and its thickness 1 or 1½ inches. Its weight is about 7 oz. The S. is a meshwork of fibres or *trabeculæ*, supporting a soft matter named the *S.-pulp*. Microscopically examined, the latter is found to consist of *blood-corpuscles* in a state of disintegration. The S.-substance also includes certain small round bodies, attached to the sheaths of the bloodvessels of the S., and named *Malpighian* or *splenic corpuscles*. During digestion the S. increases in size, but under starvation it decreases, and the Malpighian bodies disappear. The S. is supplied with blood by the *splenic artery*; its nerves are derived from the *right pneumogastric nerve*, and from the *left semilunar ganglia*. This organ may be excised from man and other animals without impairing the health, hence we may conclude that its functions are capable of being carried on by some other glands. In all probability the S. is one of the *blood-glands*, of which the *hymus* and *thyroid glands*, and indeed the whole *lymphatic system*, are examples. In the S. the blood-corpuscles undergo some changes; possibly the organ may be the seat of manufacture of red blood-corpuscles, as well as of their final disintegration.

Diseases of the S.—Most of the diseases of the S. occur as secondary affections in connection with other diseases, such as ague and leucocythæmia. *Amyloid* degeneration of the S. is frequently associated with a similar disease in the liver or kidneys. The S. is enlarged and increased in density, and it feels to the touch like wax. *Splenitis* or inflammation of the S. is rare in this country, but is common in tropical, malarial districts, and is usually associated with ague. The symptoms are pain in the left side, in the hypochondriac region, and considerable tumefaction. The hypertrophoid spleen may encroach on the stomach, and by upward pressure disturb the heart's action, or it may extend downwards into the pelvic region. The diffuse inflammation may terminate by resolution, but pus may form or the spleen may become gangrenous. Tumefaction generally subsides rapidly; but more or less hypertrophy may remain. Atrophy of the S. is a much less frequent affection.

Treatment.—Splenitis being generally associated with ague, disappears, as a rule, when the ague is cured. When the S. is chronically enlarged, it is best treated by the internal administration of the iodide of potassium, and by rubbing into the skin over the spleen the red oxide of mercury in the form of ointment.

Spleen'wort. See ASPLENIUM.

Splint, otherwise known as **Splent**, is an affection of the fore-leg of the horse. It consists of a bony enlargement between the knee and fetlock, which may affect one or both legs. The disease often appears in young horses which have been set to work at an early age, and which have especially been worked on hard roads. Cold-water bandaging is effective in its earlier stages combined with rest, and blistering or irritants must be resorted to thereafter to reduce the swelling.

Splint-bones, the rudimentary metacarpal and metatarsal bones in horses and other *Solipeda* or *Solidungula* (q. v.). They represent the beginnings of the second and fourth toes, which were fully represented in such ancestors of the Horse family as *Hipparion*, *Anchitherium*, *Orohippus*, &c.

Splints, in surgery, are mechanical appliances used to keep the fractured ends of bones as accurately as possible in position,

and immovable during the whole time of treatment. Ordinary S., used in fractures, are generally wooden, and are bought ready-made from the instrument-makers; but there are several kinds of S., the principal of which are the following:—*Gooch's splint*, composed of thin strips of light wood, bound together with a webbing. It easily adapts itself to convexities of the limb, and can readily be cut to any required length or shape; *pasteboard S.*, formed from pieces of pasteboard soaked in warm water; the *leather splint*, prepared by softening the leather in warm water, moulding it to the limb, trimming it with stout scissors, and applying it as the pasteboard splint; the *guttapercha splint*, similarly prepared; the *plaster-of-Paris splint*, thus made: One or two rollers of open material are charged with dry plaster-of-Paris by rubbing in as much as the bandage will hold, or the splint may be made of pieces of muslin or any open tissue similarly prepared with plaster-of-Paris. A layer of wadding or cotton wool being applied to the part, the bandage is placed in water for a very short time and is then applied, water being washed over each turn as it is being applied, and fresh plaster being rubbed over it as may be required. The plaster hardens very rapidly, and the splint is light. Others are the *Bavarian splint*, the *starch splint*, the *gum-and-chalk splint*. *Paraffin*, *silicate of potash*, and *glue* are also used in the formation of S. *Hides' patent felt splint* is made of felt lined with soft leather, and is hardened by a preparation sold with the felt and put on with a brush. There are also several S. used chiefly in cases of compound fracture, such as Macintyre's S., Liston's S., &c.

Splü'gen (Romaunsch *Speluga*), a village in the canton of Grisons, Switzerland, 32¾ miles S.S.W. of Coire, and 4757 feet above the sea, giving its name to the **S. Pass** (6945 feet high), which is on the Italian frontier, 4 miles south, beside the precipitous *Tambohorn* or *Schneehorn* (10,748 feet). In this pass General Macdonald, leading his division to the help of Brune (November 27–December 4, 1800), lost whole columns of men, hurled by avalanches into the abyss of the Cardinell. It was then but a bridle-path, but in 1818-22 an excellent road was made from S. to Chiavenna by the Austrian government.

Spohr, Ludwig, a celebrated musical composer and admirable violinist, was born at Seesen, in Brunswick, where his father was a physician, April 5, 1784. After receiving lessons on the violin from Maucourt, he appeared as a public performer at the age of twelve at Brunswick, when he played a concerto of his own composition. In 1802 his patron, the Duke of Brunswick, placed him under the instruction of Franz Eck, whom he accompanied on a visit to Russia. He was appointed in 1805 composer and conductor of concerts to the Duke of Sachsen-Koburg and Gotha, at whose court he remained for a number of years. He afterwards removed to Dresden, and was for a short time director of the music at the theatre at Frankfurt-on-the-Main till he was appointed chapel-master at Kassel in 1822. He made his first appearance in this country at the Philharmonic concerts in 1820. While he delighted Europe by his skill as a performer, he threw off multitudinous compositions of the most varied character—concertos, duets, trios, quartets, songs, &c., 6 operas, including *Zemire und Azor* (1819), *Jessonda* (1823), and *Faust* (1818), the last named a work which, if eclipsed in popularity by Gounod's masterpiece, abounds in fine and striking passages; 6 symphonies, including *Die Weihe der Töne*, and several oratorios of great excellence, including *Die Letzten Dinge* (1829), *Der Fall Babylons* (1840), and *Des Heilana's letzte Stunden* (1833). S. died October 22, 1859. He was a master of harmony, and his works are skilful, elaborate, and imaginative. His violin-playing was distinguished above all others for exquisite purity and delicacy of style; for refinement and polish more than for strength and passion. His Italian critics proclaimed him to be the first 'singer on the violin,' and he produced from its tones the deep and definite effects of the human voice. His *Violinschule* is one of the best books of instruction for the violin. His wife, Dorothea Schindler, was an accomplished harpist. See *The Autobiography of L. S.* (Eng. trans. 1864).

Spole'to, an ancient town of Central Italy, province of Umbria, lies on the slope of a hill, 41 miles S.E. of Perugia by rail. Outside the town is a deep ravine spanned by the imposing aqueduct Ponte delle Torri (604), which is used also as a bridge, and is built of brick resting on 10 arches, 290 feet high and 693 feet long. The principal buildings of S. are the cathedral of S. Maria Assunta, dating from 617, the churches of S. Domenico, S. Pietro, and the Palazzo Pubblico. Many Roman remains exist, of which the finest is an arched gateway called the Porta d'Annibale, or Porta della Fuga. S. manufactures woollens and hats. Pop. (1877) 20,791. S., the ancient *Spoletium*, became a Roman colony in 242 B.C., and repulsed Hannibal in 217. In 570 A.D. it became the capital of a Lombard duchy, and in 1220 was joined to the states of the Church. It fell into the hands of the Piedmontese, September 18, 1860, after a gallant defence by a body of Irish mercenaries in the Papal service, commanded by Major O'Reilly.

Sponge (*Spongida*), a horny substance valued for its ready imbibition of water, and consisting of the keratode skeleton of certain *Protozoa* (q. v.) or lowest animals. A S. is thus a colony of living animals. Such a colony communicates with the outer world by means of certain openings (capable of being closed at will), traceable in an ordinary S., and of which the larger are named *oscula* and the smaller *pores*. By the latter, currents of water are continually drawn into the S., while through the *oscula* currents are as continually discharged. These currents are kept up through the action of the minute vibratile processes named *cilia*, which are limited usually to certain spaces of the canals named *ciliated chambers*. The main use of this 'circulation in the S.' is evidently *nutritive*. Particles of food are thereby swept into the organism, whilst oxygen is also inhaled, and effete matters exhaled.

S.-reproduction is effected by means of specially developed masses of protoplasm named *spores*, which are formed in autumn, and which on liberation in spring are found to contain small reproductive particles, which after a free existence develop into S. *Sexual reproduction* is represented in S. by the union of certain cells representing *ova* or *eggs*, and other cells representing *spermatozoa*. After fecundation, a S.-egg undergoes the stages of segmentation common to the developing eggs of all animals, until the *morula* or *mulberry-stage* is reached. Thereafter the S.-egg becomes elongated and swims freely about in the water. An internal cavity is next formed, this cavity communicating by a mouth externally, and being bounded by two layers (*ectoderm* and *endoderm*). In this stage the young S. is a *gastrula*. Latterly, the outer cilia disappear, internal cilia are developed, and the S. ultimately fixes itself, and circulation is established. Sponges are classified either as the *Keratosa* (horny S.), *Silicea* (flinty S., *e.g.*, 'Venus' flower-basket,' or *Euplectella*) and *Calcarea* (*e.g.*, *Sycon*). A more philosophical arrangement divides the S.-class into families:—(1) *Fibrospongiæ* (fibrous S., including Silicea); (2) *Myxospongiæ* (*Halisarca*); *Calcispongiæ* (*e.g.*, Sycon and Calcareous S. generally). *Fossil sponges* are of frequent occurrence.

S. Trade.—The sponges of commerce come from the Eastern Mediterranean Sea and the West Indies. In the Archipelago, Crete, Cyprus, on the coasts of Asia Minor, Syria, Barbary, and the Bahama Islands, sponge fisheries constitute a very important industry. The finest sponges are obtained in Turkish waters. The fishing season commences in May, and closes in September or October. Diving is practised, and is carried on in a rude, primitive manner. The diver, who has no dress, seizes hold of a large stone to which a line is attached, and sinks by means of it to a depth varying from 30 to 180 feet. Keeping hold of the rope, he tears the sponge off the rocks within his reach, and places it in a net; when he has secured a netful he signals by means of the rope to be drawn up. A diver usually remains under water from 40 to 60 seconds. Formerly all the sponges gathered in the Archipelago were sent to Smyrna for transhipment to England and the Continent, but now many cases of sponge are shipped direct from the islands. The exports in 1876 from Rhodes and the Sporades amounted in value to £140,000, from the Cyclades £21,340, and from Smyrna £204,433. The fisheries of Cyprus in 1877 yielded 2500 okes (1 oke = 2·84 pounds avoir.), and the exports from Beyrout in the same year were valued at £8000. S. of a coarse texture and large honeycombing is found all along the coast of Tripoli and Tunis. The total exports from the regency of Tunis in 1875 were valued at £10,862, of which £1272 worth were unwashed. The value of sponges exported from Bengazi, Tripoli, amounted in 1876 to £55,000. The West Indian trade is annually increasing, and the fishing industry gives employment to 500

vessels and 2000 persons. The Bahamas and the coast of Florida are the fishing-grounds, and it is expected that Cuba will soon be added to them. The sponges are obtained by spearing with a pronged fork fixed to a long pole. 2899 cwts. of sponge, valued at £18,508, were exported to New York, Canada, and England from the Bahamas in 1877. The qualities most in demand were 'wool,' 'reef,' and 'velvet;' the other kinds go by the names of 'boat,' 'silk' or 'glove,' 'grass,' 'hardhead,' 'mixed,' 'yellow,' and 'refuse.' West Indian sponge is harsher, coarser, and less durable than its Mediterranean congener.

Sponge has many uses besides those of the household. It is indispensable to the surgeon; mattresses, &c., are stuffed with it; and it is also employed as a filter and as a polishing material for fine surfaces.

Spon'sors (Lat. 'promisers'). In the early Church, when the children of heathen parents were to be baptized, one or two persons were required to make a profession of the Christian faith on behalf of the children, and to become surety to the Church that they would be educated as Christians. Christian parents were properly the S. for their own children, but the practice was kept up of having other persons to act in this capacity. See GODFATHER.

Spontane'ity is the characteristic of an occasional act, immediately arising from the law of exercise for a mental or a bodily power. It has been simply defined as 'self-active causality.' In mind, the unexpected play of memory is said to be an instance of S., and the playfulness of a kitten is supposed to arise spontaneously from the vigour of its organism. Those, however, who believe in the mental S. defined above do not make sufficient allowance for the laws of association, and those who believe in physical S. do not, and indeed cannot yet, ascertain how much causality is to be attributed to obscure operations like reflex action and unconscious cerebration.

Sponta'neous Combus'tion, a very misleading term, differs from ordinary combustion in degree, not in kind. Combustion is the result of chemical combination of two or more substances, and is conditioned by the temperature, which varies for different combinations; and S. C. is simply combustion at ordinary temperatures. The same applies to the so-called S. C. of the human body, of over fifty recorded cases of which, according to Liebig, not one is well authenticated.

Spontoon' (Ital. *spuntone*, 'pointed'), an obsolete weapon resembling a partizan without its curved basal projections. It was carried till near the close of the 18th c. by English infantry officers who indicated commands, as 'advance,' 'retire,' 'halt,' by its motions.

Spool (Dutch, *spoel*, Ger. *spule*, 'a bobbin'), a hollow cylinder of wood or metal on which thread or yarn is wound.

Spoon (Old Eng. *spón*, a 'chip' or 'splinter' of wood), a familiar domestic implement used in carrying food to the mouth, and for other purposes. The earliest spoons were probably bivalve shells to which handles were attached for convenience. Many ancient Egyptian spoons of glass, wood, stone, and ivory preserve the primitive shell form. Horn was formerly a very common material for S.-making, and out of its use arose the proverb, 'To make a S. or spoil a horn,' signifying a determination to accomplish an object at any cost. German-silver spoons are now chiefly in use. They are stamped from sheet metal by means of 'punches' (having the outline of a S.) and 'bolsters' of steel worked by presses. In the subsequent operations the 'blank' is 'pippened,' filed, bowled, and set, and buffed or polished; better-class spoons are finished by electroplating, with silver or gold. Christening gifts in the Middle Ages took the form of *Apostle spoons*, so named because the stems bore figures of the Apostles.

Spoon'bill (*Platalea*), a genus of wading or *Grallatorial* birds, of which the *P. leucorodia*, or common white S., is the familiar species. This bird, which attains a length of about 30 inches, occurs but rarely in Britain, but is common on the European continent, and is also found in Asia and Africa. The bill is straight, flat, and very broad at its tip—hence the popular name. The colour is black, tinted with a rosy-pink, and the breast yellowish. The throat has a bare skin patch of yellow. The S. is common in Holland. They are members of the *Ardeidæ*, or Heron family, and feed on vegetable matters. The *P. ajaja* of S. America is another species, known from its plumage as the Roseate S.

Spor'ades. See ARCHIPELAGO, GREECE, and TURKEY.

Sporad'ic (Gr. 'scattered'), a term applied to solitary cases of disease, naturally epidemic or contagious, which are not prolific; thus single cases of such diseases as cholera, typhus fever, enteric fever, scarlatina, or measles, may occur without spreading in a district, and such cases are called S.

Spore in its widest sense is currently used to designate the reproductive bodies of Cryptogamia or acotyledonous plants. In by far the greater number of cases they are simple cells enclosed in a single or double cell-wall, and formed at particular places, very commonly in special receptacles to which the name *sporangia* is given. This is prominently the case in ferns where the sporangia are arranged in masses (called *sori*) at definite spots, usually on the under surface of the frond. The spores of ferns are asexual reproductive cells. So also are the spores of most other vascular cryptogams, and of fungi and Mosses (q. v.), also the 'tetraspores' of the red seaweeds. But the 'zygospores' and 'resting-spores' of other algæ are the result of a process of union, while the spores of the large brown or olive-coloured section are oospheres which require to be fertilised in order to enable them to germinate.

Spott'iswood, or **Spots'wood, John**, a Scottish ecclesiastic and author, belonged to an ancient family in the Merse. He was born in 1565 at Greenbank, near Midcalder, of which his father had been 'parson' since 1565, studied at the University of Glasgow, and succeeded his father at Calder at the age of eighteen. In 1601 he acted as chaplain to the Duke of Lennox's French embassy, and on the accession of James VI. to the English throne, he became a privy councillor and Archbishop of Glasgow. Twelve years afterwards he was made Scottish Primate in the see of St. Andrews. In 1618 he carried the famous 'Five Articles of Perth,' which committed Scotland to episcopacy. In 1633 he crowned Charles I. at Holyrood, and two years later he succeeded Lord Kinnoul as Chancellor of Scotland; but in 1639 the disturbed state of the country compelled his withdrawal to England, and he died at London, December 26, 1639. S. was the best scholar and historian of his day, but an arrogant, impolitic churchman, who lived to see the destruction of the ecclesiastical polity which he had so painfully built up. The only works of S. published in his lifetime is the *Refutatio Libelli de Regimine Ecclesiæ Scoticanæ* (Lond. 1620), a reply to the attacks of Calderwood. Four years after death appeared his valuable *History of the Church and State of Scotland, beginning the year of our Lord* 203, *and continued to the end of the Reign of James VI.* The S. Society republished the History in 1847–51 (3 vols.).

Spott'iswoode, William, LL.D., F.R.S., a living mathematician, was born at London, January 11, 1825. From Eton and Harrow he passed to Balliol College, Oxford, where he graduated in 1845, and subsequently gained two mathematical scholarships. On quitting Oxford he became manager of the business of the Queen's printer, devoting his leisure to the study of physical and mathematical science, to philosophy and Oriental languages. He is a member of many scientific societies, to whose transactions he has contributed papers of unquestioned ability. He was president of the British Association at the Dublin meeting of 1878, and succeeded Hooker as president of the Royal Society in November of the same year. He is author of *Elementary Theorems Relating to Determinants* (1851); *A Tarantasse Journey through Eastern Russia* (1857), and *Polarisation of Light* (1874, *Nature* series). See a Life of S. in the *University Magazine* (Dec. 1878).

Sprague, William Buell, D.D., was born at Andover, Connecticut, U.S., 16th October 1795, studied at Yale and Princeton, settled as pastor at W. Springfield in 1819, transferred to Albany, New York, in 1829, but in 1869 went to Flushing, Long Island, where he died 7th May 1876. S. wrote many evangelical sermons, &c. His chief work is *Annals of the American Pulpit* (1859–60).

Sprains are due to a violent stretching of tendinous or ligamentous parts, with or without rupture. S. of the back are very

common, and are caused by wrenches or contusions, producing violent fluxion of the whole column, the most common seat of the sprain being near the sacrum. There is stretching and probably more or less rupture of muscles, fasciæ, and ligaments on the posterior aspect of the spine. The symptoms are swelling, with subsequent inflammation, and great pain in moving, more especially in extending the spine. The treatment consists in subduing the inflammation by hot fomentations and leeches. Opiates should be given and perfect rest enjoined. When the acute symptoms disappear, the part may be fomented with poppy-heads, warm Goulard lotion, laudanum, or compresses of tincture of arnica may be applied. At a later stage friction and stimulating embrocations may be employed, and blistering or painting with iodine may relieve any remaining pain. S. of the joints of the lower extremity, especially of the ankle and knee, are very common, and when at the ankle it is sometimes difficult to decide whether there is fracture or not. Severe S. are generally followed by a good deal of effusion into the synovial cavity, and they often lay the foundation of permanent disease of the articulation. The treatment of all S. is conducted on the same principles.

Sprat, otherwise named the 'Garvie,' is the *Clupea sprattus* of naturalists—a Teleostean fish belonging to the section *Malacopteri*, and to the *Clupeidæ* or Herring family. This fish was formerly considered the young of the Herring (q. v.). A closer examination has served to show that it is specifically distinct. Thus the margin of the belly is distinctly serrated or notched, that of the herring smooth. The ventral fins of the S. are placed further forward than those of the herring, and commence at a point on the lower surface corresponding with the first ray of the dorsal fin on the back. There are also differences between the teeth of the S. and those of the herring. Sprats appear off the British coasts in immense shoals in winter and spring. They are captured in vast quantities, and form a cheap, nutritious, and palatable food. They are often used as manure in agricultural districts. An allied genus is the *C.* or *Harengulus latulus*, the 'Blanquette' of the French.

Spree, a river of N. Germany, rises at Ebersbach in the E. of Saxony, near the Bohemian border, flows N. into Prussia, expanding at times into marshy lakes, and passing Bautzen, Spremberg, Kottbus, Lübben, Beeskow, Fürstenwalde, Berlin, and Charlottenburg, and falls into the Havel at Spandau after a circuitous course of 221 miles. It is connected with the Oder by the Muilrose or Friedrich Wilhelm's Canal.

Spreng'er, Aloys, born at Nassereut, in Tirol, 3d September 1813; from 1832 studied medicine and Oriental languages at Vienna, and coming to London (1836), assisted the Earl of Munster in his *Military Science of the Mohammedan Nations.* In 1843 he sailed for India, and there promoted the establishment of Western culture as founder of a native press, as president of the College of Delhi (1845), as secretary to the Asiatic Society (1850), and in various other capacities. He returned to Europe (1857), and since 1858 has been honorary professor of Oriental Languages and Literature at Bonn. S. is author of an *Elementary Grammar of the English Language, explained in Urdu* (Delhi. 1845); *Das Leben und die Lehre des Mohammed* (3 vols. Berl. 1861–65), &c.

Spring is a mechanical contrivance which, by taking advantage of the elasticity of matter, stores up or transforms energy for a variety of useful ends. Thus the energy with which a railway carriage comes into collision with another is used up in compressing the S. of the buffer; the S. of a chair or sofa yields to the weight of the occupant, and in yielding calls into existence an equal and opposite force. Whenever work is spent in compressing, extending, or otherwise altering the form of a S., this energy can always be recovered (neglecting dissipation) by simply permitting the S. to regain its original form. The *S. balance* consists of a metallic helix, which, by the compression resulting from the weight of a body acting at its upper and free extremity, measures the weight of that body. It may be used for demonstrating the variation of gravity with latitude and height.

Spring-Beetles. See ELATER.

Spring-Bok (*Antidorcas* or *Gazella Euchore*), a species of antelopes, of a rich brown colour on the back and sides, and white on the belly. The horns are black, ringed, and lyre-shaped. A white stripe marks the back and rump, and the head has a prominent brown band on a white ground. The croup is provided with a covering of long hairs, which become very prominent in the course of the leaping movements of the S.-B., from which movements the popular name of the animal is derived. A full-grown S.-B. is a little larger than a roebuck. Immense hordes of spring-boks—numbering sometimes, it is said, 30,000—roam over the plains of S. Africa. The flesh is nutritious and palatable, and a strong, durable leather is manufactured from the hide.

Spring'er, a variety of dog allied to the spaniel. It has long ears, and is of a white colour with red spots. The nose and palate are black, and the head is small. The S. is chiefly valuable for raising game in close underwood.

Spring'field, the name of many towns in the United States. (1) The capital of Illinois, U.S., 180 miles S.W. of Chicago by rail. It has sixteen churches, seven newspapers, five ward-schools, and several higher educational institutions, including the State University. The State capitol, commenced in 1867, and estimated to cost $3,500,000, stands in the great central square. Abraham Lincoln was a lawyer in S. before his election to the Presidency, and a national monument has been erected to him in the Oak Ridge Cemetery at a cost of about $200,000. The manufactures of S. are inconsiderable, but it is the centre of a rich agricultural district. Pop. (1870) 17,364; estimated (1877) at 25,600.—**S.** (2) a city of Massachusetts, U.S., on the Connecticut River, 98 miles W. of Boston. It has a fine City Hall, twenty-seven churches, five newspapers, and twenty-nine schools. It is the seat of the United States armoury, established in 1794, and now employing about 350 men, though during the war 3000 men were employed, and 1000 rifles produced per day. The arsenal has accommodation for 300,000 stand of arms. There are also large private manufactories of arms, as well as of other hardware goods, and cotton and woollen fabrics, the falls of the Mill River providing good water-power. Five lines of railway centre in S., three meeting in one depôt. Pop. (1870) 26,703.—**S.** (3) a town of Ohio, U.S., on the Mad River, 80 miles N.E. of Cincinnati. It has twenty churches, seven newspapers, and seventy factories, employing about 4000 men. The principal branch of manufacture is agricultural machinery. S. is the seat of the Wittenberg Lutheran College, and several other educational institutions. Pop. (1870) 12,622.—**S.** (4) a city of Missouri, on the Union Pacific railway, 241 miles S.W. of St. Louis, is the business centre for the whole of S.W. Missouri and N. Arkansas. It has several mining industries, a college, conservatoire, schools, &c., and is said to be growing rapidly. Estimated pop. (1877) 9000.

Springs, which form the evident sources of most river systems, are a stage in the cycle of phenomena which restores to the ocean the water which has been drawn by evaporation from it. Any outflow of water from the earth is a spring, and its supply is regulated by the precipitation of moisture over the earth's surface. This moisture, precipitated as rain, snow, hail, mist, or dew, is partly re-evaporated but partly drained off directly to contiguous channels. A third part, however, descends into the earth's crust, saturating such rocks and soils as are porous and permeable to water, or collecting in fissures or cavities in or above impermeable rocks. If all strata were horizontal, then the possibility of water descending into the crust of the earth would depend upon the nature of the upmost layer, and in any case the descent would be checked if a hard solid formation like granite or a stratum of clayey consistency formed one of the series of underlying rocks, for through such water cannot penetrate except along joints or fissures. Strata, however, are usually more or less upturned, so that their edges crop up out of the soil. Consequently a layer of sandstone or limestone may become saturated, though it is intermediate to two impermeable strata. The water precipitated along the outcropping margin sinks into the permeable rock, and is retained there by the bounding impermeable surfaces until circumstances are favourable to its exit. For example, the water-filled stratum may crop out again along the face of a cliff, or may be thrown up to the surface by the occurrence of a fault, or the water may gradually collect in a cavity from which it ultimately issues along a fissure. S. frequently issue from caves, through the roofs and

walls of which water drips or oozes incessantly. Artesian Wells (q. v.) indicate another means by which water finds its exit from the earth, being forced up by hydrostatic pressure through a joint or opening in the overlying impervious layer.

The water as it percolates through the surface rocks must of necessity carry along with it various substances in solution. When such natural salts are present in considerable quantity, the S. become what are known as mineral S. acquiring the peculiar properties which give them their medicinal value. S. which issue from great depths are often charged with carbonic acid and sulphuretted hydrogen. For detailed description of such S. and where they occur, see MINERAL WATERS; and under GEYSERS the subject of hot S. is entered into more fully.

Spring'tails. See PODURA.

Sprit (Old Eng. *spreot*, *spryt*, 'sprout,' from *spreotan*, Ger. *spriessen*), a spar crossing a fore-and-aft sail diagonally from the mast to the upper aftmost corner.

Spruce, or **Abies**, is a genus of *Coniferæ*, best distinguished from its near allies, the pines, larches, and cedars, by the persistent leaves being single instead of in clusters or tufts. The most important S. is the Norway S. (*A. excelsa*), which furnishes excellent timber (commonly known as white deal), and produces the chief supply of Burgundy pitch. Its bark also is used for tanning. The Hemlock S. of Canada (*A. Canadensis*) is a very ornamental tree, and though the timber is inferior, is valuable on account of the tanning properties of the bark. The young shoots are used in making S. beer. The white S. and the black S. are two other American important members of this genus.

Spruce-Beer, a wholesome fermented liquor prepared by boiling lump sugar (for white beer) or treacle (for brown beer) in water along with essence of spruce, and fermenting the whole with yeast. The following is Dr. Wood's method of preparing it:—Take of essence of spruce ½ pint, pimento and ginger (bruised), 5 ounces each, hops 5 or 6 ounces, and water 3 gallons, boil ten minutes, then add of treacle 3 quarts and warm water 11 gallons, stirring the whole together; when the mixture has become lukewarm, add of yeast 1 pint, and allow fermentation to proceed for twenty-four hours before bottling the beer. *Medicinally*, S.-B. is diuretic and antiscorbutic.

Spru'ner, Karl von, a German historian and geographer, was born at Stuttgart, 1803, and educated at Munich for military service, early showing a taste for the studies to which he devoted his life. His chief works in cartography are a *Hist.-Geogr. Hand-Atlas*, with 122 maps (Gotha, 1837-52; 3d ed. 1865), *Hist. Atlas von Baiern* with 7 maps (*ib.* 1838), *Tabellen zur Geschichte der Deutschen Staaten* (*ib.* 1846-48), *Hist. Schul-Atlas von Deutschland* (2d ed. 1866), *Hist. Geogr. Schul-Atlas*, with 23 maps (*ib.* 8th ed. 1875), *Hist. Geogr. Hand-Atlas* (*ib.* 1856; new ed. 1877). His principal writings are *Leitfaden zur Geschichte von Baiern* (2d ed. Bamb. 1853), *Pfalzgraf Rupert der Cavalier* (Mun. 1854), and *Die Wandbilder des Baiern Nationalsmuseums*, accompanying Jos. Albert's photographs (Mun. 1868). Having risen through various grades, he was made adjutant-general by Ludwig II. in 1864. Apart from their minuteness and accuracy, S.'s works are valuable as illustrations of the interdependence of his two subjects. See Justus Perthes' *Verlags-Katalog* (Gotha, 1878).

Spuil'zie is the name given in Scotch law to the violent removal of the goods of another without legal warrant or authority. The person thus acting may be sued not only for the recovery of the goods, but for all the profits that might have accrued to him from their use.

Spur (Old Eng. *spura*, Ger. *sporn*, Gael. *spor*), a metal instrument composed of a *shank*, *neck*, and *prick* or *rowel*, fastened to the heel of a horseman to goad his horse to greater speed. Its use cannot with certainty be traced further back than Roman times. Early spurs had no neck, a prick being rivetted to the shank. Prick-spurs had straight necks in the 11th c. and bent ones in the 12th c. Rowels first appeared early in the 14th c. The neck was then short and inclined downwards, but in the succeeding c. it was made straight and very long, while the rowels bore from 12 to 18 points. The S. afterwards was shortened, and the fashion in rowels of different forms changed very much. The spurs of mediæval knights were gilt and those of esquires silvered. 'To win his spurs' meant to gain knighthood.

Spurge (Fr. *espurge*, Lat. *expurgare*, 'from the medicinal effects'), a vast genus (upwards of 700 species) of herbs, shrubs, or soft-wooded trees with fleshy branches, abounding in milky juice. An extensive group, abounding in S. Africa, have succulent, spiny, or unarmed, often melon-shaped or cactus-like stems. The flower-heads resemble single flowers, consisting of a calyx-like cap-shaped involucre, with 4-5 teeth, alternating with as many large horizontal glands, which enclose 10-15 male and 1 central female flower; the capsule separating when ripe into its three 2-valved constituent carpels. For ordinal characters see EUPHORBIACEÆ. The genus is represented in all climates excepting the Arctic. Eleven non-important species are natives of Britain, and three others are more or less naturalised. Of the latter the caper S. (*E. Lathyris*) has seeds containing a powerfully purgative oil. The most noteworthy medicinal species are *E. resinifera*, furnishing the intensely acrid gum-resin known in commerce as euphorbium, used principally as a vesicant in veterinary practice; *E. ipecacuanha* of N. America—called wild ipecac—the root-bark of which possesses emetic, expectorant, and cathartic properties; *E. corollata*, of which the root is officinal in the United States pharmacopœia as an emetic; and *E. nerii-folia* of India, yielding a juice employed externally in native medicine, while the root is used as a remedy in snake-bites. Various species with brilliant scarlet bracts are grown for ornament.

Spurge Laurel. See DAPHNE.

Spur'geon, Charles Haddon, the son of an Independent minister, was born at Kelvedon, Essex, June 19, 1834, and soon 'by his pious precocity attracted the attention of all around him.' After four years' schooling at Colchester, he became an usher at Newmarket (1849) and at Cambridge (1850), where, having joined the Baptists, he began to preach, a lad in his seventeenth year. Receiving an invitation to the Baptist chapel of New Park Street, Southwark (1853), 'he came, he preached, he conquered,' and in the following spring entered upon its pastorate. In two years' time his fame had outgrown his church, and he had to hold services in the Surrey Music Hall till the opening of the Metropolitan Tabernacle (1861) gave him a building holding 6000 persons. Here he has since continued to labour, with the exception of short excursions at home and on the Continent. Opinions differ as to his preaching powers, but measured by the standard of success they should be great, the Tabernacle membership having steadily increased from 1178 (1861) to 5152 (1877), whilst at the Crystal Palace and Agricultural Hall he has attracted congregations of 20,000 and 12,000 persons. Up to 1877 his Pastors' College (opened 1855; rebuilt 1874) had trained 388 pastors, and the Stockwell Orphanage (opened 1869) had received 428 orphans. His works, moreover, have had an enormous sale—the *Sermons* (1855 *et seq.*), the monthly *Sword and Trowel* (1865 *et seq.*), in which *John Ploughman's Talk* (260,000th, 1877) first appeared, the *Lectures to My Students*, &c. See Stevenson's *S., His Life and Work* (Lond. 1877).

Spurn Head, the extreme point of a peninsula in the S.E. of Yorkshire, at the mouth of the Humber, 15 miles S. of Withernsea. It is connected with the mainland by a causeway of pebbles and sand 2½ miles long, and on it are two lighthouses, one 90 feet high, built by Smeaton in 1776.

Spur'rey (*Spergula*—from Lat. *spergo*, alluding to the *scattering* tendency of the seeds), a genus of *Caryophyllaceæ* of two or three species of annual herbs with forked branches, occurring as weeds on cultivated ground in most temperate countries. *S. arvensis*, with awl-shaped leaves arranged (apparently) in whorls, and white flowers in stalked panicled cymes, is the one frequent in Britain. A tall variety of it with large seeds (*S. maxima* of Weihe) is recommended as a commencing crop for poor sandy soil intended to be used ultimately for sowing barley and rye. It serves both for green fodder and for mixing with grass hay. The seeds yield a bland oil.

Spurz'heim, Johann Kaspar, M.D., the phrenologist, was born at Longwich, near Treves, Rhenish Prussia, December 31, 1776. At Vienna, where he went to study medicine in 1799, he attended the lectures of Dr. Gall, whom he accompanied in 1805 on a lecturing tour through Germany, France, Prussia, and Denmark. In 1807 they settled at Paris, and worked together

at their common subject. In 1813 S. separated from Gall, and removed to England, where he made the system very popular. In 1832 he went to the United States, but had hardly begun his lecturing when he died at Boston, on November 10th of the same year. S. wrote numerous works bearing upon phrenology, both in English and French, and a few more general works, including *Elementary Principles of Education* (1821), and *Sketch of the Natural Laws of Man* (1828). The system he advocated is discussed under PHRENOLOGY.

Spy (French, *espion*), in war, a person employed to obtain by surreptitious means information regarding the enemy, and sent into the hostile camp or territory under a disguise and on false pretences. Spies may be broadly divided into two classes, viz., local spies, such as men accidentally employed, and the regular paid spies attached to the intelligence department of an army. The latter are most useful auxiliaries, as by a proper use of their services the most secret designs of the enemy may be discovered. They are liberally paid on account of the danger of their office, as all proved spies captured by an army are summarily put to death. Though this stern martial law prevails, no stigma attaches to the general who employs spies, these being considered essential to the pursuit of war.

Squad'ron (Lat. *quadra*, 'a square,' Ital. *squadra*, Fr. *escadron*), the unit in cavalry tactics, consists of two troops of horse, ranging in strength from 120 to 200. In the navy a S. is a section of a fleet, under the command of a flag-officer.

Squa'lus. See SHARK.

Squamipen'nes. See CHÆTODON.

Square, in geometry, is a quadrilateral whose sides are equal and whose angles are right angles. Its area is found by multiplying the number expressing the length of the side by itself, and hence a number so treated is said to be *squared*. Conversely, to extract the *S. root* of a given number is to find that number which when multiplied by itself will give the original number. See EVOLUTION AND INVOLUTION.

Square, in military evolutions, is the quadrilateral formation of troops for the resistance of cavalry attack. The Greek *syntagma* was a solid S. of sixteen men on each side. In modern warfare the S. is formed five deep; the outer rank kneels, the two next stoop, and in the centre are the officers on horse, the colours, &c. The S. could maintain a heavy rolling fire, but one of the results of the late Franco-German War has been its abandonment on account of the subordination of cavalry to field artillery of greatly increased precision and range.

Squash. See GOURD.

Squatt'ers, a name which is probably of American origin, as appears from Washington Irving's *History of New York*, but now applied almost exclusively to the holders on lease from the Government of large sheep and cattle 'runs' in Australia and New Zealand. The S. are in most colonies being driven further and further inland as their runs near the coast are being thrown open to 'free selection,' *i.e.*, permanent appropriation in small quantities under certain conditions of purchase.

Squid, a general name given to species of cuttlefishes or *Cephalopoda*, belonging to the family *Tenthidæ*.

Squier, Ephraim George, American geographer and archæologist, was born at Bethlehem, New York, 17th June 1821. He began life as a schoolmaster, and was subsequently editor of several country newspapers. His first work was an account of an examination of the aboriginal monuments in the valley of the Mississippi, which was published in 1848 as the first of the *Smithsonian Contributions to Knowledge*. In the next year he published his *Aboriginal Monuments of the State of New York*. Being appointed United States Chargé-d'Affaires to the Republics of Central America, he interested himself greatly in a proposed inter-oceanic railway, which was not, however, carried out, though it was surveyed, and a *Report* published in London (1859). In 1863 he was appointed United States Commissioner to Peru, where he remained two years, but, owing to a protracted illness on his return to New York, his book called *Peru: Incidents of Travel and Exploration in the Land of the Incas*, did not appear until 1876. His other principal works are *Notes on Central America* (1854); *Waikna, or Adventures on the Mosquito Shore* (1855); *The States of Central America* (1857); *Monograph of Authors who have written on the Aboriginal Languages of Central America* (1861); and *Honduras: Descriptive, Historical, and Statistical* (1870). In 1851 S. received the gold medal of the French Geographical Society.

Squill (*Scilla*) is a genus of *Liliaceæ* numbering about 72 known species of bulbous plants with radical linear leaves; usually blue flowers (rarely purple or white), in racemes on leafless scapes; perianth segments six, free or nearly so; capsule three-angled, loculicidally three-valved, seeds small, swollen. The genus is confined to the Old World. Three are British. *S. autumnalis*, in which the leaves are autumnal, succeeding the flowers, is confined to a few counties in S. England; whilst *S. verna*, with leaves appearing in spring in anticipation of the light-blue fragrant flowers, is met with in localities near the coast between Cornwall and Shetland. The third is the familiar wild hyacinth often called 'bluebell' in England, the 'English Iacint' of old writers, the *Hyacinthus non-scriptus* of Linnæus, now named *S. nutans*. It is common from Ross southwards, often occurring in such profusion as to render large tracts of woodland a sheet of blue from April to June.

Scilla Siberica.

The medicinal S. belongs to an allied genus of the tribe *Scilleæ*, named *Urginea*, comprising 24 species spread through the whole of Africa, and reaching Hindostan and S. Europe. It is the species known as *U. scilla* or *maritima* (formerly *S. maritima*), a native of the coast district from Syria to the Canaries, appearing also in the Cape flora. From a bulb of four to six inches in diameter leaves are produced in spring, followed in autumn by a raceme of whitish flowers borne by a round scape of one to three feet high. For the preparation of the drug the bulbs are dug up, divided into four parts, the centre portion and outer scales removed, and the remainder cut into slices and gently dried. In this state it reaches the druggist's shop. *Medicinally*, S. is used as a diuretic in certain forms of dropsy, and as an expectorant. In large doses it causes vomiting, and in extreme quantity acts as a narcotico-acrid poison.

Squill'a, a genus of *Crustaceans* of the order *Stomapoda*, in which from 6 to 8 pairs of legs are developed, while the gills are borne, not in a spinal cavity, as in the pure shrimps and lobsters, but beneath the chest or abdomen. The shell is thin, and often membranous. The genus S. includes the species familiarly named Locust Shrimps (*S. mantis*).

Squint, or **Strabis'mus**, is a well-known deformity, usually commencing in early childhood, between two and six years of age, and depending on a want of parallelism in the visual axes, when the patient endeavours to direct both eyes to an object at the same time. In looking at a near object, the eyes start from the position of acquired convergence, which become greater than is necessary, and they are both directed to a point nearer than the object, so that double vision is produced. 'In order to see clearly and avoid the double images, the child renders one eye more divergent, so that it may be directed to the object, and as the two axes have become combined in a relation of convergence instead of in their original relation of parallelism, it follows that, when one of them turns outward to fix the object, the other turns inward in a greater degree than before.' The result is that the S. becomes fixed, and the vision of the squinting eye undergoes steadily progressive deterioration.

When the sight of both eyes is good, and when the S. does not depend upon paralysis, it is always curable, but it may be necessary to operate twice or even thrice. The operation consists in separating the tendon of the internal rectus muscle from the sclerotic, so that the muscle may form a new attachment posterior to its original one, and may produce by the same effort

of contraction a smaller degree of convergence than previously. The causes of S. are various. Intestinal irritation, such as from worms; cerebral irritation, as from teething, and hydrocephalus, frequently produce S. among children, but in the great majority of instances of confirmed S. the optic nerves themselves are ill-developed, being usually smaller than natural, of a more or less oval form, and of a dusky colour. See Holmes's *System of Surgery*.

Squints, an oblique opening through the wall of a church, so placed as to allow a view of the high altar from the transept or aisles. The term 'Hagioscope' is sometimes used.

Squire, a corruption of the word *Esquire* (q. v.), is applied in England to a country gentleman, being nearly equivalent to the Scotch 'laird;' while in the United States it denotes persons of very different ranks, and is often used as a mere slang nickname.

Squirr'el (*Sciurus*; Gr. *skia*, 'a shade,' and *oura*, 'a tail,' because the animal has part of its body covered by its upturned tail), a genus of *Rodent* quadrupeds belonging to the *Sciuridæ* family, in which the incisors are prominent and orange-coloured. The molars—ten in the upper jaw and eight below—are complicated in structure. The fore feet have rudimentary thumbs. No cheek-pouches are developed in the true S., of which the *S. Europæus* is the most familiar species. It is distinguished by a small head, prominent jaws and ears, and by a large bushy tail. A sitting posture is the normal attitude of the S., which grasps its food, consisting chiefly of nuts, with the fore paws. The fur becomes somewhat greyish during winter. The S. makes a nest of wood, leaves, moss, and other materials, and securely fixes it to the foot of a bough. The young number three or four, are born in June, and remain in the parent nest till the succeeding spring. To the genus *Sciurus* belong many of the N. American species, where the most typical squirrels are found. The black S. (*S. niger*) is a typical New World species, as also is the red S. (*S. Hudsonius*). The grey S. (*S. cinereus*) and long-eared S. (*S. macrotis*) are also famous N. American species, whose fur is in request as an article of commercial value. In the Southern States of America the *S. vulpinus*, or fox-S., which derives its popular name from its vulpine appearance, attains a length of 14 inches. Squirrels often prove singularly destructive in America; thus the *S. migratorius* has frequently caused immense damage to crops in Pennsylvania. In 1749 no less than 640,000 of these animals were killed, and a royalty of 3d. per head was paid for their destruction. The genus *Tamias* includes the ground or earth S., in which *cheek-pouches*, serving for the temporary stowage of food, are developed. *T. Lysteri*, the hackee or chipping S., is a familiar species. It attains a length of 11 inches, and has a brownish-grey fur. The flying S. (q. v.) belongs to the genus *Pteromys*.

Squirr'el-Monk'ey (*Callithrix*), a genus of *Platyrhine* or Old World monkeys, found in Brazil, and closely resembling squirrels in appearance. *C. cinereus* is a familiar species, also named the Saimiri another example is the *C. torquatus*, or Collared Callithrix. These monkeys are inoffensive and intelligent, and may become very tame.

Squitch. See COUCH GRASS.

Sráddha or **Shradh**. The funeral ceremonies in the Hindu ritual, which are of great importance both religious and legal, as it is through their performance that the soul of the departed obtains rest and the succession of property is transmitted to the heir. The S. proper, which is in fact a worship of departed ancestors, commences on the 11th day after death, the interval having been occupied with minor ceremonies personal to the deceased. Its essential feature consists in offering *pindas* or balls of rice to the spirits of all those who are recognised as agnates. It is accompanied by much feasting and costly gifts to the Brahmans invited to assist at the celebration, and is sometimes repeated at stated periods. Wealthy families pride themselves on spending many thousand pounds on this account.

Sru'ti or **Shru'ti** ('that which is directly heard or revealed'), the Sanskrit term for Revelation, applied to the three portions of the Veda (q. v.) which are believed to have no human author. It is opposed to Smriti (q. v.).

Sta'bat Ma'ter, a Latin hymn, in Leonine verse, on the sorrows of the Blessed Virgin, composed by the Italian Franciscan, Giacomo Bendetti, or 'Jacopone' as he was nicknamed, who died 25th Dec. 1306. It has been set to music by Palestrina, Pergolesi, and Rossini. The most popular setting and that most frequently performed is that of Rossini, which is distinguished by great brilliancy and richness of melody. The hymn has been translated into English by Bishop Mant (*By the Cross sad vigil keeping*, &c.) and the Rev. E. Caswell (*At the Cross her station keeping*, &c.), and is sung in the Catholic Church on the Feast of the Seven Dolours, in Holy Week, and during the Devotions for the Way of the Cross. See Lisco, *S. M.; Hymnus auf die Schmerzen der Maria* (Berl. 1843); and A. Schwartz, *How the S. M. was written* (Macmillan's Magazine, Aug. 1873).

Stabil'ity. See EQUILIBRIUM.

Stabular'ii. See NAUTÆ, CAUPONES, STABULARII.

Stacca'to (Ital.), a term denoting that certain musical notes are to be produced in a clear crisp manner. Dots are placed above the notes, or dashes when the S. is intended to be more marked. They have the effect of shortening the notes, and of supplying rests for the remainder of their natural length.

Stach'ys (Gr. 'a spike,' in allusion to the inflorescence), a genus of herbs or, rarely, shrubs of the natural order *Labiatæ*, with crenate or serrate leaves; whorled flowers; sub-campanulate; five-toothed calyx; four stamens; connivent, glabrous anthers; obtuse nutlets. There are about 160 known species, dispersed chiefly through warm, N., temperate, and Oriental regions. Of the five British species, *S. betonica*, or Betony, a frequent plant of thickets and overgrown hedgebanks, was formerly much used in medicine: the roots are nauseous and very bitter. Several species, which are ornamental from being clothed with shaggy white silky hairs, are grown in gardens, such as *S. germanica* (a very rare English species), *S. lanata* of S. Europe, and others. *S. coccinea*, from Peru and Chili, with large dark-scarlet flowers, is much cultivated as a greenhouse plant.

Sta'de (Low Ger. the 'place' or 'station;' comp. Old Eng. *Stede*), a town of Prussia, province of Hanover, on the Schwinge, 2½ miles from its confluence with the Elbe, and 22 W. by N. of Hamburg. It has considerable trade, manufactures tobacco, woollens, cottons, lace, and pianofortes, and carries on brewing, shipbuilding, and fishing. It has a winter harbour for Elbe vessels. The oppressive *Stader Elbzoll* ('S. Dues'), for centuries levied at Brunshausen on all goods passing up the Elbe, was in 1861 commuted for the sum of £465,000, paid by all the maritime states concerned, Great Britain contributing one-third. Pop. (1875) 8761.

Stad'holder (Dut. *stadhouder*), the name given in the United Provinces of Holland to the governor of a province, who was commander-in-chief of its military forces, and, except in the case of Flanders, supreme judge of its civil and military tribunals. At the beginning of the great struggle of the Dutch with Philip II. of Spain, William of Orange reassumed (1572) the title of S. of Holland and Zealand (to which he had been appointed in 1559), meaning thereby that the revolt of the Dutch was to combat the authority of Alva, not that of the King. This stadholdership, equivalent to the chief military and civil command of the Netherlands, passed in 1587 to Moritz, son of William, and S. was the hereditary title of the head of the state till the annexation of Holland to the French empire in 1802.

Sta'dium, in the Grecian games, the 'course' devoted to foot, as the Hippodrome (q. v.) to horse and chariot races, the two being similar in construction. The most famous S., that of Olympia, was 600 Greek feet in length, and was taken as the standard of the S. or measure of length, equalling 625 Roman and 606¾ English feet.

• **Staël-Holstein, Anne-Louise-Germaine, Baronne de**, was born at Paris, 22d April 1766. The only daughter of Necker (q. v.), Louis XVI.'s Minister of Finance, she grew up under the combined influence of a Calvinist mother and her father's philosophic friends. Montesquieu was her favourite author, and in her sixteenth year she annotated his *Esprit des Lois*; till, over-study injuring her health, she was sent to the country, and there read Richardson's and Rousseau's works. In 1786 the Baron de Staël-Holstein, Swedish Ambassador at

Paris, her co-religionist but senior, became her husband, and in the same year she published anonymously a three-act play, *Sophie ou les Sentiments Secrets.* Her first acknowledged work, *Lettres sur les Écrits et le Caractère de Rousseau* (1788), is full of that worship of Jean Jacques which, only tempered by admiration of the English constitution, led her to welcome the Revolution. But her sympathies stopped at the point where reform gave place to licence; and having vainly suggested a plan for the royal family to escape, she had herself to fly to England (1792), where she composed *Réflexions sur le Procès de la Reine, par une Femme* (1793), and the powerful *Reflexions sur la Paix, addressées à M. Pitt et aux Français* (1795). Sweden's acknowledgment of the French Republic allowed the Baron and his wife to return to Paris, but in 1796 she separated from her husband, only to join him shortly before his death (1802). Meantime she published *De la Littérature considérée dans ses Rapports avec l'État Moral et Politique des Nations* (1796), and as leader of the 'Cercle Constitutionnel' brought about Talleyrand's recall, formed Constant's views, and scenting the designs of Bonaparte, opposed the policy of the 18th Brumaire. 'I leave the whole world open to Mdme. de Staël, Paris only I keep to myself,' said Bonaparte, making good his word by banishing her and her friends, the Comte de Montmorency, August von Schlegel (q. v.), and Mdme. Récamier. Yet were these years of enforced wandering the period of her finest work, the novels *Delphine* (1802) and *Corinne ou l'Italie* (1807), and *De l'Allemagne* (1810), which, shedding on France the brilliance of Weimar's luminaries, originated French Romanticism (q. v.). In 1812 she privately married an officer of hussars, M. de Rocca, and the same year had to fly to Vienna, Moscow, St. Petersburg, and Stockholm. At length the fall of the Empire let her return to her loved capital, and having spent the last two years of her troubled life in the society of her old Doctrinaire and Constitutional friends, Constant, Guizot, Broglie, &c., she died at Paris, 14th July 1817. Her *Œuvres Complètes* (17 vols. 1820–21; new ed. 1830), and *Œuvres Inédites* (3 vols. 1836), contain, besides the already mentioned works, *De l'Influence des Passions sur le Bonheur des Individus et des Nations* (1796), *Réflexions sur le Suicide* (1812), and the posthumous *Dix Années d'Exil* and *Considérations sur les Principaux Événements de la Révolution Française.* See Maria Norris, *Life and Times of Mdme. de Staël* (Lond. 1853), and Mdlle. de Launay, *Mémoires de Mdme. de Staal* (Eng. trans. S. Bathurst, Lond. 1877).

Staff, in music, five parallel lines upon which and within the spaces they enclose the notes of a composition are printed. Guido d'Arezzo was the inventor of the first musical S., about A.D. 1022.

Staff, in the army, a body of officers not attached to particular regiments who are responsible for the general organisation and the harmonious co-operation of the various branches of the army. S.-officers act as assistants to the general in command in all questions relating to the procuring of military information, strategy, tactics, &c., and their duties require more than ordinary skill and ability. In time of war these include the drawing up of orders regarding the cantonment of troops, outposts, marches, and battles; the communication of the wishes of the commander-in-chief to the army, and the practical development of his plans; the collection and preparing of all necessary documents and maps, the sifting of information brought in by reconnoitering parties, spies, &c.; and the supervision of the condition and comfort of the troops. The S. superintends reconnaissances and guides the columns to their destined positions on a new movement being made.

The S. of the British Army includes (*a*) the general officers commanding divisions, district brigades, &c.; (*b*) the general S., which includes the officers of the Quartermaster-General's and the Adjutant-General's departments; (*c*) the personal S., consisting of officers attached to commanding general officers as military secretaries and aides-de-camp; and (*d*) the officers employed in connection with the civil departments at the War Office, and those engaged in recruiting and garrison work. Officers of the general S., unless of proved ability in the field, must pass through the S. College (q. v.). Those of the personal S. are appointed, after passing a qualifying examination, on the recommendation of the general to whom they are to be attached, and they hold their appointments during his pleasure. The Chief of the S. in time of war is an officer ranking next to the general in command of the army, and an immense amount of detail work falls to his share. A regimental S.—the adjutant, quartermaster, paymaster, &c.—is attached to each regiment.

The first permanent military staff (*etat majeur*) was made in France in 1783, and a similar establishment in England about 1800. The Great General Staff in Germany collects information relating to military affairs about every part of the world, different countries being assigned to different sections. The Intelligence Department of the War Office in England is a similar but much smaller organisation.

Staff'a (from the Teut. root *stauf* or *staef* (Eng. *staff*), a 'pole' or 'stake,' used in Germany of a perpendicular rock: S. is thus 'the isle of the pillared rocks'), a celebrated basaltic island off the W. coast of Scotland, lies 5½ miles N. of Iona, and nearly 7 miles W. of the nearest point of Mull. It is reached by steamer from Oban. The island is 1½ miles in circumference, about 144 feet above the sea at its highest point, and is uninhabited. It is visited solely on account of its caves, the largest of which, Fingal's Cave, is 240 feet long and 66 feet high. Its roof is partly formed of pillared basalt and partly of amorphous trap, the sides are straight vertical prisms of basalt, washed at their base by a deep and often tumultuous sea. From the roof many stalactites depend.

Staff Coll'ege, a military institution near Sandhurst, founded in 1858, for the instruction of officers desirous of being placed on the staff of the army. It is open to officers of all branches of the service who have served five years, but the number is limited to forty students, selected by competitive examinations held annually in London about the month of June; and only one officer at a time from one battalion of infantry or regiment of cavalry, and only ten officers from the two royal corps of artillery and engineers, can belong to the college. The course lasts two years (four terms), and the expenses, with the exception of mess subscriptions, are borne by the State. A candidate for admission must produce a certificate from his commanding officer that he is a good regimental officer, and a report from the three senior officers of his regiment, a medical certificate of health, and a certificate that he has passed his troop or company examination.

Staff Corps, a corps which served on staff duties in the Peninsular campaigns of Wellington. There is no corps of this name now in the home army. In India the S. C., raised after the Mutiny of 1857–58, is divided into three branches, one of which is attached to each Presidency.

Staff'ord, the county town of Staffordshire, on the left bank of the Sow, 26 miles N.W. of Birmingham. Its two parish churches—St. Mary's, a fine cruciform building in Early English style, and St. Chad, a smaller edifice of the Norman period—have been recently restored, the former in 1847, the latter in 1875. A new church, St. Thomas, was erected and endowed in 1866 at the cost of Mr. J. Tyler, and a Roman Catholic chapel was also erected in 1862. In 1875 the foundation-stones of a new borough hall and law court were laid, and in 1874 a public library, called after its founder the William Salt Library, was opened. It has also a county jail and two county lunatic asylums. A bust of Izaak Walton was placed in 1878 in St. Mary's, where he had been baptized in 1593. S. possesses a grammar-school founded by Edward VI. in 1556. It is a great railway centre. The chief industries are tanning, engineering, and the manufacture of shoes. S. has one weekly newspaper, and returns two members to Parliament. Pop. (1871) 15,946.

Staff'ordshire, one of the midland counties of England, is bounded on the N.W. and N. by Chester, on the E. by Derby and Leicester, on the S. by Warwick and Worcester, and on the W. by Salop. Area, 732,434 statute acres; pop. (1871) 858,326. Geologically, the central portion of the county consists of red marl (in which occur valuable brine springs), the Bunter conglomerate, and Keuper and other sandstones. In the S. of the county is the great South S. coalfield, in which is included the famous ten-yard coal. The smaller coalfield in the N. of the county is celebrated for its bands of ironstone and fireclays. In both cases this mineral wealth has led to the establishment of many works for the production of crude and finished iron, and in the northern extremity to the establishment of the earthenware

trade in the district known as the S. Potteries. The mountain limestone in the N. and the Silurian limestone in the S. of the county are employed to a large extent as fluxes in the manufacture of pig-iron. The millstone grit which overlies the mountain limestone in North S. is quarried for building purposes as well as for millstones. Lying between the coalfields of North and South S. is the Cannock Chase coalfield, the opening up of which is an event of recent date. Lead and copper mining are almost extinct industries in S. The county slopes gradually from the N.W., the principal river being the Trent, which rises on the northern border, and flows S.E. to Burton, 2 or 3 miles below which it enters Derbyshire, having received numerous affluents. A perfect network of railways and canals covers the county, the most important of which respectively are the London and North-Western Railway, the North S. Railway, the Midland Railway, and the Trent and Mersey Canal. In 1875, in the North S. district, 12,595 persons were employed in the coal mines; in the same year, 1,654,474 tons of iron were produced over the whole county. In 1877 the 23 furnaces in blast of North S. produced 255,383 tons of pig-iron; the 57 of South S., 428,276 tons. For parliamentary purposes S. is divided into three districts —N., W., and E. Staffordshire—each of which returns two members. The chief towns are Stafford (q. v.), Lichfield (q. v.), Wolverhampton (q. v.), Walsall (q. v.), Burton (q. v.), and Hanley (q. v.), the capital of the 'Potteries,' a hilly and picturesque corner in the N.W. of the county, 10 or 12 miles long. Three Roman roads traverse the county, which was the scene of not a few struggles between the English and Danes, between the Red and White Roses, and again between Cavaliers and Roundheads, but it contains no antiquarian remains of any great interest.

Stag or **Red Deer** (*Cervus elephas*), a typical species of *Cervidæ* or Deer (q. v.), occurring in the N. of Europe and Asia. It was once found throughout the whole of Britain, but is now confined to the Scottish Highlands. The horns or antlers are round, and have a basal *snag* in front. The females are hornless, and are named *hinds*. The horns of the first year are mere bony projections; they advance in development during the second year, when the stag is named a *brocket*. In each succeeding year the horns grow more and more branched, the stag being named a *hart* in its sixth year, when the horns may be said to reach their maximum size. As in all deer, the horns are shed annually. The average height of a full-grown stag is about 4 feet at the shoulder; the winter coat is greyish-brown; in summer, brown is the prevailing tint. The food of the S. consists of grasses and the young shoots of trees, lichens forming the greater part of its food in winter. The S. is a powerful runner and swimmer. Driven to bay, it becomes a formidable adversary to the largest and most powerful staghound, or even to man himself. The pairing season occurs in August, and the males then engage in combats for the females, and become peculiarly fierce. The flesh is somewhat coarse.

Stag'-Beetle (*Lucanus cervus*), a species of beetle belonging to the *Lamellicorn* (q. v.) group, and so named from the *mandibles* or jaws of the male, which project on either side like the horns of the stag. The common S.-B. attains a length of about 2 inches. It is found in summer in the neighbourhood of oak woods, its larvæ being very destructive to the foliage of the oak and willow. The S.-B. was probably the *Cossus* of the Romans, who regarded it as a delicacy; the modern genus *Cossus* including the *Oak-moth* (*C. ligniperda*). *L. dama* is another species. The larva of *L. cervus* is said by Rosel to exist in that stage of existence for six years.

Stage. See Theatre.

Stage-Coach', a vehicle for carrying passengers on regular routes, the journey being accomplished by *stages*. Such vehicles were formerly universal in Great Britain, but the railway system has led to their almost entire discontinuance, except in localities to which the railway has not reached. The first 'stages,' so called, were waggons which carried goods and passengers towards the close of the 16th c. In 1610, Anderson, a native of Stralsund in Pomerania, secured the royal privilege of running stage-coaches and waggons between Edinburgh and Leith. About 1640, stage-coaches plied between the metropolis and the principal towns in the kingdom. The speed was slow on account of bad roads and the cumbrous nature of the vehicles. Eight days in summer and ten in winter were occupied in traversing the road between London and Exeter, and even so late as 1754 it was considered quick travelling to reach Manchester from London (187 miles) in four and a half days, and Edinburgh in ten days in summer and twelve in winter. The Edinburgh and London S.-C. of 1754 was the first to be mounted on steel-springs. Seats were added on the roof for outside passengers about 1779. After 1784, stage-coaches of improved construction were gradually introduced, and roadways were kept in better repair, so that a speed of 8 miles an hour was not uncommon. In France and Spain the S.-C. is known as the Diligence (q. v.); and in Germany as the *Postwagen* or *Postkutsche*. The Russian *tarantass* serves the purpose of a S.-C., but is a very different kind of vehicle.

Stagg'ers, a disease of horses, often ending in convulsions and stupor or coma. 'Mad S.' is essentially a brain-disease, and is almost invariably fatal. A commoner form is known as 'Stomach S.' or 'Grass S.' It is caused by acute indigestion, the result of the stomach having been overloaded with wet grass and like food. S. occur most frequently in autumn, and is marked by distention of the abdomen and by the characteristic gait. The staggering is often relieved by taking blood from the palate; but the constitutional treatment consists of purgation, injections, and warm applications to the belly.

S. in sheep is caused by the presence in the brain of the *Cœnurus cerebralis*, the *scolex* or immature form of a tape-worm (*Tænia serrata*), which in its mature state inhabits the digestive system of the dog.

Stag'hound. See Deerhound.

Stahl, Friedrich Julius, an eminent German jurist, was born of Jewish parents at Münich, January 16, 1802, at the age of seventeen passed over to Christianity, became professor at Würzburg (1832), Erlangen (1835), Berlin (1840), and sought to combat 'radical' liberalism, basing both jurisprudence and civil polity on Scripture. A member of the First Prussian Chamber from 1849, he was one of the ablest leaders of the reactionary party in Prussia, and opposed with eloquence and vigour the broadening of the Prussian constitution. He died at Bruckenau, August 10, 1861. S.'s great work is *Philosophie des Rechts nach Geshichtl. Ansicht* (4th ed. 1870), but he was an incessant and brilliant polemic, and wrote numerous pamphlets and treatises.—**Georg Ernst S.**, an eminent chemist and physician of the 17th c., was born at Anspach, 21st October 1660. He was educated at Jena, and filled in succession the offices of court physician to the Duke of Weimar, professor of medicine at the University of Halle, and physician in ordinary to the King of Prussia. He died at Berlin, 4th May 1734. S. was the first expounder of the doctrine of *phlogiston*, a theory of combustion, which, though erroneous, yet helped at the time to give coherence to chemistry. He also held the theory of a *vital force* or *anima* residing in the body, whose motions it directed. His writings were very numerous—250 in all, but his most important is *Theorea Medica Vera* (Halle 1737). See Lemoine's *Le Vitalisme et l'Animisme de Stahl* (Paris 1864).

Stained Glass is glass permanently coloured by fluxing mineral pigments on its surface by means of heat. See Glass Painting.

Staines, an interesting old English town, in Middlesex, on the left bank of the Thames, 6 miles S.E. of Windsor, and 18 S.W. of London by the South-Western Railway. Its church of St. Mary, rebuilt in 1828, has a tower by Inigo Jones (1631), and the granite bridge of three arches, which here crosses the river, was designed by Rennie (1832), and cost £40,000. A stone (hence the town's name) bearing date 1285 here marks the limit of the Thames Conservancy. A Roman Catholic church, in Gothic style, was erected in 1868. There are mustard mills, breweries, and market-gardens. S. has a well-known race-course. Pop. (1871) 3659.

Stains for Wood are preparations for colouring wood in imitation of mahogany, rosewood, walnut, ebony, and other costly woods. The stains are for the most part composed of decoctions of dye-woods, modified with pigments, metallic salts, acid, &c., or of alcoholic solutions of turmeric and certain resins, as gamboge and dragons' blood.

Stair, Earls of. See DALRYMPLE.

Stalac'tites and **Stalag'mites** are deposited by evaporation from waters charged with carbonate of lime. The mineral water, dropping from the roof of a cave, leaves behind it a small residue of what it held in solution, and by constant accretions this residue grows downwards like an icicle from the roof. Simultaneously, a similar but upward growth takes place at the spot vertically below where the successive drops of water fall and evaporate. The former is called a stalactite, the latter a stalagmite; and not unfrequently the two portions meet and form a continuous pillar.

Sta'leybridge, a municipal and parliamentary borough, 7½ miles N.E. of Manchester, partly in Lancashire and partly in Cheshire, in the parishes of Ashton-under-Line and Dukinfield, with which towns it is practically united. It has communication by railway in all directions, has two weekly newspapers, and returns one member to the House of Commons. Its chief manufacture is that of cotton goods, but it has also numerous iron foundries and machine-works. Pop. (1871) 21,092.

Stall'baum, Johann Gottfried, born at Zaasch in Prussian Saxony, 25th September 1793, in 1808 entered the Thomasschule, and in 1815 the University of Leipzig, whither after two years of teaching at Halle (1818–20) he returned to be an under-master in his old school. He became its rector (1835), and in 1840 was appointed extraordinary professor, retaining both offices down to his death, 24th January 1861. S. did good service to classical philology by his critical edition of Plato's Works (12 vols. Leip. 1821–25), a separate edition of his text (8 vols. Leip. 1825), and an edition with a commentary in the *Bibliotheca Græca* (9 vols. Gotha, 1827; new ed. 1867). Besides other editions of the classics, he published *Ueber den innern Zusammenhang musikalischer Bildungder Jugend mit dem Gesammtzwecke des Gymnasiums* (Leips. 1842), *Das Griechische und Lateinische in unseren Gymnasien* (Leip. 1846), &c.

Stambul', or **Istambul'** (Gr. *Es tan polin,* 'to the city'), the Turkish name of Constantinople (q. v.).

Stalls, in churches, are fixed seats ranged along the choir, with a screen behind, projecting elbows, and frequently canopies overhead.

Sta'mens are the male or fertilising organs of a flowering plant. Collectively they constitute the *andrœcium* ('male habitation'). In a perfect and complete bi-sexual or hermaphrodite (q. v.) flower they number from one to many, and are situated within the petals and outside the pistil. S. usually consist of a stalk, called a *filament,* bearing at the top an *anther* divided into two pouches or *cells.* When these two cells are not closely contiguous, the portion of the anther that unites them is called the *connective.* The anther-cells are filled with *pollen,* consisting of minute grains commonly forming a yellow dust, which, when the flower expands, is scattered from an opening in each cell, and is conveyed either by the wind, by the agency of insects, or by peculiar movements or positions of the S. or the carpels to the female organ or Pistil (q. v.), there to effect fertilisation, and enable the Ovules (q. v.) to develop into ripe Seed (q. v.). The filament is often wanting, and the anther *sessile,* yet still the stamen is perfect; but if the anther is wanting, or does not contain pollen, the stamen is imperfect, and is then said to be *barren* or *sterile, abortive* or *rudimentary.* Imperfect stamens are often called *staminodia.* S. are *monodelphous* when united by their filaments into one cluster, *diadelphous* when united into two clusters (the term is more especially applied to certain *Leguminosæ*), *triadelphous, pentadelphous, polyadelphous* when so united into three, five, or many clusters; *syngenesious* when united by their anthers in a ring round the pistil; *didynamous* when there are four S. in two pairs, those of one pair longer than those of the other (as *Labiatæ*), *tetradynamous* when (as in *Cruciferæ*) there are six, four of them longer than the two others. As regards the mode of attachment, S. are *hypogynous* when growing directly from the receptacle beneath the ovary (as in the buttercup); *periginous* when springing from the calyx (as in the wild rose); *epipetalous* when springing from the corolla (as in the primrose); *epigynous* when attached to the upper part of the pistil (as in the carrot). An anther is *adnate* when continuous with the filament, the anther-cells appearing to lie their whole length along the upper part of the filament; *innate* when firmly attached by their base to the filament; *versatile* when attached by their back to the very point of the filament, so as to swing loosely. Anthers have often, on the connective or their cells, appendages termed *bristles, spurs, crests, points, glands, &c.,* according to their appearance. To let out the pollen, anthers open or *dehisce,* like capsules, in *valves, pores,* or *slits.* Dehiscence is *introrse* when the opening faces the pistil, *extrorse* when towards the circumference of the flower. The pollen consists of granular cells variously shaped, marked, or combined, peculiar forms being constant in the same species, or often in large genera, or even natural orders. In the Linnæan system the twenty-three classes of flowering plants are founded on the number, position, relative lengths, and connection of the S.

Stam'ford, a market-town and parliamentary borough in the county of Lincoln, on both sides of the river Welland, here dividing Lincoln from Northampton, 12 miles N.W. of Peterborough. It has several schools, two of which are handsome buildings, recently erected under a new scheme by which an endowment of £600 a-year has been supplemented by an annual grant of £1500 from the surplus funds of Browne's Hospital, founded in the reign of Richard III. for ten men and two women. The new scheme provides for a high-class school, a middle-class school for boys and girls, and an elementary school. Of the churches, All Saints' and St. Mary's, both fine specimens in the Early English style, are the most interesting. S. has an infirmary erected by public subscription, and supported chiefly by a bequest from Henry Frier, at one time surgeon in the city, and recently enlarged at a cost of £7000; a museum, library, and several almshouses, the principal of which is Browne's bede-house, recently rebuilt. The district is almost exclusively agricultural. S. has two weekly newspapers, one of which, the *Mercury,* has been established since 1695. Since 1867 S. has returned only one member to parliament. Pop. (1871) 8086. During the Middle Ages S. was frequently visited by the English sovereigns, and in 1566 Queen Elizabeth was entertained here by Cecil, whose lands have now become the property of the Marquis of Exeter, and who benefited the town greatly by inducing certain Flemish refugees, silk and serge weavers, to settle in it in 1572.

Stam'ford, a favourite summer resort of the inhabitants of New York, at the entrance of Mill river, in Long Island Sound, in Fairfield County, Connecticut, 32 miles N.E. of New York city. Pop. (1870) 9714.

Stamm'ering, a condition of speech in which the subject suffers from a want of power to combine the varied muscular acts involved in the production of articulate sounds. The causes of S. are probably multifarious and diverse, and depend on very varied states of the nerve-centres. Dr. Marshall Hall maintained that in S. the nerve-centres or parts regulating S. were invariably affected. The cause of S. is named *centric* when the nerve-centre itself is affected, and *excentric* when it arises from impressions made upon its afferent nerves—*i.e.,* nerves proceeding to the centres. There is every probability that the great majority of cases of S. depend on causes connected with derangement of nerve-centres. The fact that S. is often congenital seems to prove this. The stammerer meets his greatest difficulty in pronouncing consonants such as *f* and *v,* which entirely supersede the passage of air through the nose, and where necessity arises for firm contraction of the parts of the mouth. The *cure* of S. has formed the subject of much discussion, and is even yet made subject-matter for empirical treatises and quack treatment. Attention to the patient's general health, and the careful examination of his habits and nervous constitution by a recognised medical authority, are necessary preliminaries to the cure or alleviation of this complaint. Thereafter, a strict attention to the mode of speech of the patient, and the acquirement of the habit of slow and distinct pronunciation, are amongst the means most likely to be successful in inducing a cure. Dr. Neil Arnott of London used to assert that S. might frequently be cured if the patient learned to connect his words by a kind of intonation or sustained note, so as to preclude the spasmodic stoppage of breath so familiar in this complaint.

* **Stamp Duties** are taxes for an amount expressed upon the paper or parchment on which most legal documents require to be written. When a stamp is necessary to the legal validity of a

document, its omission or insufficiency in value may, in certain cases, be remedied by subsequent payment to the Inland Revenue of the duty and penalty. The S. D., first imposed in the reign of William III., were consolidated and amended in 1870.

Stamp'ing of Met'als. Many articles are shaped from sheet metal by means of steel dies brought together in a stamping-press. The stamping-machines assume various forms, and are worked manually, by steam, or by hydraulic power. The ordinary stamp used for brassfoundry consists of an iron hammer or 'ram' working between two upright pillars or guides. An intaglio die is fixed to the bed of the machine, and a raised counterpart or reverse die to the hammer. A 'blank' or piece of sheet metal is laid on the lower die, and the hammer, elevated by a rope or other means, is allowed to descend, with the result of sinking the sheet metal into the die beneath. Several successive blows are given, and between them the metal is annealed in order to restore its ductility. Balance weights of chandeliers and other globular articles are stamped in pieces which are afterwards soldered together. Vessels of tinned iron are produced by pressing the sheet-metal into as many as sixteen to twenty-five moulds in succession, each mould approaching more and more to the form of the finished article. Annealing is performed after each pressing, and the vessel is finished by tinning and burnishing. Objects in German silver are stamped in like manner.

Stan'chion (Old Fr. *estançon*, 'a prop or support'), an upright iron bar of a window or open screen; in shipbuilding, a post for supporting deck-beams, an awning, or quarter-railing, &c.

Stan'dard, a kind of Flag (q. v.), larger than the Banner (q. v.), which came into use in England in the time of Edward III. Used solely for display, it bore all the achievements of its owner, and varied in size according to his rank. The name S., in the military service of the United Kingdom, is now applied only to the flags of cavalry regiments not composed of dragoons or dragoon-guards. Each regiment has two of these, both silken—the first, or royal S., crimson, with a device; the second, or regimental S., of the same colour as the facing of the regiment, and bearing a different device. The present Royal S. is of a square or oblong form, and bears the royal arms only.

Stan'dard, in carpentry, a post or upright piece in a truss; in shipbuilding, a knee-timber with one arm fastened to the upper side of the deck and the other arm to the ship's side.

Stan'dard, Battle of. See NORTHALLERTON.

Stand'ing Or'ders, the name given to regulations made by legislative or municipal assemblies for the regulation of their proceedings, and which are of continual obligation unless rescinded or repealed. See PARLIAMENT.

Stan'dish, Miles, one of the 'Puritan fathers,' and best known as the hero of Longfellow's poem, *The Courtship of Miles S.*, seems to have been born in Lancashire about 1584, and claimed to be a cadet of the knightly family of S. of Duxbury Hall in that county. After serving for some time in the Netherlands, where he attained the rank of captain, S. went out in the *Mayflower* in 1620, rendered good service to the young colony in its dealings both with Indians and with the mother country. He founded the township of Duxbury in Plymouth Co., Mass., where he died, 3d October 1655, and where a monument to him was commenced in 1872. His friendship with John Alden is well known to all readers of Longfellow. Other interesting information about S. is given in Justin Winsor's *History of Duxbury* (1849).

Stan'hope, Lady Hester Lucy, daughter of Charles, third earl Stanhope, and Hester, daughter of Pitt, first earl of Chatham, was born in London, 12th March 1776. When her father got into difficulties through his romantic advocacy of republicanism, Lady Hester went to live with her uncle the prime minister, and for upwards of ten years she was one of the most eminent personages in political society; but on Pitt's death in 1806 she retired to Wales, and in 1810, under the influence of a strange belief in her own destiny, determined to settle in Syria. She finally took up her residence in 1813 in the old convent of Mar Elias in the Lebanon, and there she lived for more than a quarter of a century in almost complete alienation from European civilisation. She died there, 23d June 1839. The mingled pomp and poverty of her establishment; the power she exercised and the insults to which she was subjected; her own strange mixture of masculine capacity and childish caprice; her domestic despotism, and princely liberality, and all the endless peculiarities of her character and position, have been minutely described by her English physician, Dr. Madden, who published anonymously *Memoirs of Lady Hester Stanhope* (3 vols. Lond. 1845) and *Travels of Lady Hester Stanhope* (Lond. 1846); and almost every traveller on the Lebanon from Lamartine downwards has added some detail or other to the picture. The *Memoirs* were translated into German by Birsch (3 vols. Stuttg.). See also Ph. Chasles, *Lady H. Stanhope*, in *Revue des Deux Mondes* (1845).—**Philip Henry, Earl S.**, nephew of the preceding, was the only son of Philip Henry, fourth earl, and Katharine, daughter of the first Lord Carrington. He was born at Walmer, January 31, 1805; took his B.A. at Oxford, 1827; entered the House of Commons, 1830; was Under-Secretary of State for Foreign Affairs in Peel's first ministry, 1834-35; and served as Secretary to the Board of Control during the last year of Peel's second Ministry, 1845-46. Having lost his seat in 1852 in consequence of his maintenance of the old Navigation Laws, he did not return to parliament till he succeeded his father in the House of Lords in 1855; and after that date he acted as a moderate Conservative and usually voted with his party. His name is more immediately associated with the Copyright Act of 1842, which indeed is known as Lord Mahon's Act, and with the Act (1858) for the removal from the liturgy of the objectionable petitions about Charles I., &c. To him we are largely indebted for the founding of the National Portrait Gallery; and he did good service as trustee of the British Museum, president of the Corporation of the Liturgy Fund, president of the Society of Antiquarians (1846), and Lord Rector of the University of Aberdeen (1858). He died at Merivale House, Bournemouth, December 22, 1875. Lord Mahon—for it is by this courtesy title that he is best known in literature—was one of the few members of the English peerage who have regularly devoted themselves to literary pursuits. In 1829 he published a *Life of Belisarius*; in 1832 a *History of the War of Succession in Spain*; in 1836-54 a *History of England from the Peace of Utrecht to the Peace of Versailles*, 1713-83 (7 vols.); in 1842 an *Essai sur la Vie du Grand Condé* (Eng. trans. 1845); in 1849 *Historical Essays from the Quarterly Review*; and in 1861-62 a *Life of Pitt*. Under the title of *Spain under Charles II.* he published in 1844 extracts from the correspondence of Hon. A. Stanhope; in 1845-53 he edited the letters of Lord Chesterfield, and 1856-57 he was joint editor with Mr. Cardwell of Sir Robert Peel's Memoirs. As a historian Lord Mahon is careful and impartial, and always strives to give a calm and honest representation of facts. His *History of England* is the standard work on the period, and has found equal popularity on both sides of the Atlantic.

Stanislau', a town of Austrian Galicia, on the river Bistritza, 78 miles S.S.E. of Lemberg by rail. It has a gymnasium and a castle (formerly fortified), manufactures machinery, and carries on a considerable trade in corn and cattle. Pop. (1870) 14,479.

Stan'ley, Arthur Penrhyn, son of the late Bishop of Norwich, was born at Alderley, Cheshire, December 13, 1815, and educated at Rugby under Dr. Arnold (1829-34). As a scholar of Balliol, he gained the Newdigate, Ireland, and other university distinctions, took a first class in classics (1837), and was elected fellow of University College (1840). Taking orders, he was for twelve years tutor of his college, Select Preacher (1845-46), secretary to the Oxford University Commission (1850-52), canon of Canterbury (1851-58), Regius Professor of Ecclesiastical History and canon of Christ Church (1858-64), in 1863 declined the archbishopric of Dublin, and became next year the Dean of Westminster. St. Andrews University conferred on him the degree of LL.D. (1871), and he was installed its rector (1875). He made a tour in the East (1852-53), and again as chaplain to the Prince of Wales (1862), performed the Protestant marriage of the Duke of Edinburgh at St. Petersburg (1874), and visited the United States (1878). The leader since Maurice's death of the 'Broad Church' party, S. has shown his sympathies with free thought by his action in the *Essays and Reviews* and Colenso controversies, by his presence at the second 'Old Catholic' Congress, by invitations to Dissenters and Max

Müller to preach or lecture in the Abbey. Amongst his numerous publications are the *Life of Arnold* (1844; 9th ed. 1875), *Sermons and Essays on the Apostolic Age* (1846; 3d ed. 1874), *Memoir of Bishop S.* (1850), *Epistles to the Corinthians, with Notes and Dissertations* (1854; 4th ed. 1876), *Historical Memorials of Canterbury Cathedral* (1854; 6th ed. 1872), *Sinai and Palestine* (1855; 20th ed. 1874), *Lectures on the Eastern Church* (1861; 4th ed. 1869), *Lectures on the Jewish Church* (3 series, 1862-75; 7th ed. 1877), *Historical Memorials of Westminster Abbey* (1867; 4th ed. 1874), *Essays on Questions of Church and State from 1850 to 1870* (1870), *The Athanasian Creed* (1871), *Lectures on the Church of Scotland* (1872), and *Addresses and Sermons at St. Andrews* (1877). He married in 1863 Lady Augusta Bruce, daughter of the seventh Earl of Elgin, who was born 3d April 1822, resided constantly with Queen Victoria (1846-63), and died at the Deanery, Westminster, 1st March 1876.

Stan'ley, Henry M., a celebrated African explorer, was born of humble parentage near Denbigh, Wales, in 1840. An inmate of the poorhouse till his thirteenth year, he subsequently taught for a while in a primary school, and then sailed as cabin-boy to New Orleans, where he was adopted by a merchant, whose name he took in place of his own—John Rowlands. His benefactor dying intestate, he joined the Confederate army, and was taken prisoner, but volunteered in the United States navy, and became acting ensign on an ironclad. As a newspaper correspondent he travelled in Turkey and Asia Minor, and represented the *New York Herald* on the occasion of the British expedition to Abyssinia (1868), his letters appearing separately under the title *Coomassie* and *Magdala* (1874). He spent part of 1869 in Spain, whence he was summoned by the *Herald* to head an expedition in search of Livingstone (q. v.). Starting from Zanzibar in March 1871 with a company of 192 men, he pushed vigorously into the interior, and in November, at Ujiji, on Lake Tanganyika, discovered Livingstone, whom he furnished with supplies. After exploring the N. end of the lake in company with the veteran traveller, S. set out in March 1872 for England, where he arrived in July, when he published *How I Found Livingstone* (Lond. and New York 1872). Among other marks of distinction, he received a gold, diamond-set snuff-box from the Queen, and the patrons' medal from the Royal Geographical Society (1873). At the joint expense of the *Herald* and the *Daily Telegraph* he was again despatched to equatorial Africa, commissioned to settle the question of the doubted unity of the Victoria Nyanza, the problem of the Tanganyika's outlet, and that of the destination of Livingstone's great river the Lualaba. Leaving Zanzibar, 11th November 1874, with a company of 356 souls, he advanced, like Burton, Speke, and Cameron, through the pastoral lands of Ugogo, and those of the inhospitable Urimi. The expedition sighted the great Uusukuma Sea, the Victoria Nyanza, 26th January 1876, but by the time its shores were reached, the company was reduced by the death and desertion of 194 men. In a portable boat S. circumnavigated Nyanza, the width of which each way exceeds that of the North Sea between the Lincoln coast and Holland, and which has an area of 21,500 sq. miles. He thus confirmed the hypothesis of Speke and Grant, that the lake was a single sheet of water, and not a cluster of lagoons as supposed by Burton and Livingstone, while he added the fact that the Shimeeyu is the most southerly affluent of this great fountain of the Nile. S. was received in a princely manner by M'tesa of Uganda, the 'emperor of equatorial Africa,' whom he induced to renounce Islam in favour of Christianity, and to whose request for missionaries the Church Missionary Society responded in 1878. A minute account is given in S.'s narrative of Uganda (q. v.), a kingdom that is likely to play an important part in the civilisation of the interior. While exploring the lake, S. was involved in 'the affair of Bambireh,' which on his return led to much controversy. Leaving Uganda, escorted by several thousands of M'tesa's warriors, he pushed W. through hostile Unyoro, and reached the cliff shores of Muta Nzige (the native name of Albert Nyanza), but the defection of his Waganda followers forced him to retire without launching his boat. Till his return, S. believed that at this point, close to the equator, he had touched a southern gulf of Albert Nyanza, but the more recent explorations of the Egyptian Staff have shown that he had discovered another lake, separated from the former by a full degree of latitude. If the Muta Nzige drains into Victoria Nyanza, a point not yet settled, it is in all probability the highest reservoir of the Nile. Passing through the land of the gentle old king Ruminika and the warrior chief Mirambo, S. circumnavigated Lake Tanganyika (q. v.), and everywhere found evidences of its rising. His ingenious solution of the drainage problem is based on a belief that the Lakuga, discovered by Cameron, is about to resume its old function of carrying off the surplus waters westward to the Congo. Turning to his final and greatest task, S. rapidly marched to Nyangwe, an Arab station on the Lualaba, where Livingstone and Cameron were alike defeated by the want of canoes. With 400 Arabs S. began the arduous descent of the river, which he re-named the 'Livingstone.' For 200 miles from Lake Bemba he found that it skirts the mountains which shut in Tanganyika, and drains the entire western versant of the lake region as far as 4° N. lat. At the equator it flows N.W. in a lower bed, and is joined by the Aruwini (the Welle of Schweinfurth) and the Kaseye, the greatest of all the affluents. A little E. of long. 18° the river becomes identified with the Kwango of European maps, and beyond 17° occur the series of falls which interrupt the navigation of the Lower Congo, and in which the descent is 585 feet in 180 miles. S. reports that for about 780 miles the Livingstone is continuously navigable, so that the construction of a portage or canal from Emboma to beyond the rapids would open the interior to commerce. Above the falls the country is thickly populated, and many of the tribes are reputed to be cannibal. The people are engrossed in trade, and possess enormous supplies of ivory, besides abundance of cotton, indiarubber, ground-nuts, sessamum, copal, palm-kernels, &c. In his progress through the region, S. fought thirty-one 'battles,' and lost thirty-five men, while many of his followers reached the coast stricken with dysentery, ulcers, and scurvy. The narrative of this remarkable journey, *Through the Dark Continent* (2 vols. Lond. 1878), is at once a vivid, exhaustive account of strange lands, and a stirring tale of adventure and hairbreadth escapes without parallel in the history of discovery. If not entitled to rank as a scientific explorer, S. has shown the possession of rare powers of courage, determination, generalship, and enterprise. He has done, as Colonel Yule says, 'the greatest feat in the history of discovery' in unveiling the great wilderness of Western Africa. Welcomed by the Geographical Society in February 16, 1878, he received the medal of the *Société Géographique* in June. The materials collected by him in the midst of constant danger and distress are far from being wholly embodied in his published narrative, which is to be followed by a volume dealing with Central African hydrography, ethnology, and natural history.

Stan'ley, Thomas, an English scholar of great repute in his day, was born at Cumberlow, in Hertfordshire, in 1625, educated at Pembroke Hall, Cambridge, and entered the Middle Temple. Between 1655 and 1662 S. published his *History of Philosophy* in three parts, still a useful storehouse of facts, the best edition of which is that of 1743, with a life of the author. In 1663 appeared his edition of *Æschylus* with a Latin translation and commentary, a work long since superseded. He published also various poems and translations from classical and Continental authors. He died in London, April 12, 1678. See the *Life* prefixed to Brydges' edition of *S.'s Poems* (Lond. 1814-15).

Stann'ary (Lat. *stannum*, 'tin'), a term variously applied to a tin-mine, the tin-mines of a collective district, or the royal rights relating to such. The S.-Courts of Cornwall and Devonshire were founded in the middle of the 13th c., and confirmed by Edward I. in 1305. They administer justice among the 'tinners' of those counties, who claim to be exempt from all other jurisdiction, save in matters affecting land, life, or limb. The Prince of Wales, as Duke of Cornwall since 1337, is Lord Warden of the Stannaries, and a Vice-Warden, usually a barrister, presides over the courts still held at Truro, where also the last 'S. Parliament' was held in 1752.

Stann'ic Acid. See TIN.

Stanovoi'. See SIBERIA.

Stans'field, Clarkson, an English landscape-painter, born of Irish parentage, at Sunderland, in 1793. During a roving youth spent at sea he came in casual contact with Douglas Jerrold, and procured the lasting friendship of Captain Marryat,

who early appreciated his artistic powers. He was latterly engaged as captain's clerk on board a man-of-war's-man, but in consequence of a fall from the fore-topgallant mast-head retired from the navy, and procured employment as a scene-painter first at the Edinburgh Theatre-Royal (where he formed a life-long intimacy with David Roberts), then at the Old Royalty, London, and eventually at Drury Lane. After the success of the first picture he exhibited at the British Institution in 1826—'Market-boats on the Scheldt'—he devoted himself more and more to easel-painting. In 1828 he obtained a prize of fifty guineas from the Institution, in 1832 was made A.R.A., and R.A. three years later. Together with Roberts and others he established the Society of British Artists in 1830. Among his more famous pieces are 'Wreckers off Fort Rouge,' 'A Calm at Sea,' 'Mount St. Michael,' 'Views of Venice,' 'Battle of Trafalgar,' 'Battle of Ischia,' 'The Abandoned,' 'Against Wind and Tide,' 'Siege of St. Sebastian,' 'The Bass Rock.' Frequent visits to the Continent supplied S.'s ready brush with such a variety of subjects that his work never sank into sameness. Although one of the most fertile and effective of scene-painters, his art is characterised by elaboration rather than breadth, and its fidelity to nature, delicacy of finish, and harmony of colour, have obtained for S. the name of 'the English Vandervelde.' Ruskin says that one of his works shows 'as much concentrated knowledge of sea and sky as, diluted, would have lasted any one of the old masters for life.' He died at Hampstead, 18th May 1866. A volume of his engraved works was published by Messrs. Virtue & Co. in 1873.

Stan'ton, Edwin M'Masters, a United States lawyer and statesman, was born at Steubenville, Ohio, December 19, 1814. Admitted to the bar in 1836, he rose rapidly to the head of his profession, and while acting in California in 1858 as counsel for the United States in certain important land cases, he did good service to students of history by collecting a large mass of documents relating to Mexican affairs. In 1860 S. was appointed by Buchanan Attorney-General, and in 1862 he became Secretary of War under Lincoln. In this capacity he showed a zeal and prudence so strongly appreciated by the nation, that when in 1867 he was requested by President Johnstone to resign his portfolio, the Senate refused to concur in the suspension, and the unseemly strife was only ended in May 1868 by S.'s voluntary resignation. On December 20, 1869, he was nominated by President Grant associate justice of the United States supreme court; but his incessant labours had undermined his health, and he died on December 24 of the same year.

Stan'za (Ital. *estancia*, 'a room,' from Lat. *stare*, 'to stand'), a group of verses forming a complete period or followed at least by a rest, and presenting in metre, rhymes, and the number of its lines, a combination which repeats itself several times in the course of the same poem. The S. is variously termed *terzina*, *quartetto* (quadrain), *sestina*, *ottava*, &c., according as it consists of three, four, six, or eight lines. Dante quaintly ascribed the origin of the name to the fact that a S. is the *storeroom* of a song, in which the poet's art is concentrated.

Stape'lia. See CARRION-FLOWERS.

Staphyle'a. See BLADDER-NUT.

Staphylo'ma (Gr. *staphylē*, 'a bunch of grapes') is a term used in medicine, by oculists, to denote any protrusion on the anterior surface of the eye. In cases of perforating ulceration of the cornea, the cicatrix, formed in the first instance by the iris, which falls against the opening and becomes adherent to it, has a tendency from its want of firmness to bulge out under the pressure of the ocular muscles, and the resulting protrusion is called a S. In cases of complete S., it is usually necessary to remove it to make room for the insertion of an artificial eye.

Sta'ple (Old Eng. and Ger. *stapel*, 'a heap,' 'a mart'), a term formerly denoting a market-place where certain kinds of merchandise were brought together for sale; in this sense it occurs in the local names Dunstable, Barnstaple, and, in France, Etaples. It is now applied to the leading production or industry of a place; thus we say straw-plait is the S. of Dunstable. Commerce was largely controlled in medieval times by statutes; marts were fixed for certain commodities, on which dues were levied and the prices regulated. Statutes relating to the S. of wool, hides, leather, butter, lead, tin, &c., were passed by Edward III. and subsequent monarchs. The S. of wool was fixed at Brabant in 1336, at Bruges in 1341, and at Calais in 1348. Merchants attending the marts, while subject to restrictions, enjoyed peculiar privileges. 'Merchants of the S.' is the name of a society of merchants instituted in 1248 for the export of the S. goods of the kingdom. The length of textile fibres, as cotton, flax, and wool, is now spoken of as the 'S.'

Star, in heraldry, an ensign common to all orders of knights, usually having six wavy points or rays. When the rays are more than six, they are alternately wavy and straight.

Starai'a-Russa, a town of Russia, government of Novgorod, on the Polista, 185 miles S.S.E. of St. Petersburg by rail, has an imperial palace and celebrated salt-springs. Pop. (1870) 8700, greatly increased by occasional visitors.

Star Anise. See ILLICIUM and ANISE.

Star Apple is a name applied to the fruit of *Chrysophyllum Cainito* of the W. Indies (where it is used as a table-fruit) on account of its being of the size of a large apple, and when cut through showing the seed-cells arranged in a starlike form around the centre. The genus, which belongs to *Sapotaceæ*, consists of trees or large shrubs with milky juice. Its botanical name is derived from the *golden* colour of the under *leaf*-surface.

Star'board (Old Eng. *steórbórd*, from *steóran*, 'to steer,' and *bórd*, 'board,' 'side'), the right-hand side of a ship, to one looking towards the bow.

Starch, Preparation of. Starch is a definite chemical principle which occurs in great abundance in the vegetable kingdom, being found at one time or other in all flowering plants. It is found most abundantly in those parts of plants connected with reproduction and propagation, being the largest constituent of farinaceous seeds like those of cereals and pulses, and of tuberous roots such as the potato and the cassava and arrowroot plants, and it also gorges the stems of certain palm-trees, especially at the period when they are about to flower. It is only from those sources where it is present in large quantity that commercial varieties of starch are obtained. Having regard to the purposes to which starch is applied, the various kinds may be divided into (1) starches used for food and (2) starches used for laundry and industrial purposes, although certain kinds are extensively used under both of these heads. In their chemical relations all varieties of starch are identical, but in their physical constitution and microscopic structure they present marked differences among each other, and they also vary much as regards digestibility and suitableness as articles of food. Seen under the microscope, the various kinds of starch present the appearance of minute granules made up of a series of layers concentrically surrounding one or sometimes more nuclei. The size of these granules and the arrangement of layers differ in every different species of plant, and therefore the source of any particular starch is readily determined by microscopic examination.

The food starches embrace arrowroot, tous-les-mois, sago, and tapioca, all of which are described under their own headings, and under that head is also placed the so-called 'corn-flour,' which under a variety of names, such as 'Oswego flour,' 'maizena,' &c., is sold for use in the same manner as arrowroot. Corn-flour, which has now an enormous sale, is simply the starch of Indian corn or maize separated from the grain by prolonged steeping in water, crushing the swelled grains between cylinders under a flow of water, and washing the mass through a cylindrical sieve so as to separate out the husky matter. The milk-like fluid which contains the starch in suspension is run along a series of gently inclined surfaces, on which the heavier granules are deposited, the lighter and finer particles being carried with nitrogenous matter into settling-tanks. The deposit which accumulates in the settling-tank is purified by repeated straining and settling, and the separated starch is dried by gentle artificial heat, when it crumbles to a powder, and as such it is packed up for use.

The principal sources of starch for industrial purposes are potatoes, wheat, and rice, but sago starch is also extensively employed for other than food purposes; and as very many plants yield the substance, so it is found that starch, from many different substances, finds occasional or limited employment. As potatoes affected by disease yield as pure and useful a starch

as sound tubers, the preparation of potato starch was prosecuted on a great scale in the United Kingdom during the years when potato disease prevailed. In ordinary seasons the trade is more restricted, but on the Continent—in Germany, Holland, and Russia especially—the manufacture is one of importance. On a small scale the P. of S. from potatoes is a simple operation. The tubers have simply to be thoroughly steeped and washed to free them from all earthy impurity, then rasped down to a fine pulp in a tub of water and allowed to settle, when the starch will fall to the bottom and the greater part of the skin or husk will float on the water. By repeated washing and settling of the starchy deposit the starch may be obtained in a condition of purity, and it may then be dried by gentle heat for preservation and use. On the manufacturing scale machinery of various kinds is adapted for performing the several processes of steeping and washing, straining out of stones, rasping, straining, settling, purifying, draining, and drying which the potatoes undergo. Beyond its use in industrial pursuits in common with other starches, potato starch is much employed for making imitation sago, for adulterating and as a substitute for the more costly food starches, for preparing starch sugar, and as a source of potato spirit.

Wheat starch is prepared by two distinct processes. The first and old method—the grain is subjected to a process of fermentation whereby the gluten or nitrogenous constituent of the wheat is rendered soluble and the remainder of it loses its adhesive property, and in this condition the starch is easily separated out by a washing wheel or drum. By this process the greater part of the gluten is wasted, and a smaller yield of starch is obtained than can be secured by the more recent system of Martin. The principle upon which it proceeds can be easily illustrated by making a dough of flour, placing it in a muslin bag, and squeezing it under the water, when the starch exudes mingling with the water and settling as a sediment, leaving within the muslin a grey semi-elastic mass consisting chiefly of gluten. In this way the gluten is saved, and can be utilised for cattle-feeding, &c. By whatever process prepared, wheaten starch is purified by repeated washing and settling, and dried by gentle heat, and on drying it assumes the columnar structure by which it is familiarly known. In the preparation of rice starch, a variety preferred for laundry purposes, the grain has to be steeped in a slightly alkaline solution on account of its peculiarly hard and horny structure. In addition to being most extensively used in laundries, starch is largely consumed in the manufacture of Dextrine (q. v.) or British gum, and it is also employed as a thickener in calico-printing, and in the finishing of bleached and printed calicoes. A paste of starch is generally used by photographers for mounting prints, and it finds a valuable minor adaptation in dusting moulds in metal-casting, besides being applied for many miscellaneous purposes.

Medicinal Properties of S.—Wheat S. is employed in medicine as an external application to the face and hands when affected by cutaneous eruptions, and to prevent the chafing of the skin of infants. Violet powder used in such cases is merely scented S. The pharmaceutical preparations of S. are the glycerine and the mucilage. The *glycerine*, an opaque, soft, solid jelly, is composed of one part of S. and eight of glycerine, prepared by rubbing them well together, heating the mixture gradually to 240°, and stirring until a translucent jelly is formed. The *mucilage* is prepared by boiling and stirring for a few minutes one part of S. and forty of water, and is used in enemas, and in surgery to stiffen bandages for fractures, &c.

Star-Chamber, a court whose name, popularly ascribed to the gilded stars studding the roof of the room in which it sat, is derived by Mr. Green from the Jewish bonds (Heb. *starrs*) deposited for safety by the Conqueror in a chamber of the royal palace at Westminster. Originally a committee of the Privy Council (q. v.), this court was remodelled by statutes 3 Henry VII. and 21 Henry VIII., thenceforth consisting of four high officers of state, with power to add to their number a bishop and temporal lord of the council, and of two justices of the courts of Westminster. Their jurisdiction, extending over riots, perjury, and other notorious misdemeanours contrary to the law of the land, was exempt from the intervention of a jury, and they could inflict any punishment short of death. Thus constituted by Wolsey to check the power of the nobles, the S.-C. was greatly developed during the Tudor and two first Stuart reigns; under Charles I. its scope was extended to cases properly belonging to the courts of common law, solely for the purpose of levying fines; and the arbitrary nature of its sentences was experienced by opponents of ship-money, their cruelty by Leighton, Prynne, Bastwick, &c. Even Clarendon owns that 'never were the foundations of right more in danger to be destroyed;' and one of the first acts of the Long Parliament in 1640 was summarily to abolish the S.-C. along with its fellow the Court of High Commission. See S. R. Gardiner's *Personal Government of Charles I.* (Lond. 1877).

Star'-Fish, the name applied generally to various members of the class *Echinodermata* (q. v.) from the form of the body. The true and typical star-fishes belong to the order *Asteroidea*, in which the rays are parts of the body, and contain prolongations of the viscera. The body is supported by an internal skeleton of calcareous nature, and the mouth, which wants a dental apparatus, is placed in the centre of the inferior surface. There are numerous feet on the under surface, each being a muscular tube provided with a terminal sucker, and capable of being distended with water or retracted at will. The common S.-F. (*Uraster rubens*), also named the 'Five Fingers' and 'Cross-fish,' has five rays, which are capable of being reproduced when mutilated or destroyed. The common sun-star (*Solaster rapposa*) is distinguished by having numerous arms, varying from 13 to 16 in number. Certain genera of S.-F. known as *Brittle Stars* and as *Sand Stars* belong to the order *Ophiuroidea* (q. v.).

Star'-fort, a fieldwork in the shape of a polygon, constructed so that a cross fire may be brought upon the ground before any of its angles. Its defects are the room taken up by the angles and the diminishing of the length of the faces of the fort, and consequently the quantity of the fire from each.

Star'gard (Slav. *Starograd* or *Starigrod*, 'old town'), an interesting town of E. Pomerania, Prussia, on the navigable Ilna, 25 miles E.S.E. of Stettin by rail. Its well-preserved walls are surmounted by handsome towers, and its chief buildings are the Gothic Marienkirche of the 16th c., with richly adorned interior, a Rathhaus of the 11th c., the quaint Protzensche Haus, and a higher Burgerschule of 1860. It manufactures woollens, linens, leather, &c., and trades in grain and cattle. Pop. (1875) 20,173. S., destroyed by the Poles in 1120, was raised to the rank of a town in 1229, joined the Hanseatic League, and was strongly fortified. It played an important part in the Thirty Years' War.—**S.**, or **Preussisch-S.**, in the province of Prussia, on the Ferse, 30 miles S. of Danzig, has some trade in linen, cattle, iron, &c., and a pop. (1875) of 6022. Built in 1339, it was taken by the Teutonic knights in 1461, frequently besieged by the Poles, and seized by the Swedes in 1655. See Stadie, *Geschichte der Stadt S.* (Starg. 1864).

Star'let, a name given to certain species of Starfishes. A good example is the Gibbous S. (*Asterina gibbosa*), in which the rays are united by an intervening membrane.

Star'ling (*Sturnus*), a genus of Insessorial birds belonging to the family *Sturnidæ*, and to the section *Conirostres* (q. v.). It has a compressed straight bill, pointed wings, and a short tail. The tarsi are broadly scaled in front, and the nostrils are in membranous grooves. The first wing-quill is rudimentary, the second being the longest. The common S. (*S. vulgaris*) is of a dark-green colour glossed with purple, the shoulders being brown and the plumage generally spotted with buff. The plumage of the first year is brown or grey. The nest is built in trees, and the eggs, which usually number five, are of a pale-bluish tint. The food consists of insects. Starlings are gregarious. Their voice is harsh and unmelodious, but they may be taught to mimic sounds, and pronounce words with great clearness. Bold and wary, they often alight on the backs of cattle and sheep, to procure the insect larvæ which burrow in the skin, and also wool for their nests. The common S. occurs in Europe, Africa, and in Asia and Japan. The *S. unicolor* has a limited European distribution, and occurs in Sardinia. The Redwinged S. belongs to the genus *Agelaius*. It is the *A. Phœniceus* of naturalists, and occurs in America, where it is very destructive to the corn crops. The *Sturnus Ludovicianus* is known as the American S., and also as the Meadow Lark.

Star'lings, in architecture, are structures of piles driven round the piers of a bridge for their defence and support.

Star'nosed Mole, or **Starnose** (*Condylura*), a genus of *Talpidæ* or Moles (q. v.) inhabiting Canada, and of which the *C. cristata* is the familiar species. The name is derived from the peculiar form of the snout, which ends in a cartilaginous tip, composed of rays or arms arranged in a starlike form.

Starodub (Slav. 'old oak-tree'), a town of Russia, government of Tchernigov, on the Bodenez, an affluent of the Dnieper, 85 miles S.W. of Briansk, the nearest railway station. It is the centre of a rich agricultural district, but its trade is checked by the difficulties of transit. Pop. (1870) 13,652.

Star of Bethlehem is *Ornithogalum umbellatum* (a bulbous plant of the Lily family), so called from its white stellate flowers resembling the figures in old pictures of the Nativity star (St. Matt. ii. 2, 9, 10). The species is common in many parts of Europe, extending to Armenia and Palestine. In Britain the S. of B. is an old-established garden favourite, which has resulted in its becoming naturalised here and there in meadows and copses. *Ornithogalum* numbers 73 species, divided into seven sub-genera, of which two are exclusively European and Oriental, two are exclusively Cape, and three other mainly Cape. A few species are found in tropical America, one only Peruvian and Chilian, and none E. Indian, E. Asiatic, or Australasian.

Star of India. The most exalted order of the S. of I. was instituted by Queen Victoria by letters patent under the Great Seal in February 1861, in order to afford to the princes, chiefs, and people of her Indian Empire a testimony of her royal regard, and to commemorate her resolution to take upon herself the government of that portion of the empire. The order has been remodelled in 1866, 1875, and 1876. It now consists of the sovereign; a grand master, who is the viceroy for the time being; 30 knights grand commanders, or G.C.S.I.; 72 knights commanders, or K.C.S.I.; and 144 companions, or C.S.I., together with such extra and honorary knights as the sovereign may appoint. The insignia are a jewel containing a medallion of the queen, with the motto 'Heaven's light our guide,' surmounted by a star and suspended by a gold collar. The colour of the robe is light blue, with silver border. Native and European officials are alike eligible for the order; and a Mohammedan lady, the Begum of Bhopal, is a distinguished member. Foreign personages connected with the East receive honorary knighthood. Two Grand Chapters have been held in India by the Duke of Edinburgh and the Prince of Wales, on which occasions the pomp of mediæval pageantry was elaborately imitated. Each G.C.S.I. had a pavilion with a pennon and an esquire; he was preceded by six men-at-arms and a standard-bearer, and his train was borne by two pages in gorgeous attire.

Stars are the self-luminous bodies which surround our solar system on all sides. They are distinguished from the planets by their flickering light, by the comparative constancy of their relative positions in space, and by their inappreciable diameter even when viewed by the most powerful optical instruments. The number of stars visible to the naked eye is estimated at about 5000; and these have from an early age been grouped in Constellations (q. v.), and classified according to their brightness or magnitude. Those belonging to the first six magnitudes are visible to the naked eye; but the telescope reveals myriads which are distinguished down to the sixteenth magnitude. The earliest catalogue which has come down to us is that in Ptolemy's *Almagest*, supposed to have been compiled by Hipparchus (150 B.C.). Ptolemy gives 1030 stars, of which several cannot now be certainly identified. The catalogue of Ulugh Begh (15th c.), a son of Timur, the Tartar monarch, is founded upon Ptolemy's, but checked by careful observation and re-determination of the positions of the 1019 stars which it contains. The last important catalogue before the invention of the telescope was that of Tycho Brahe, who re-determined with still greater accuracy the positions of 1005 S. Of modern catalogues, Argelander's *Sternverzeichniss* is the largest, enumerating more than 300,000 down to the ninth magnitude, all situated between the pole and 2° S. of the equator. Gould is extending this catalogue to the southern hemisphere at the observatory of Cordoba, S. America. The large majority of stars are of constant magnitude, but there are certain, known as variable S., which vary in brightness and vary periodically. Algol, in the constellation Perseus, fluctuates between the second and fourth magnitudes in a period of about three days. Mira in the constellation Cetus is such another star, being usually invisible to the naked eye, but bursting out at intervals of eleven months with the brilliancy of a second or third magnitude star. There are many others, but their variations are not so marked, and are only recognisable by careful observation. At times, S. have suddenly appeared where none were known before. The most remarkable of these are the one described by Tycho Brahe (1572), that observed by Kepler (1604–6), and the star of 1866 which blazed out suddenly in Corona Borealis. Near the place of the first a small telescopic star now exists, and the last was entered as a ninth-magnitude star in Argelander's catalogue. The spectrum of the 1866 star as examined by Huggins consisted of a continuous spectrum crossed not only by the usual dark absorption lines, but also by bright lines which corresponded in part with the spectrum lines of hydrogen. In these outbursts, then, we recognise an action probably similar to, but on a grander scale, than the outbursts of the solar protuberances. The general similarity of the stellar spectra to the solar spectrum is a convincing proof, if any further were needed, that our sun is a star, and that S. are suns with a probable retinue of accompanying planets. According to the nature of their spectra, S. have been grouped under four types. Type I., of which Sirius, the brightest known star, is a good representative, is characterised by a continuous spectrum with a very few absorption lines crossing it; in Type II. the spectrum is crossed by numerous fine lines, as in the sun's spectrum; in Type III., to which α Orionis and α Herculis belong, fluted spaces begin to appear; and in Type IV., which includes the *red S.*, fluted spaces only exist. Here there is an evident gradation from the spectrum of few absorption lines to that broken by gaps. According to the accepted theory of spectrum analysis, the former spectrum indicates a higher temperature than the latter, so that here we have an evidence of a development in time of each individual star. As a star is cooling, its spectrum passes through all these types, and thus our sun is at a later stage in its life-history than Sirius, though it may not be really any older, since it is probably much smaller than Sirius, whose development will therefore be slower. Our sun, indeed, cannot be compared in size or splendour to some of its distant compeers, not a few of which must present peculiarly complicated systems. Thus the telescope reveals many S. to be really double. This may be due to the fact that two S. happen to be in nearly the same straight line with the earth; but by careful observation over many years, it has been established that many of these double S. are physically connected, just as our own earth and the moon are, the one component revolving round the other in a definite period. Comparison of Herschel's observations with the elder Struve's, and of his with the younger Struve's, has proved this beyond a doubt, and observation is constantly adding to our list of real binary S. One of the most interesting of these is Sirius, from the irregularity of whose movements Peters and Anwers had concluded that it was accompanied by an attendant star or at least a large planet; and in 1862 such a companion was discovered by the younger Clark in the very direction in which theory had predicted it to be at that time. Its great minuteness renders detection hopeless except in very favourable circumstances. The motions of Procyon indicate a similar doubleness, but its companion has not yet been seen. Triple and multiple S. forming one system are also not uncommon. For instance, μ Herculis, recognised as a double star by Herschel, is really a triple star, the small Herschellian companion having been resolved into two in 1856 by Alvan Clark. An interesting optical property of these binary systems is that the colour of the one component is frequently the complement of that of the other. A very remarkable double star is 61 Cygni, whose components have not perceptibly altered their relative position since the time of Struve; and yet that they are physically connected there can be little doubt, since they have both got the same large proper motion (see below). 61 Cygni is also famous as the first star whose distance from the sun was calculated directly from its parallax, *i.e.*, from the angular distance between its positions as viewed from opposite extremities of the earth's orbit. The most probable mean of the various results gives about ·5 of a second for this parallax. This, however, is not the nearest star; it is nearly twice as far away as α Centauri, which according to Henderson has a parallax of 0″·91, corresponding to a distance of 226,000 times the radius of the earth's orbit, or more than twenty millions of millions of miles (20×10^{12}). In other words, light, which travels at the rate of 236,000 miles per second, takes

nearly three years to pass from the nearest fixed star to us. The parallax of at least half the stars of the first magnitude is probably less than one-tenth of a second, so that their average distance is greater than two million radii of the earth's orbit. That the magnitude of the stars may be taken *statistically* as a measure of their relative distances is quite warrantable, and was the principle upon which Herschel, and after him Struve and others, proceeded in their speculations as to the structure of the stellar universe. For these, however, we must refer to detailed treatises upon astronomy. Though, to the naked eye, S. have probably occupied the same relative positions from the earliest of historic times, the telescope reveals that they are not strictly *fixed*. Many have appreciable proper motions, among others 61 Cygni, as was before noticed. Its annual motion is 5″·2, which is exceeded, however, by that of Groombridge 1830, a star of the seventh magnitude, whose proper motion is 7″. As a general rule, the brightest S. have the greatest proper motion, and S. below the third magnitude move only a few seconds in a hundred years. This motion in the heavens cannot be taken even as an approximate estimate of the velocity with which any star is moving, since only the portion of the real velocity which is resolved perpendicular to the line of the sight is measurable. Spectrum analysis has, however, given us a means of measuring the velocity along the line of sight. The physical meaning of the dark absorption lines which cross the spectra of the sun and S. has been pointed out under SPECTRUM ANALYSIS. They indicate the *absence* of certain rays of definite refrangibility and wave-length from the solar or stellar light which reaches us. Since each star spectrum has its own peculiar lines, these must be due to absorption by the star's own outer envelope or atmosphere. Now, exactly as ocean waves will appear shorter or longer than they really are according as the observer is sailing against or with them, so will the wave length of each individual ray be shortened or lengthened according as we approach or recede from the source of light, and each absorption line in the spectrum, corresponding as it does to a ray of definite wave-length, will be displaced towards the violet or red respectively. By comparison with the spectrum of the substance to which a determined portion of these lines corresponds, this displacement may be measured, and from its relation to the particular wave length the ratio of the relative velocity of approach or recession of the star and us to the velocity of light can be calculated. The measurement of such a minute displacement requires extreme delicacy of manipulation, and accounts for discrepancies between results arrived at by different observers. Huggins, the most trustworthy of stellar spectroscopists, assigns to the receding S. Sirius, α Orionis, and α Geminorum velocities of 20, 22, and 25 miles per second respectively; and to the approaching S. β Geminorum, α Lyrae, and Arcturus velocities of 49, 50, and 55 miles per second. To get the whole velocities of these S. relatively to our system, these *radial* velocities must be compounded with their *tangential* velocities, which can be calculated only from a knowledge of their proper motions and parallaxes. Thus Sirius has an annual motion of 1″·3, and a parallax of about 0″·2; consequently its derived tangential velocity of 20 miles per second compounded with its radial velocity gives a total velocity of 28 miles relatively to the solar system. Such applications are, however, still in their infancy, and must lead in time to more certain results. See Struve's *Etudes d'Astronomie Stellaire* (1847); Herschel's *Cape Observations* (1847); Herschel's *Outlines of Astronomy* (1849); Lockyer's *Star-Gazing, Past and Present* (1878); and Newcomb's *Popular Astronomy* (1878).

Start Point (*Start*, old English *steort*, a 'tail' or 'point'), (1) A rocky headland jutting into the English Channel, on the coast of Devonshire, 8 miles S.W. of Dartmouth, and at the entrance to Start Bay. It has an intermitting light at an elevation of 204 feet. (2) The N.E. extremity of Sandy, in the Orkneys, with a revolving light.

Star-Thistle, from its prickly involucre and leaves, is a name given to *Centaurea calcitrapa*. See CENTAUREA.

Starva'tion, or Inani'tion. The symptoms which depend on protracted abstinence from food are thus described by Rostan and Orfila:—'In the first instance, pain is felt in the stomach, which is relieved by pressure. The countenance becomes pale and livid or cadaverous; the eyes are wild and glistening, the breath hot, the mouth dry and parched, the saliva thick and sparingly secreted. An intolerable thirst supervenes, which, in all cases of attempted suicide by S., or privation of food by accident, has formed the most prominent symptom. The body becomes slowly emaciated, the eyes and cheeks sink, and the prominences of the bones are perceptible; the feeling of pain may be so intense as to give rise to delirium. There is the most complete prostration of strength, which renders a person incapable of the least exertion. After a longer or shorter period the body exhales a fetid odour, the mucous membrane of the outlets becomes sometimes red and inflamed, and death may be preceded by a fit of delirium or by convulsions.' Dr. Taylor says regarding death from S.:—'The period which it requires for an individual to perish from S. is subject to variation; it will depend materially upon the fact whether a person has had it in his power or not to take at intervals a portion of liquid, to relieve the overpowering thirst which is commonly experienced. The smallest portion of liquid, thus taken occasionally, is found to be capable of prolonging life. It is probable that in a healthy person, under perfect abstinence, death would not commonly take place in a shorter period than a week or ten days. This opinion appears to derive support from the results of those cases in which there has been abstinence owing to disease in the throat and difficulty of swallowing food. Age, sex, state of health, and the effects of exposure to cold, may accelerate or retard a fatal termination.'

Several cases of *pretended fasting* are on record, the most recent of which is that of Sarah Jacobs, the *Welsh Fasting Girl*. This girl, æt. thirteen, was said to have voluntarily abstained from food for a period of *two years*. She had kept her bed during that time—lying in it decorated as a bride, visited by hundreds of persons: in fact, she was thus publicly exhibited by her parents as a girl of miraculous powers. Her lips were moistened with water once a fortnight, but, according to her parents, no food was taken. Four professional nurses from Guy's Hospital were set to watch the girl, and the result was, that after passing through the usual stages of actual S. she died on the ninth day. In this case the only proved abstinence from food was during the last eight days of her life. See *Medical Jurisprudence*, by Dr. Taylor (Lond. 1873), and *British Medical Journal* (May 12, 1877).

Sta'ten Island, so named by the Dutch in honour of the States-General, an island forming part of the State of New York, U.S., separated from Long Island by New York Harbour and the Narrows, which are strongly fortified, and from New Jersey by the Kill van Kull on the N., S. I. Sound on the W., and Raritan Bay on the S. Its length is 14 miles, its greatest breadth 8 miles, and its area 58 sq. miles. Its scenery is rich and beautiful, and it is a favourite site for the country residences of New York merchants, &c. In its centre is the county town of Richmond. It is traversed by the S. I. Railroad, and connected with New York by a system of ferry-boats. Pop. (1870) 33,029.

Sta'ten Island is separated from Tierra del Fuego by the strait of Le Maire, and has an extreme length and breadth of 45 and 10 miles respectively. It has a precipitous and deeply-indented coast, a mountainous surface clothed with evergreen vegetation, and a very wet and stormy climate.

States, or Estates (Fr. *états*; Ger. *Stände*), the name given in politics to the different classes or castes into which the people of a country is divided for legislative purposes. 'In nearly every Western country,' says Mr. Freeman, 'the old primary Assemblies gave way to representative Assemblies, formed on the principle of E. These E. were in most countries three—the clergy, the nobles, and the commons, the commons being for the most part only the citizens of the chartered towns. In some cases, however, where there was a numerous and independent yeomanry, they also had a share in the representation. Thus in Sweden the four E., the House of Peasants being one of them, lasted, wherever the genuine constitution of the country was in force, down to within a very few years past' (1866). The history of the English E. is traced in the article PARLIAMENT, and that of the French *tiers état* in the article STATES-GENERAL It is a common error to suppose that 'the three E. of the realm' in Britain are the Crown, the Lords, and the Commons—a mistake which has probably been occasioned by the

complete legislative fusion of the two E. of the Lords Spiritual and Lords Temporal. The 'Crown' is *not* an E. at all. As democracy progresses, the distinction between the different E. is in most countries becoming gradually obliterated, while in pure democracies, such as the United States, it is non-existent. The press is sometimes known as 'the Fourth E.' in England, but this is a mere witticism.

States-General (Fr. *états généraux*), so called in contradistinction to the local *états provinciaux*, the only representative assembly of France up to the Revolution. Under the Karolings there was an annual assembly of clergy and nobles, called either the *Champ de Mars* or the *Champ de Mai*, according to the time of meeting, but it had little of a representative character. The S.-G., properly so called, was first assembled by Philippe le Bel in 1302, on the occasion of his disagreements with the Pope. It was composed of representatives of the three estates, nobles, clergy, and *tiers-état* or *bourgeoisie*. It assembled at pretty frequent intervals during the 14th c., and not so regularly in the 15th and 16th centuries, being principally occupied with financial matters, though its functions in the imposition of taxation, &c., were very undefined, and its powers were encroached on from time to time by the royal authority. It had no legislative power whatever. The last S.-G. before the famous one which heralded the Revolution was that held under Louis XIII. in 1614. From that date until the 5th May 1789, the crown absorbed the whole functions of taxation as well as of government. The S.-G. of 1789, almost immediately on its constitution, was resolved by the secession of the representatives of the *tiers-état* into the *Assemblée Nationale* (q. v.).

The name S.-G. is also applied to the legislative body of Holland, lineally descended from the Estates-General of the United Province, which took such a prominent and honourable part in the revolt of the Netherlands.

Stat'icé, a genus of upwards of sixty species of herbaceous or sub-shrubby plants belonging to the natural order *Plumbaginaceæ* (q. v.). It is chiefly indigenous in saline districts and the sea-shores of temperate climates. Four species are British. The genus is amply represented in the greenhouse and the garden by species introduced from S. and E. Europe, Central Asia, and the Canary Islands.

Stat'ics is, briefly, the dynamics of equilibrium, as Kinetics (q. v.) is the dynamics of motion. In modern phraseology they are said to make up together the science of *dynamics*, since both deal with the effects of forces. According to Newton's first and second laws of motion, change of motion in a given mass indicates the existence of a force which is in the direction in which the change of motion occurs, and is measured by the product of the mass into the rate of this change, or what is called the acceleration. Thus, a falling stone of mass M suffers a constant acceleration g per second; hence the force pulling it down, *i.e.*, its *weight*, is measured by the product Mg. While the stone is descending, the problem is one of kinetics; but when it reaches the surface of the earth its motion relatively to the earth ceases, there is no acceleration, and the problem becomes statical. We do not conclude, however, that the force which formerly produced the acceleration no longer exists; but rather that its effect is balanced by the action of an equal and opposite force, conditioned by the impenetrability of matter. This upward *pressure* is exactly equal to the downward *weight*, and there is consequent equilibrium. Similarly a mass suspended by a cord is in equilibrium under the action of its own *weight* and the *tension* of the cord. Every kinetical problem may be reduced to a statical problem by introducing into the material system forces whose effects will balance the various accelerations to which the different parts of the system are subject. This, stated mathematically, is d'Alembert's famous principle, and is a direct consequence of Newton's third law of motion. Taken in connection with the principle of work done, otherwise known as the principle of virtual velocities, it forms the complete analytical expression for all problems, kinetical or statical, bearing upon natural phenomena. The problems with which S. deals are evidently particular cases of more general kinetical problems. Strictly, then, kinetics includes S.; but it has always been found convenient to discuss them separately, taking S. first as being the simpler though logically it depends upon the former. Dealing thus with equilibrium, it is independent of the consideration of mass except indirectly in so far as *weight* is involved.

Sta'tionery, a general term for paper, pens, and ink, and all the materials connected with writing. These articles were formerly vended by a merchant now called a bookseller, but then a *stationer*, because he carried on his business in a stall or *station*.

Sta'tionery Office, in London, a sub-department of the Treasury established in 1786, the medium through which all offices at home and abroad in connection with the Government are supplied with stationery, and through which all contracts for the printing of Parliamentary papers and reports are made. There is a branch establishment at Dublin. The S. O. is presided over by a Controller. On account of the magnitude of its transactions—£680,000 was expended by the department in 1872-73—a Select Committee of the House of Commons in 1873 recommended that on the next vacancy a Controller with a 'technical knowledge of stationery and printing' should be appointed, but on the resignation of Mr. W. R. Greg in 1877 Lord Beaconsfield found the recommendation 'utterly impracticable,' as no gentleman engaged in a successful business could be got to abandon it for the post. See Hansard's *Parliamentary Debates*, June 1877. There are permanent experts in every branch of the office, including two examiners and two assistant examiners of printing and printing accounts, one examiner and one assistant examiner of paper as material, and an examiner and two assistant examiners of binding.

Sta'tions (Lat. *statio*, 'a standing,' hence 'a post' or 'guard'), were the assemblies for divine service which the early Christians held at the tombs of the martyrs, walking thereto in procession. The assemblies were held on the anniversaries of the passion of the martyrs, and the name was perhaps derived from the regular return of these days (*stato die*). The name of *stationary* days was afterwards applied, however, to the Wednesday and Friday of every week (in connection with the passion of Christ), as well as to the Saturday and Sunday; and indeed the name S. seems to have been applied generally to all assemblies for worship. It is therefore thought by some that S. was simply a military term, so many of which are used in the New Testament (*cf.* Eph. vi. 10-18), transferred to the Church, as if Christians at their services were like soldiers upon duty. In later times, when processions came to play such an important part in the ritual of the Church, S., which properly meant the assembly appointed to be held at a certain church, &c., on a certain day, or the liturgy appointed for the occasion, came to be loosely applied to the places where the procession stopped, or even to the procession itself. In the Middle Ages it became common during Passion Week (q. v.) to make dramatic representations of the Passion of Christ in the form of a procession from a supposed Mount of Olives to Mount Calvary. The different incidents in the progress were marked by pictures, statuary, &c., at points where the procession stopped and engaged in appropriate devotions. The name of **S. of the Cross** was given to the different points on this Via Calvaria, and also to the series of devotions. See Bingham, *Orig. Eccl.* (2d ed. Lond. 1726); Martigny, *Dict. des Ant. Chret.* (new ed. Par. 1877).

Statis'tics, a branch of political science which deals with all collections of facts relating to social life, and which bases economical problems on numerical calculations. In the operations of government, attempts to gather statistical information have been made in the earlier stages of the development of all civilised countries. Thus taxation was regulated by the census of the Egyptians, Jews, Greeks, and Romans. But it is only in modern times that the subject has been rated at its just importance, and that statesmen and publicists have seen the necessity of laying a tangible foundation for speculation and theory. The honour of first directing public attention to S., and of re-naming the subject, formerly called 'political arithmetic,' belongs to Gottfried Achenwall (1719-72), professor of philosophy at Gottingen. In his lectures he enunciated the fundamental principle that the laws which govern nature, and especially those affecting the moral and physical condition of man, are constant, and may be discovered in the collection and collation of large masses of data, allowing that accidental diversities neutralise each other. Von Schlözer developed and illustrated this principle effectively towards the end of the 18th c., and the increased

study of political economy supplied a motive for its application in various countries. From the close of the French revolutionary wars all the leading European states organised statistical bureaus, departments, or commissions. In England, although the first census was taken in 1801, the birth of the science of S. may be identified with the passing of the first Reform Bill, which was immediately followed by the establishment of the statistical department of the Board of Trade (1832), of a statistical section in the British Association (1833), and of the London Statistical Society (1834). France, Prussia, and Austria are famed for the method and range of their 'returns,' but they were anticipated by Belgium, the statistical department of which, formed in 1841 under the influence of Lambert Quetelet (1796-1874), has ever since been a model for other states. In England the returns of exports and imports, of shipping, trade, and railways, are supplied by the Board of Trade; those of banks and circulation by the Treasury; those of pauperism by the Poor Law Boards; those of mortality by the Registrar-General, &c. The London Statistical Society has made an important collection of facts bearing on every branch of social science, and regularly tabulates the movements of trade and finance. The value of S. consists chiefly in their supplying premisses for the calculation of an average; and as an instance of the important side-light they throw on history, we may refer to Thorold Rogers' *Agriculture and Prices in England, 1259-1793* (Lond. 1866). Parliamentary reports embodying vast masses of S. are now annually published in England, while in the United States the bureau of S. and the Treasury Department issue monthly reports. Societies entirely or in part devoted to S. are to be found in every European capital, as well as in New York, Mexico, and Rio Janeiro. In 1853, on the suggestion of Quetelet, the first international congress was held at Brussels, and such meetings have since been held triennially. Several periodicals are devoted expressly to S., *e.g.* the English *Statistical Journal* and the French *Bulletin de Statistique*. A seminary of S. was formed at Berlin in 1861, and a chair of S. in the university there in 1874. The practical value of S. in sanitary science has favoured the demand for the appointment of a special minister of S. made by Dr. Richardson and others at the Social Science Congress of 1878. See *Report of Fourth International Statistical Congress*, with introduction by Dr. Farr, and Quetelet's *Lettres sur la Theorié des Probabilités appliqué aux Sciences Moral et Politiques* (1846), and Hubner's *S. of All Countries* (Lond. 1872).

Stat'uary. See SCULPTURE.

Stat'ute. See ACT OF PARLIAMENT.

Staub'bach ('dust-stream'), a famous Swiss waterfall in Bern, 8 miles S. of Interlachen, and near Lauterbrunnen village. The rocky heights here send down some twenty brooks, the chief being S., which has a sheer descent of 980 feet. In the sunshine it presents the appearance of a transparent lace veil of 'rainbow hues,' thrown by the breeze into exquisitely beautiful ever-varying forms. Long before it reaches the ground it is dissipated in silvery spray, as its name signifies. It is described by Byron, Wordsworth, Goethe, and others.

Staun'ton, a town of the State of Virginia, United States, on a branch of the Shenandoah, 136 miles N.W. of Richmond by rail. It has twelve churches, three newspapers, and considerable hardware manufactures, and is also the site of the State Institutions for the deaf, dumb, and blind, and of the State Lunatic Asylum. Pop. (1870) 5120.

Stavro'pol, a government of Russia in Cis-Caucasia, bordering on the Caspian Sea, is in extent as large as Bavaria, but has little more than half the inhabitants of Berlin. Area, 28,000 sq. miles; pop. (1870) 437,118. For the most part flat and low, it is watered by the Kuban, Terek, and Kuma. In the N.E. the inhabitants, chiefly nomads, rear large quantities of live-stock and horses, while those in the S.W., where the soil is more fertile, cultivate wheat, millet, wine, and mulberries.—**S.** (*i.e.*, Cross-Town), the chief town, on a hill, 2000 feet high, near the Kuban, has a modern appearance, with gardens, boulevards, &c. It has considerable trade in horses, cattle, sheep, wool, skins, honey, &c. Pop. (1870) 20,927.

Stavan'ger, a town of Norway, on the Stavangerfjord, a branch of Bukkenfjord, on the S.W. coast, 187 miles W.S.W. of Christiania. Its finest building is St. Swithin's Cathedral, built in the 12th c. by Reinald of Winchester, first bishop of S., burnt in 1272, rebuilt by the middle of the 15th c., and 'restored' in 1867 at a cost of £4500. S. has two excellent harbours protected by islands, and to it belong 533 ships (6 steamers) of 33,729 tons. In 1873 there entered 346 ships (106 steamers). The exports are pyrites, copper ore, dried fish, lobsters, and mackerel preserved in ice. Till recent years the herring-fishery was the chief support of S., but shipbuilding and freight trade are now its main sources of income. Pop. (1799) 2154; (1825) 4000; (1875) 20,370.

Stay, a strong rope running from the head of one mast of a ship to another mast ('fore-and-aft S.'), or to the side of the vessel ('back-S.').

Steal'ing. See LARCENY.

Steam, in scientific language, is water in the gaseous condition. Popularly, however, the name is applied to water in a state of cloud or mist at a high temperature, such as is produced when a jet of steam comes into contact with the cold air. Thus, the cloud which is seen issuing from a vessel in which water is boiling is not simply S., but is a mixture of steam with minute drops of water, which have resulted from the condensation of the water vapour as it came into contact with the colder atmosphere. Water vapour may exist as such at ordinary temperatures, as is proved by the fact that the atmosphere is always more or less humid. At a temperature higher than 100° C., water, if under the ordinary pressure of an atmosphere, cannot exist save in the gaseous condition; and to convert water into S. requires a definite expenditure of work. The heating of water at its boiling point does not raise the temperature of the water, but transforms it rapidly into S. at the same temperature; and the number of units of heat expended in converting unit mass of water into S. is called the *latent heat* of S. Regnault has experimentally determined this latent heat to be 536, where the unit of heat is the heat which is required to raise unit mass of water 1° in temperature. In other words, nearly five and a half times as much work must be done to convert boiling water into S. as is required to raise water from 0°C. to 100°C. This quantity of energy which steam contains is utilised as a source of work in our Steam-Engine (q. v.). At higher temperatures than 100°C., S. behaves, with reference to volume, pressure, and temperature, very much as other gases do, obeying Boyle's and Charles's laws. See HEAT, WATER.

Steam-En'gine is a machine which transforms heat into useful work through the medium of steam. Like the old Caloric Engine (q. v.), and the more modern Gas-Engine (q. v.), it is a special form of heat engine, its distinctive characteristic being the employment of steam as the vehicle of the energy which is transformed into useful work. The heat which disappears in converting the water into steam is stored up in the steam as potential energy, part of which, as the steam is cooled again, reappears as energy of motion in the moving parts, while part is dissipated in the inevitable form of unavailable heat. There is thus a more or less complete cycle of operations, the heat taken in at the boiler reappearing partly as heat in the condenser; and the difference in thermal units between the heat taken in and the heat given out has its equivalent in the mechanical work which the engine does during the operation. Ultimately, of course, this working part of the energy is also retransformed into heat. Such is the general principle upon which all steam-engines work. The steam, in passing from the boiler where it has been generated to the condenser where it is cooled—and wherever this cooling, which must be that work may be, occurs, there is theoretically a condenser—evolves the energy which is partly utilised in performing useful work. The other parts of an engine are simply the mechanical contrivances by which the necessary transformation is regulated and applied. In the following historical sketch of the development of the S.-E., the more important of these contrivances will be noticed in their due course, and their functions explained.

The first notice of a machine dates from the time of Hero of Alexandria, who flourished about 250 years B.C. His *aolipile* (Gr. 'the ball of Æolus,' the god of the winds) was simply a hollow globular vessel, capable of rotating round a central axis. By heat applied below, the contained water was transformed

into steam, which escaped out of side orifices. These escape-pipes were so directed that the outrush of steam caused the vessel to rotate in the opposite direction, according to the principle of Barker's Mill (q. v.). The energy of rotation was derived from the energy stored up in the steam, which cooled as it expanded. Hero also described an engine in which water, expelled from a receiver by the pressure of steam, was simultaneously raised to a height. His inventions, however, were productive of no real practical good; and not till the dawn of the Renaissance was any further attempt made to utilise steam as a motive power. Leonardo da Vinci, that universal genius whose touch gave an impulse to every department of art, literature, and science, has left a description of a steam-gun, which he ascribed to Archimedes. The bullet was propelled by the sudden generation of steam, when the closed compartment in which water had been previously strongly heated was suddenly opened. The next information we have is of a Spaniard, Blasco de Garay, who is said to have succeeded in propelling a ship by steam in the harbour of Barcelona in the year 1543 A.D. What truth there is in the report it is difficult to say; but if a fact, it must be regarded as the first attempt at steam navigation. In the next century, however, we have three well-authenticated inventions. Giovanni Battista della Porta (1601), Solomon de Caus (1615), and the Marquis of Worcester (1663), seem to have independently applied steam to raise water. Their inventions could not have differed much from Hero's invention for a like purpose, since their construction was as simple as could well be. The principle of all was that the pressure of steam acting upon the surface of water in a closed vessel drove the liquid out at the mouth of a vertical tube whose lower extremity dipped under the water. In Savery's engine (1698), which was intended for raising water out of mines, not only was the pressure of the steam used directly to force water up, but by cooling and condensing the steam which filled the water-chamber (connected by an upward-opening valve to the cistern) the pressure in this chamber was diminished, and the chamber re-filled with water by the action of atmospheric pressure. The steam from the boiler was then again admitted, and forced the water up to the exit-pipe to a height depending upon the pressure, the return of the water being prevented by a valve. Re-condensation of the steam was followed by a re-filling of the chamber; and thus, by alternate generation and condensation of steam, water was raised to a considerable elevation. In this apparatus there was necessarily a great waste of heat; and besides, enormous steam-pressure would be required to raise the water from even a moderately deep mine. It is to be observed that, in these inventions of the 17th c., the steam is used simply to raise water, and that the ancient *aeolipile* of Hero more nearly resembles our modern S.-E. than these do. A rotatory engine, which was impelled by steam as a windmill is by the wind, was constructed by Brancas in 1629, and successfully applied to raise water in buckets, saw timber, &c. That which made an effective S.-E. a possibility, however, was the introduction of the piston by Papin in 1690. A piston is simply a rigid disc, usually circular, which fits more or less closely in a cylindrical vessel, but not too tight to prevent its to-and-fro motion. It had been long used in the various forms of suction and force pumps with or without attached valves; but Papin was undoubtedly the first to conceive the idea of working a piston by steam pressure. His method was to generate steam in the lower portion of the cylinder, and thus raise the piston. When the piston had reached its highest point, the steam in the cylinder was condensed by cooling, and the piston forced down by the atmospheric pressure upon its upper and exposed surface through the vacuum created below it. Papin proposed that such a machine should be made to work pumps, and by means of rack and pinion work drive paddle-wheels and other revolving machinery. Here, then, was the germ of the now extensive development of steam power. Besides thus inaugurating a new era in the history of the S.-E., Papin made other useful inventions, notably the Safety-Valve (q. v.), which prevents the pressure in a boiler increasing indefinitely. Succeeding Papin we have Newcomen (1713), who improved upon the engine of the former by separating the boiler altogether from the cylinder, an improvement which it is singular Papin should have missed. The down stroke of the piston was still produced by the atmospheric pressure; but the condensation of the steam was effected by introducing a jet of cold water, a method which much facilitated matters. A characteristic feature of Newcomen's engine was the *beam*, which oscillated upon a central horizontal axis about its mean horizontal position. Its extremities were expanded in the form of circular arcs, to the upper extremity of each of which a chain was attached. The one chain was fastened to the piston, the other to the pump-rod by which the pump was to be worked. The pump-rod extremity of the beam was heavier than the piston extremity, so that when the engine was at rest the piston was at its highest point. Matters being so, let steam be introduced from the boiler into the cylinder until most of the air is expelled from the latter. The communication with the boiler is now cut off, and by the same mechanical operation a stop-cock is opened which projects a jet of cold water into the cylinder, thus condensing the steam and diminishing the pressure below the piston. The piston is accordingly driven down by the pressure of the atmosphere; its end of the beam descends, the opposite end rises, and with it the pump-rod and load of water. Such is the essential action of the Newcomen engine. The water raised was taken to the tank which supplied the cold jet, and the cold jet and condensed steam in the cylinder were drained off to feed the boiler. In the original engine ceaseless attention was required to work the taps, which opened and closed the duct from the boiler, and simultaneously closed and opened the cold-jet nozzle. A Cornish lad, Potter, to save himself such trouble, attached the taps to the beam, which then did the necessary work. The valve-motion was an immediate improvement, and a self-acting engine was a reality. Since the only effectual work was done during the *down* stoke of the piston, Newcomen's engine was not strictly a *S.-E.* It was an atmospheric engine, and steam was employed not to do work directly, but only to make conditions favourable for work to be done by the atmospheric pressure. Several improvements were added by Smeaton, who first laid down rules for proportions and attempted to measure the power; but Newcomen's engine remained essentially the same till about the year 1763, when Watt appeared. Before passing on to consider the radical improvements introduced by him, we should notice Leupold's engine (1720), which was provided with two piston chambers placed side by side. The pistons, provided with rigid piston-rods, were raised alternately by the direct pressure of the steam, as had been done in Papin's engine a quarter of a century before. The novelty introduced by Leupold was in the means of condensing the steam which was simply exhausted into the atmosphere. The same movement which let the steam escape from the one cylinder cut off its supply from the boiler, but opened the duct leading from the boiler to the other cylinder.

In the year 1763 James Watt, philosophical instrument maker to the University of Glasgow, received a model of a Newcomen engine from the natural philosophy professor to repair. The difficulty he experienced in making this model work opened his eyes to the great defects of the engine, and these he proceeded to eradicate. His great improvements, as specified in his patent of 1768, were as follows: To prevent needless waste, the cylinder in which the piston worked must be kept at the temperature of the steam which came from the boiler. The exterior surface of the cylinder should therefore be covered with some badly conducting material; steam or other hot substance should circulate freely round the cylinder, between double walls for instance, and nothing of a lower temperature than the steam should be permitted to enter. Hence the steam must be drawn from the cylinder and condensed elsewhere, either in the air as in Leupold's engine, or in a separate vessel which Watt called a *condenser*. To remove from the condenser any uncondensable gases which by their presence might impede the action of the engine, Watt added pumps which were worked by the engine itself. The pressure of the steam he also purposed to use directly to move the piston, which he made steam-tight by covering it with a layer of oil or liquid fat instead of the water which had till then been universally employed. From one improvement he was led to another. Covering the cylinder above to keep out the cold air, he conceived the bold idea of making the piston work by steam-pressure alone, without any use whatever of atmospheric pressure; and thus was his *double-action* engine gradually developed. The principle of its working is simply this: The steam introduced below, after forcing the piston up, is drawn off to the condenser, where a jet of cold water is playing. At the same time, the supply of steam from the boiler is directed into the upper part of the cylinder, so that, with pressure above and vacuum below, the piston descends. This steam is in its turn

drawn off and condensed; a new supply enters below; and with pressure below and vacuum above the piston ascends. Since the up-stroke as well as the down-stroke is effective, the piston had to be attached to the beam by a rigid rod. This rod must move vertically up and down; but as certainly must the extremity of the beam describe a circular arc. How, then, to convert circular motion into rectilinear motion was a problem needing a practical solution. In the earlier engines, a rack working upon a toothed arc served the purpose. But this lacked smoothness of motion, and, besides, was necessarily accompanied by great waste. In his *parallel motion*, however, Watt surmounted the difficulty; and his ingenious mechanism is an essential part of every beam-engine. So far Watt's engine accomplished no more than Newcomen's, though it accomplished it infinitely better. Both sustained a reciprocating motion, which was specially useful for pumping water out of mines. To convert such reciprocating motion into a rotatory motion, so as to apply the engine to a variety of useful ends, was now the great problem. It also was solved by Watt. To the other extremity of the beam he applied the Crank (q. v.). True, in his own engines he was compelled for a time to adopt another device known as the 'sun-and-planet' motion, since the 'crank' had been pirated and patented by another. On the expiry of the patent, however, the superiority of the earlier invention asserted itself. To equalise the motion, the fly-wheel was subsequently added, which by its momentum carries the crank past its dead-points. (See FLY-WHEEL.) To Watt also is due the beautiful mechanism, known as the Eccentric (q. v.), which so effectually works the valves which regulate the action of the steam in the cylinder. In 1782 Watt took out a new patent, which embodied another great improvement. The steam introduced into the piston-cylinder was cut off before the piston had completed its stroke. The momentum of the piston, and the expansion of the steam in the cylinder, were sufficient to make the piston complete its stroke, which it did without coming into violent contact with the end of the cylinder. There was thus no energy lost as heat of percussion, and the chance of damaging the engine was very much lessened. The governor and indicator complete the list of Watt's most important inventions and improvements. The governor consists, in its most usual form, of two balls so suspended from a vertical shaft that they swing outwards when the shaft is rotating. For a certain position of the balls, conditioned by the rate of rotation of the shaft (*i.e.*, by the speed at which the engine is working), a connecting mechanism, which has assumed an endless variety of forms, opens a valve, thus diminishing the steam pressure and slackening the speed of the engine. The indicator consists of a small piston working in a cylinder which is fixed to the steam cylinder of the engine, and by means of a stop-cock can be put into communication with the interior of the same. When this is done, the steam pressing upon the indicator-piston raises it, and presses it against a spiral spring, so constructed that the distance through which it is compressed is proportional to the pressure which raises the piston. A pencil is attached to the piston, and presses lightly against a sheet of paper which is wrapped round a vertical cylinder capable of turning round its axis. This rotation of the cylinder is regulated by the working piston of the engine, and the angle through which it has turned at any instant is proportional to the distance through which the piston has moved from the beginning of the stroke. Hence, during a complete stroke of the piston, the indicator pencil will move up and down and back to its original position, measuring at every instant the *pressure* which drives the piston, while simultaneously the indicator-cylinder will rotate once and return, measuring at every instant the *volume* of the steam or working fluid. The pencil will thus trace upon the paper which covers the indicator-cylinder a closed curve, which not only tells us much about the action of the engine, but represents by its *area* the amount of work done by the steam at each stroke of the engine. (See Maxwell's *Theory of Heat*, chap. v., for the complete theory of the indicator.) Our condensing engine of the present day is in all essentials the same as Watt left it. True, we have altogether dispensed with the *beam*, which was so long characteristic of this type of engine; but Watt himself did not fail to see that the beam was simply an adjunct and not an essential. He however retained it as convenient for the purpose to which his engines were chiefly applied during his lifetime; that, namely, of pumping water out of mines. The subsequent application of the S.-E. to locomotion and manufacturing purposes proved the beam to be not only unnecessary but absolutely deleterious to the working of the engine. Thus in the inverted beam-engine of the *Great Western*, which crossed the Atlantic in 1838, the beam was found to be unfitted to sustain the strains which came upon it. In applying the beam-engine to navigation, the beam was first lowered so as to make the ship's centre of gravity as low as possible, as in the *side-beam* S.-E., invented by Napier of Glasgow. To make the engine more compact, the one arm of the beam was dispensed with, and this form of *lever-engine* is still to be seen on paddle-steamers. The lever, however, soon followed its predecessor; and the tendency is now to make all engines *direct-acting*, in which the piston-rod is connected directly by a rod with the crank. Of such three kinds are distinguished. In the one kind the parallelism of the piston-rod is preserved by the use of Watt's parallel motion linkage; in the second it is preserved by *guides* or sliding surface; while in the third, the *oscillatory* engine, the cylinder is hung upon pivots and follows the oscillations of the crank. The second kind is extensively used for navigation, and the last is common in the ordinary steam-crane. The position of the cylinder matters very little, but the commonest type of engine is the *horizontal* S.-E., introduced by Taylor and Martineau, in which the cylinder is set horizontally, an arrangement familiar in the ordinary locomotive of the present day. The locomotive, as it now exists, is undoubtedly due to the genius of Robert Stephenson; but before his day several successful attempts had been made to drive a vehicle along a road by steam. In 1769, Cugnot constructed a steam-carriage which carried four persons at the rate of 2 or 3 miles an hour. Oliver Evans, of the State of Maryland (1772), William Symington, best known for his early development of steam navigation (1786), and others, proposed and constructed steam-carriages; but the first really successful road-engine was Trevethick's, patented in 1802. It was a high-pressure, non-condensing engine, exhausting into the chimney, and had a horizontal cylinder and piston, with a connecting crank, working at the mid-length of an axle, which carried a fly-wheel and a pair of cog-wheels which geared into corresponding wheels on the axle of the driving-wheels. It was run upon a railway at Merthyr-Tydvil, and was the first locomotive to run upon rails, which were then constructed with projecting teeth into which cogs on the bearing wheel fitted. This contrivance was shown to be unnecessary by Hedley, whose *Puffing-Billy* (1813) was the first locomotive which ran on smooth rails. The success of the locomotive is, however, due chiefly to Stephenson, who in his *Rocket* (1829) introduced the blast-pipe and the tubular boiler, which together adapted the engine for the peculiar work it had to perform. The blast-pipe, by conveying the steam from the cylinders into the chimney, aids the draft and thus regulates the rate at which steam is produced in the boiler; while by means of the tubular boiler the surface by which heat is communicated from the fire to the water is greatly increased. It was the combination of these two improvements which gave to the *Rocket* its advantage over Hackworth's *Sanspareil*, and Braithwaite and Ericsson's *Novelty*, on the day of the famous competition, October 6, 1829. The blast-pipe Stephenson borrowed from Hackworth's engine, and the boiler was invented independently by Booth and Séguin; but to Stephenson was due their practical combination. Further, he introduced many detailed modifications and improvements, determining the best relative dimensions of the component parts, so that to him, and to his son George, we owe the development of a locomotive system which has covered the civilised world with a network of railways, has extended commerce, increased wealth, and by facilitating and encouraging travel broken down many of the barriers of national prejudice.

Since the days of Watt, who we have seen first successfully transformed reciprocating motion into rotatory motion, the problem of obtaining this rotatory motion directly has engaged the attention of many mechanicians. As yet, however, no rotary (more properly rotatory) engine has been constructed which has proved more economical than the reciprocating engine with crank attached. The rotary machine of Brancas has been already mentioned, and all later attempts have proceeded upon the same principle; that, namely, of using a piston capable of moving continually round a centre. The steam was made to act either directly, as upon Brancas' vanes, or by its reaction, as in the still older *æolipile*. Scheutz, Thomp-

son, Behren, Pillner, and Hill are names connected with the most successful of these attempts; and more recently Dudgeon, a Scotchman resident in America, has invented a rotary engine of very simple construction. It consists of two spur-wheels, whose teeth work steam-tight into each other, and whose ends work steam-tight against two side plates. The steam, introduced through one of the end plates into the cavity between two pair of teeth, press against them so as to force both wheels round in the required direction. In a certain position the steam is cut off and introduced into the next succeeding cavity, the steam in the first cavity meanwhile expanding until, when the teeth pass beyond contact with each other, it escapes. It has been impossible in the preceding historical sketch to describe in any detail the working parts of an engine. These can only be thoroughly understood by studying the engine itself or a working model. Numerous varieties of engines are annually constructed by different manufacturers, but all work upon substantially the same principles which were embodied in Watt's S.-E., and to understand one is to understand all. The total value of S.-engines, apart from other kinds of machinery exported by Great Britain, was £2,018,864 in 1877. See Rankine's *S.-E. and other Prime Movers* (1859), for the complete theory of the S.-E.; also Goodeve's *Text-Book on the S.-E.* (1878).

Steam-Hamm'er. See HAMMER.

Steam Naviga'tion. To apply steam to the propulsion of vessels occupied the attention of many before it was fairly accomplished. Blasco de Garay (1543), Denys Papin (1695), Savery (1696), and the other early engineers who studied the action of steam, proposed and even carried into execution plans for realising S. N. Papin launched a boat upon the Seine which was driven by paddles worked by steam; but the great loss of energy in his form of engine prevented the practical development of his idea. In 1730 Dr. Allen, an Englishman, suggested the use of a backwardly discharging pump; and seven years later, Jonathan Halls patented a method for propelling a ship by a stern-wheel driven by an atmospheric engine. Not till the introduction of the crank by Watt, however, could S. N. be really successful, on account of the difficulty of transforming reciprocating into rotatory motion. Still, some success was attained by Symington in 1788, when he applied a steam-engine to the pleasure-boat of Patrick Miller, of Dalswinton, to drive side-paddles. The succeeding year he constructed a steam-boat, 60 feet long, which travelled at the rate of seven miles an hour upon the Forth and Clyde Canal. In 1802 he constructed another boat, the *Charlotte Dundas*, in which he adopted Watt's double-action engine, with connecting-rod and crank, and used only one paddle-wheel placed at the stern. Meanwhile, in America, Oliver Evans had constructed a steam-driven dredging machine (1789), which navigated the Schuylkill and Delaware rivers; and in 1807 Fulton established the now extensive American steam-boat system. His *Clermont* accomplished the distance from New York to Albany in 32 hours; and he thus obtained the monopoly of the Hudson. The next year, however, Stevens' *Phœnix* steamed from New York to Philadelphia in three days, and was thus the first steamer used in ocean navigation. To Fulton is due the invention of the paddle-box; and by proportioning the size and strength of the parts he did more than any other man in introducing S. N. as a system, especially upon the great rivers of the West. In 1814 a steam man-of-war was launched under the name of *Fulton the First*. In 1812 the *Comet*, built by Bell, plied between Glasgow and Greenock; and two years later there were five steamers plying regularly in Scottish waters before one had been introduced in England. Since then, however, the development of S. N. has been extremely rapid; and in 1818 the *Savannah* (Captain Rogers) accomplished the distance between Savannah and Liverpool in 22 days, 18 of which she was propelled by steam. She was thus the first steamer to cross the Atlantic. In 1824 the *Enterprise* (Captain Johnson) doubled the Cape of Good Hope. The introduction of the Screw-Propeller (q. v.) was mainly due to Ericsson (1837). It would be impossible now to particularise any of the magnificent passenger steamers belonging to the Cunard line, the Inman line, the White Star line, the Pacific S. N. Company, the Pacific Mail Steamship Company, &c. The largest steamship ever constructed is the Great Eastern, which is 674 feet long, 77 feet broad, and has a gross tonnage of 22,500 tons. It is provided with ordinary paddle-wheels and a four-bladed screw-propeller, with engines to suit, of a total nominal horse-power of 2000. In 1877 there were registered at the 83 principal ports of Great Britain and Ireland 4552 merchant steamships, of a total tonnage of 2,136,361.

Stear'ic A'cid ($C_{18}H_{36}O_2$) is prepared by saponification with soda-lye of certain fats, such as beef or mutton suet, cacao fat, or the fat of cocculus berries. An impure form is largely prepared for the manufacture of stearin candles by saponification of the harder fats with lime. Pure S. A. is a tasteless and inodorous solid, of the same density as water at 10° C. It melts at 69°, and can be distilled without decomposing. It has a distinct acid reaction, and forms stearates which have the consistency of hard soaps and are mostly insoluble in water. Of the glyceryl stearates or stearins the most important is that having the composition $(C_3H_5)(C_{18}H_{35}O_2)_3$. It exists as the solid constituent of natural fats associated with olein. It crystallises in masses of white pearly needles, and whether prepared artificially or obtained directly from solid fats, can exist in three allotropic conditions, which differ markedly in their melting points.

Ste'atite, or **Soap'stone** (Gr. *stear*, 'fat'), a silicate of magnesia, with small and variable quantities of water, alumina, and lime. It is opaque and non-crystalline, soapy and unctuous to the touch, and grey or yellowish white in colour. It occurs abundantly in Cornwall, Greenland, and many other parts of the world, generally in connection with limestone and serpentine. Agalmatolite is a beautifully mottled variety, used in China for delicate carvings. Common soapstone is used for very numerous purposes; *e.g.*, for polishing mirrors, for marking cloth, for fulling, and for diminishing friction in machinery.

Steator'nis, or 'Fat Bird' (*S. Caripensis*), a species of *Caprimulgidæ*, or Goat-Sucker (q. v.), found in Trinidad, and so named from the fat obtained by the Indians from the young birds, which are knocked down in great quantities by long poles. The fat is melted in clay pots, and is highly valued by the natives.

Steel. Recent improvements in the metallurgical treatment of iron have so broken down all dividing lines between malleable iron, cast iron, and steel, that there is now much difficulty in defining and limiting any of these forms. S. may in a general way be defined as a variety or condition of iron capable of being melted and cast, hammered and welded, and of being tempered, or hardened and softened. It is thus in its properties intermediate between malleable and cast iron, and in its composition it also occupies a middle place between these two varieties. The proportion of carbon contained in the metal is the chief element in determining its character, cast iron containing generally from 2·5 to about 5 per cent. of carbon, S. having from ·05 to 1·80, and the proportion in malleable iron varying from ·016 up to about ·34; but there are other circumstances which also go to determine the nature and quality of any of the kinds.

The methods by which S. of various qualities are now produced are numerous, but they may all be included under these heads:—1st, The partial decarbonisation of cast iron; 2d, The addition of carbon to malleable iron; and 3d, The complete decarbonisation of pig-iron, and the addition of the necessary carbon by means of pig-iron or other kinds rich in carbon to the molten mass. By the first of these processes what are known as natural S. and puddled S. are produced. Natural S. is made from pure varieties of pig-iron (white or fusible grey pig, from spathic or magnetic ores) by melting it with charcoal on the hearth of a refining furnace, as in the corresponding operation in the manufacture of malleable iron; the operation being so controlled that it can be stopped when the desired amount of decarbonisation has been effected. Natural S., known also as Styrian or Carinthian S., from having been largely made in these provinces, was formerly in great request on the Continent for tool-making. Puddled S. is a similar but less pure product, made also direct from cast iron on the bed of a puddling furnace, the puddling being stopped before the complete oxidation of the carbon. In this process, also, the only difference from the analogous stage in malleable-iron manufacture consists in stopping the operation at an earlier stage. The S. of the famous works of Krupp at Essen is made by this process, and it is largely used for machine castings, railway wheel-tires, and other large works.

The kinds of S. produced by the imparting of carbon to malleable iron are known as cementation S., and the varieties included under this head embrace the most valuable classes of

S. The production of cementation S. depends on the fact that when malleable iron is heated to a high temperature in contact with carbonaceous matter without access of air, it absorbs carbon, and thus becomes converted into S. Bar iron of the highest quality only is used for making cementation S., and the bars are embedded in powdered charcoal, and packed in a chamber heated by a furnace. The temperature is gradually raised, and kept uniformly at a full red heat (about 2000° Fahr.) for about a week, at the end of which time the furnace is allowed to cool slowly down, which requires another fortnight. When the bars are unpacked they exhibit a surface covered with small blisters, whence the S. in this condition is called 'blister S.' To make it homogeneous, the bars are faggoted, heated to welding heat, and hammered or rolled, the resulting material being 'shear S.' When, instead of being hammered, the blister S. is melted in crucibles and cast in moulds, it forms 'crucible cast S.,' the purest of all varieties of S., and that which is principally used for files, cutlery, and fine tools generally.

Siemens-Martin S. is produced by what may be regarded as a modification of the cementation process, since in it malleable iron is carburetted by means of pig-iron or other compound rich in carbon. There is, however, in the process little in common with the cementation process, and the product is of a different class. Siemens-Martin S. is manufactured by the agency of the Siemens Regenerative Gas Furnace, and it is entirely owing to its employment that the method of S.-making which was introduced by Martin, and had been proposed by others has been rendered practicable. On the hearth of an open furnace, heated by gas on the regenerative system, a quantity of pig-iron is melted, and to that scrap iron, old rails, &c., heated to redness, are gradually added. When by the examination of test pieces it is found that the quantity of carbon is sufficiently reduced, by the addition of malleable iron, for the kind of S. required, the charge is run off. The Siemens-Martin process is also conducted in a manner modified as follows:—The pig-iron and malleable scrap are melted together, an operation which occupies from 2½ to 3 hours, and thereupon a quantity of iron ore (hæmatite) is added to the furnace, which in giving off its combined oxygen decarbonises the entire charge. When the decarbonisation is found to be complete, from 8 to 10 per cent. of spiegeliesen (or about 2 per cent. of ferro-manganese), previously raised to a red heat, is thrown into the furnace. After about ten minutes this will be thoroughly dissolved, the carbon disseminated through the mass, and the charge ready for being tapped off. S. so made is now largely used for rails, waggon wheels and axles, and it is being introduced for boilers, ships' plates, and other similar purposes.

Bessemer S. forms the subject of a separate article. S. presents physical characteristics so distinct from those of malleable iron, that it may be for practicable purposes regarded as a distinct metal. Its most remarkable physical characteristic is its power of becoming exceedingly hard by sudden cooling from a high heat, and of passing through many grades of hardness downward from that point by the process of tempering. The tempering is accomplished by re-heating the metal to a certain degree and allowing it gradually to cool, and according to the heat to which it is raised is the resulting temper, the higher the heat the softer being the S. In practice the colour which bright S. assumes as its temperature rises is a sufficient guide to the workman in tempering bright S. articles. A light straw colour indicates a heat of from 428° to 446° F., and gives the hardest temper required for lancets, &c. A full yellow 473° is employed for fine cutlery; at 509°, indicated by a purplish tinge, is the temper for ordinary cutlery obtained, and the shades of blue shown from 536° to 572° yield S. of high elasticity useful for watch-springs and similar purposes. Sir Joseph Whitworth has introduced a method of compressing with enormous force cast S. in its fluid state, and he demonstrates that thereby the tensile strength and homogeneity of the metal are increased in a remarkable manner.

In the British Mineral Statistics and the Board of Trade Returns, the manufacture of S. has not hitherto been distinguished from the ordinary statistics of iron in such a manner as to enable the progress of S.-making to be distinctly indicated by figures. The manufacture, however, of S. on the large scale has been entirely created since 1855; and during the last five years, in spite of general commercial depression, the development of the British S. industry has been greater than during any previous quinquennial period. In 1870 there were 18 Bessemer S.-works, having 85 converters, which turned out 215,000 tons; while in 1877 the production of 24 S.-works, with 110 converters, amounted to 750,000 tons,—more than a threefold increase in seven years. Messrs. Bolckow, Vaughan, & Co., who introduced Bessemer S.-making into the Cleveland district, are turning out (December 1878) at Eston about 1700 tons of S. rails weekly. They are at present on the eve of a still greater enterprise, the erection of a magnificent S.-making plant at Middlesborough, for the double purpose of discovering the best and cheapest means of making the material which is superseding iron, and achieving the dephosphorisation of Cleveland pig, so as to pave the way to the use of native Teesside iron without the mixture of more costly Spanish and other ores. The attainment of the latter object will revolutionise the whole iron industry of N. England.

In 1877, experiments at the Spandau foundry by the Achatius method, with bronze S., were so successful, that they are regarded as the first step towards the complete substitution of bronze S. for S. ordnance in the German army. In the same year satisfactory experiments were made on the Steinfeld range, near Vienna, with two 15-centimetre bronze S. guns. The United States furnishes an extraordinary example of sudden growth and expansion in the S. manufacture, in so far as the production of Bessemer S. ingots increased from 40,000 tons in 1870 to 191,933 tons in 1874, 375,517 tons in 1875, and 525,996 tons in 1876, in which year the total number of converters was only 22. It will be seen on contrasting the statistics of the two countries that the United States, with one-fourth the number of converters, produced over two-thirds of the production of Great Britain,—a fact which is partly to be ascribed to the superior mechanical appliances in use in the former country. Prussia produced, in 1876, 369,446 tons of S., France 230,828 tons (268,361 in 1877, and 130,801 in the first six months of 1878), Belgium 75,258 tons, Sweden 22,789 tons, and Russia 8500, the Bessemer process chiefly being prosecuted in all these countries. S. is rapidly taking the place of iron in the construction of certain goods for which iron was formerly used alone. On railways the change in the material for rails is already complete, while every year S. is being more and more preferred for boilers, tyres, &c. In shipbuilding S. is now practically employed for making tow-lines, and experiments are at present being made for its introduction in other ways. The Admiralty gave instructions (November 1878) for the testing of the material in the construction of a few anchors, and if, as is expected, it stands the strain, it is likely to pass into extensive use, for Bessemer S. can be produced much cheaper than the 'best' iron of which anchors are now made. See *Iron and S.*, by W. Mattieu Williams (*Brit. Industries Series*, Lond. 1875), and J. Deby, *Report on the Iron and Steel Industries in Foreign Countries* (Newcastle, 1878).

Steele, Sir Richard, the son of an Englishman in the service of the Duke of Ormond, was born in Dublin in 1671. From Charterhouse School, to which he was sent by the Duke on his father's death, he proceeded to Merton College, Oxford, in 1692; but after three years at the university he fell in love with a military life, and in spite of his friends entered the Horse Guards as private. He soon became a favourite in the regiment, and rose to be captain of a company in Lord Lucas's Fusiliers. Finding that the temptations of his position were continually leading him to excesses which his better judgment condemned, he adopted the strange device of writing an account of *The Christian Hero* and publishing it to the world, in order that the fear of being ridiculously incongruous with his own acknowledged work should act as a check on his evil propensities. His literary faculty almost immediately afterwards found a new outlet in the three comedies, *The Funeral, or Grief à la Mode* (1702), *The Tender Husband* (1703), and *The Lying Lover* (1704). These were much more in keeping with *The Christian Hero* than might be supposed, and the last indeed was 'damned for its piety'! The influence of Addison, who had been his friend from the old Charterhouse days, procured him the post of editor of the *Gazette;* and this giving him access to special sources of information, enabled him to start a little miscellany of literature and news. The first number of the *Tatler*, as it was called, appeared in April 12, 1709, and from the very commencement the deftness and daintiness of S.'s work is evident. On the accession of the Tory minis-

try the post of Gazetteer was taken from him, and in 1711 he modified the plan and scope of his magazine and began the *Spectator*. In 1713 he entered Parliament; but in spite of the support of Walpole, Stanhope, and Addison, he was expelled from the House by a large majority for accusing the ministry, in a pamphlet called the *Crisis*, of treacherous intentions in regard to the Protestant succession. The following year saw him not only appointed surveyor of the royal stables, governor of the company of comedians, and justice of peace for Middlesex, but raised to the rank of knighthood, and returned again to Parliament. As commissioner of forfeited estates he visited Scotland in 1717, and while there he endeavoured to procure a union of the Churches of England and Scotland. His second wife, the 'Dear Prue' of his letters, died in 1718, and the next year he lost the goodwill of Addison by opposing a bill to limit the number of peers. In 1722 he gained a last literary triumph by his *Conscious Lovers*; but shortly afterwards he retired to Wales, and there he died of a paralytic stroke at Llangunnor, September 1, 1729. It requires no deep analysis to discover S.'s virtues or his failings. He was generous and forgiving to a fault; his intellect was clear, and his moral sympathies unimpaired; but his emotions were easily affected, and he had no permanent sense of the necessity of what was originally meant by *conduct*. His position in our literature has been the subject of debate. In his Essay on Addison, Macaulay used him as a foil to his hero, with a partiality which S. would have been the first to condone, but which Addison would not have been the last to censure. Mr. Forster, in an anonymous article in the *Quarterly Review*, 1855 (reprinted in his *Historical Essays* 1858), entered the lists in S.'s defence, and successfully maintained his right to equal honours with his illustrious friend. To S. we are indebted for the plan of the *Tatler* and the *Spectator*: it was S. whose fancy gave birth to Sir Roger de Coverley, Will Honeycomb, and Sir Andrew Freeport; and it is no disparagement to Addison to say that the best of S.'s essays are equal to the best of Addison's. We have to thank Mrs. S. for the preservation of her husband's letters, which were published by Nichols in 1787 (2 vols.), and form one of the most remarkable collections of the kind in our literature. See H. R. Montgomery's *Memoirs of Life and Writings of Richard S.* (Lond. 1865, 2 vols.), and for minor notices, Thackeray's *English Humourists*: *Esmond*; Disraeli's *Calamities of Authors*: Theophilus Parsons in *North American Review*, x., and E. T. Channing, *ibid.* xlvi.

Steell, Sir John, a Scottish sculptor, was born at Aberdeen in 1804, and received his first artistic education in the Royal Academy, Edinburgh. On his return from Rome in 1833 his colossal model of Alexander and Bucephalus attracted attention; and from that period onwards his career has been one of distinguished success. The figure of Queen Victoria for the front of the Royal Institution in Edinburgh procured him in 1844 the title of Sculptor to her Majesty in Scotland; and after the unveiling of the national monument to the Prince Consort in Charlotte Square, 17th August 1876, the artist was knighted at Holyrood Palace. To the embellishment of Edinburgh he has further contributed by the statue of Sir Walter Scott on the Scott monument, the equestrian statue of Wellington, the statues of Lords Melville and Jeffrey, of Professor Wilson (1865) and Dr. Thomas Chalmers (1878). In the hall of Greenwich Hospital is his statue of Lord de Saumarez; in the cathedral at Glasgow his monument to the 93d Highlanders; and in the Cathedral at Dunkeld his monument to the 42d Royal Highlanders. At Calcutta the statues of Dalhousie and Wilson are his; and at New York the colossal statues of Sir Walter Scott (1872) and Robert Burns (1873) in the Central Park.—**Gourlay S.**, brother of the preceding, born at Edinburgh in 1819, received his art-education at the Board of Manufactures under Sir William Allan, and studied privately under Robert Scott Lauder, R.S.A. He first exhibited in 1832. Among his principal works are 'Robert Burns turning up the Mouse's Nest' (1839; engraved); 'The Master of Ravenswood parting with Caleb Balderstone' (1842); 'Scene from *The Monastery*' (1843); 'Llewelyn and his brave Hound Gelert' (1857); 'The Death of Old Mortality' (1859); 'The Highland Raid' (1863); 'A Cottage Bedside at Osborne' (1863; engraved); 'The Pass of Leny—Cattle going to the Tryst'; 'A Challenge' (1876), &c. As a painter of cattle S. is unsurpassed in Britain. The rough shaggy creatures on his canvas seem almost to live under the touch of his graphic and brilliant brush.

Steel Toys is a technical term for small articles, as buttons, buckles, watchguards, &c., made of polished steel. They are mainly produced at Birmingham and London.

Steel'yard. See BALANCE.

Steen, Jan, a Dutch painter, second only to the greatest, was born at Leyden in 1626. His chief instructors were Brouwer and Jan van Goyen. In 1658, at his father's advice, he set up a brewery at Delft, and when this proved a failure he became keeper of a tavern. According to the traditional accounts he led a dissipated and thriftless life, and at his death left his wife and a large family in utter destitution. But whatever were his faults or misfortunes, the number of his paintings is sufficient to prove that he was no idle debauchee. His lines are too correct and his colouring too careful, to be the work of a drunkard. He generally selects domestic and social subjects from everyday life, and even when he represents historical and scriptural scenes he treats them with amusing simplicity. Fairs, weddings, tavern-incidents, and merry-makings are his delight, and he enters into the spirit of his theme with a fine mixture of kindly sympathy and satiric mockery. His humour is as genuine as that of Hogarth, and his satire is less brutal. He frequently introduces himself as a jovial participator or amused spectator. Among his more remarkable pieces are 'The Nine-Pin Players,' 'The Feast of St. Nicholas,' and 'The Representation of Human Life.' Upwards of 300 are described in Smith's *Catalogue Raisonné*, vol. iv. and *Supp.* As S. has always been a favourite in England, our collections, both public and private, are richer in his works than those of his native country. He is well represented at the Hague, in Amsterdam, and at the Hermitage in St. Petersburg. See Van Westrkeenen, *J. S.*, *Étude sur l'Art en Hollande* (The Hague 1856); J. A. Crour's edition of Kugler's *Handbook of Painting* (1874); and Van der Villigen, *Les Artistes de Haarlem*.

Steen'wyck, Hendrik, a Dutch painter, born at Steenwyck in 1550, died 1603. He excelled in the execution of church interiors, ablaze with tapers. His son Hendrik, called 'the Young S.,' was born about 1589, and became the friend of Vandyke, for whom he painted backgrounds. He died in London, in what year is unknown.

Steeple. See SPIRE.

Steeplechase' (Ger. *kirchthurmrennen*, 'a kirk-tower race'), the name given to a rough race across country. The peculiar name would seem to have been given to the race on account of the church steeple being fixed as the goal. Since the end of the 18th c. steeplechases have been run on regular courses marked out with flags. In 1841 the first *handicap* chase was run at Newport-Pagnell, and from that time the S. horses have been regularly weighted according to merit, without respect of sex, age, or size. In spite, almost it would seem because of, its danger, steeplechasing has become exceedingly popular throughout England, and forms an important item in nearly all spring and autumn meetings.

Steer'ing is directing a ship in a given course, and is effected by means of the helm or rudder. Under the latter heading the mechanical action of the helm is explained. The steersman's post is necessarily one of great responsibility, especially during rough weather, or in estuaries or straits where strong currents run. In such circumstances, S. is a practical solution of the composition of velocities.

Steevens, George, an English critic, was born at Stepney, Middlesex, 10th May 1736, educated at Kingston-on-Thames and Eton, and in 1754 became a scholar of King's College, Cambridge. His first publication, *Twenty of the Plays of Shakespeare* (4 vols. Lond. 1766), at once secured him a position among the literary workers of his time, and Johnson gladly accepted his assistance for the edition of Shakespeare which was completed in 1773; but after the appearance of Malone's 'Supplement' in 1780, S. set to work on his own account as a rival commentator, and in 1793 he produced a corrected text of the great dramatist in 15 vols. Though the work was as remarkable for the audacity of its gratuitous alterations as for its exhibition of learning and ability, it met with complete success, and remained the standard edition till the publication of Knight's in 1838. The fortune which he

inherited from his father relieved S. from all necessity to labour, and though he contributed to the *St. James' Chronicle*, the *Critical Review*, Johnson's *Lives of the Poets*, and Dodsley's *Annual Register*, and assisted Reed in his *Biographia Dramatica*, and Nicols in his *Anecdotes of Hogarth*, he made no important venture in his own name. He died at Hampstead, January 22, 1806. His library was sold for £2740, and a catalogue was published as *Bibliotheca Stevensiana*.

Steff'ens, Henrik, was born May 2, 1773, at Stavanger in Norway, entered Copenhagen University in 1790, and devoted himself to botany and mineralogy. After travelling at the expense of the Danish state in Norway (1794), and in Germany (1798), he was successively appointed lecturer at Copenhagen University (1802), professor at Halle (1804), at Breslau (1811), and at Berlin (1832), where he died, 13th February 1845. S. was a foremost disciple of the school of Schelling. His chief works, remarkable for their variety, the abundance and freshness of their ideas, and the richness of their style, are *Grundzüge der Philosophischen Naturwissenschaft* (1806), *Handbuch der Oryktognosie* (3 parts, 1811-19), *Anthropologie* (1822), *Karicaturen des Heiligsten* (2 vols., 1819-21), *Von der falschen Theologie und dem Wahren Glauben* (2d ed. 1831), the novels *Die Familien Walseth und Leith* (3 vols. Bresl. 1827), *Die vier Norweger* (6 vols. Bresl. 1828), and *Malcolm* (2 vols. Bresl. 1831), collected under the title *Novellen* (16 vols. Bresl. 1837-38), and his interesting autobiography, *Was ich Erlebte* (10 vols. Bresl. 1840-45), and *Nachgelassene Schriften*, with a preface by Schelling (Berl. 1846).

Stein, Heinrich Friedrich Karl, Freiherr vom und zum, the eminent Prussian statesman, was born of a noble family at Nassau on the Lahn, October 26, 1757. He studied at the University of Göttingen (1773-77), and in 1778 entered the service of the Prussian state, in which, owing to his rank, fortune, and abilities, he rapidly rose. In 1804 he was summoned to Berlin, and made minister of finance, trade, and commerce, under Friedrich Wilhelm III. In 1807, owing to some court quarrel, he was dismissed, but that same year he was recalled and appointed Prime Minister. This was immediately after the battle of Jena, when Prussia was completely under the power of France, and at the very lowest point of national existence. In the dark years that followed, S. carried through a system of reforms that cut his country free from past trammels, and laid the foundations of future greatness. The land had hitherto been exclusively in the possession of the nobles; now it might be held by peasants, whilst in return the upper classes were permitted to engage in trade without losing caste. All vestige of slavery was abolished. The right of self-government was given to municipalities, and military service was made compulsory on the whole male population. But these reforms, and S.'s general activity, soon attracted the unfavourable notice of the French government, and he was obliged to retire again into private life. In Hardenberg he found a worthy successor, who carried on his work cautiously but firmly while he lived in retirement at Prague. In 1812 he went to Russia, where he strove with all his might to rouse the Czar against Napoleon. He took an active part in the war of liberation that followed in a few years, though he was bitterly disappointed at its result as far as regarded Germany. He said the Vienna Congress ended in a farce. After the settlement of affairs he had no real share in the imperial government. His views were far too liberal to suit the then rulers of Prussia. In the management of the provincial affairs of Westphalia he took a warm interest, and in 1827 he was appointed a member of the Berlin Council of State, though this appointment was given as a mere empty honour which Prussia could not in decency withhold from her greatest living statesman. He occupied himself during the last years of his life in studies relating to the history of Germany. The last in the male line of his ancient family, he died at his castle of Kappenberg in Westphalia, 29th June 1831. S. was a man of iron will, of great practical ability, and of wide and far-seeing views. His darling schemes were German unity and a constitutional and free government; and though he did not live to see their fulfilment, he did much to make possible that which afterwards happened. See Pertz's *Leben des Freiherrn von S.* (6 vols. Berl. 1849-1855); Stern's *S. und seine Zeitalter* (Leip. 1855); and above all Seeley's *Life and Times of S.* (3 vols. Lond. 1878).

Stein'bok. See BOQUETIN.

Stein'thal, Heymann, an eminent German philologist, was born in Anhalt 16th May 1823, studied philology and philosophy at Berlin and Paris, and was appointed professor at Berlin in 1863. He is the author of *Ursprung der Sprache* (1851; 3d ed. 1877), *Entwickelung der Schrift* (1852), *Charakteristik der Hauptsächlichsen Typen des Sprachbaues* (1860), *Geschichte der Sprachwissenschaft beiden Griechen und Römern* (1862), *Abriss der Sprachwissenschaft* (1871), and a number of lesser writings on philological subjects.

Stella'ria. See CHICKWEED and STITCHWORT.

Stel'vio (It. *Giogo di Stelvio*, Ger. *Stilfserjoch*), a mountain pass between Italy and the Tyrol, and the loftiest carriage-road in Europe. It is part of the great road from Milan to Innsbruck, and crosses the Tyrolese Alps from Bormio to Glurns, in Austria, about half a mile S. of the Grisons frontier. The road, which attains a height of 9045 feet, was completed by the Austrian government in 1828 at a cost of £300,000. Over the pass tower the Geisterspitze or Monte Video, 11,362 feet, and the Tuckett-spitze, 11,368 feet, while the magnificent view to the N. includes the snowy dome of the Ortler. The S. is only free from snow in warm seasons; even in July the road is usually lined with drifts some 8 feet deep. In this pass are the Cristallo and S. glaciers.

Stem of a plant is its ascending axis, which grows upwards from the embryo, branches, and bears first one or more leaves in succession, then one or more flowers, and finally one or more fruits. It contains the tissues or other channels by which the nutriment absorbed by the roots, the water supply, and the elaborated sap, are conveyed to the necessary parts of the plant. The anatomical structure of the S. is very different in the two great classes of flowering plants called *Exogens* and *Endogens*, which correspond with few exceptions to the two classes Dicotyledons and Monocotyledons.

Sten'cilling, a ready method of producing a running ornament, fret, or other design on a wall or other surface by means of a stencil, *i.e.*, a piece of pasteboard or plate of metal in which the required pattern is cut. The stencil is laid on the wall, and a brush charged with colour is passed over it. Letters may be printed with ink in the same manner. Sometimes the stencil has the pattern pricked in outline only; in this case a small bag containing powdered chalk is struck against it, and the pattern so outlined on the wall is afterwards painted in.

Sten'dal, a town of Prussia, province of Sachsen, 36 miles N. of Magdeburg and 65½ W. of Berlin by rail. The finest of its six churches are the *Marienkirche* and the cathedral, founded in 1188. It has also a gymnasium, and a monument to Winckelmann. There are tanneries, wool, cotton, tobacco, glove, and cloth manufactories, and brick kilns. The first book printed (the *Sachsenspiegel*) in Altmark was issued here in 1488. Pop. (1875) 12,870.

Sten'ochromy (Gr. *stenos*, 'short,' and *chrōma*, 'a colour;' hence a short way of colouring), a process of Polychrome Printing (q. v.) recently brought to considerable perfection by Mr. Otto Radde of Hamburg, and patented by him in Great Britain. A colour-block representing a picture or design is built up after the manner of a mosaic, with soapy compositions, prepared by thoroughly incorporating pure pigments with fatty substances. The colour-compositions melt with heat, solidify on cooling, and possess the same specific gravity and yielding power. The method of forming the colour-block is as follows:—A shallow wooden frame of the size of the intended picture is taken, and into a portion of it, marked off with strips of brass placed edgewise, a quantity of liquid colour is poured. As soon as the colour has solidified, the required outline is traced on it, the brass strips are removed, and the colour is cut vertically to the tracing by means of a peculiar knife. Another compartment or cell is then formed with the pieces of metal, and a second colour is poured in and cut vertically as required. The same plan is followed with all the other colours; and when the picture is completed, the surface is levelled, and impressions are taken on paper of an absorbent nature with slight pressure in a kind of lithographic press. The stenochrome is finished by an overprint from a stone which marks the outlines. For highly-finished pictures from two to four overprints are necessary to obtain proper blending effects.

Stenog'raphy (Gr. *stenos*, 'narrow,' and *graphō*, 'I write'), a method of writing expeditiously by means of simple arbitrary

signs and abbreviations. The ancient Greeks had some acquaintance with this art, but it was left for Professor Taylor of Oxford to reduce it to rule during last century. Phonetic systems of shorthand writing like Pitman's have brought S. into disfavour, so that it is now seldom practised. See SHORTHAND.

Ste'phen, the name of ten, or, according to others, nine Roman popes. **St. S. I.** succeeded Lucius III. in 253. His pontificate (253-57) was signalised by his zeal against the heresies of Marcien, bishop of Arles, Basilide, bishop of Merida, and Martial, bishop of Leon, and by his controversy with Cyprian, bishop of Carthage, on the re-baptising of heretics. **S. II.** was elected pope, March 27, 752, but having died of apoplexy a few days after his election and before his consecration, he has not been counted in the number of popes by some historians.—**S. III.** (or **II.**) was elected pope, March 29, or 30, 752. Harassed by Ataulf, king of the Lombards, he fled over the Alps to Pippin, who received him with the utmost reverence, and was crowned by him king of the Franks in Rheims Cathedral (754). Pippin, warmly embracing the cause of S., entered Italy, defeated the Lombard king, and deprived him of the Exarchate of Ravenna, which he presented to the pope. From this 'donation of Pippin' dates the temporal power of the papacy. A second defeat of Ataulf added the Pentapolis to the dominions of the pope, who died in 757.—**S. IV.** (or **III.**) was elected pope August 5, 768, and the following year, in opposition to the Eastern Church, sanctioned at the Lateran Council the reverence of saints and images. He died in 772. **S. V.** (or **IV.**) succeeded Leo III. June 22, 816, but died in January 817, immediately on his return to Rome after having crowned Hludwig the Pious.—**S. VI.** (or **V.**), a native of Rome, succeeded Adrian III. in 885. Elected without the confirmation of the Emperor Karl the Fat, the latter wished to depose him, but S. was successful in maintaining his position. He died in 891.—**S. VII.** (or **VI.**), elected May 22, 896, is only remembered for his having caused the corpse of Formosus, his predecessor but one in the papal chair, to be exhumed, stripped of its pontifical robes, and condemned to lay burial. S., however, was strangled by his enemies after a reign of eighteen months, and condemned by his third successor to a similar indignity.—**S. VIII.** (or **VII.**) reigned from 929 to 931, entirely under the control of his mistresses, Theodora and Marozia. **S. IX.** (or **VIII.**), a kinsman of the Emperor Otto, reigned from 939 to 942. **S. X.** (or **IX.**), a brother of Gottfried, Duke of Lothringen, was elected pope in 1057 by the influence of Hildebrand (afterwards Gregory VII.). He vigorously opposed the sale of benefices and the immorality of the clergy, but after reigning eight months, died at Florence in 1058.

Ste'phen, King of England (1135-54), was born in 1105, third son of the Comte de Blois and Adela, sister to Henry I. Comte of Mortain by his uncle's grant, he was also Comte of Boulogne by marriage with the last count's daughter, and she through her mother came of Cerdic's line, and was the niece of David of Scotland. S. had sworn to receive the Empress Matilda as Lady (1127), but upon Henry's death he hastened over to England, and, elected king by a body composed of London citizens and notables of the land, was crowned by the Archbishop, 22d December 1135. Even Robert of Gloucester, the Empress' natural brother, paid him homage; Normandy acknowledged him before the year was out; and Pope Innocent confirmed a title which S. himself based in his Oxford Charter (1136) on the consent of clergy and people. Others, however, were found to challenge it. Geoffrey, the Empress' husband, had already invaded Normandy, and David (q. v.), crossing the Border, was only stayed by the cession of Cumberland. Next came a Welsh revolt and scattered risings; and a second Scottish invasion (1138) ended in the Battle of the Standard, fought at Northallerton (q. v.), the one bright spot in the darkness of S.'s reign. In 1139 Matilda landed in England, took S. prisoner, and, joined by his brother, the legate Henry of Winchester, was elected Lady of England and Normandy by a clerical synod (1141). Her haughtiness soon lost her the hearts of the London citizens; she fled to Oxford, and there was besieged by S., who had been exchanged for the Earl of Gloucester. In snow-white robes she crossed unnoticed the frozen Thames, and after five more years of weary warfare returned to Normandy (1147). The death of her brother and chief champion (1148), and of Eustace, S.'s son (1152), made both the rivals willing to come to terms; and the Treaty of Wallingford (1153) left S. king, with Henry, Matilda's son, his recognised heir. Before a year had passed S. died at Canterbury, 25th October 1154. 'He, mild man, was soft and good, and no justice did not,' says the pithy chronicler, and then describes with marvellous vigour how the land was filled with castles, and the castles were filled with devils, how poor men starved of hunger, and it seemed as if Christ and his hallows slept. Good came from the evil though, their common sufferings welding Norman and Englishman into a common people; whilst from the alternate depositions by the Church of S. and Matilda flowed the deposition of James II., the principle of a compact between the ruler and the ruled. See vol. v. of Freeman's *History of the Norman Conquest* (Oxf. Clar. Press, 1876).

Ste'phen, James, born at Pode, Dorsetshire, in 1759, of an Aberdonian family, was educated at Winchester. After serving as a parliamentary reporter, he received a post in the W. Indian island of St. Christopher's, there gained a thorough mastery of colonial law, and returning home with a large fortune became a celebrated advocate in prize cases before the Privy Council. Entering Parliament for Tralee, and appointed under-secretary for the colonies, he warmly espoused the anti-slavery cause, and for his suggestion of the successful Continental Blockade (1803) was created a master of the Court of Chancery. He died at Bath, 10th October 1832, having published *War in Disguise, or the Frauds of Neutral Flags* (1806), *History of Toussaint l'Ouverture* (1814), and *Slavery of the British W. Indies* (2 vols. 1824-30), which Macaulay described as 'the most comprehensive and in many respects most valuable' work upon the subject. —His son, **Henry John S.** (1787-1864), serjeant-at-law, was author of a *Treatise on Pleading in Civil Actions* (1824); *Summary of the Criminal Law* (1834), *New Commentaries on the Laws of England* (1841; 7th ed. by his son James S., 1874, &c.). —The third son, **Sir James S.**, born at Lambeth, 3d January 1789, having graduated LL.B. from Trinity Hall, Cambridge (1812), was called to the bar at Lincoln's Inn (1813). Appointed counsel to the Colonial Office and Board of Trade, he held these posts till 1834, when he became under-secretary of state for the colonies in Melbourne's Ministry. Ill-health obliged him to retire from office (1847), when he was knighted; but two years later he accepted a call to the chair of modern history at Cambridge, which he occupied down to his death at Coblenz, 15th September 1859. His brilliant *Essays in Ecclesiastical Biography* (1849; 4th ed. with Memoir by his son, 1860) were all but one contributed to the *Edinburgh Review*, and he was also author of *Lectures on the History of France* (1851).—**Sir James Fitzjames S.**, eldest son of the preceding, was born in London, March 1829, and educated at Eton, King's College, London, and Trinity College, Cambridge, graduating B.A. (1852). Called to the bar of the Inner Temple (1854), he travelled the Midland Circuit; and becoming Queen's Counsel (1868), was recorder of Newark-on-Trent (1859-69), and legal member of the Council of the Viceroy of India (1869-72), as such being author of the Indian Evidence Act. He was knighted, and in 1875 became Professor of Common Law at the Inns of Court. In 1873 he unsuccessfully contested Dundee as a moderate Liberal. Among his works are *Essays by a Barrister* (1862), reprinted from the *Saturday Review*; a *General View of the Criminal Law of England* (1863); *Liberty, Equality, and Fraternity* (1873); and *Digest of the Law of Evidence* (1876). In November 1878, when the policy of the English Government in reference to the Ameer of Afghanistan was vehemently assailed, S. was one of its most unflinching champions.—His younger brother is **Leslie S.** (born 1832), late fellow of Trinity Hall, and president of the Alpine Club, the present (1878) editor of the *Cornhill Magazine*. Besides the charming critical essays, *Hours in a Library* (2 vols. 1874-76), he has published *The Playground of Europe* (1871), *History of English Thought in the 18th C.* (2 vols. 1876), and *Samuel Johnson* (1878), in the series *English Men of Letters*. —**Sir George S.**, the first James S.'s youngest son, was born at St. Christopher's in 1794, and, formerly a solicitor, was called to the bar in 1849, travelling the Northern Circuit. Like his father, an earnest abolitionist, he was also active in the reform of parochial relief, the police force, and imprisonment for debt, earning thereby the honour of knighthood (1837). In 1855 he emigrated to Victoria, where he has since resided. Of several works by him, the chief are *The Niger Trade and African*

Blockade (1849), *Principles of Commercial Law* (1853), and *Anti-Slavery Recollections* (1858).

Ste'phen, St., King of Hungary (997-1038), was canonised after his death in recognition of his services as the introducer of Christianity into Hungary. An Order named after him exists in Hungary, and he is the patron of numerous churches. See HUNGARY.

Ste'phens (Lat. *Stephanus*, Fr. *Estienne*), the name of a celebrated French family of printers. (1) **Henri** (born about 1460 or 1470) was descended from the lords of Lambèsc in Provence.. He began to print along with Hopil Wolfgang at Paris in 1502, and before his death he had brought out more than 120 works in folio. The first was the *Ethica* of Aristotle, and most of the others were scientific or philosophical. His motto was either *Plus olei quam vini*, or *Fortuna opes auferre non animum potest*, the latter perhaps referring to the fact that he had been disinherited by his father as disgracing the family by his mechanical craft. He died in 1520. His three sons followed in his footsteps.—(2) **François** (born 1502, died 1550) continued in partnership with Simon de Colines, who married his father's widow and carried on the business.—(3) **Robert**, born in 1503, was one of the most learned men of his time. While still with Colines, and not more than nineteen years of age, he printed a copy of the New Testament, remarkable for its accuracy, and after his marriage in 1527 with Petronella, daughter of Judocus Badius Ascensius, his house became a regular rendezvous of the literati of Paris. The particular attention which he devoted to the Scriptures aroused the hostility of the Sorbonne, and in spite of the protection of François I., who made him printer to the king in 1539, he was more than once formally prosecuted for printing heretical matter. At length under Henri II. his position became so dangerous that he sought refuge at Geneva, where he passed over to the Protestant Church. He died in 1559. By his will, still preserved at Geneva, he disinherited his sons Robert and Charles because they returned to the Roman Catholic communion. Among the finest specimens of his printing are his Hebrew Bibles, the Greek New Testament of 1550, and the edition of the Old Testament in 1540, with the Vulgate and a new translation side by side. His greatest original work was his *Thesaurus Linguæ Latinæ*, which, since its first appearance in 1531, has been reprinted at Venice (1551), Lyon (1575), London (1734), Basel (1740), and Leipzig (1749).—(4) **Charles** (born 1504, died 1564) was named printer to the king in 1552, and proved a worthy successor to his brother, but he fell into debt, and his last days were spent in the Chatelet prison.—(5) **Henri**, son of Robert, born at Paris in 1528, is the greatest scholar of the family. Educated by Pierre Danes, Jacobus Tusanus, and Adrianus Turnèbus, he attained great proficiency in the classical languages at a very early date, and when only twenty he published an edition of Horace. His father sent him to Italy to visit the libraries and learn the art of engraving; and on his return he brought with him many valuable manuscripts of ancient authors. In 1550 he visited England, and was well received by Edward VI.; in 1554 he was at Paris and printed the first edition of Anacreon; in 1556 he again visited Italy, and in 1557 he finally settled at Geneva. For ten years he received the powerful assistance of Ulrich Fugger of Augsburg, who furnished him both with money and MSS., but on Fugger's death his resources were hardly sufficient for the production of his great *Thesaurus Linguæ Græcæ* (4 vols. 1572; new ed. by Didot, 9 vols. 1829-63). To add to his difficulties, the Consistory at Geneva proved as prone to persecution as the Sorbonne at Paris. He was admonished, debarred from the sacrament, excommunicated, imprisoned, expelled from the Council of the Two Hundred, and forbidden to print anything which had not been submitted to the censors. For some months in 1592 he occupied the chair of Greek at Lausanne; we next find him at Heidelberg and Montpellier; and in March 1598 he died in the public hospital at Lyon, broken-hearted with the news that his MSS. and books had perished in an earthquake. He had published in all about 170 editions of classical authors; and besides his *Thesaurus* he had written *La Conformité du Langage François avec le Grec*, and other works in praise of French, which he regarded as the finest modern language, *La Vie de Catherine de Médecis*, and *Rex et Tyrannus*, a poem in refutation of Machiavel.—(6) **Antoine**, born in 1592, closes the line. He was appointed printer to the king at Paris in 1615, and syndic of the printers' guild in 1649. His last publication dates 1664, and he died in poverty and blindness in the public hospital at Paris in 1674.

No one has done more for the history of the S. family than Ambroise Firmin Didot, the publisher. The results of his investigations may be found in *Nouvelle Biographie Générale*, vol. xv., and *Essai sur la Typographie*, 1855, reprinted from *Encyclopédie Moderne*. See also Maittaire, *Stephanorum Historia* (Lond. 1709); Passow, *Heinrich Stephanus*, in Raumer's *Hist. Taschenbuch* (1831); Crapelet, *Rob. Estienne et le Roi François I.* (Par. 1839); Greswell, *View of the Early Parisian Greek Press* (Oxf. 1833); Renouard, *Annales de l'Imprimerie des Estiennes* (2d ed. 1843); Dupont, *Hist. de l'Imprimerie* (Par. 1854); Bernard, *Les Estienne et les Types Grecs de François I.* (Par. 1856); Feugère, *Caractères Littéraires du XVIe. Siècle* (Par. 1864); *Quarterly Review* (Lond. 1865); Werdet, *Hist. du Livre en France* (Par. 1864); and Albert de Montet, *Dict. Biographique des Genevois* (Laus. 1877).

Ste'phens, Alexander Hamilton, an American politician, was born at Crawfordville, Georgia, February 11, 1812. He was educated at the University of Georgia, and was called to the bar in 1834. After sitting for some years in the Georgia House of Representatives, he was elected a member of the United States House of Representatives, where he sat from 1843 until 1859, being a prominent member of the Democratic party. In the disputes which preceded the Civil War, while opposing the *policy* of secession, he maintained the *right* of a State to secede from the Union. On the outbreak of the struggle he became a member of the Confederate congress, and Vice-President in the Provisional Government, being afterwards confirmed in that post under the so-called 'permanent constitution.' At the end of the war he was confined for five months as a state prisoner in Fort Warren, but was released on parole in October 1865. He has since been twice elected to Congress, where he maintains his position as a staunch Democrat.

Ste'phenson, George, born at Newcastle-on-Tyne, June 9, 1781, was the son of an engine-tenter at a colliery. In 1804 he became a breaksman at Killingworth colliery, where his mechanical genius secured him a growing reputation as a repairer of engines, and led to his promotion to the post of engine-driver, at a wage of 12s. per week. The improvements of Watt were now bearing fruit, and steam was rapidly coming into favour as a motive power. A locomotive had already (in 1811) been constructed for the Wigtown Railway before S. turned his attention to this application of steam. His first locomotive, run on the Killingworth Railway, July 25, 1814, was sufficiently successful to encourage him in his work, and in 1822 five of his locomotives, constructed upon improved principles, were at work on the Hilton Colliery Railway, of which he had become engineer. In 1823, with the aid of Edward Pease, he started the famous locomotive manufactory at Newcastle, which supplied the Stockton and Darlington Railway, opened for traffic in 1825, with locomotives capable of travelling at the rate of 8 miles per hour. In 1826, S. surveyed and subsequently constructed the Liverpool and Manchester Railway, on which, October 1, 1829, the famous competition of locomotives took place, which established at once the fame of S. and the adoption of the steam-engine as a locomotive power. His engine, the *Rocket*, attained a maximum speed of 29 miles per hour. This increased speed was greatly due to the use of the blast-pipe, invented by Hackworth, whose engine, the *Sanspareil*, broke down during the competition. The great merit of Stephenson's improvements lay in the simplification of the machinery, thus diminishing the liability of the engine to get out of order. His subsequent career was one of unbroken prosperity. As contractor, engineer, and manufacturer, he took the lead at once; and the network of railways which now cover our island is a fitting tribute to his genius. His claims as an independent inventor of the safety-lamp are now unquestioned, though Davy had the priority. He died August 12, 1848, at Tapton House, near Chesterfield, Derbyshire. His character was as admirable as his genius; rugged strength, boyish enthusiasm, and sterling honesty were its most conspicuous qualities.—**Robert S.**, son of the preceding, was born at Willington Quay, near Newcastle-upon-Tyne, 16th October 1803. His father spared no pains to give him as good an education as was possible, sending him for a session to the University of Edinburgh. In 1822 he was apprenticed to his

father; but soon after he went out to S. America to report upon the gold and silver of Columbia and Venezuela. On his return to England in 1827 he entered heartily into his father's schemes, suggesting many of the improvements which were embodied in the *Rocket*. The *Planet* engine was a subsequent development, and forms the type upon which our modern locomotives are constructed. S. was also engaged to survey the London and Birmingham Railway, and was designer or consulting engineer of many of the national railways of Germany, Norway, Denmark, Egypt, India, &c. As an engineer of bridges he is world-famed, his greatest undertakings being the high-level bridge at Newcastle, the Victoria Bridge at Berwick, and the bridge over the Nile at Kaffre Azzayat, the tubular railway bridges at Conway and over the Menai Straits, and the Victoria Bridge over the St. Lawrence. The last is undoubtedly his masterpiece. In 1847 he became M.P. for Whitby, and in 1855 was decorated by the Emperor of the French with the Grand Cross of the Legion of Honour, was made a D.C.L. of Oxford, and was elected President of the Institute of Civil Engineers. He died October 12, 1859, of an illness contracted in Norway, and was buried in Westminster Abbey. He inherited the fine character as well as the great abilities of his father, whose memory he cherished with more than filial devotion. See Smiles' *Lives of Engineers* (1862).

Steppes (Slav.), the distinctive name given to the immense barren plains of Central Asia and S.E. Europe. Mackenzie Wallace, who visited the territory of the Inner Horde, near the Caspian, describes the steppe as 'a country level as a sea, with not a hillock or even a gentle undulation to break the straight line of the horizon, and not a patch of cultivation, a tree, a bush, or even a stone, to diversify the monotonous expanse' (*Russia*, 1877.) The S. correspond to the Prairies (q. v.) of N. America, and to the S. American Llanos (q. v.) and Pampas (q. v.). In spring they are veiled with a thin covering of bright verdure, which is scorched and russet by June; in winter they lie under a thick pall of snow, which is swept hither and thither during stormy weather in dense, fine-particled clouds. The mirage is a common phenomenon of the steppe.

Sterculia'ceæ, a large order of herbs, shrubs, or trees allied to Malvaceæ (q. v.), possessing also the mucilaginous, fibre-yielding qualifications of that order. It is chiefly tropical, dispersed over the Old and New World, with some extra-tropical genera in S. Africa and Australia, and a few species without the tropics in the N. hemisphere. The flowers, young shoots, &c., of the type genus *Sterculia* have frequently an unpleasant smell, hence the name. Of plants belonging to S., the most noteworthy are *S. urens*, the seeds of which are eaten in India, and a gum is obtained from incisions made in the bark; *S. villosa*, the inner bark of which yields a very strong coarse fibre for ropes and bags; *S. carthaginensis* of tropical America, with seeds forming an article of diet in Brazil, &c., under the names Chaca and Panama; *S. rupestris*, called 'bottle-tree' in Australia from its bellied trunk. Various species of *Thomasia* and *Lasiopetalum* from Australia are grown as ornamental greenhouse shrubs. See BYTTNERIACEÆ, COCOA, COLA NUT, DURIAN, and TRAGACANTH.

Stére (Gr. *stereos*, 'solid') the French unit of solid measure, equal to one cubic metre, or 1·30802 cubic yards.

Ste'reochromy (Gr. *stereos*, 'solid,' and *chrōma*, 'colour'), a process of mural painting in which water-glass is employed to fix or consolidate the colours. It has not hitherto proved successful, and is for the time abandoned.

Ste'reoscope (Gr. *stereos*, 'solid,' *scopeō*, 'I see,' or 'I look at'), a simple and popular optical contrivance, by which two flat slightly dissimilar pictures of an object are fused into one image, having the actual appearance of relief. The S. is constructed in accordance with the visual phenomena which convey to the mind impressions of the relative forms and position of an object. When a near object having three dimensions is looked at, a different perspective representation of it is seen by each eye; in other words, there is distinct binocular parallax. Certain parts are seen by the right eye, the left being closed, that are invisible to the left eye, the right being closed, and *vice-versa*, and the relative positions of the portions visible to each eye in succession differ. These two visual impressions are simultaneously perceived by both eyes, and are combined into one image, producing the impression of perspective and relief. If, then, truthful right-and-left monocular pictures of any object be so presented to the two eyes that the optic axes, when directed to them, shall converge at the same angle as when directed to the object itself, a solid image will be seen. This is effected with the S., a reflecting form of which was invented by Professor Wheatstone in 1838. It is constructed so that the two dissimilar pictures are reflected to the eyes from two small plane mirrors placed at right angles, the faces being towards the observer. Subsequently Sir David Brewster invented the refracting or lenticular S., based on the refractive properties of semi-double convex lenses; and this instrument, of which there are numerous forms, is now in general use. Convex lenses magnify the pictures besides producing a stereoscopic effect. Photography greatly assists the S. in providing perfectly accurate right-and-left monocular views, which are taken simultaneously on a plate in a twin-camera. Sometimes, in the case of objects which from their distance have no sensible binocular parallax, photographs are taken from two points considerably apart; and when such views are combined in the S., the effect of relief is greatly exaggerated. Several modifications of the reflecting S. are distinguished by the names *pseudoscope*, *iconoscope*, *telestereoscope*, and *polistereoscope*, the last being an apparatus which serves the purposes of all the others.

Ste'reotyping and Elec'trotyping. S. is the process by which fac-simile plates of metal are substituted for movable type in the art of printing. These plates are composed of lead and tin, with a small proportion of antimony, to give the metal a sufficient degree of hardness to bear the impression of the printing press or machine, and they are more used now in consequence of the cheapness of books generally causing large numbers to be printed, thus saving the wear and tear of the type. S. was invented by Mr. William Ged, a goldsmith of Edinburgh, about 1725, and after trying to introduce it in that city for a time, he removed to London, where he entered into partnership with a bookseller named Fenner. These two afterwards associated with themselves several others, amongst whom was Ged's own son James, and they were first employed by Mr. Basket, the king's printer, and afterwards by the University of Cambridge to stereotype Bibles and Prayer-Books. The pressmen, however, who were engaged in the work of printing from these plates, acting in conjunction with the compositors, the latter dreading the new invention would be detrimental to their interests, did not scruple to damage the plates, and in consequence of this opposition, combined with disagreement among the partners, Ged shortly after returned to Edinburgh. Here he again proceeded with his invention, among his first works being an edition of Sallust, a plate of which can still be seen in the Advocates' Library, as well as a copy of the work. Ged did not seemingly profit by his invention, as he died in straitened circumstances in October 1749. Nothing more was heard of the process till it was re-invented by Dr. Tilloch, also of Edinburgh, in 1780, who imparted his secret to Mr. Wilson, a printer in London, and the latter in turn communicated it to Earl Stanhope, by whose aid S. was brought to perfection after many experiments. The original process is altogether simple, but effective. After the form of type has been finally 'read' by the corrector for the press, it is laid on a smooth table, when a square moulding frame with bevelled edges is placed over the forme, into which liquid stucco is poured over the face of the type to a depth of nearly an inch, the types having previously been lightly brushed over with pure sweet-oil to prevent the stucco adhering. As soon as the stucco is set sufficiently, the mould is gently lifted from the type and placed in an oven, where it is subjected to a gradual baking. Transferred from this to the casting-pan, which may contain about a dozen moulds set into grooves, and separated one from the other by thin iron plates, the pan is gradually dipped into a caldron of molten lead, which flows gently into it through small openings left at the corners. Removed after sufficient time has been allowed to fill the pan, it is allowed to cool gradually, and is then broken up and the plates taken out. The plates are then dressed for printing, bad letters looked for and replaced by good ones being soldered in, and the plates reduced to a uniform thickness of about one-sixth of an inch. They are next mounted on wooden blocks, having side and top catches or grips of brass to hold them firmly in their places; and the plate and block both combined being only the same height as movable type, they can be printed on a press or machine in the usual way. This

stucco casting has for some years been greatly supplanted by what is known as the papier-maché process, modified in some particulars by different casters, but generally as follows: The form being ready for casting is covered by a prepared matrix of several sheets of paper—two of tissue, one of blotting, and one of brown, each sheet being brushed over by a mixture of glue, paste, and whiting. This matrix is beaten into the type by a long-handled flat brush, and the hollows on the outside smoothed over by stucco, and then backed up by a sheet of strong wrapper paper. The matrix is next subjected to a heavy pressure over a steam-chest and thoroughly dried, when it is placed within a shallow casting-box slung upon swivels, and secured on three sides by an iron gauge the thickness of the plate. The box is closed firmly by a screw, leaving only a narrow opening at the top into which the metal is poured when the box is brought up to a vertical position. In a very short time the metal sets, the box is thrown back, the screw unloosed, and the plate taken out. If the matrix is carefully removed from the plate, it may again be placed within the box and a second cast taken if required, or laid aside in reserve in the event of accident to the first casting. In many cases where it is doubtful whether a second edition of a book may be wanted, moulds are taken and retained to meet the contingency. By the papier-maché mode plates can be prepared for printing in a very short time, the stucco process being the work of several hours. The introduction of self-feeding rotary machines (see PRINTING) into the newspaper press necessitated a change in their arrangements, as these machines print only from impression cylinders, and this could only be done by stereotype plates, and with them both matrix and plate form the segment of a circle, to enable the plate to fit on to the impression cylinder.

Electrotyping is a similar process for producing plates from types, &c., for printing, chiefly of the finer class of illustrated books and works containing tables of figures, logarithms, &c. The types in the form are first of all brushed over with a very fine kind of blacklead or plumbago, when a shallow tray filled with melted bees'-wax mixed with turpentine and spermaceti is placed over the form, which is then placed under a hydraulic press and subjected to a heavy pressure while the wax is still soft. The wax-mould is next inlaid all round the pages with fine brass wire to conduct the copper, and then suspended by copper wire to the negative pole of a Smee battery, a plate of copper being hung upon the other pole, the whole being suspended in a bath containing a solution of sulphate of copper. The action of the battery deposits a thin layer of copper over the blackleaded type-face of the wax mould, which after several hours' immersion is taken out of the bath, and the thin shell of copper removed from it. The reverse side of the shell from the printing face is next slightly coated with solder, then floated over with metal in such a way that none can reach the type-face, after which the plate is dressed and prepared for printing in the same way as ordinary stereotype plates.

Ster'let. See STURGEON.

Ster'ling, a name used with reference to British money, both of account and currency. The word is a corruption of *Esterlings* or *Easterling*, a name given at first in England to the German traders, and from the time of Richard I. applied to their coins which were of exceptional purity. Hence the use of the word as a synonym for genuine.

Stern'berg, a town of Austria, in Moravia, on the Oskav, a left tributary of the March, 10 miles N.N.E. of Olmütz by rail. Linen and cotton stuffs are extensively manufactured, and are known as S. wares. In the vicinity cherries are cultivated, and there are numerous slate quarries. Pop. (1869) 13,509.

Sterne, Laurence, son of an army lieutenant, was born in the barracks at Clonmel in Ireland, November 24, 1713, passed in 1733 from the free school of Halifax, Yorkshire, to Jesus College, Cambridge, and in 1736 and 1740 took the degrees of B.A. and M.A. The influence of his cousin, the Rev. Jacques S., prebendary of York, procured him the living of Sutton in 1740, and on his marriage with Miss Elizabeth Lumley he obtained the additional and neighbouring living of Stillington. For the next twenty years and more he 'remained an obscure country parson,' finding his amusement in books, painting, fiddling, and shooting, and preaching eccentric and forcible sermons to his wondering parishioners. Two sermons published in 1747 and 1750 attracted little attention; but when in 1759 the two first volumes of *Tristram Shandy* appeared, 'nothing else was talked of, nothing else admired,' and the author on a visit to London found himself the most famous man of the day. He at once took advantage of his success to publish two volumes of sermons in 1770; the following year saw vols. iii. and iv. of *Tristram;* and other two volumes appeared in 1762. Though in 1760 he had been presented with the new living of Coxwold by Lord Falconbridge, he remained but little in the country; the excitement of London life (and such London life!) told heavily on a naturally feeble frame, and he was obliged to go to France for his health. His fame had preceded him, and Paris was only a copy of London. It was not till 1765 that he was able to bring out the 7th and 8th volumes of *Tristram*, and he was again on the Continent for some time before the appearance of the 9th and last in 1767. His travels furnished material for a second great work. The first part of the *Sentimental Journey* was published in two volumes in 1778, but he did not live to write the sequel. An illness caught while looking after the publication of the *Journey* proved too much for his weakened frame, and he died in a lodging-house in Bond Street, 18th March 1778. 'Now it is come!' were the last words he uttered. His body, buried in a graveyard near Tyburn, was unlawfully removed to Cambridge for dissection. The fate of his wife and daughter was long unknown, but it has been ascertained (see *Athenæum*, No. 2225, 1870) that Mrs. Sterne died in 1773 at Albi on the Tarn, and that her daughter married a French tax-collector called Alexandre Medalle in 1772, and died before 1783.

There is hardly an English writer whose moral character has been more severely canvassed than that of S.; and the damnatory epigrams of Walpole, Warburton, Johnson, and Gray are too well known to require repetition. No man of moral sanity would think of setting S. up as a model of conduct; about conjugal fidelity, at least, he seems to have taken but little thought. At the same time his character assumes a less degraded aspect when it is cleared of the mud thrown upon it by malice and ignorance, and receives as its proper background the grossness and depravity of contemporary life. About his position in our literature there is no question. Were Dr. Ferriar's accusations of plagiarism (*Illustrations of S.*, 1798) all well founded, it would make as little difference to the essential originality of S. as it would to that of Michael Angelo could it be proved that he had purloined some of the bricks for St. Peter's at Rome. It has yet to be shown that the humour and pathos of Uncle Toby, Dr. Slop, Mr. Shandy, and Corporal Trim are the product of any theft less sublime than that of a Prometheus.

In 1775 S.'s daughter published his *Letters to his Friends*, along with a brief autobiography (3 vols.); *Letters from Yorick to Eliza* appeared in the same year; and *Letters supposed to have been Written by Yorick and Eliza*, 2 vols., in 1799. W. Durrant Cooper printed for private circulation *Seven Letters by S. and his Friends* (1844). In his *English Humorists* (1851) Thackeray made use of unpublished materials, and more particularly of a *Journal* kept by S. after Mrs. Draper's departure to India, which was in the possession of a gentleman of Bath (see *Athenæum*, 16th March 1878). A work purporting to have been written by S., but now recognised as spurious by all English critics, was edited by Alfred Hédouin as *S. inédit: le Koran* (Par. 1853). Percy Fitzgerald's *Life of Laurence S.* (2 vols. Lond. 1864) is the most elaborate which has appeared, and on the whole it is strongly apologetic and exculpatory. Paul Stapfer's *Laurence S.; sa Personne et ses Ouvrages* (Par. 1870), supplies little that is new, except a fragment of very dubious authenticity, which he regards as a genuine production of his author. The complete edition of S.'s works, by James P. Browne, M.D. (4 vols. Lond. 1873), contains thirteen letters not previously published; and in the *Academy* (1874) may be found an extract from a diary in the British Museum which reports the talk of S.'s servant Richard Greenwood about his master, and a letter of S.'s also in the British Museum, dated November 3, 1750, and containing a notice of his quarrel with his uncle. See, besides, Sir Walter Scott's *Lives of the Novelists; Quarterly Review*, vol. xciv.; and M. Montegut in the *Revue des Deux Mondes* (1865).

Stern'hold, Thomas, an English courtier of the 16th c., who originated what was for a long time in England the standard metrical version of the Psalms. He is usually said to have been a native

of Hampshire, but even on this point authorities are at variance. The only important fact in his life is that he served under Henry VIII. as groom of the chamber with sufficient acceptance to be remembered in the royal will by a bequest of 100 marks, and was continued in the same office under Edward VI. Incited by the success of Clement Marot in France, he published in 1548 *Certaine Psalmes of David* (19 in all), and hoped to 'travaile further in that booke.' But his death followed almost immediately; and when in 1549 there appeared *All such Psalmes of David as T. S. had in his lifetime drawen into English*, the whole number from his pen was only 37. Among the other translators whose versions were added to swell the volume was John Hopkins, and thus it came to pass that S. and Hopkins became in English literature the Castor and Pollox of religious doggerel. In spite of its æsthetic defects, the book was popular, editions appearing in 1550, 1551, 1553, 1560, &c. It was not till 1561 that tunes were printed along with the words, though S. had been accustomed to sing his Psalms to Edward VI. As an appendix to the *Book of Common Prayer*, the completed collection kept its ground till Tate and Brady's version was substituted in the year 1717.

Stern'um, or Breast'bone, the bone in Vertebrates occurring in the chest, and to which certain of the ribs are attached in front. In man it consists of three parts; the upper, called the *manubrium*; the middle, called the *gladiolus*; and the lower, named the *ziphoid*, or *ensiform cartilage*. Posteriorly the S. is concave. Its average length is 6 inches. The first seven *ribs* are attached to the S. directly by their *costal cartilages*. The S. in man is developed from six centres of ossification. In fishes, serpents, tortoises, and turtles there is no S. In bats, armadilloes, and moles it bears a prominent median keel for the attachment of the pectoral or breast muscles. Flying birds have also a large keel.

Stesich'orus, one of the nine great lyric poets of antiquity, is said to have been born in 632 B.C., either at Himera in Sicily, or Metaurus in Magna Græcia, and to have died about 556, but nothing certain is known concerning him. His own name, Tisias, he changed to S. ('leader of choirs') as the inventor of strophe, anti-strophe, and epode, and with his predecessor Alcman he stands at the head of Dorian choral poets. His fragments include erotic, pastoral, and mythological pieces, fables and elegies, hymns, pæans, and epithalamia, and are collected in Bergk's *Poetæ Lyrici Græci* (3d ed. Leip. 1867).

Steth'oscope, The (Gr. *stethos*, 'the chest,' and *skopeō*, 'I look into'), is an instrument invented by Lænnec for examining the sounds of the chest and other cavities of the body. The S. is a simple, hollow cylinder, usually of some fine-grained light wood, as cedar or maple, or of vulcanite or metal, the one extremity being funnel-shaped for application to the part to be examined, and the other large and flat to secure perfect apposition and occlusion for application to the ear. The main object of the S. is to circumscribe and localise the sounds which it transmits; so that the chest end should be small, in order to determine the exact seat of the greatest intensity of sound. The S. is made of a variety of shapes, and it may be either single or double, straight or curved. See RESPIRATION.

Stettin', one of the chief seaports of Prussia, and capital of the province of Pommern, lies on the left bank of the Oder, 14 miles from its embouchure in the Stettiner Haff, and 83¼ miles N.E. of Berlin by rail. The town, which previous to 1874 was a fortress of the first class, consists of the hilly and uneven Altstadt, the modern Neustadt, built since 1848, and the suburbs of Lastadie and Silberwiese on the right bank of the river, but connected with the former by one railway and three passenger bridges. The principal buildings are the Schloss, erected in 1575, formerly the seat of the Dukes of Pommern, now occupied as government buildings; St. Peter and Paulskirche, the oldest church in Pommern, founded 1124, restored 1816; the conspicuous Jacobikirche, dating from the 13th c.; and the Rathhaus, with a collection of Russian medals dating from Catherine II. (1729) and Maria Feodorowna, both natives of S. In the Königs-Platz are marble statues of Friedrich the Great and Friedrich Wilhelm III. S. is the most important manufacturing town in Pommern, and has numerous distilleries, sugar, tobacco, leather, silk, and sail factories, anchor forges, and manufactories of machinery and railway material. The harbour, which has a depth of 13 to 17 feet, was greatly improved during 1877. A new quay 2100 feet long was erected, furnished with six large steam-cranes. Larger vessels discharge at Swinemünde (q. v.) which is the port to S. In 1877 there entered the harbour of S. 11,628 vessels of 1,103,181 tons (2861 of 598,066 tons sea-going vessels), and cleared 11,880 of 1,129,310 tons (2933 of 612,346 tons sea-going vessels). Of those entered, 518 of 190,629 tons were British, and of those cleared, 520 of 190,850 tons, being 7·81 per cent. more than in 1876 and 12·82 per cent. more than the average of the preceding ten years. In 1877 the chief imports were coal 87,895 tons, pig iron 55,341 tons, wine 708,948 gallons, other liquids 170,670 gallons, corn 876,416 quarters, herrings 371,345 barrels, and 1,563,000 bricks; and exports, seeds 4365 tons, oils 7141 tuns, flour 14,168 tons, potatoes 41,225 tons (112·66 per cent. above 1876, and 439·17 per cent. above the average of the preceding twenty years), spirits 177,997 gallons, other liquids 75,598 gallons, corn 350,815 quarters, timber 42,621 lasts, and 530,600 bricks. The import of Scotch herrings for 1878 up to 7th December amounted to 145,362 barrels. The estimated total value of the imports was in 1877, £6,441,219 (£2,450,421 from Britain), of the exports £3,833,741 (£1,432,384 to Britain). The total value of imports and exports was 4·17 per cent. less than in 1876, but British exports and imports showed an increase of 5·52 per cent. Pop. (1875) 113,278.

Steu'ben, Friedrich Wilhelm August Heinrich Ferdinand, Baron von, a general in the American War of Independence, was born at Magdeburg on 15th November 1730. Brought up from childhood in camps and garrisons, he took part as a volunteer in the siege of Prag (1744) at the age of fourteen. His education was completed in the Jesuit Colleges of Neisse and Breslau, and in 1747 he entered the Prussian army as a cadet. At the battles of Prag and Rossbach he distinguished himself, and was an especial favourite of Friedrich the Great, who, on his retirement from the army, at the peace of 1763, assigned him a pension of 400 thalers. In 1764 he became Grand Marshal to the Prince of Hohenzollern-Sigmaringen, a post which he held for ten years. S. then travelled in different parts of France, and being at Paris in 1777 on his way to England he was persuaded by the Comte de St. Germain to offer his services to the American insurgents. He landed at Portsmouth, New Hampshire, on the 1st of December 1777, joined Washington at Valley Forge, and was appointed inspector-general in March 1778. He took part in the battle of Monmouth, sat in the court-martial which tried Major André, and distinguished himself at the siege of Yorktown. His principal service, however, lay in the thorough drill and discipline which he introduced into the colonial armies. He sacrificed a great part of his own property for the maintenance of the soldiers and officers under him, and after the war was tardily rewarded with a pension of $2500 and several grants of land, many of which he gave away to poor soldiers. Ultimately he settled on a tract of land in Oneida county, New York, and died November 28, 1794. See Sparks' *American Biography*, and a Life by Friedrich Kapp (New York, 1860).

Steu'benville, a town of Ohio, U.S., in a district with rich deposits of bituminous coal, 70 miles from Pittsburg by rail, has 17 churches, 4 newspapers, a large nail-factory, blast furnaces, foundries, machine-shops, boiler-works, an oil-refinery, &c. Pop. (1870) 8107.

Ste'vens, Thaddeus, an American politician, was born at Peacham, Vermont, April 4, 1793, graduated at Dartmouth College in 1814, was admitted to the Pennsylvanian bar in 1816, and soon acquired a large practice. In the presidential campaign of 1828 he opposed Jackson, was repeatedly a member of the State Legislature from 1833, was chosen in 1836 a member of the Convention to revise the State constitution, became a canal commissioner in 1838, and took an active part in procuring for Pennsylvania a public-school system. In 1842 he was elected to Congress, of which he remained a member uninterruptedly till his death at Washington, 11th August 1868. S. was a keen anti-slavery politician, a bitter enemy of the South; and by the force of his convictions, no less than his business talents, rose to be one of the leaders of the Republican party. He played a foremost part in the famous impeachment of President Johnson.

Ste'venson, Robert, an eminent Scottish engineer, was born at Glasgow 8th June 1772, and died 13th July 1850. His father, a West India merchant, having died while Robert was a child, he was educated at one of the Edinburgh 'hospitals.' When he was about fifteen years old his mother married Mr. Thomas Smith, who in 1787 was appointed engineer to the new Board of Northern Lighthouses, and thus the young man's future career was practically determined. Entrusted when only nineteen with the supervision of the lighthouse-works on Little Cumbrae in the Clyde, he soon entered into partnership with Mr. Smith, and in 1789 he was chosen as his successor. The skill and daring which he displayed in the erection of the Bell Rock Lighthouse raised him high in public estimation, and his advice was eagerly sought on almost every engineering work of any importance in Scotland. He was the author of the scheme by which the Calton Hill in Edinburgh was laid out and the neighbouring roads articulated; he built the Waterloo Bridge, the Hutcheson Bridge in Glasgow, and the new bridge at Stirling, and he drew up the plans for the harbour at Granton. Among the improvements for which we are indebted to his inventive genius are the application of the catoptric principle to lighthouse illumination; the *intermittent* and *flashing* exhibition of the light; the mast-lamp for lightships; the movable-beam crane and the balance crane; and that form of suspension-bridge in which the roadway is above and not below the chains. At the Carr Rock beacon he utilised the tide as a motive power; and he discovered the *Limuria terebrans.* His writings consist of reports on professional subjects, papers in scientific journals, and articles in the *Encyclopædia Britannica.* See his *Life* by his son, David Stevenson (Edinb. 1878).

Ste'venston, a mining village and parish of Scotland, county of Ayr, about a mile from Saltcoats, on a branch of the South-Western Railway. The parish church, a handsome modern structure, occupies a conspicuous position. The Free Church is a neat little building, and a large and commodious school was erected by the School Board at a cost of over £6000, under the Education Act of 1872. The chief source of the prosperity of S. is the extensive ironworks of Ardeer, erected here in 1852 by Messrs. Merry and Cunningham. The freestone quarry of Ardeer is famous for a superior white stone, which is exported in large quantities. Dynamite works on a great scale have also been recently built. S. possesses the interesting remains of Kerelaw Castle, a stronghold of the Earls of Glencairn. Pop. (1871) of village, 3140; of parish, 5015.

Stew'ard, Lord High, was formerly the greatest officer of state in England, holding authority next in order to the sovereign. The office was long hereditary in the Earls of Leicester, till abolished by Henry III. on the death of Simon de Montfort. It is now created only for a temporary and particular purpose, such as to settle matters of precedence at a coronation, or to supply a president in the House of Lords at the trial of a peer. After the close of the proceedings in the latter case, the L. H. S. breaks the white rod, the emblem of his office, and dissolves the court. The *High Steward of Scotland* was an officer of great dignity in that country, created early in the 12th c. He was judge of the king's household, and the whole family of the royal palace was under his care. On the accession of Robert II. —the ninth heritable high steward—to the throne in 1371, the office merged in the crown, and in 1469 it was vested in the heir-apparent. *The Lord Steward of the Household* is the first great officer of the court. His duties are defined in the Black Book of the Household of Edward IV., and have only altered since that time with the modifications changes in society have produced. He is a member of the Privy Council, takes precedence of all dukes except those of royal blood, has sole direction of all the royal household below stairs, and the estate and accounts appertaining thereto. His authority extends over all the officers and servants of the household except those of the chamber, chapel, and stables. He is head of the Board of Green Cloth which formerly had authority to try all treasons and crimes within the range of the court. Its jurisdiction was entirely abolished in 1849. The salary of the Lord Steward of the Household, to which office a supporter of the administration in power is always appointed, is £2000 a year.

Stew'art, or, after the French orthography of the 16th c., **Stu'art**, the noblest and most unfortunate of Scottish families, traces its origin to Alan Fitz-Flahald, a Norman follower of the Conqueror, by him invested with the barony of Oswestry in Shropshire. His eldest son was ancestor of the Earls of Arundel, and by marriage of the Dukes of Norfolk; the second, Walter, entering the service of David I., received the lands of Renfrew, Hassendean, and Innerwick, along with the stewardship of Scotland. Of his lineal descendants, called Steward or Stewart from their hereditary office, the fourth, Alexander, was regent in Alexander III.'s minority, and defeated Hakon of Norway at Largs (1263); the sixth, Walter, commanded the Scottish west wing at Bannockburn (1314), and by his marriage with Marjory, Robert Bruce's daughter, became the father of Robert II. (q. v.). This Robert was the first of eight Scottish sovereigns — Robert III. (q. v.), who died of sorrow; the murdered James I. (q. v.); James II. (q. v.) and James III. (q. v.), both accidentally slain; James IV. (q. v.), who fell at Flodden, fighting against his English brother-in-law; James V. (q. v.), who died at the age of thirty; and Mary, Queen of Scots (q. v.), beheaded in her English prison. Mary's husband, the murdered Darnley (q. v.), was head of a younger—the Lennox—S. line, and uncle to Arabella S. (1575–1615), who, descended like him from Margaret Tudor's second marriage, died insane in the Tower of London. And from Mary's and Darnley's union sprang the four S. kings of England and Scotland—James I. (q. v.), Charles I. (q. v.), who died upon Whitehall scaffold, Charles II. (q. v.), and James II. (q. v.), ousted by his own daughter from the throne.—His only son, **James Frederick Edward S.**, born at St. James's Palace 10th June 1688, exactly a half-year later, was with his mother upon the sea, fleeing from England. He passed his boyhood at St. Germains, succeeding to the empty title of King (1701), but barred from the crown by the Act of Settlement and the party fiction of the warming-pan. The murmurs called forth by the Union suggested the Chevalier's first expedition (1707), from which he returned to France without setting foot in Scotland; the Treaty of Utrecht (1713) cost him his French asylum; and the intrigues with his half-sister, Anne, were interrupted by her death. George's unpopularity, and the espousal of the Jacobite cause by Ormond, Bolingbroke, and Mar, kindled new hopes—fatally dashed by Louis XIV.'s death and by the 13th November 1715, the day when Sheriffmuir was won and lost, and at Preston Derwentwater's 'handful of Northumberland fox-hunters' laid down their arms. James landed next month at Peterhead, but the game was up; so after six weeks of spiritless inaction he stole away, and, reaching France, madly dismissed his one sage councillor, Bolingbroke. Karl XII. of Sweden, his next supporter, had barely promised assistance when he fell before Frederikshald (1718); in the same year Alberoni's armada was wrecked off Finisterre; and James's marriage (1719) with Clementina Sobieski, grand-daughter of Poland's exiled king, served but to show that James to his father's bigotry added the vices of his uncle Charles. The princess quitted her husband, after bearing him two sons (1725); and he, having taken no active part in the '45, died at Rome, 12th January 1766.—**Charles Edward S.**, born at Rome, 20th December 1721, from early youth raised his adherents' hopes by signs of a bright, daring, chivalrous nature, and in his fifteenth year bore himself gallantly at the siege of Gaeta. In 1744 he repaired to Picardy, on a secret invitation to join the English expedition of Marshal Saxe; but storms dispersed the marshal's transports, and for eighteen months Charles was left hanging on, slighted by France, discouraged by the seeming lukewarmness of Scotland. Worn out at last, he flung himself desperately into the '45, with seven followers embarking on a brig at Nantes, to be parted at starting from the French man-of-war which, forming his only convoy, bore all his arms and stores. The brig held on; on the 18th of July Charles landed in the Hebrides, and in a month upreared the standard of King James VIII. in the valley of Glenfinnan. Wavering chieftains, talked over by the Prince's winning tongue, flung prudence to the winds. His forces rapidly swelled; and eluding General Cope, he entered Perth, then marching southward seized Edinburgh (September 17) without stroke of sword. Cope meantime hurried back by sea, and on the 22d his forces, 2300 disciplined soldiers, met Charles's 2500 Highlanders at Prestonpans. In five minutes' time the clansmen's impetuous valour had won the day; and after six weeks of Holyrood courts and balls, Charles started at the head of 5600 men on his famous march upon London. Carlisle surrendered, Manchester furnished 200 volunteers; but Englishmen as a body held aloof, even in Catholic Lancashire.

The Hanoverian troops were closing in, and at Derby the Prince, for all his passionate protests, was forced to consent to a retreat (6th December)—just at the moment when London was in an uproar of alarm; when Henry, his brother, had orders to land with 10,000 Frenchmen on the southern coast; when the great Duke of Norfolk, with Watkin Wynne, the 'King of Wales,' stood pledged to espouse the Stuart cause. *Vestigia nulla retrorsum* had hitherto been Charles's motto, no valour might atone for its abandonment. In vain did Murray, wheeling at Penrith, check Cumberland's pursuit; Carlisle's little Jacobite garrison capitulated to the Duke. In vain at Falkirk (17th January) the clansmen gained in ten minutes an easy victory over Hawley's outnumbering forces; the conquerors must raise the siege of Stirling. On the 16th of April fell the decisive blow, when, at Culloden, weariness, hunger, and their own jealousies fought with the 'Butcher' against the Highlanders, Sedgemoor avenged itself upon the Stuarts, the Bloody Assize upon their partisans. Happy for Charles had he fallen too, but he was yet to put Northern faith to harder proof. With £30,000 set on his head, he wandered among the poorest for full five months, now on the mainland, now in the Western Isles, disguised at one time as Flora Macdonald's 'muckle maid,' the guest at another of seven robbers, the Men of Glenmoriston. He sailed from the Highlands (20th September), was royally received in France, and as ignominiously expelled (1748), in accordance with the Peace of Aix-la-Chapelle. A residence of some years at Liège was only broken by secret visits to London, in one of which he is said to have witnessed the coronation of George III., in another to have turned Protestant. However that may be, he was certainly orthodox enough when on his father's death (1766) he returned to Rome, hoping the Pope would recognise his claims. Rome, Spain, and France alike refused such recognition, though the last-named power revived in 1770 the dream of his restoration, and even invited him again to Paris. He came, and visited the French minister Choiseul—drunk. The craving for drams, acquired in his wanderings, coupled with his infatuation for a Scotch mistress, had already estranged the Prince's English friends; France also henceforth wisely abstained from meddling in his affairs, beyond procuring him a wife (1772) in the Countess of Albany (q. v.). Ranke, in his *Gräfin von Albany*, has vividly described the pitiful tragi-comedy down to the closing scene, in which, 'worn out with liquor and harlots,' the heir of twelve sovereigns died at Rome, 30th January 1788. He lies at Frascati, under Canova's monument, raised at the charge of George III.; a nobler monument are the Scottish ballads, where 'Bonnie Prince Charlie' yet lives transfigured in his people's memory.—**Henry Benedict S.**, born at Rome, 26th March 1725, is described by the poet Gray (1740) as 'having more spirit than his elder brother.' In his twenty-third year, however, he accepted a cardinal's hat from Benedict XIV, and on Prince Charles's death only put forth his claims by striking a medal with the legend 'Henry IX., King of England by the Grace of God, but not by the will of man.' The Revolution cost him two rich French livings, the abbeys of Auchin and St. Amand; and the plunder of his Frascati villa by the French revolutionary troops (1798) drove him a penniless fugitive to Venice. A pension of £4000 graciously offered by George III. was gratefully received; and Cardinal York, dying at Frascati, 13th July 1807, bequeathed to the Prince Regent the crown jewels which James II. had carried away with him in 1688.

To the S. family also belonged (1) the Dukes of Albany, Earls of March, and Lords of Annandale and Man; (2) the Earls of Fife and Menteith; (3) the Lords Avandale, Ochiltree, and Castlestuart, and Earls of Castlestuart; (4) the Lords Methven; (5) the Lords Doune, Earls of Moray, and Lords St. Colme; (6) the Earls and Marquises of Bute, Lords Wharncliffe, and Lords S. de Rothesay; (7) the Earls of Angus; (8) the Earls of Darnley, Earls and Dukes of Lennox, and Lords of Aubigné, &c., whose kinship to the royal line may be found in the S. Genealogies of Duncan Stewart (Edinb. 1739), Noble (Lond. 1795), and Andrew Stuart (Lond. 1798). See also Chalmers' *Caledonia* (1807-24); Jesse's *Memoirs of the Pretender* (new ed. Lond. 1858); the Marchesa Campana de Cavelli's *Les derniers Stuarts à Saint-Germain à Laye* (2 vols. Par. 1871); and Ewald's *Life and Times of the Prince Charles Edward* (2 vols. Lond. 1875).

Stew'art, Alexander Turney, an American millionaire, was born near Belfast, Ireland, 27th October 1802, studied at Trinity College, and emigrated in 1818 to New York, where he taught classics and mathematics. Having lost in trade the little money he had taken with him, he returned to Ireland, disposed of some remaining property, and investing in Irish laces, returned to New York to open in Broad Street (1823) the store, which subsequently expanded into the largest dry-goods establishment in the world, with branches in England, Scotland, Ireland, France, and Germany, besides factories for woollens, carpets, hosiery, &c., in the United States, England, and Scotland, the whole employing some 8000 persons. S. also became a large holder and improver of real estate in and around New York, Saratoga, &c., and eventually acquired a fortune only, if at all, inferior to that of Astor (q. v.) and that of Cornelius Vanderbildt, the railway speculator. He despatched a vessel with breadstuffs to Ireland during the famine of 1846, erected the model Garden City on Long Island, near Brooklyn, established a home for working-girls in New York, and contributed large donations to the sufferers by the Chicago fire (1871) and the Franco-German War. He was president of the United States Commission at the Paris Exhibition of 1867, but took almost no other part in public affairs. He died childless, 10th April 1876, leaving his estate, with the exception of certain legacies, to his wife. A search for next of kin called forth over 2000 claims, but a more startling incident was the mysterious abstraction of the body of the deceased in November 1878. The perpetrators of this ghastly deed, still undetected, are supposed to have been actuated by the hope of ransom.

Stew'art, Balfour, LL.D., F.R.S., an eminent physicist, was born at Edinburgh, November 1, 1828. After passing several sessions at the Universities of St. Andrews and Edinburgh, he went out to Australia, where he engaged in business from 1852 to 1854. In 1855 he returned to England, served for a few months in Kew Observatory, of which after being for three years assistant to Forbes, professor of natural philosophy at Edinburgh, he was appointed director (July 1, 1859). He has also filled the chair of natural philosophy at Owen's College, Manchester, since July 7, 1870. As a meteorologist he enjoys a wide reputation. He is also one of the founders of spectrum analysis, being the first who experimentally established the equality between the radiative and absorptive bodies (1859). For these researches he obtained the Rumford medal of the Royal Society in 1868. In conjunction with Professor Tait he investigated the Rotation of a Disk in Vacuo (*Philosophical Transactions*, 1865-66). His chief works are *Researches in Solar Physics* (1866) jointly with De la Rue and Loewy, *Elementary Treatise on Heat* (1866; 3d ed. 1877), *Elementary Lessons in Physics* (1870; new ed. 1878), the *Physics Primer* (1872) in 'Macmillan's Series,' the *Conservation of Energy* (1873) in the 'International Scientific Series,' and jointly with Professor Tait two remarkable speculative works entitled *The Unseen Universe* (1875; 7th edt. 1878), and *The Paradoxical Philosophy* (1878).

Stew'arton, a town of Ayrshire, Scotland, on the right bank of the Annock, 5 miles N.W. of Kilmarnock by the Glasgow and Barrhead railway. It has five churches (Established, Free, United Presbyterian, Congregational, and Wesleyan), three banks, a handsome public school erected in 1875 and capable of accommodating upwards of 600 pupils, a public hall with reading and recreation rooms attached. Long noted for the production of Scotch bonnets, it has also manufactures of carpets, yarn, needlework, spindles, &c. A cattle-fair is held twice a year. The river is here crossed by three bridges, and close to the town the railway crosses the Annock by a lofty bridge of 10 arches. Pop. (1871) 3299.

Stew'art, Dugald, a Scottish philosopher, was born in Edinburgh, 22d November 1753, educated at the High School, passed through the regular course of study at the Edinburgh University, and attended the lectures of Dr. Reid in Glasgow. In 1772 he began to assist his father the professor of mathematics in the Edinburgh University, and in 1775 he was chosen joint professor; but the lectures which he delivered as Adam Ferguson's substitute in 1778 79 brought his philosophical ability into prominence, and on Ferguson's resignation in 1785 he was appointed to the vacant chair. He soon proved himself, in the words of Lord Cockburn, 'one of the greatest didactic orators;' and students were attracted by his fame even from the Continent and America. In 1809 his health gave way, and though he continued to be nominal professor till 1825, his work

was done by Dr. Thomas Brown, and he lived in peaceful but studious retirement at Kinneil House, near Bo'ness, which had been placed at his service by the Duke of Hamilton. His second wife, Helen d'Arcy Cranstoun, was a member of the Cranstoun family celebrated by Sir Walter Scott; and endowed as she was with rare gifts of intellect and character, she rendered the philosopher no small assistance in his work.' S. died at Kinneil House, 11th June 1828. S. was a fairly voluminous author, especially in his later years. The first volume of *Elements of the Philosophy of the Human Mind* appeared in 1792, the second in 1814, and the third in 1827. In 1793 he published *Outlines of Moral Philosophy* for the use of his students. The biographical sketches of Adam Smith, William Robertson, and Thomas Reid, originally read before the Royal Society in 1793, 1796, and 1802 respectively, were printed together in 1811. His *Philosophical Essays* appeared in 1810. The first part of his famous Dissertation on the progress of Philosophy was prefixed to the Supplement of the fourth and fifth editions of the *Encyclopædia Britannica*, 1816; and the second part followed in 1821. His last work, *Philosophy of the Active and Moral Powers*, appeared in 1828, only a few weeks before the author's death. A collective edition of S.'s works was published at Cambridge, Massachusetts, 7 vols. 1829; and again in 1831. The best edition is that of Sir William Hamilton and Professor Veitch (11 vols. 1854–58): a Memoir of S. by Professor Veitch occupies part of vol x. Lieutenant-Colonel Matthew S., the philosopher's son, unfortunately destroyed his father's MS. of a *Philosophy of Man as a Member of a Political Association*. It is rather as a literary expositor of philosophical subjects than as an original thinker that S. attained his fame. He is at best a continuator of the school of Reid, but he is a continuator who knows not only how to state and defend, but how to develop and adorn.

Stew'artry, in Scotland, a division of the crown-lands formerly under the jurisdiction of a steward appointed by the king. Besides the civil powers of a sheriff, the steward exercised an extended criminal jurisdiction, but by Act I. Vict. c. 39 the names steward and steward-clerk, &c., were abolished from the statute in favour of sheriff, sheriff-clerk, &c. The only trace still remaining of the older jurisdiction is in the designation of Kirkcudbright as a S. instead of a county or shire. While the territory of Galloway (q. v.), comprising Wigton and Kirkcudbright, was still in a strict sense only a tributary dependency of Scotland, it retained its old Celtic proprietary and its peculiar laws and usages. Ruled for a long period by its own dynastic lords, among the most powerful under the Scottish crown, it eventually fell to the Comyns, who were overthrown by Bruce. About this date (1306) it would seem that E. and Central Galloway were formed into the existing S., while W. Galloway or Wigton had already been formed into a Shire (q. v.). When in 1747 heritable jurisdiction was removed, the S., freed from certain regalities and baronies, was placed under a steward-depute, whose functions were almost identical with those of a sheriff-depute. A humbler survival of the old proprietary is seen in the name common in Scotland of land-steward—the grieve or bailiff of a farm or estate.

Stew'ing, a method of cooking both meats and vegetables, in which only a sufficient quantity of water is placed with the material to be cooked into a stew-pan, and the whole is allowed to simmer gently till quite done. In S. the food is chiefly cooked by its own juice, and the entire contents of the stewpan form one dish.

Stey'er, or **Stei'er** (officially spelt Steyr), a town of the crownland of Upper Austria, 20 miles N.E. of St. Valentin by rail, has a parish church (Gothic) built in 1447, a fine 'square,' and most extensive manufactures of iron and 'Steier-steel' goods. Pop. (1869) 13,392.

Stich'omancy (Gr. *stichos*, 'a line,' and *manteia*, 'divination'), a form of Bibliomancy (q. v.) in which the future is augured from lines in a book taken haphazard.

Stick'ing-Plaster, or **Court-Plaster**. S.-P. is prepared from resin, in powder, 2 parts; litharge plaster, 16 parts; and hard soap, 1 part. The plaster should be melted with a gentle heat, and the resin and soap, first liquified, should be added, and the whole mixed and then spread upon linen.—C.-P. is thus prepared: dissolve separately 1 oz. of isinglass in 8 oz. of hot water, and 2 drachms of gum-benzoin in 2 oz. of rectified spirits. Strain and mix. Several coats of this mixture are then to be applied to a piece of silk stretched on a frame, or to gold-beater's skin. A solution composed of 1 oz. of Chien turpentine in 2 oz. of tincture of benzoin is then to be applied to the other side of the silk.

Stick'-insects, the name applied to certain very remarkable insects belonging to the order *Orthoptera* (q. v.), and to the family *Phasmidæ*. The body exactly mimics a small piece of dried twig, and when at rest the legs are disposed in an irregular manner so as to increase their resemblance to pieces of stick.

Stick'leback (*Gasterosteus*), a genus of freshwater *Teleostean* fishes, distinguished by the long and compressed shape of the body, and by the ventral fins being provided with strong spines. These fishes are noted for their pugnacious habits, their nest-building instincts, and the care they take of their young. The three-spined S. (*G. aculeatus*) is common in all British brooks and ponds. It has three dorsal spines. It constructs a nest composed of vegetable matter cemented round some aquatic plant by a glutinous substance secreted by the fishes themselves. The entrance to the circular nest is at the top, and the eggs are of a bright yellow hue. Both male and female guard the nest with care and jealous attention, and ward off the attacks of other fishes. The ten-spined S. (*G. pugnitius*) is another freshwater species, but the fifteen-spined S. (*G. spinachus*) or 'Sea-adder' is a marine form, attaining a length of from 5 to 7 inches. It is of a greenish hue above, and has a long snout, the lateral line being keeled. Other species are the quarter-armed S. (*G. gymnurus*) and the half-mailed S. (*G. semiloricatus*).

Stiel'er, a famous German cartographer, was born at Gotha 26th February 1775, studied law at Jena and Göttingen, received an office in the ministerial department at Gotha in 1797, became a member of council in 1829, and died 13th March 1836. His principal works, masterpieces of art and science, are a *Hand-Atlas*, issued in conjunction with Reichard (75 maps, Gotha 1817–33; new ed. by Petermann, 90 maps, 1872), and a *Schul-Atlas* (Gotha 1821).

Stig'ma. See PISTIL.

Stigmatisa'tion. See HÆMIDROSIS.

Stilett'o (Ital. from Lat. *stilus*, 'a pointed instrument used in writing'), a short pointed dagger introduced in the Middle Ages, and even yet well known in Southern Europe.

Stil'icho, the last great Roman general, was born about the middle of the 4th c. A.D. His father is said to have been a captain of the Vandal auxiliaries incorporated in the Roman army by Valens, and to his sympathy with these Gothic tribes who furnished now alike the defenders and the enemies of Rome, his subsequent success was probably in large measure due. At an early age S. attracted the attention of the great Theodosius, who held the whole Roman Empire firmly under his power, and was employed by him in several missions of importance, being ultimately made (384) commander-in-chief of the imperial armies. In 394 he and his wife Lerena, a niece of the emperor's, were sent to Rome as guardians of the youthful Honorius, and on the death of Theodosius (395) S. became practically ruler of the Western Empire. For the next twelve years his life was one continuous and, till the last moment, successful struggle against overwhelming odds, in the conduct of which he exhibited military and political talents of the very highest order. His enemies were the ever-returning swarms of barbarians and the jealous court of Constantinople, whose mutual intrigues it required the utmost vigilance to elude. The news of the death of Theodosius excited the Germans and Gauls to revolt, and after they had been subdued in one swift summer's campaign, S. turned to the E., where Rufinus, the able but unscrupulous minister of the late emperor, was using the young Arcadius as a foil for his ambition. By dexterous negotiations, the Gothic auxiliaries who formed nearly the whole of the Byzantine army were induced to turn traitor, and Rufinus was cut to pieces at the moment of his expected triumph. Relieved from this enemy, S. had immediately to turn his attention to another, for in 396 Alaric appeared in Greece with an immense host, and though blockaded in the Peloponnesus, managed to escape, and by the aid of Arcadius defied the Western general for nearly

eight years. At last two crushing defeats drove him from Italy, and in 404 Rome for the last time beheld a triumph over the Goths. No sooner was he effectually humbled than S. was forced to enter into treaty with him, in order that the Byzantine court might be kept employed, and so prevented from interfering with S.'s designs on the imperial throne. Even before the death of Theodosius, Honorius had been betrothed to Maria, the daughter of S., but now the latter proposed to marry his son Eucherius to Placidia, the sister of the two reigning emperors and their heiress should they die childless. But not even his great services could excuse such an act of ambition, and both Pulcheria, the widow of Arcadius and guardian of his infant son Theodosius, and Honorius, whose hopes of an heir had been revived by his marriage with Æmilia, the sister of his late wife, exerted themselves to the utmost to thwart him, and as soon as the formidable invasion under Radagaisus had been checked, the proposed occupation of Illyricum was made a pretext for inflaming the minds of the soldiers against him, and, suddenly deserted by his faithless legions, S. was seized and put to death at Ravenna, August 23, 408. For an account of S.'s life and character the English student need not go beyond Gibbon's *Decline and Fall of the Roman Empire.* The principal ancient authorities are the Church historians, the pertinent parts of whose voluminous works can be learned from the notes in Gibbon.

Still. See DISTILLATION.

Still, John, D.D., born at Grantham, in Lincolnshire, about 1543, studied at Christ's College, Cambridge, became Master of St. John's (1574) and of Trinity (1577), was made bishop of Bath and Wells (1592–93), and died 26th February 1607–8. S. has an obscure place in English literature as the supposed author of the second oldest comedy in the language, *Gammer Gurton's Needle*, a piece of low rustic humour in rhyme, turning on the loss and recovery of the needle with which Gammer Gurton was mending the breeches of her man Hodge.

Stillicid'ii Ser'vitus. See EAVESDROP.

Still'ingfleet, Edward, born at Cranbourne, Dorsetshire, 17th April 1635, passed from the grammar-school of his native town to St. John's College, Cambridge, of which he became a fellow. Taking holy orders, he was successively rector of Sutton in Bedfordshire (1657), preacher at the Rolls Chapel, London (1664), rector of St. Andrews, Holborn, and lecturer at the Temple (1665), canon of St. Paul's (1667) and Canterbury (1669), chaplain-in-ordinary to the king (1670), archdeacon of London (1677), and bishop of Worcester (1689). He battled hotly with Romanists, Atheists, and Unitarians, rather employing borrowed and arrogant arguments than 'the softness, gentleness, and activity' ascribed him by Clarendon. He got the best of Dryden in one controversy, but a defeat by Locke is said to have hastened his death, which took place at Westminster, 27th March 1699. His *Collected Works* (1710), filling six folio volumes, include *Irenicum, a Weapon Salve for the Church's Wounds* (1661); *Origines Sacræ* (1662); *Discourse concerning the Idolatry practised in the Church of Rome* (1671); and a *Discourse in Vindication of the Doctrine of the Trinity* (1697).

Still-Life, in painting, is the designation of subjects that are *still* or without *life*, as dead game, fruit, flowers, vases, and *bric-à-brac.*

Stim'ulants may be defined as medicines which, when given internally, increase the power and force of the circulation, and are used by the physician for such purposes; or as medicines which increase the sensibility of the nervous and muscular system, and the secretions of the mucous membrane, and give energy to the whole system. Wood includes under *Cardiac* S., ammonia, alcohol, turpentine, and digitalis. Neligan divides S. into general and special; but the distinctions are confused. Squire divides S. into spinal and stomachic. The *spinal* S. are arnica, cannabis indica, cantharis, ergota, nux-vomica, phosphorus, and strychnia. The *stomachic* S. are ammonia, anethum, anisum, armoracia, assafœtida, cajuputi, capsicum, chloroform, cardamomum, carum, caryophyllum, cinnamomum, coriandrum, fœniculum, macis, mentha, myristica, pimenta, piper, sinapis, spiritus vini gallici, and zingiber. Electricity, galvanism, and magnetic electricity also act as stimulants.

Sting, the name given to the offensive apparatus occurring as a terminal appendage to the abdomen of certain insects, notably the Bees, Wasps, Ants, and other *Hymenoptera* (q.v.). The S. or *aculeus* is a sharp-pointed appendage protected by two lateral processes. A poison-gland communicates with the S., the secretion of this gland being introduced by the S. into the wound.

Sting-ray (*Trygon*), a genus of Rays, or *Raiinæ*, in which the tail is armed at about the middle of its upper surface with a very prominent spine, the edges of which are serrated. The tail itself is long and slender, and nearly wants a terminal fin. The *Trygon pastinaca*, also named the 'Fireflaire,' is the only British species. It is common in the S. coasts of Britain, and also in the Mediterranean Sea. Its colour is red, and its flesh is said to be unpalatable. Other and allied species inhabit warm seas.

Stink-wood, so called from the offensive smell of the fresh-sawn timber, is *Oreodaphne bullata*, a S. African forest tree, of which the fine-grained dark-coloured wood is used in cabinet work. The better specimens have much the appearance of rose-wood, and take a fine polish. *Fœtidia Mauritiana*, known as 'le bois puant' in Mauritius, is also called S.-W.: it furnishes good furniture wood.

Stipe (Lat. *stipes*, 'a stalk'), in botany, is the foot-stalk (*i.e.*, the portion up to the lowest pinnæ) of fern fronds, as also the stem supporting the pileus or cap in the mushroom-shaped fungi.

Stipe. See FEATHER GRASS.

Sti'pend is the provision for the support of the parochial clergy of the Church of Scotland. It consists of payments of money, or grain (see FIARS), or both, varying in amount according to the state of the free Teinds (q. v.), or of any other fund for the purpose. The terms at which S. is payable are Whitsunday and Michaelmas. See AUGMENTATION, PROCESS OF.

Sti'per Stones, or Arenig formation, the lowest series of rocks in the Silurian system. It consists of several thousand feet of flags, shales, and siliceous or quartzose sandstones with contemporary igneous rocks, well developed in Merionethshire, Shropshire, and in the Lake district. The formation is analogous to the calciferous sandstones, &c., in the state of New York. About eighty species of fossils have been detected in the British rocks of this period, though, with the exception of annelid-burrows, specimens are not abundant.

Stip'ple. See ENGRAVING.

Stip'ules in botany are leaf-like or scale-like appendages at the base of the leaf-stalk, or on the node of a stem. In a great number of plants they are entirely wanting. When present there are generally two. They vary exceedingly in size and appearance, sometimes exactly like the true leaves except that they have no buds in their axils, or looking like the leaflets of a compound leaf, sometimes apparently the only leaves of a plant; generally small and narrow, sometimes reduced to minute scales, spots, or scars, sometimes united into one opposite the leaf, or more or less united with, or *adnate* to the petiole, or quite detached from the leaf, and forming a ring or sheath round the stem in the axil of the leaf. *Stipellæ*, or secondary S., are similar organs, sometimes found on compound leaves at the points where the leaflets are inserted.

Stir'ling, one of the oldest and most interesting and picturesque towns of Scotland, situated on the S. bank of the Forth, 29 miles N.E. of Glasgow and 36 N.W. of Edinburgh by railway. Like old Edinburgh it lies on a steep basalt ridge, the precipitous, rocky brow of which, 350 feet high, crowned by the romantic castle, overlooks the fertile Carse of S., threaded by the sinuous, silvery 'links' of Forth. The magnificent view westwards, across the rich vale of Menteith, extends to the noble rampart of the Grampians jagged by the peaks of Ben Lomond, Ben A'an, Ben Ledi, and Ben Venue. The Ochills form a background to the N.E., and the Campsie Hills close the prospect to the S., while in the vicinity rise Craigforth, the Wallace Monument on the Abbey Craig, and the beautiful remains of Cambuskenneth Abbey. The castle, of unknown antiquity, became a favourite royal residence under the Stewarts, and was the birthplace of James II. and James V., the latter of whom was crowned

here. James III. strengthened the fortress and added the Parliament House; James V. built the palace, a quadrangular edifice; and James VI. (1594) erected the Chapel-Royal, now used as an armoury. The 'Douglas Room' was the scene of the murder of William, Earl of Douglas, by James II. One of the four strongholds which, by the articles of the Union, must be kept in repair, the grey old castle is still used as a military station. On the spacious esplanade a statue of Bruce was unveiled, 24th November 1877. The cemetery adjoining has statues of Knox and other worthies of the Reformation, Covenant, and Secession. The famous 'Back Walk' that skirts the rock below the castle was 'contrived' in 1724. The Greyfriars' Church (divided since the Reformation into the East and West Churches), a fine specimen of Later Pointed Gothic, was erected by James IV. (1494), and extended by Archbishop James Beaton. Here Knox preached on the coronation of James VI. (1567). 'Mar's Work' is part of a mansion designed by the Earl of Mar; 'Argyle's Lodging,' one of the finest specimens of Scottish architecture, built by Alexander, Earl of Stirling, is now a military hospital. S. has 16 places of worship, including the episcopal church of the Holy Trinity, erected at a cost of £14,000, and opened 1878. There are also a town-house, with a square tower, and a council chamber with a spire 100 feet high; a corn exchange; Cowan's Hospital, with a fine Guild Hall; the new county buildings, completed in 1876; a High School; the Smith Institute; a free public reading-room, museum, and picture-gallery opened in 1874; militia barracks, and extensive barracks for married soldiers, still (1878) in course of erection. Besides the Royal Gardens below the castle, which still contain the 'King's Knot' and terraces, S. has a public 'King's Park' of 163 acres. The Forth is spanned by old S. Bridge, which existed prior to 1571, by a modern stone bridge, and by two railway bridges, one of iron, the other of wood. S. is on the Caledonian Railway, and is the centre of two other lines. The industries are woollens, carpets, tanning, and brewing; there is also an active trade in mining and agricultural products. The Forth is navigable thus far to vessels of 200 tons, and passenger steamers run to and from Leith. S. publishes four weekly newspapers, and unites with the Dunfermline burghs in returning one member to Parliament. Pop. (1871) of the parish 12,014; of the parliamentary borough 14,279. *Stryvelyne* or *Estrivelin* first emerges in history as one of the four towns forming the Convention of Burghs. Wallace (q. v.) achieved his brilliant success of 1297 near S., which was taken by Edward I. after a three months' siege in 1304. One mile and a half S.E. is the field of Bannockburn (q. v.). The castle, taken by Monk in 1651, successfully resisted the Highlanders in 1745.

Stir'ling, James Hutchison. LL.D., was born at Glasgow, June 22, 1820, entered Glasgow University in 1833, and studied with distinction for nine consecutive winter sessions in Arts and Medicine, graduating in the latter faculty in 1842. He practised in Wales for some years, but on the death of his father in 1851 relinquished his profession, and devoted himself wholly to metaphysics and literature. S. subsequently spent six years in France and Germany. He has written *The Secret of Hegel, being the Hegelian System in Origin, Principle, Form, and Matter* (2 vols. 1865); *Sir William Hamilton, being the Philosophy of Perception* (1865); *Jerrold, Tennyson, Macaulay, and other Essays* (1868); *Address on Materialism* (1868); *As Regards Protoplasm* (1869; 2d ed. 1872); *Lectures on the Philosophy of Law*, &c. (1873). He also translated Dr. Albert Schwegler's *Geschichte der Philosophie in Umriss*. Of this translation the seventh edition appeared in 1879. S.'s latest original work is *Burns in Drama, together with Saved Leaves* (1878), which is perhaps in some respects the finest effort of his genius. S. keenly opposes the biological theories of Häckel and Huxley, and is not only a profound metaphysician, but a trenchant and incisive critic. He has not worked out a distinct system of his own, but he is a singularly independent and fearless thinker, and blends a rugged vigour and sagacity of intellect in abstract speculation with the picturesque eloquence of literary art.

Stir'ling, William Alexander, Earl of, a Scottish poet and politician, belonged to a family which since the middle of the 15th c. had been settled in Clackmannanshire, where it held the lands of Menstrie. The poet, who was the seventh baron of Menstrie, was born in 1580, in his youth travelled on the Continent as tutor and companion to the Earl of Argyle, and followed James VI. to London, where his talents and accomplishments raised him high in favour at court. Knighted in 1614, he obtained in 1621 a grant of Nova Scotia in America (though it had previously been discovered and partly occupied by the French), of which he was appointed 'hereditary lieutenant,' with the right of creating an order of baronetcy on payment of one hundred and fifty pounds. In 1626 he became Principal Secretary of State for Scotland, in 1630 was created Earl of S., and died in London, 12th September 1640. S. wrote *Darius, a Tragedy* (1603); *Aurora, containing the First Fancies of the Author's Youth* (1604), a hundred lachrymose sonnets in praise of an obdurate fair; *The Monarchicke Tragedies* (1604, 3d ed. 1617); *An Elegie on the Death of Prince Henry* (1612); *Doomesday* (1614); *A Supplement of a Defect in the Third Part of Sidney's Arcadia* (1621); *An Encouragement to Colonies* (1625); *A Map and Description of New England*, &c. (1630). His complete works (except the *Aurora*), entitled *Recreations with the Muses*, were published in 1637. S. is a grave moralising poet, elegant in language and melodious in verse. He was highly esteemed in his own time, and even in the next century. Swift pronounced S. and Drummond of Hawthornden to be 'Scottish bards of highest fame.'

Stir'lingshire, a fertile county of Scotland, on the isthmus between the Firths of Forth and Clyde, and forming part of the border land between the Highlands and Lowlands. Area, 298,579 acres; pop. (1871) 98,218. It is bounded N. by Perth and Clackmannan, from which it is separated by the Forth, E. by the Firth of Forth and Linlithgow, S. by Lanark and Dumbarton, and W. by Dumbarton and Loch Lomond. The parish of Alva forms a detached portion of S., and there is another small portion towards the W. extremity of the Ochils. The district of the 'Carse,' 36,000 acres in extent, stretching along the Forth, is only a few feet above the level, but in the W. and S. the surface is varied by tracts of heath, moss, and pasture. In the N.W. is Ben Lomond (q. v.), in the N.E. part of the Ochils and in the S. the lower Campsie Fells. Besides the Forth, the streams of S. are the Avon, Allander, Kelvin, Endrick, Bannock, Carron, Allan (for about a mile), &c. The county includes rich coal and iron districts, and in 1877 had 4 out of 7 furnaces returned for S. and Linlithgow, which together yielded 55,241 tons of pig-iron. There are some 40,000 acres of oak coppice, yielding a large supply of bark. The soil is varied, and agriculture is in a highly proficient state. Wheat and beans are abundantly produced in the Carse, and potatoes and turnips in the higher 'dry-field' farms. In 1876 there were 30,655 acres in corn crops, 9503 in grain crops, 24,036 in clover, sainfoin, and grasses in rotation, 45,009 in permanent pasture, exclusive of mountain-land and heath. The live stock comprised in the same year 30,225 cattle, 115,610 sheep, 2297 pigs, and 4801 horses. The manufacture of carpets, tartans, plaidings, shawls, and other woollens is carried on at Bannockburn, Cambusbarron, &c. There are large ironworks at Carron (q. v.); cotton-mills at Fintry, Balfron, and Milngavie; printfields at Denny, Milngavie, Lennoxtown, &c.; tanworks at Stirling and Falkirk; and shipping-yards at Grangemouth. A member is returned to Parliament by the county.

Stir'pes, Succes'sion by, is a term of Scotch law, denoting that an inheritance is distributed among representative *families*, and not among the individual members of such families.

Stirr'up Cup, a parting drink, from the former custom of travellers in Scotland receiving a parting cup from the host when their feet were in the stirrups.

Stirr'ups are metal rings or loops with a flat 'footrest' suspended by leathers from a saddle to support the feet of a horseman. No trace has been found of their use prior to the 6th c., and they are first mentioned under the name *scalæ* in a work by Emperor Mauricius. S. were known in England before the Norman Conquest, but they do not appear to have come into general use till the 12th or 13th c. S., on shipboard, are short ropes pendent from a yard and having eyes through which a foot-rope passes for sailors to stand on. Stirrup, in machinery, denotes a bent strap for securing one object to another.

Stitch in the side is a popular designation for the peculiar pain often experienced in various affections of the lungs and its lining membranes, such as pleurisy, pneumonia, and phthisis. It is sometimes also applied to the pain felt in pleurodynia.

Stitch'wort (*Stellaria*), a genus of *Caryophyllaceæ*, of which there are about 70 species (7 British)—all slender herbs, widely distributed through the temperate and cold regions of the globe. The best-known members are the great S. (*S. Holostea*), which from its large white flowers in early summer is an ornament of hedgerows and pastures; wood S. (*S. nemorum*), frequent in the N. of England and Scotland in shady places, but not so striking as the above; and the chickweed (*S. media*), native through Arctic and N. temperate regions, and now a cosmopolitan naturalised weed. The great S. was supposed to cure 'stitch' in the side (Gerard, *Herbal*, p. 140), hence the name.

Stiv'er, a Dutch coin, valued at 5 centimes or $\frac{1}{20}$th of a guilder, and therefore equivalent to about one penny sterling.

Stoat. See ERMINE.

Stobæ'us Joannes, a learned Greek, native of Stobi in Macedonia, who probably lived in the 6th c. of our era. In the course of his extensive reading he made extracts of the most important passages, sometimes verbatim, sometimes merely epitomes, which he put together under subjects for the instruction of his son Septimius. Photius has given an alphabetical list of 500 Greek writers from whom he made extracts, which are invaluable, as most of the originals have perished. He himself called his anthology, *Eklogōn, apophthegmatōn, hypothēkōn, biblia tessara.* It has come down in 3 books, forming two separate works. The first and second books are usually called *Eklogia physikai, dialektikai kai ēthikai*, and the third *Anthologion*. The *editio princeps* of the *Eklogai* was published in 1575 at Antwerp. The best modern edition of the *Eklogai* is that by A. H. L. Heeren (2 vols. Gött. 1792-1801), and of the *Anthologion* by T. Gaisford (4 vols. Oxf. 1822; reprinted at Leipzig 1823 and 1853). A complete edition of the works of S. was published by Tauchnitz (3 vols. Leip. 1838).

Stock (originally 'Stock-gilloflower,' to distinguish it from the stemless *Dianthus caryophyllus*, the clove-pink, called 'gilloflower') has passed beyond its original application to *Matthiola incana*, to be the accepted English name of the genus, and of some allied cruciferous garden plants. *Matthiola* (named after *Matthiolus*, an Italian physician) is a genus of herbs, of which there are about 30 species dispersed through Europe, N. Africa, and W. Asia, and one belonging to the Cape. The *M. incana* is a plant of W. Europe, Canaries, and Levant, occurring in Britain only in the Isle of Wight. It is the source of numerous varieties or breeds ranging under the names 'Queen S.' and Brompton S., which are treated only as annuals or biennials in the garden. *M. tristis*, a low-growing species with narrow hoary leaves and dingy brown flowers, a native of S. Europe, is best known as the Night-scented S. *M. annua* is the source of Ten-week S. group, and *M. græca* of the smooth-leaved annual stocks. *M. sinuata*, a diffuse herbaceous species, reaching as a native the shores of W. England and Ireland, has pale lilac flowers, fragrant at night, but it does not appear to be cultivated. The so-called Virginia S. (*Malcolmia maritima*) is indigenous to the coasts of S. Europe, and has become a favourite garden annual.

Stock'broker. See EXCHANGE, STOCK.

Stock-Fish, a general name given to such fishes as cod, ling, tusk, &c. These fishes are largely used in a dried state, and are split up on being caught, gutted, washed, partly boned, and then placed in salt vats and heavily weighted. After an interval they are taken from the vats, washed and laid out on rocks to dry, the flesh then becoming white. Gathered into bales, the S.-F. are ready for the market. S.-F. are usually prepared in northern lands. In Scotland, Canada, and Newfoundland the curing of S.-F. is a great industry.

Stock'holm (Sw. *stock*, 'a stake,' or Lapp. *stock*, a 'sound' or 'strait,' and Sw. *holme*, 'an islet'), the capital of Sweden, lies on the outlet of the Mælar Lake into an island-studded bay of the Baltic (here called *Saltsjö*), and is built partly upon islands, partly on the mainland. Its beautiful situation has gained for it the name of 'Queen of the Baltic.' Not even in Venice is the water communication more easy and extended. The town proper occupies three islands, on the largest of which, Stadsholmen, is the king's palace, built by Tessin on the site of the old 'Adelshus' (burnt 1697), a plain, massive quadrangular building 408 feet long by 381½ broad, with wings at its corners, three of which are 161 feet long by 50 feet broad. It contains a festival hall called 'Hvita Hafvet,' 115 feet long and 38-35½ feet broad, and in the N. wing is the Royal Library. S. of the palace are an obelisk (98 feet) commemorating the deeds of citizens of S. in the Russian war of 1788-90, Gustaf III.'s statue by Sergel, the finest in S., the Cathedral of St. Nicholas (founded 1264, almost entirely rebuilt 1736-43), Italian externally, internally Gothic, with a spire 185 feet high, and the Exchange (1776). Also on Stadsholmen are the New Masonic Temple (1877), occupying the old Riddarhus (1648-70), on the purchase and fitting up of which £101,250 has been expended, with Gustaf Vasa's statue (1773) in front, the townhouse (1731), the prison (1846-52), and the Royal Bank; and here stood the German church, formerly St. Gertrude's chapel, with a spire 217 feet high, and the only peal of bells in Sweden (28 in number), cast at Hamburg in the 16th c., which was burnt down October 3, 1878. To the W. is Riddarholmen, with Riddarholm Church (founded 1278-85, rebuilt 1568-76, and nearly destroyed by lightning in 1835, but restored in 1847), 187 feet long, with a spire 295 feet high, and eight chapels, since 1807 the Swedish Westminster Abbey, containing 6000 flags and trophies taken in the wars of Sweden; Svea Hofrätt, the residence of the royal family from 1697 to 1754; Birger Jarl's statue (1854), and the Riksdagshus, where the lower house of the Riksdag met from 1834 to 1866, and both houses now meet. From Stadsholmen, the granite Norrbro (1797), the finest bridge in S., 808 feet long, with the Stromparterre, a favourite promenade, on its E. side, leads over Helgeandsholmen, the third islet of the town proper, to Norrmalm ('north suburb'), the largest and finest division of S., entered from Gustaf Adolf's Square, between the Grand Theatre-Royal (seated for 1500) and Prince Oscar's Palace. In Norrmalm are St. Jakob's Church (1588-1643), the King's Garden, with statues of Karl XII. and of Karl XIII. and the Molin Fountain (1873), Berzelius' Park, with a statue of Jacob Berzelius (1858), the Jewish Synagogue (1870), the Dramatic Theatre (700 seats), the Academy of Art, the Clara Church (1572-75, burnt 1751, rebuilt 1753), the Central Railway Station (513 feet long), the Catholic Chapel of St. Eugenias, the Technical School (erected 1868, and having, in 1874-75, 2523 pupils), the Baptist and Methodist chapels, the Public Orphanage (4000 children), the English Episcopal Church (1866), Adolf Fredrik's Church (1768), the Academy of Science, with the Royal Museum (1820), the richest collection of Arctic objects in the world, a library of 35,000 vols., and an Observatory; and the Technological Institute (1863) and School of Mines (1869), with a library of 20,000 vols. To the E. of Norrmalm is Ladugardslandet, with the Ladugardsland Church (1658-1737), the New Royal Library, the horse and life guards' barracks, and the artillery barracks; to the S.E., Blasiholmen, with Blasiiholm Church (completed 1867), the New Theatre (1510 seats), the Grand Hotel (300 rooms), the largest in Sweden, and the National Museum, erected (1850-65) after designs by Stuler, 254 feet long, 166 broad, and 88 high, comprising a historical museum and cabinet of coins, collections of majolica and other porcelain, old armour and clothing, ancient vases and bronzes, antique and modern sculpture, Egyptian antiquities, 70,000 engravings, and a mediocre picture-gallery of 1350 works (250 Italian, 451 Dutch and Flemish, 108 Swedish). To the S.E., connected by an iron bridge 536 feet long, is Skeppsholmen, a station for part of the Swedish fleet, with Karl Johan's Church (1826-42); and further S.E. is Kastellholmen. To the S.W. of Norrmalm is Kungsholmen, where are the Mint, the Serafimer Lazaret (1752, with 300 beds), the Karolinska Institut (1811), the chief medical school in Sweden, the Kurhus (1816, 200 beds), the maternity, children's, and garrison (1834, 430 beds) hospitals, and hospitals for incurables and for the insane. In Södermalm ('south suburb'), south of the town proper, are the great iron warehouse and docks, the Maria Magdalena Church (founded 1586, extended 1658 and 1673, restored after the fire of 1759), the Katarina Church, the finest in S. (built 1656-70, burnt 1723, restored 1724), and the Southern Theatre (550 seats). S. is the chief manufacturing and trading town of Sweden, its manufactures being cloth, cottons, linen, silk, glass, stoneware, tobacco, sugar, leather, soap, lucifer matches, and machinery. Ironfounding, brewing, and tile-making are also carried on. In 1872 there were 327 manufactories (38 of tobacco), with 8000 workmen, producing goods worth £2,812,500. The customs in 1873 amounted to £1,030,462.

S. has a large and excellent harbour, deep enough for ships of war. In 1874 there entered 1755 ships (535 Swedish) of 466,725 tons, and cleared 1508 (488 Swedish) of 487,580 tons. In 1877, 211 vessels (148 steamers) of 43,540 tons belonged to S. Iron and wood are the chief exports. E. of Skeppsholmen is the Djurgarden, a beautiful park, the favourite resort of the citizens, with Rosendal, Karl XIV.'s summer palace, Manilla, an institute for deaf mutes and the blind, Bellman's statue, and his colossal bust (1829); and near S. are the castles of Karlberg (from 1792 a military school), Haga (1786), Ulriksdal, and Drottningholm. S. was founded and fortified by Birger Jarl, who gave the town its earliest privileges in 1255. During the Middle Ages it was mainly confined to Stadsholmen. It began to increase about 1635-36, when Norrmalm and Södermalm were incorporated. The famous 'S. Massacre' took place in the 'Great Square,' 8th November 1520. S. suffered much from the plague in 1484, 1565, 1580, and 1710, from cholera in 1834 and 1853, and from the great fires of 1407, 1640, 1685, 1697, 1723, and 1759. Pop. (1663) 15,000; (1763) 73,000; (1840) 84,000; (1878) 156,677. See Ferlin, *S.'s Stad* (2 vols. Stock. 1854-58); Atkinson, *Art Tour in Northern Capitals* (Lond. 1873); *S. och dess Omgifningar* (Stock. 1874).

Stock'ings and **Stock'ing-Frame.** The Old English wore coverings for the legs and feet made of cloth or leather cut to shape and sewed up. These coverings were termed *hose.* The term S. came into use in the 16th c., and was applied to continuations ('nether-stocks') of the trunk-hose or breeches ('upper-stocks') then worn. Knitted S. were not made in England before the middle of the 16th c. About that time knit silk S. were introduced from Spain, into which country the art of knitting had been carried by the Moors, who learned it from the Arabs. Queen Elizabeth encouraged the manufacture of knit S. in England, and the industry not long after received an immense impetus by the invention of a machine which dispensed with the manual labour of knitting. This machine, called the S.-F., was designed in 1589 by William Lee, a native of Woodborough, Notts, Fellow of St. John's, Cambridge, and curate of Calverton. Failing to get his S.-F. adopted in England, Lee carried it to France, where he was favourably received by Henri IV. After the death of his royal patron, however, Lee shared in the persecution to which Protestants were subjected, and died in Paris in 1610. Some of his workmen returned to Nottingham, and there established the machine stocking-trade, which has since remained one of the staples of the county. The original S.-F. has been variously improved and modified, and out of it have grown the lace and net-making machines. As in hand-knitting with skewers or needles, one continuous thread is employed in the construction of the web in the S.-F.; there is therefore neither warp nor weft as in woven cloths. The S.-F. consists of a highly complex arrangement of working-parts. There is a series of 'needles' with peculiar elastic hook-shaped heads, and thread from a bobbin being laid across them, a set of levers with plates, termed *jack-sinkers,* descend and push down the thread between each pair of needles. Another set of levers with plates, called *lead-sinkers,* are then brought down on the thread so as to form loops, which are next pushed back on the needles. Another course of loops is then formed in the same way and pushed into the open hooks at the ends of the needles; the 'beards' of the hooks are pressed down by a *presser-bar,* and over the loops thus held there the first course of loops is drawn. A third course of loops is then formed, and the second drawn over them, and by a repetition of these operations the whole web is constructed. The web so produced is flat, and has to be seamed up the back to form a stocking. See HOSIERY and KNITTING.

Stock'mar, Christian Friedrich, Freiherr von, a celebrated diplomatist, was born at Koburg, 22d August 1787. He studied medicine, and practised first in his native city, and then for two years in the army. In 1816 he was appointed physician to Prince Leopold of Koburg, to whom he subsequently became private secretary. His tact, sagacity, elevation of character, and knowledge of affairs procured him the confidence of the prince, and led to his taking a prominent part in European diplomacy. Among the many delicate negotiations with which he was intimately concerned were the accession of Leopold to the Belgian throne (1831), the marriage of Prince Ferdinand of Koburg with Queen Maria II. of Portugal (1836), and the marriage of the Prussian Crown Prince with the Princess Victoria of England (1858). He was the beloved friend and trusted counsellor of Prince Albert and Queen Victoria, and in Theodore Martin's *Life of the late Prince Consort* (vol. i. 1874, vol. ii. 1876) may be traced the rare qualities of head and heart which gained him alike power and popularity. Ennobled in 1821, he was made Freiherr of Bavaria in 1831. He died at Koburg, 9th July 1863. His *Denkwürdigkeiten aus den Papieren des Freiherrn von S.,* edited by his son (Brunsw. 1872), appeared in English under the title of *Notabilia from the Papers of Baron S.* (2 vols. Lond. 1872).

Stock'port, a cotton town of Cheshire, 5¾ miles S.E. of Manchester, is built on the slopes of a narrow gorge where the Thame and Goyt unite to form the Mersey. Eleven bridges connect its numerous suburbs; and right across the valley, over the houses, the 30-arched viaduct (1840) is thrown of the London and North-Western Railway, 111 feet high and 1876 feet long. St. Mary's, the mother church of thirteen others, was rebuilt (1817) in Perpendicular style, all but a 14th c. Decorated chancel (restored 1848); and of twenty-three non-established places of worship the chief are St. Joseph's Catholic Church (1862) and a Congregational chapel (1866), with a spire 126 feet high. The public buildings include a market hall (1851-60); Mechanics' Institute (1862); the Bank of S., an ornate Italian edifice (1868); a Free Library, which in the year ending September 1877 issued 73,166 vols.; the infirmary and dispensary (1832); and a grammar-school (founded 1482; rebuilt in Collegiate Gothic style 1831), which in December 1878 had 6 masters and 148 boys. The beautiful Vernon Park, with its seven terraces, was opened in 1858, and contains a museum (1860). According to the Census Returns (1871), the employment of adults in S. district is thus distributed:—cotton manufacture 14,950, hat-making 2400, silk manufacture 872, cotton and calico printing 433, engine and machine making 494, spindle-making 109, coal-mining 530, and iron-mining 498. S. returns two members to Parliament, and publishes two weekly newspapers. Pop. of borough (1851) 53,835; (1871) 53,014. S. was the site of a Roman station, and of an old English and Norman castle, which, held by the Earls of Chester till 1327, was taken by Prince Rupert (1644), and shortly after demolished by the Parliament. After Derby, S. was the first place where silk-mills were established on the Italian principle, but to cotton it chiefly owed its growth during the second half of last century, a growth severely checked by the trade outrages against machinery (1810-20), the strike of 1828-29 when troops were called out and many persons wounded, the 'Plug Riots' (1840), and the Cotton Famine (1861-64). See Heginbotham's *S., Ancient and Modern* (parts i.-ii. Lond. 1877-78), and vol. i. of J. P. Earwaker's *East Cheshire* (1877).

Stock'ton, a river-port of England, in the county of Durham, 11 miles E.N.E. of Darlington by rail, stands on the left bank of the Tees, 4 miles above its mouth. Its six Anglican churches include St. Thomas's (1712; restored 1859), with a tower 80 feet high, St. James's (1868), in French First Pointed style, with a spire of 130 feet, and St. John's (1872), a brick edifice of the basilica type; and of numerous non-established places of worship the finest are the Roman Catholic St. Mary's (1842-70), designed by the elder Pugin in Early English style, and the United Presbyterian St. Andrew's (1861). Other buildings are the town-hall and assembly-rooms (1735), the borough hall (1852), exchange (1874), post-office (1878), free-masons' hall (1872), surgical hospital (1875), holding 120 beds, &c., and a cattle-market was constructed (1876) at a cost of £17,500. The S. and Darlington Line, the earliest in the kingdom, celebrated its fiftieth anniversary in 1875, and S. is now an important railway centre. Its harbour, also, improved by a cutting below the town (1808), carries on an extensive trade, being entered (1877) by 565 vessels of 74,146 tons, and cleared by 217 of 41,149 tons. The imports amounted to £354,523, the customs to £52,214, and the exports to £3519; and on December 31st of the same year 26 ships of 3727 tons were registered as belonging to S. In 1871, according to the Census Returns, the iron-manufacture employed 7260 adults, engine and machine making 1579, coal-mining 98?, shipbuilding 822, the earthenware manufacture 292, and brickmaking 238, and since that

date the shipbuilding industry has steadily increased, 12 British vessels of 8506 tons having been turned off the stocks in 1873, and 19 (15 steamers) of 17,063 tons in 1877. S. publishes one weekly newspaper. Pop. (1831) 7763; (1871) 28,021. A former residence of the Bishop of Durham, S. was taken by the Scots in 1645, and seven years later its castle was demolished by the Parliament.—**South S.**, in the North Riding of Yorkshire, stands on the opposite bank of the river, which is spanned by a five-arch bridge (1770), and is also a busy place, with a pop. (1871) of 6967. The two towns together form one parliamentary borough, which returns one member to Parliament, and has a pop. of 37,467; but South S. is governed by a Local Board.

Stock'ton, a town of the State of California, U.S., on the main line of the Central Pacific Railway, 100 miles E. of San Francisco, at the head of a navigable channel of the same name, which connects it with the San Joaquin river, and affords access for ships of 150 tons burden, and steamers of 500 tons. It was formerly a great emporium and place of despatch for several gold-mining regions, and is at present the chief inland wheat-market in California. It has 14 churches, 2 newspapers, 5 artesian wells, warehouses capable of storing 3,000,000 bushels of grain, large flour-mills, and manufactures of farm implements, hardware, carriages, &c. Pop. (1870) 10,066.

Sto'ics. The name applied to a body of philosophers who flourished first in Greece about the 4th c., but whose influence finally spread over the whole classical world. Their place in the history of philosophy is immediately after Plato and Aristotle. These two mighty geniuses had in turn made the two greatest efforts that have ever been made to give finality to philosophy, by putting forth a reasoned theory of the universe. Later thinkers began to seek rather for a practical system by which to live than to again attempt to solve the secret of existence. Hence Stoicism is a code of practical rules as much as a reasoned theory: still, as it was the former in a philosophical manner, it necessarily had the latter. The leading thought of the S. may be thus stated. They divided philosophy into three parts—Logic, Physics, and Ethics. 'Logic supplies the method for attaining to true knowledge; Physics teach the nature and order of the universe; and Ethics draw thence the inferences for practical life.' The only means we have of knowing about a thing is by the impression it makes on us: but we have many impressions which are certainly false: how are we to discriminate between the false and true? The S. answered this by asserting that a true impression would come home to us by a sort of 'striking evidence.' The irresistible force of truth would influence our minds in a way that false impressions were utterly unable to do. Being true, they would force us to believe they were true. In their physics (which were really metaphysics) the S. enunciated a theory of pantheism. 'The world is produced, animated, ruled by God; it is a prodigious living thing (*zôon*), the rational soul of which is God.' It follows, then, that all is wisely willed, that evil is only apparent, and that for man (here we pass into ethics) the highest good is to live in accordance with the perfect life of the universe. (Here we have the celebrated stoic maxim, 'Follow Nature.') But if this be so, pleasure, which is a merely individual thing, cannot enter into a true theory of life. It is hostile, or at least indifferent, to virtue, for that is the fashioning of the life of the individual after the universal. Material goods are of no importance to the individual save in so far as they aid him in the pursuit of virtue. They have no absolute value, nor have any external things; though some, through the chance assistance they may give to virtue, are preferable to others. Since virtue is the life in accordance with nature, the least departure from it destroys its absolute nature. 'He only is good who is perfectly good; vicious is every one who is irrational or wrong in any one point.' Virtue is absolute justice—absolute perception of the good and true, and its exact reproduction in the individual life. That is the duty of a man to himself, and he must help other men to fulfil theirs. He must help them equally, and fully also, for the 'entire race ought to form a single community with the same principles and laws.' The ideal of virtue is painted in the stoic picture of the 'Wise Man.' Living absolutely in accord with the centre principle of the universe, he possesses all knowledge and all aptitudes. He alone is the true statesman, king, educator, critic, and physician. In social life none but he can be a true friend. Absolutely independent of earthly things, he leads a life undisturbed by their ceaseless mutations. His life partakes in its essence of the life of the universe, and as such it cannot be disturbed.

The founder of stoicism was Zeno (340–260 B.C.), who opened his school in the 'many-coloured portico' (*Stôa poecile*); hence the name of the sect. After him came Cleanthes, surnamed the Ass from his stubborn patience. Then Chrysippus (of Soli, in Cilicia, died about 208 B.C.), of whom it was said, 'If Chrysippus were not, the Stoa were not,' so much was he the centre figure of the school. He wrote, it is said, 705 different works, and to him is due the regular exposition of stoicism as a system of philosophy. After him we have a new period. When Greece was brought under subjection to Rome, her systems of philosophy became known to her conquerors, and no system had more adherents than stoicism. Panaetius and Posidonius, later rulers of the Porch, were friends of the younger Scipio, Cicero, and Pompey. There was something in the stern practical character of stoicism that agreed well with the Roman mind. And how powerful its effect was we see from the great Roman writers. It is essentially the philosophy of Cicero; its influence is felt in Tacitus, and many references in Horace, Juvenal, and Persius as to the external and internal characteristics of the school show its place in the Roman world. Among its later adherents were Seneca, the tutor and victim of Nero; the slave Epictetus—'the lame old man,' as he called himself—whose writings show so remarkable an approximation to Christianity; and Marcus Aurelius, the Roman emperor. Its influence was felt in the composition of the Roman Law, which, originally a narrow code, became under the empire the greatest, the most systematic, and in many respects the wisest system of jurisprudence the world has ever seen. Specially stoical, though not stoical alone, was the conception of the Law of Nature, 'which Nature teaches all animals,' and which in its vast applications as an underlying principle had so much influence on all further legal modifications. Although stoicism as a system fell to pieces with the ancient world, it essentially reappeared in the ascetic forms of Christianity and other religions. But the reason is, not that they were descended from stoicism, but that both came from a common source. Stoicism has its origin in human nature. It is not all truth, but truth is many-sided, and this system is at least one aspect of it. The best work on the S. is Zeller's '*S. and Epicureans*' (Eng. trans. by Reichel, Lond. 1870), forming chap. 3d of his *Philosophie der Griechen*; see also F. Ravisson, *Essai sur le Stoïcisme* (Paris 1856), P. Montée, *Le Stoïcisme à Rome* (Paris 1865), and the preliminary dissertations to Grant's *Ethics of Aristotle* (3d ed. Lond. 1874).

Stokes, George Gabriel, F.R.S., was born at Skreen, County Sligo, August 13, 1819. In 1837 he entered Pembroke College, Cambridge, graduated as Senior Wrangler and First Smith's Prizeman in 1841, became a Fellow of his college the same year, and in 1849 was elected Lucasian Professor of Mathematics, a post once filled by Newton himself. Like his great predecessor, S. combines a splendid mathematical genius with a rare experimental skill, a combination which has enabled him to attack problems of the gravest difficulty in mathematical physics. Of these may be mentioned his researches into the internal friction of fluids in motion and the elasticity of solids, and a magnificent series of papers upon the undulatory theory, all in the *Cambridge Philosophical Transactions* (1845-51). His hydro-kinetic theorems formed the basis upon which Helmholtz developed the theory of vortices, which, in the hands of Sir W. Thompson, has assumed such an importance in material hypotheses. S. is best known perhaps by his explanation of Fluorescence (q. v.), contained in a paper *On the Change of the Refrangibility of Light* (*Phil. Trans.* 1852), for which he obtained the Rumford Medal from the Royal Society; but there is no doubt that he was the first to clearly enunciate (in his class lectures) the principle upon which Spectrum Analysis (q. v.) depends, and which was afterwards independently arrived at by Stewart and Kirchhoff. The value of his work, which unfortunately is scattered in numerous papers, published chiefly in the *Philosophical Transactions* and the *Cambridge Philosophical Transactions*, can hardly be overestimated; and at present he is believed to be engaged upon a systematic treatise on Sound and Light. S. has been a secretary of the Royal Society since 1854, and was president of the British Association in 1869. His *Light* (1876) contains a lucid and elementary exposition of fluorescence. A

biographical sketch by Professor Tait was published in *Nature*, vol. xii. (July 15, 1875).

Stoke-upon-Trent, the capital of the 'Potteries,' Staffordshire, stands on the Trent, 2½ miles S. of Burslem by rail. Its parish church, a Gothic structure of last century, has a tower 112 feet high, and contains the tomb of Wedgewood; other buildings are the town-hall and market-house (1834), a Tudor railway station and hotel, with statues fronting it of Wedgewood and Minton, the Hartshill Infirmary (1868), and the Harpfield Schools (1875). The enamel and porcelain works of Minton and of Copeland are widely famed, but trade has been slack during the present year, the total value of the goods exported from the Potteries in the first nine months of 1878 being £1,260,590 against £1,288,777 in the corresponding period of 1877. Other important industries are coal-mining, the iron manufactures, brickmaking, and the manufacture of engines and machines. Pop. of town (1871) 14,007; of parliamentary borough, which includes Hanley, Burslem, &c., and returns two members, 130,985.

Stol'berg, a town of Rhenish Prussia, 7 miles from Aachen, and a station on the Köln-Aachen railway. It is a centre of an important metal-ware industry. In the town and the neighbourhood are numerous brass foundries, copper mills, wire, needle, and pin factories, &c. Cloths, mirrors, and other glass wares, chemicals, &c., are also manufactured. Pop. (1875) 10,256.

Stol'berg, Christian Graf zu, a German lyric poet, belonging to one of the oldest German families, was born at Hamburg, 15th October 1748, studied at the University of Göttingen (1769-74), filled for over twenty years the post of Amtsman at Tremsbüttel, Holstein (1777-1800), lived for other twenty in retirement, and died 18th January 1821. He wrote a large number of lyric poems, several unsuccessful imitations, and some successful translations of Greek plays. He and his younger brother, **Friedrich Leopold Graf zu S.**, were both members of the celebrated literary society called the 'Göttingen Hainbund,' in which many of the best-known lyric poets of that period who took Klopstock as their model were united. Of the two the younger brother was by far the better poet. He was born in Bramstedt, 7th November 1750, was employed as minister of the bishopric of Lübeck, in Copenhagen (1777-89), and as ambassador at Berlin. In 1800 he resigned his offices, and with all his family professed at Münster his adhesion to the Roman Catholic Church. This conversion created a profound sensation in Germany. S. had already published a large number of works, which showed an earnest and passionate love of freedom both in thought and action. The tendencies of the school to which he belonged were liberal Protestant, and his most intimate friends were bitter opponents of Catholicism. S.'s last days were embittered by the controversies to which his conversion gave rise. He died at Sondermühlen, near Osnabrück, 15th December 1819. S. wrote a large number of works, of which the chief are a romance entitled *Die Insel* (1788); *Reise durch Deutschland, die Schweiz, Italien, und Sicilien* (1794); translations of Homer, Æschylus, and Ossian; *Leben Alfred's des Grossen* (1815); *Geschichte der Religion Jesu Christi* (1811-18). The historical works all belong to the period after his conversion, and as they are written in accord with the spirit of Roman Catholicism, they are wanting in independent historical value. His poems exhibit a wide range of sentiment and thought, from the expression in simple language of simple feeling, to wild utterances on freedom and friendship. The *Werke der Brüder S.* were published at Hamburg in 22 vols. 1821-26. See Nicolovius, *Friedr. Leop. Graf zu S.* (Mainz. 1846); Menge, *Der Graf Friedr. Leop. von S. und seine Zeitgenossen* (2 vols. Gotha, 1862).

Stole (Gr. *stolē*, 'a robe'), among the ancient Romans, was properly the robe of women, as the *toga* was of men. Some of the luxurious emperors having added to their togas the embroidery which bordered the S., the latter garment became common to both sexes. Then as this border was the most valuable part of the S., the robe itself seems to have gradually fallen into disuse, and the border to have been kept as an ornament, which assumed its present form of a long narrow scarf, and came to be regarded as belonging exclusively to the clergy. As early as the 4th c. the use of the S. was forbidden to any under the rank of deacons, and these even could only wear it when celebrating the holy mysteries, while priests wore it constantly as a mark of sacerdotal dignity. Besides, while priests wore it round the neck, with both ends in front, deacons had to wear it over the left shoulder, with the ends fastened under the right arm (in the Eastern Church with one end before and the other behind).

Stolen Goods, by English law, if purchased *bona fide* in market overt, may be retained by the purchaser unless the owner have duly prosecuted and convicted the thief; if, however, they have not been exposed for sale in market overt, but have been bought privately, the purchaser is bound to restore them to the true owner. By Scottish law, on the other hand, the true owner may raise an action not only against the thief, but against any person or persons who have purchased the goods irrespective of *bona fide*.

Stol'pe, a town of Prussia, province of Pommern, on the river S., 15 miles from its mouth, and 75 W. by N. of Danzig by rail. It has a garrisoned castle, a large Marienkirche (1311), with a tower 190 feet high, an hospital, &c., and manufactures amber, brandy, beer, linen, and cordage. Pop. (1875) 18,356. The port of S., Stolpemünde, has a pop. of 1830, and possesses 31 vessels of 3879 tons.

Stom'ach, the dilated portion of the alimentary canal, in which the food is detained for a longer or shorter period to admit of its being mixed with the *gastric juice*. A stomach may be entirely wanting in some animals; *e.g.*, Protozoa (q. v.), tape-worms, &c., and in *Cœlenterate* animals, represented by such forms as the jelly-fishes, sea anemones, corals, &c. The S. is of very imperfect structure, and in its most typical development exists as a sac which opens freely below, and communicates with the body-cavity. In man's own class (*Mammalia*), the S. may exhibit certain important complications, which reach their maximum in the ruminants, where the S. is divided into four compartments; the whole S. of a ruminant, however, corresponding to the human S. Man's S. is a simple pear-shaped organ, situated in the epigastric and right and left hypochondriac regions. The base of the pear or cone lies towards the left site, the smaller extremity of the S. lying to the right side, and being continued to form the *small intestine*. Below the S. the *transverse colon* is situated. Above, the S. is in close relation to the *Diaphragm* (q. v.) or midriff, and also the front wall of the abdomen. The weight of the S. is about 4½ ounces. The transverse diameter of the S. when full is about 12 inches, and its vertical diameter 4 inches. The larger (left) extremity is the fundus. The gullet opens into this extremity by the *cardiac* opening. The opposite or intestinal aperture of the S. is named the *pyloric aperture*, this latter opening being guarded by a circular fold of the mucous or lining membrane of the S., which serves as a valve to prevent the escape of the food before the proper moment arrives. The *lesser curvature* of the S. is its upper border, the *greater curvature* forming its lower margin. The structure of the S. shows it to consist of four coats. Externally is the *serous* coat; then comes the *muscular coat*, composed of unstriped muscular fibres: a *cellular coat* lies below the muscular covering; and the inner or *mucous coat* forms its lining membrane, and comes in contact with the food. This mucous coat is thickest at the pyloric extremity of the S., and exhibits *rugæ* or folds when the S. is empty. These folds disappear when the cavity is distended with food. In the mucous coat are the *gastric glands*, which secrete the *gastric juice*. These glands are tubular prolongations of the mucous coat lined by *epithelial cells*. They may be simple tubes, or may exhibit a branching arrangement. The glands attain a length of the $\frac{1}{25}$ of an inch and a diameter of $\frac{1}{35}$ of an inch. Other (*lenticular*) glands occur in the S., but have no openings, and are most numerous in early life. The S. derives its blood from the *hepatic* and *splenic arteries*, and its nerves from the *pneumogastric trunks*. The *gastric juice* of the S. consists of water (994·40) and solids (5·59). The solids include *pepsin*, *hydrochloric acid*, *chloride of lime*, *potass*, *sodium*, and *phosphates*.

Diseases of the S.—The various morbid conditions of the S. may depend on functional disorders, lesions of texture, or both combined. The morbid states of the S. are (1) softening of tissue; (2) glandular degeneration of the proper mucous substance; (3) congestion; (4) forms of inflammation tending to exudations and destruction of parts, or condensations of tissue about the pyloric orifice; (5) ulceration; and (6) carcinoma.

Softening of the S.—According to Dr. Handfield Jones 'there are two forms of softening: one, the commonest by far, which is simply the result of the action of the acid contents of the S. upon its own dead tissue; the other, the consequence of a peculiar change taking place in its glandular structure, which generates a powerful acid, dissolving, corroding, or destroying the surrounding tissue. The latter form may occur either with an empty or a full state of the blood-vessels of the S., the softening part of which will accordingly be either quite pale or of a dark blackish tint. This same form occurs in a great variety of morbid states, which seem to have only this in common, that they are attended with great depression of the vital powers. It is more common in children than in adults, on account of the greater delicacy and less resisting power of the system.' Softening of the S. most frequently occurs in connection with such diseases as enteric fever, peritonitis, cancer of the uterus, tubercular hydrocephalus, ulceration of the S., and inflammatory diseases of the brain. The symptoms in connection with such diseases are pain, tenderness at the epigastrium, thirst, nausea, vomiting of acid fluids, and loss of appetite. *Glandular degeneration of the mucous substance* is a much more common lesion. In such cases there may be complete destruction of the tubular glands without replacement of tissue, or there may be a replacement of tissue by the deposition of granular matter within the tubes without diminution or alteration of form. The general symptoms of such conditions are anæmia and debility, without any obvious organic cause, loss of appetite, nausea, and vomiting, a peculiar feeling of weight in the S. and an abundant generation of gas.

Congestion of the S. may be passive or active. *Passive* congestion may depend upon any mechanical impediment preventing the blood returning from the S. towards the heart, such as an obstruction in the liver. The immediate effects of congestion may be hæmatemesis, or the vomiting of blood, or a marked decrease in the secretion of the gastric juice. In the latter case the digestive powers of the S. are impaired, and the persistence of the congestion leads to organic changes and the formation of ulcers. There is also a form of congestion called *vicarious*, which sometimes occurs in women from the stoppage of the catamenia, and which also occurs in cases of yellow fever, cholera, and enteric fever.

Idiopathic Gastritis is an exceedingly rare disease, and when inflammation does occur it is generally due to direct injury, the most frequent form being that induced by excess of eating or drinking, especially of alcoholic drinks.

Ulceration of the S. is not an uncommon lesion, the forms usually described being simple, chronic, and perforating. The ulcer is general, solitary, and deep, with well-defined edges, as if it were punched out, and about the size of a shilling, its site being generally near the lesser curvature, on the posterior wall, and towards the pyloric orifice. It most frequently occurs among women in middle or advanced life, and is especially found in maid-servants between the ages of eighteen and twenty-five. According to Dr. Brinton, about 13·4 per cent. of cases of ulceration terminate by perforation, and in such cases death may result from the first shock, or the patient may succumb to peritonitis and gastric exhaustion. The symptoms of gastric ulcer are disturbance of digestion, uneasiness and pain, nausea and vomiting, the food being expelled, and along with it a tasteless or acid watery secretion. Retaining the liabilities to death by perforation, by hæmorrhage, by vomiting, and by exhaustion, the lesion often ends by one of these modes of dying, or by two or more of them in combination. In other cases, a spontaneous subsidence of these symptoms, in something like the inverse order of their occurrence, announces a recovery; or a similar amendment is only effected by a careful medical treatment, such as quite entitles us to dignify it by the name of a cure.

Cancer of the S. is of much less frequent occurrence than ulceration. Of necropsies, performed at four of the great London hospitals, only about 1 per cent. of the total mortality is due to this disease, and it has been found that males are more frequently affected than females, cancer amongst females most frequently appearing in the breasts and the uterus. The orifices of the S. are the parts most frequently affected. The symptoms of cancer, in the first stage, are very similar to those of ulceration, but the complexion acquires a muddy, yellowish, or faint greenish hue, and these are the usual symptoms of the cancerous cachexia. At the later stage, a tumour often becomes perceptible near the middle of the epigastric region, which may be regarded, in conjunction with the cachexia, as symptomatic of the disease. The termination of cancer of the S. is debility, emaciation, prostration, delirium, and death. In the treatment of cancer of the S. nothing can be done except to support the strength by the administration of easily-digested food, as in cases of indigestion, and by the administration of opiates to alleviate pain. The treatment of the different forms of diseases of the S. has been described in special articles, such as INDIGESTION, ENTERITIS, GASTRALGIA, HÆMATEMESIS, and SARCINA VENTRICULI.

Stomap'oda (Gr. 'mouth-footed'), an order of the class *Crustacea*, belonging to the *Podophthalmate* or 'stalk-eyed' divisions of the class, and including the *Squilla*, or Locust Shrimp, the Opossum Shrimp (*Mysis*), &c. These shrimps are not to be confounded with the common shrimps, which belong to the order *Decapoda* (q. v.). In S. the legs number from 6 to 8 pairs, and the gills are borne either beneath the chest or on the abdominal segments. The shell is usually thin and membranous, and the foot-jaws are well developed. The tail-fin is broad and powerful.

Sto'mata (Gr. 'mouths') are minute openings existing between the cells of the air-exposed epidermis of plants. They are oval or mouth-shaped, bordered by *lips* or *guard-cells*, formed of two or more elastic cells, so disposed as to cause the S. to open in a moist and to close up in a dry state of the atmosphere. These guard-cells contain chlorophyle. S. communicate with intercellular cavities, and are obviously designed to regulate evaporation and respiration. They are found in all the higher plants from the *Hepaticæ* upwards, usually occurring in the green parts, more rarely in the coloured petals, and in fruits and seeds. Both surfaces of the leaf in Monocotyledons are provided with S., while in Dicotyledons they are generally almost or altogether absent from the upper surface.

Stone. See CALCULUS and LITHOTOMY.

Stone (in building). See BUILDING STONES.

Stone, the name of a British weight, equal usually to 14 lbs. avoirdupois. A S. of wool, however, contains 24 lbs., and a S. of butcher-meat only 8. The same weight is used throughout Germany, Sweden, and Holland, for such goods as wool, flax, hemp, feathers, &c.; but its value varies greatly with locality.

Stone, a market-town of Staffordshire, on the Trent, 7 miles S. of Stoke-upon-Trent by rail. It has two churches, St. Michael's (1750) and Christ Church (1840), a Congregational chapel (1871), two convents, with 126 and 48 inmates respectively in 1871, a town-hall (1869), market-hall (1868), and a free school founded in 1558. The earthenware manufacture in 1871 employed 1328 adults in S. and its vicinity, and shoemaking 908 more, while other industries are malting, brewing, tanning, and brick-making. Pop. (1871) 3732.

Stone, Artifi'cial. Most varieties of A. S. [(using the term in a restricted sense, excluding Brick (q. v.) and Terra-Cotta (q. v.)] have a base of hydraulic mortar, with which sand and pulverised stone of different kinds are mixed. Some years ago Mr. Ransome of Ipswich introduced a kind of A. S. in which silicious instead of calcareous matter was employed as the cementing material. The process at present followed in the manufacture of this A. S. consists in carefully mixing well-dried sand and dust of chalk with silicate of soda, obtained by digesting flints under pressure in a boiling solution of caustic soda. After moulding, the blocks are exposed to the action *in vacuo* of chloride of calcium in a solution, where, by chemical reaction, the block is transformed into a silicate of lime, a body of unusual strength and durability. The other compound formed is chloride of sodium, or common salt, and is removed with water. The A. S. of Sorel, a French chemist, is made by mixing a cement formed of the basic oxychloride of magnesium with sand, chalk, or powdered marble. The cement, which may be moulded of itself into a hard stone, is procured by acting on protoxide of magnesium (calcined and ground carbonate of magnesia or magnesite) with a concentrated solution of chloride of magnesium. Sorel's process has been widely adopted in the United States, where calcareous and silicious A. S. is also abundantly manufactured.

The applications of A. S. are very numerous; building-blocks, flag-stones, tiles, statuary, vases, architectural ornaments, grind-stones, sewer-pipes, are but a few of them; and in the break-waters of Dover, Cherbourg, Port Said, and Cape Henlopen at the mouth of the Delaware, we have examples of its suitableness for marine constructions.

Stone, Preservation of. Many processes have been devised for preventing the destruction of buildings and monuments by atmospheric influences, but as yet the results have not been entirely satisfactory. Fatty and oleaginous substances for filling the pores of the stone are efficacious only when renewed from time to time. Several inventors have employed *mineral* solutions with fair success. Kuhlmann chose an aqueous solution of silicate of potash (water-glass), and applied it to the Louvre and the cathedral of Notre Dame in Paris. In the moist climate of England, however, water-glass yields uncertain results, an unsightly efflorescence appearing on the surface of the stone. Fluosilicic acid washed with an alkaline solution, alumina soap, a silicate coated with asphaltum varnish, fuller's earth in diluted hydrofluoric acid, and an alkaline silicate washed with chloride of calcium solution, have all been suggested. The last-mentioned process, Ransome's patent, has so far received most favour. The silicate is brushed over the stone, and when it has dried the other solution is applied; double decomposition takes place, and an insoluble silicate of lime is precipitated in the pores of the stone, filling them up and thereby cementing together the particles of the stone.

Stone Age. See BRONZE AGE.

Stone-Chat (*Saxicola rubicola*), a species of *dentirostral insessores* allied to the robin, and attaining a length of 4 or 5 inches. It is black above and white tinted with light brown below, the breast being chestnut-brown. This bird has a harsh, chattering voice, hence its name. It is usually found near furze-thickets. The eggs number from four to six, and are of a pale blue colour spotted with reddish brown at one extremity.

Stone'-Crop. See SEDUM.

Stone' Cutting and Dress'ing Machines. Considerable progress has been made in the application of machinery to the shaping of stone. Marble and slate are cut into slabs by sawing-machines of different forms, having usually a reciprocating motion and iron blades like the ordinary hand stone-saw. For cutting the slabs of marble into strips, a machine, consisting of a gang of circular iron discs mounted on a horizontal spindle, which is rotated by a band and pulley, is in general use. The slab is mounted on a travelling carriage which presses the stone against the discs, while sand and water are profusely applied to the kerbs or slits so made. Mouldings are imparted to edges of marble strips intended for mantel-pieces and other objects, by means of a solid iron cutter, having a converse form to that of the moulding to be produced. The cutter revolves rapidly on a vertical axle, and the marble, resting on the bed of the machine, is brought up against it, and carried onward as fast as the moulding is produced. Marble is also cut into balusters and other architectural ornaments on a lathe with steel tools, the marks of which are afterwards removed by grinding. Stone-working machines, in which boart or black diamond constitutes the cutting agent, are being widely introduced in the United States. In the diamond stone-saws every tooth is tipped with a diamond, much ingenuity being displayed in the fixing of it to a thin metal body. The circular form is chiefly adopted, the diameter being about 6 feet, and the disc revolves at a high velocity, while the slit is deluged with water. The diamond circular saw of the Everson Stone-Saw Company is reported to cut through 75 feet of ordinary sandstone per hour, and other stones at a rate inversely proportional to hardness. Machines for dressing or facing building-stones have been contrived on different principles, but they have very limited use. The action of the patent dressing machine of Mr. Holmes, of London, resembles handwork with chisel and mallet. The cutters consist of a double row of chisels fixed into a transverse holder, and have a short radial movement. The rough stone is laid on a travelling bed which has a slow action to and fro, and at each pass one set of cutters meets the stone on an angle. A few passes are sufficient to produce a smooth surface. Messrs. Brunton and Frier, Battersea Foundry, London, exhibited at the Paris Exhibition of 1878 a stone-dressing machine of novel and substantial design. The stone to be operated on moves along a bed, by the side of which is mounted a vertical rotating chuck, nearly eight feet in diameter. On the circumference of this chuck are mounted a series of steel cutters, carried on obliquely radiating spindles, and to which absolute rotation is given from suitable gearing within the chuck. The edges of the cutters travel at a speed of 1900 feet per minute, and in the same time 24 inches of granite and 36 to 40 inches of freestone are dressed in a manner equalling handwork, the stone being thrown off in chips about 1 inch thick.

Stone-Fly (*Perla bicaudata*), a species of *Neuropterous* insects familiar to anglers, and much used as a bait in trout-fishing. The hinder wings are large, and the abdomen has two long filaments. The larger jaws or mandibles are rudimentary. The S. and its larvæ are common in ponds.

Stone-Fruits is popularly applied to those fruits in which the single 'kernel,' is enclosed in a 'stone,' and this enveloped in an edible pulpy mass covered by a thin 'skin.' We have examples in the cherry, peach, plum, olive, &c. Botanically this kind of fruit is called a *drupe*, the skin being the *epicarp*, the pulp the *mesocarp*, and the hard shell of the seed the *endocarp*.

Stoneha'ven, the chief town of Kincardineshire, in Scotland, on S. Bay, 16 miles S. by W. of Aberdeen by rail. It consists of an Old and a New Town. The former, to the S.E., on the low ground near the harbour, has a Roman Catholic chapel (opened 1878), an old Episcopal church and school, and a handsome county court. It is chiefly inhabited by fishermen. The New Town on the N. side of the Carron River has a Free church, a United Presbyterian, a new Episcopal church (1878), and a new townhall (1878). Half a mile from the town is the parish church (Dunnottar), in the churchyard of which 'Old Mortality' laboured; and 2 miles off is Dunnottar Castle, one of the most striking and famous ruins in Scotland. S. has considerable fisheries, employing about 90 boats. Near the town is Glenurie distillery. Pop. (1871) 3396.

Stone'henge (Old Eng. 'hanging stones,' or 'stones of Hengist'), the megalithic structure rising in lonely grandeur on Salisbury Plain, is distinguished from all similar circles by being the only hewn-stone monument we possess, the only one where we meet with horizontal architrave. So far as its ruined state lets us determine, its outer stone circle consisted of thirty piers, 13 feet high, connected by a continuous impost, the circle's diameter being 97·6 English or exactly 100 Roman feet. Within it stood five great trilithons, the central and highest 21·6 feet high, forming a kind of choir, across whose entrance eight stones from 3 to 6 feet high would represent the screen. Thus far the structure is wholly composed of 'sarsens,' a local class of silicious sandstones, but there are also inside the choir eleven igneous 'blue-stones,' which must have been brought from a distance (Wales, Cornwall, or most probably Ireland), and which in Mr. Fergusson's opinion are the remains of smaller trilithons. Add that an earthen vallum ran round the outer circle at a distance of 100 Roman feet, and the chief features of S. are here complete. Inigo Jones's theory (1620), that S. was 'a Roman temple, inscribed to Cœlus, and built after the Tuscan order,' was opposed by Dr. Charleton, who ascribed it to the Danes; but Dr. Stukeley (1740) overrules both their opinions, proclaiming it a Druid temple, the view adopted by Wood, Cooke, King, Davies, even Sir R. C. Hoare. Next, Maurice claimed it for the Assyrian Bel; Ellis and Duke saw in it an astronomical observatory; the modern school of palæontologists, with Lubbock at their head, assign it an antiquity of from 10,000 to 50,000 years; and the Rev. L. Gidley (1873), viewing it 'by the light of ancient history and modern observation,' ascribes it to 'Helios-Arkites,' whoever they may be. Lastly, Mr. Fergusson maintains that S. and similar structures are 'sepulchral, or connected directly or indirectly with the rites of the dead, that they are not temples, and that they were erected by partially civilised races after they had come in contact with the Romans.' He grounds his theory on the negative evidence that no allusion is made by classical writers to S., though the Romans occupied Old Sarum during their whole stay in the island, and the Via Badonica ran close by, whilst Druids are only heard of in Mona, not in Wiltshire, Cumberland, the Western Isles, or Scandinavia. Secondly, these unroofed circles, reared in the most

exposed situations, are utterly unsuited for temples, and no astronomer can say what observations could possibly have been better made by their aid. Thirdly, excavations carried out by the Duke of Buckingham (1620), and later by Cunnington and Hoare, brought to light iron armour and Roman pottery at such depths, and in such positions (*e.g.*, under the base of fallen stones), as show that the Romans must have been been in Britain before the erection of S. And fourthly, all direct historic evidence such as we have points to the same conclusion, Nennius and Geoffrey of Monmouth representing S. as raised by Ambrosius to commemorate the slaughter by Hengist of 300 nobles (462 A.D.), whilst the neighbouring structure of Avebury is actually called a burying-place (*byrgelsas*) in a charter of Æthelstan (939). See J. Fergusson's *Rude Stone Monuments* (Lond. 1872), and the works there cited.

Stone'house, the central of the 'Three Towns' forming Plymouth (q. v.), contains the Victualling Office, the Royal Marine Barracks, and the Royal Naval Hospital, and had a pop. (1871) of 14,585.

Stone'ware, the general term for a strong, dense, highly vitrified variety of earthenware. See POTTERY and PORCELAIN.

Ston'ington, a seaport of Connecticut, U.S., 50 miles S.W. of Providence by rail, and the port of transference from steamship to railroad on one of the routes between New York and Boston. It has 6 churches, 2 newspapers, &c., and annually despatches a number of whaling and sealing vessels. S. dates as a settlement from 1649. Pop. (1870) 6313.

Sto'nyhurst College is situated in the parish of Mitton, E. Lancashire, 10 miles to the N. of Blackburn. Standing on Longridge Fell, above the Hodder, its buildings, for centuries the seat of the Shireburn family, passed (1754) to the Welds of Lulworth, and by Thomas Weld were granted in 1794 to eighteen Jesuit fathers, driven from Liège by the Revolution. The college they founded has grown to be the Catholic Eton, with 22 instructors and 252 students in December 1878. The original mansion, Romanesque in style, has been largely added to during the years 1835-78; and there are now three chapels, the finest that of the Sodality (1859), besides the Perpendicular St. Peter's Church (1835) at the S.E. angle, which is open to the public. The valuable library and museum, observatory (1836), gymnasium, and covered play-room, Academy-room and theatre, the Seminary (1835), a capital cricket-ground and bathing-place, are all described in Hewitson's *S. C., its Past and Present* (2d ed. Preston 1878).

Sto'ny Point, a small rocky promontory on the W. bank of the Hudson River, U.S., opposite Verplanck's Point, 42 miles N. of New York city, at the entrance to the Highlands. A fortification of some importance in the Revolutionary War, it was captured and strengthened by the British, but was recovered in a night attack by Wayne. It is connected by a marsh with the shore, and supports a lighthouse and fog-bell tower. In the village here is the house where Benedict Arnold held his treasonable interviews.

Stool of Repen'tance was the name given to a stool on which persons undergoing Church Discipline (q. v.) had to sit during divine service in full view of the congregation. With the modern relaxation of discipline the S. of R. is now entirely disused, although in some of the remote parts of Scotland it has been so for a much shorter time than might be supposed.

Stop, in music, an instrument by which the sounds of wind instruments are regulated. The stops of an organ are a collection of pipes similar in tone and quality which run through the whole or a large part of the instrument. By means of registers the air may be admitted or excluded from each stop at pleasure. When a note is struck, all the pipes belonging to the note in those stops of which the register consists sound simultaneously. The chief organ-stops are the two diapasons; the principal, the twelfth, the fifteenth, the sesquialtera, the mixture or furniture, the trumpet, the clarion, and the cornet, but there are a great number of others. The stops taking their names from musical instruments are designed to produce imitations of these. The choir organ usually contains the diapason, the dulcimer, the principal, the twelfth, the flute, the bassoon, and the vox humana.

Stopp'age in Trans'itu. When the consignee of goods on credit becomes insolvent before delivery, but not otherwise (see GOODS, PURCHASE AND SALE OF), the consignor may, in many cases, countermand delivery and so resume possession. The exercise of this right is termed S. in T. Goods delivered to a carrier named by the vendee may be stopped by the vendor. Payment of part of the price does not affect the right, but it is barred by even partial delivery of the goods. It is also barred if the vendee has exercised any right of ownership, such as payment of storage rent, even though the warehouse of the vendor be the store paid for.

Stopp'ages of Pay, in the army and navy, small sums of money deducted from a soldier or sailor's pay for messing, washing, hospital, hair-cutting, damages to barracks, fines for drunkenness, &c.

Sto'rax, a balsamic gum-resin obtained from *Styrax officinale*, a tall bush or small tree native of countries bordering the Mediterranean. S. is obtainable both as an exudation of the plant and by pressure of the stripped bark. It was formerly much employed as a stimulating pectoral remedy, but has now almost if not quite disappeared as a commercial drug, being supplanted both for medicine and perfumery by liquid S. Besides resin and a volatile oil it contains about 2 per cent. of benzoic acid.

Stork (*Ciconia*), a genus of *Grallatorial* or Wading Birds, having a long and much-compressed bill, long wings, and tarsi, and toes united at their bases by membrane. The third and fourth quills are the longest, and the hinder toe hardly reaches the ground. The common or white S. (*C. alba*) occurs in Europe and migrates to Africa in winter. The average length is 3½ feet, and the plumage is white; the wing-quills and greater wing-coverts are black. The S. is protected especially in Holland. It builds its nest on housetops, and shows the greatest familiarity with its human surroundings. The attachment of the S. to its young is so remarkable that it has become a proverb. The Black S. (*C. nigra*) occurs in Europe, Asia, and Africa. The name Adjutant S. is given to the *Leptoptilus argala*, common in India, where it is protected by law. An allied form (*L. Marabou*) gives the famous 'Marabou feathers' of Africa. The Whale-headed S. (*Balæniceps rex*) inhabits N. Africa, and has a very large and clumsy bill, whence its name of 'Shoe-Bird.'

Storms. See WINDS.

Storn'oway, the chief town and seaport of Lewis (q.v.), the largest and most northerly of the Outer Hebrides, in the N.E. of the island, at the head of the deep inlet of Loch S., which is sheltered to the N. by a long, irregular peninsula. It has several good public buildings, and on an eminence overlooking the town stands S. Castle, a castellated Tudor edifice, the residence of Sir James Matheson, Bart., who has made great improvements in the vicinity. A Free Church (for services in English) was opened in 1878. S. is an important fishing station now possessing (1878) 661 boats, and employing 3466 fishermen resident within the limits of the port and 4500 strangers, while it has several saw, carding, and corn mills, a large distillery, &c., and is the seat of an important cattle fair held on the second Wednesday in July. Two steamers ply regularly between S. and Glasgow, and there is a bi-weekly mail-packet *via* Poolewe to Dingwall. Pop. (1871) 2535.

Stor'thing. See NORWAY.

Sto'ry, Joseph, LL.D., born at Marblehead, Massachusetts, 8th September 1779, graduated at Harvard College in 1798, began to practise law at Salem in 1801, and as member of the State Legislature (1805-8) was the acknowledged Republican leader. Returned to Congress in 1808, he urged the repeal of the embargo on foreign commerce, and declining re-election in 1810, was again chosen a member and elected Speaker of the State Legislature. He was appointed associate justice of the Supreme Court of the United States (1811), a member of the convention for the revision of the State constitution (1820), and Dane professor of law in Harvard University. He died 10th September 1845. A voluminous writer on legal and constitutional subjects, his *Commentaries* have passed through several editions. His written decisions comprise twenty-seven volumes, and his judgments in the Supreme Court thirty-four volumes. They are regarded with the greatest respect both in

America and England. His *Life and Letters*, by his son W. W. Story, appeared in 1851, and a collected edition of his *Miscellaneous Works* in 1852.—**William Westmore S.**, son of the preceding, born 19th February 1819, is the author of several legal works, but is better known as a sculptor. He has resided for some thirty years in Rome, and among his best-known works are his 'Medea,' 'Cleopatra,' and 'African Sibyl;' his statues of George Peabody for the London Corporation, and Edward Everett for Boston; and his busts of his father, of J. R. Lowell, Josiah Quincy, and Theodore Parker. His sculpture is distinguished rather by grace and beauty of finish than by strength or originality. He is the author of *Roba di Roma* (1862), *Proportions of the Human Figure* (1866), *Graffiti d'Italia* (1869), *A Roman Lawyer in Jerusalem* (1870), and several volumes of verse.

Stoth'ard, Thomas, an English artist, was born 17th August 1755, at the Black Horse, a public-house kept by his father in Long Acre, London. On his father's death he was apprenticed to a pattern-draughtsman in Spitalfields, but before his term was expired some of his drawings had struck the fancy of the proprietor of the *Novelist's Magazine*, and on his master's death he found more congenial employment in book illustration. His first efforts appeared in an edition of *Ossian*, and in Bell's *British Poets;* and he afterwards illustrated *Peregrine Pickle* (1781), *Clarissa* and *Sir Charles Grandison*, *The Pilgrim's Progress* (1788), *Robinson Crusoe* (1790), and *The Rape of the Lock* (1798). In 1778 he appeared with his oil-painting of 'The Holy Family' in the exhibition of the Royal Academy; and he continued to exhibit till 1824, when he contributed 'Venus attended by the Graces.' Although he never attained the same success in oil as in Indian ink, some of his paintings became popular, *e.g.* 'The Canterbury Pilgrims' and the 'Dunmow Flitch;' and he was employed to adorn the staircase of Burleigh House and the ceiling of the Advocates' Library at Edinburgh. Turner greatly admired him, and called him the Giotto of England. A typical idealist, he joined to intense mental purity a love of physical smoothness, the secret of his success in expressing tender pathos or graceful gaiety. He became a member of the Royal Academy in 1794, and in 1814 he succeeded Burch as librarian. He died 27th April 1834.—**Charles Alfred S.**, son of the preceding, was born 5th July 1787, published *Monumental Effigies* (1811–18; completed 1823), assisted Lysons in his *Magna Britannia*, and was appointed historical draughtsman to the Society of Antiquaries. He was killed by a fall while engaged in tracing a stained-glass window of the church of Bere Ferrers, 28th May 1821. See *Life of Charles S.* (1823), and *Life of Thomas S.* (1854), both by Charles's widow, better known as Mrs. Bray.

Stour'bridge, a market-town of Worcestershire, on the Stour, 5 miles S.S.W. of Dudley by rail. It has two churches, St. Thomas's (1742) and St. John's, designed by Street, in First Pointed Style (1860), a Second Pointed Catholic church by Pugin (1864), a convent (1868), a corn exchange (1854), mechanics' institute, county court (1864), and a grammar school (founded in 1553 and rebuilt in 1862). In 1871 the manufacture of nails engaged 3490 adults in S. and its vicinity, that of iron 2902, of glass 1006, of chains 658, of fire-bricks 501, of machines 333, and of guns 61, whilst coal-mining employed 981 more. 'S. clay' for making fire-bricks is an article of export. S. publishes one weekly newspaper. Pop. (1871) 9376; (1878) over 10,000.

Stoves, apparatus for retaining and slowly diffusing heat, are in common use in most countries where fuel is scarce. The old S. were faced with plain porcelain or highly ornamented tiles. The first iron S. was designed by Cardinal Polignac in the 18th c. Count Rumford (q. v.) devised several improvements with the view of economising fuel and heat. In America the stove has undergone immense modifications, the later inventions referring chiefly to self-feeding, base-burning, and hot-air feeding. Gas, petroleum, and soapstone S. are widely used, but excluding these there were 2,686,000 S. (value $47,040,000) produced in the United States by 200 foundries, employing 28,000 men, in 1876.

S. for botanical and horticultural purposes are of various kinds, but may be reduced to the dry-stove, the damp-stove, and the intermediate or bark-stove, respectively used for succulent plants, for orchidaceous plants and ferns, and for tropical trees and shrubs, together with the pine-stove used for fruiting pine-apples. The dry-stove requires abundance of light, with power of heating to 60° in winter; the damp-stove should have heating power up to 80° above the external winter temperature, and a power of saturating the atmosphere with moisture at all seasons; the ordinary botanic or bark-stove requires a like degree of heating power, but more space and light; and for the pine-stove—which is a low structure with bark or other beds in which the pots are plunged—the heating power should be equal to 70° during winter.

Stow and **Stoc**, two Old-English words meaning a place, and entering into the composition of many names of places, *e.g.*, Stow-market, Stow-upland, Bridstow ('St. Bridget's place'), Elstow ('Helen's place'), Bristol, originally Briegstow ('the place at the bridge'), Tavistock ('the place on the Tavy'), Stoke-upon-Trent, Stoke-Pogis, &c. When used as a prefix, 'Stoc' often denotes the chief place of a district, as Stockton ('the chief town,' *i.e.*, on the Tees), Stockport ('the chief port,' *i.e.*, on the Mersey). Stoc, however, is not merely English, it is Teutonic, and occurs in a somewhat different sense in German and Scandinavian topography, as *Hoch-stock* ('the high hill'), Stockholm ('the island built upon *stakes*').

Stow, John, born in London in 1525, was by profession a tailor, but early devoted himself to the 'delectable study of antiquities.' Having published a *Summary of the Chronicles of England* (1561), he wholly forsook the tailor's board, and wandered over England collecting the documents dispersed at the Dissolution for a great historical work he had in view. This purpose he only so far fulfilled that in 1580 he issued the *Annals of England*, the *Survey of London* in 1598. This last work was entirely recast by Strype (q. v.); the others were reprinted in their author's lifetime, but they seem to have brought him little profit, since after five-and-forty years of chronicling he was driven to beg his bread. James I. gave him a patent authorising him to collect gratuities (1604), and he died in London, 5th April 1605. See the *Life and Writings of J. S.*, by Thoms, prefixed to his edition of the *Survey* (Lond. 1875).

Stowell, William Scott, Lord, elder brother of Baron Eldon (q. v.), was born at Howorth, Durham, 17th October 1745, and educated at Newcastle, whence he passed to Corpus Christi College, Oxford, in 1761, graduating in 1767. From 1773 to 1785 he was Camden reader of ancient history, taking his degree of D.C.L. in 1779. On the nomination of Dr. Johnson he became a member of the Literary Club, and soon won a conspicuous place in the intellectual society of London. Called to the bar in 1780, he rose rapidly in his profession, becoming in 1798 judge of the High Court of Admiralty and member of the Privy Council. In 1790 he was chosen M.P. for Downton, and in 1801 one of the representatives for Oxford, a post he continued to hold till he was called to the House of Lords in 1821. S. retired from the Court of Admiralty in 1828, and died 28th January 1836. He never published any legal treatise, but his judgments, especially on questions of international law, reported by Dr. Dodson and revised by himself, are highly prized by legal experts. In the opinion of Lord Brougham 'they ought to form part of every classical library of English eloquence, or even of national history.'

Stow'market, a town of Suffolk, on the Gipping, 12½ miles N.N.W. of Ipswich by rail. Amongst its buildings are the church of St. Peter and Mary (restored 1867, at a cost of £2000), a Roman Catholic church (1877), an Independent chapel (rebuilt 1861 on the site of the older chapel of William Godwin), the Corn Hall (rebuilt 1872), and the Literary Institute (1875). In the vicarage gardens is a mulberry tree planted by Milton. Machine-works employ 100, chemical-manure works 40, and a gun-cotton factory 130 hands, the last having in 1871 been the scene of an explosion, by which 24 persons were killed and 72 wounded. S. publishes one weekly newspaper. Pop. (1871) 4146. See Hollingworth's *History of S.* (1844).

Stow-on-the-Wold, a market-town of Gloucestershire, England, 28 miles S.S.E. of Evesham by rail, has a 14th c. parish church, a Gothic town-hall, erected (1877) at a cost of £4000, and malting and brewing industries. Pop. (1871) 2040.

Strabane', a market-town of Tyrone, Ireland, 14½ miles S.S.W. of Londonderry by rail, on the Mourne, which is connected by a canal 4 miles long with the navigable Foyle. It has one Catholic and one Anglican church, four chapels, and two shirt factories employing about 2000 women. Pop. (1871) 4309, of whom 2675 were Catholics.

Strabis'mus. See SQUINTING.

Stra'bo, the geographer, was born at Amasea in Pontus, about 66 B.C. (?) 54 B.C. (*Clinton*). Of his personal history the little that is known is gleaned from passages in his own work. On the mother's side he was descended from a Greek family closely connected with the kings of Pontus. Of his father we know nothing. The dates of S.'s visits to most of the countries through which he travelled are very doubtful. In B.C. 29 we know he was at Gyaros on his way to Corinth. In 24 B.C. he was with his friend Ælius Gallus in Egypt. When he first visited Rome he must have been of mature years.

The name S., 'squint-eyed,' is originally Greek, and its origin is obvious, but whether any of his ancestors bore it is uncertain. His preceptors were Tyrannio of Amisus, Aristodemus of Nysa, and Xenarchus of Seleucia. His acquaintance with history, mythology, and the poets of Greece attests at once the thoroughness of his education and his general culture. Professional life had evidently no charm for him. He seems to have been possessed of ample means, which he expended on travel, the results of which, after a lifetime's toil, he has bequeathed to us in his *Geography*. But S. also devoted himself to philosophy, and is cited by Plutarch (Lucullus 28, Sulla 26) as S. the philosopher. His work entitled *Historica Hypomnēmata* in forty-three books is supposed to have contained a narrative of the events from the close of the *History* of Polybius to the battle of Actium. The facts recorded in the *Geography* of S. are in great measure the result of his own observation. Yet there exists a vast difference in his treatment of different countries. In the case of some he is almost microscopic in fulness of detail. Of others he is content with a hasty and cursory description. The range of his travels is a wide one, embracing the territories from Armenia to Tyrrhenia westward, and from the Euxine to Ethiopia southward. In his work he is largely indebted to the geographers who preceded him—Eratosthenes, Artemidorus, Polybius, Posidonius, Aristotle, Theopompus, Thucydides, Aristobulus, and others. Of Greece he seems to have seen less than of almost any country. He appears, however, to have obtained in Rome much information regarding the Transalpine regions. Strangely, he disparages the discoveries of Herodotus, and undervalues the works of Roman writers, quoting almost none save Fabius Pictor, Asinius Pollio, and Julius Cæsar.

The principal value of S.'s works lies in his method. The number of historical facts recorded by him is enormous. The date of his death is unknown, but it must be placed between 21 and 25 A.D. As a writer S. is always clear, simple, and unaffected. His *Geography* comprises 17 books; 2 introductory, 8 devoted to Europe, 6 to Asia, and 1 to Africa. The *editio princeps* is the *Aldine* (Ven. 1516). That by Falconer (Oxon. 1807, 2 vols. fol.) is a reprint of Almeloveen's reprint of Casaubon's edition, with no improvement in the text, but containing a collation of the Eton, the Escurial, and the two Medicean MSS. The edition of Adamantios Koray (Par. 1815–18, 4 vols. 8vo.) is the first notable critical text. That by Gustavus Kramer (Berl. 1844 *et seq.*) is the first really valuable one. In 1875 a MS. of the *Geography* was discovered in the abbey of Grotta Ferrata near Frascati, older than any of the 28 previously known MSS., and supplying many lacunæ. The best translations are those in German by C. J. Groskurd (3 vols. 8vo., Berl. and Stettin 1831–34). A fair English version with copious notes and a complete index was published in Bohn's *Classical Library* (Lond. 1854–56–57, 3 vols. post 8vo.). An excellent edition of the text is that of Aug. Meineke (Leip. Teubner 1852–53, 3 vols. 8vo., 2d edit. 1866). See also Heeren's essay *De Fontibus Geographicorum Strabonis* (Göttingen, 1823).

Stradell'a, a town of N. Italy, province of Pavia, 39¾ miles E.N.E. of Alessandria by rail. It was formerly fortified, and has two yearly fairs. Pop. (1874) 6119.

Stradell'a, Alessandro, an excellent composer, singer, and violinist, was born at Naples in 1645. He wrote well for the voice, and was styled by his admirers the 'Apollo della Musica.' Among his works the *Oratorio di San Giovanni Battista* (Rome 1676), and the opera-seria *La Forza dell' Amor Paterno* (Geneva 1678), are the most remarkable. S. was murdered in Genoa in 1678 by assassins in the pay of a rival in amour, an incident upon which the libretto of the opera by Flotow bearing his name is founded.

Stradiva'ri or **Stradua'ri**, a celebrated violin-maker, born at Cremona in 1644, was a pupil of Nicolo Amati, in whose employment he continued till 1700. Then he started for himself, and soon surpassed all his contemporaries in the excellence of his workmanship. Even yet he has no equal. His best instruments were made between 1700 and 1730, and now command from £200 to £600. S. died December 18, 1737. His sons, Francesco and Omobono S., possessed not a little of their father's art.

Straff'ord, Thomas Wentworth, Earl of, was born in London, 13th April 1593, and having been bred at York and St. John's College, Cambridge, made the 'grand tour' of Europe. Not yet nineteen, he married a daughter of the Earl of Cumberland, and two years later inheriting from his father the ancient estate of Wentworth Woodhouse in the West Riding, received the honour of knighthood. He sat in Parliament for Yorkshire (1614 and 1621), for Pontefract (1624), and York (1625), having obtained the post of *Custos Rotulorum* to the West Riding (1615). From his first entry on public life he sought employment in the service of the Crown, but thwarted by Buckingham's jealousy, joined the Opposition and came to be suspected by the Court. Pricked, with five fellow 'patriots,' for sheriff, and thus shut out from Parliament, he modestly applied for the presidency of the Council of the North, and for answer was deprived of his keepership of the Rolls. 'Since they thus weakly breathe on me a seeming disgrace,' said Wentworth, 'I shall crave leave to wipe it away as openly as easily;' and having suffered six weeks' imprisonment in the Marshalsea for refusing the royal loan (1627), he became, as member again for Yorkshire, one of the hottest and ablest advocates of the Petition of Right (1628), protesting, 'Should I not faithfully insist for the common liberty of the subject to be protected whole and entire, may I be set as a beacon on a hill for all men else to wonder at.' Brave words from one who three weeks after the prorogation made friends with Buckingham and was created Baron Wentworth, on Buckingham's death to be raised to the rank of viscount, sworn of the Privy Council, and appointed President of the Council of the North (October 1628). Knowing that England's welfare depended on far-seeing government, and conscious of his own capacity, he set himself to the task of making men better against, or at least without, their free consent. He, the self-chosen captain of the ship of state, must exercise a 'thorough' discipline, mutiny must be checked by the heaviest penalties. So in the north he aimed at the improvement of the poor and relief of commerce, whilst obtaining a commission 'to hear and determine offences according to the course of the Star Chamber, whether provided by Acts of Parliament or not;' and in Ireland, of which he became Lord Deputy (1632), he doubled the revenue, founded the linen manufacture, cleared the seas of pirates, established a well-paid, disciplined army, and did his best to reform the Church, always by just, if possible, if not by other, means. To Laud (q. v.), his coadjutor across the channel, he wrote, 'The king is as absolute here as any prince can be;' but England, he found to his cost, was less amenable than Ireland, or than the England of Elizabeth. The Bishops' War brought Wentworth, now Earl of S. (1640), to Charles' side; with Charles he marched northwards and shared the reverses of the Scottish campaign, reverses that forced the summoning of the Long Parliament. It met on November 3, and on the 11th S.'s impeachment was moved by Pym (q. v.), in a speech which, attacking the man, arraigned the system of which that man was head. Sent to the Tower in spite of the king's safe-conduct, and placed at the bar 22d March 1641, he for fifteen days baffled the charges of his assailants, well-nigh the entire House, with marvellous eloquence melting them even to tears. Suddenly the Commons, finding the Lords were wavering, dropped the impeachment for a bill of attainder, which, under intimidation, was only passed by a majority of seven. The pitiful king gave his consent, after a feeble plea for mercy, ending, 'If no less than his life can satisfy our people, *fiat justitia*.' With 'Put not your trust in princes' on his lips, S. passed to the scaffold, bending below Laud's prison window to

receive a blessing from his old friend's outstretched hand, and upon Tower Hill he died valiantly, 12th May 1641. The 'lost archangel,' the 'Satan of the apostasy'—these are Macaulay's titles for the 'wicked earl,' whose one great fault was his lack of sympathy with the times and country in which he lived. He was indeed ambitious and ill-advised, unloving and unlovable, haughty and self-contained, but a man of wonderful parts and industry, not more unscrupulous than Burleigh, Cromwell, or Hastings (men whom the world delight to honour), and faithful to his master unto death. See S.'s *Letters and Despatches*, edited by Dr. Knowles (1739); the Histories of Hallam, Macaulay, Ranke, Green, and Gardiner; the latter's *Puritan Revolution* (Lond. 1876); vol. ii. of Forster's *British Statesmen* (Lond. 1831); Mozley's *Essays, Historical and Theological* (Lond. 1878); A. H. Hamilton's 'S.' in *Fraser* (November 1878).

Strain, in kinematics, is any definite alteration in the form or dimensions of a given portion of matter. When the Stress (q. v.) which produces the S., or the stress which is called into action by the S., is taken into consideration, the question becomes one of dynamics. In solid bodies S. is always accompanied with internal stress, and this property of exerting stress when strained is called Elasticity (q. v.). Thus a coiled string, or a bent bow, is an example of a strained body, and the external force which each exerts is the resultant of the stresses produced in its elements by the S. The kinematics of strains is discussed in considerable detail in the opening chapter of Thomson and Tait's *Natural Philosophy*, and the connected subject of elasticity in bodies is treated of in the chapter bearing upon statics in the same work.

Strain, in music, in general a song or tune, or a part thereof; in particular a piece of music marked off by double bars.

Straits Settlements, the general designation of the British possessions in the Straits of Malacca, comprising Singapore (q. v.), Malacca (q.v.), and Penang (q. v.), or the Prince of Wales Island, including the province of Wellesley. They were made a separate dependency of the British crown in 1853, and remained under the jurisdiction of the Governor-general of India till 1867, when they were placed under the administration of a governor residing at Singapore. Area, 1445 sq. miles; pop. (1871) 308,097, of whom 7655 were whites. The revenue amounted (1877) to $1,723,466, the expenditure to $1,589,143; the estimated revenue (1878) to $1,916,000, the expenditure to $1,691,000. The native states of this peninsula (Queda, Perak, Salangor, Rambow, and Johor) are bound by treaty to the English crown, and have an aggregate area of 21,460 sq. miles, and a pop. of 209,000. In time of peace, a thousand English troops and a few vessels are sufficient to maintain order; but this force was greatly increased during the revolt in Perak (q. v.) in 1875-76. Smuggling is carried on extensively, and deeds of violence are not unfrequent in the outlying districts. The governor of Dinding, an island off the coast of Perak, was murdered by Chinese robbers, 26th November 1878.

Stral'sund (Scand. 'the arrowy strait'), a fortified seaport of Prussia, province of Pommern, on the Strela Sunde, a strait 2 miles wide, separating the island of Rügen from the mainland, 145 miles N. of Berlin by rail. The town itself, a fortress of the second class, is entirely surrounded by water, and communicates with the mainland by three bridges. It has a quaint medieval appearance with its lofty-gabled houses; among its chief buildings are the vast brick-built Marienkirche (1416-78), a fine Rathhaus with a rich façade (1316), and the Nicolaikirche, adorned with a carved wood altar of the 15th c. Besides its industries in tin wares, paper, tobacco, oil, spirits, and mirrors, it has a large trade in grain, wool, cattle, and horses. The harbour is protected by the fortified islet of Dänenholm. Pop. (1875) 27,765. Founded in 1209 by Jaromar of Rügen, it was second only to Lübeck among the Hanse towns of the Baltic in the 14th c. It was on the side of the reformed faith, and of Sweden in the Thirty Years' War, and was attacked by Wallenstein (1628), who swore to take it 'though attached by chains to heaven.' But S. was aided by Danish and Swedish vessels, and the besiegers eventually withdrew with a loss of 12,000 men. S. belonged to Sweden till 1815, when it was ceded to Prussia.

Strange, Sir Robert, an English engraver, was born in Pomona, one of the Orkney Islands, July 14, 1721. He had begun business in Edinburgh as an engraver when the Pretender came to Scotland in 1745; but the part which he took in assistance of the Jacobite cause rendered it advisable that he should leave the country for a time. At Rouen and Paris he studied under Le Bas and Descamps, and at a later period pursued his art at Rome, Florence, Parma, and Bologna. Finally returning to England, he earned a high reputation as an engraver, and acquired no inconsiderable fortune. He was knighted in 1787, and died in London, July 5, 1792. Among his finest efforts are reproductions of Raphael, Domenichino, Guido, Guercino, Salvator Rosa, and Carlo Dolci; but perhaps his technical skill is nowhere more strikingly displayed than in the two plates for Hunter's *Gravid Uterus*, one of which Sir James Simpson pronounced the most perfect work of art in its kind. S.'s hostility to the Royal Academy, from which he was excluded as only an engraver, gave birth to his *Inquiry into the Rise and Establishment of the Royal Society*. He also wrote but never published a *History of the Progress of Engraving*, and a portion of an autobiography which he left unfinished. It is given in Mr. Dennistoun's interesting *Memoirs of Sir R. S.* (2 vols. 1855). The Rev. Francis Woodward has prefixed a life of S. to his *Photographic Reproduction of Twenty of S.'s Finest Engravings* (1874).

Strang'ford, Viscount, the Irish title conferred in 1628 on Sir Thomas Smythe, descendant of an old Wiltshire yeoman family, which in the 16th c. had migrated to Osterhanger, Kent.—**Percy-Clinton-Sydney Smythe**, sixth viscount, was born 31st August 1780, and having graduated at Trinity College, Dublin (1800), entered the diplomatic service. In 1801, the same year that he succeeded his father in the title, he was appointed secretary of legation at Lisbon, where he translated Camoens' *Rimas*; and afterwards he was ambassador to Portugal (1806), Sweden (1817), the Sublime Porte (1820), and Russia (1825). A liberal patron of letters and the arts, he bought back Osterhanger, squandered away by the second viscount, was raised to the English peerage as Baron Penshurst, and died 29th May 1855. His son, **Percy-Ellen-Frederick-William Smythe**, eighth and last viscount, was born at St. Petersburg, 26th November 1825, and educated at Harrow. A postmaster of Merton, he began at Oxford the study of Arabic and Persian, and while attaché at Constantinople (1843), and Oriental secretary during the Crimean War, he thoroughly mastered these and innumerable other languages (Turkish, Afghan, Slavonic, Teutonic, Celtic, Basque, &c.), becoming, in Mr. Freeman's words, 'our greatest English philologist.' His knowledge of Eastern politics was equally profound; if any man could have solved the 'Eastern Question,' that man was he. In 1857, succeeding to the family honours, he returned home; in 1862 married Emily, Admiral Beaufort's daughter, and author of *Travels in the East and on the Adriatic*; and thenceforth lived chiefly in London, where he died, 9th January 1869, being at the time of his death president of the Asiatic, and one of the foremost members of the Geographical Society. With all his infinite erudition he published nothing beyond a few *Quarterly*, *Saturday*, and *Pall Mall* articles, and some chapters contributed to his wife's *Eastern Shores of the Adriatic*; and his posthumous *Letters and Papers on Philological and Kindred Subjects* (Lond. 1878) serve but to show what might have been. See Fonblanque's *Lives of the Lords S.* (Lond. 1878).

Strangula'tion is defined by M. Tardieu as 'an act of violence, in which constriction is applied directly to the neck, either around it or in the fore part, so as to prevent the passage of air, and thereby suddenly suspending respiration and life.'

A sudden and violent compression of the windpipe causes almost immediate insensibility and death; but when a ligature or bandage is used, death takes place much more slowly, and is attended with convulsions. In cases of S. a much greater degree of violence is employed than is necessary to cause death, and hence the external evidences are generally apparent; but if no great mechanical injury has been done to the muscles and vessels of the neck, there is a chance of recovery if the cause of constriction be removed, air being permitted to have access to the lungs within a period of five minutes. When there is suspended animation, Artificial Respiration (q. v.) may be practised. The more prominent symptoms of death by S. are thus described by Dr. Taylor:—'The face is commonly livid and swollen, the eyes wide open, prominent, and congested, and the pupils are dilated. The tongue is swollen,

dark-coloured, and protruded; it is sometimes bitten by the teeth, and a bloody froth escapes from the mouth and nostrils. See *The Principles and Practice of Medical Jurisprudence*, by Dr. Taylor (Lond. new ed. 1873).

Stran'gury (Gr. *strangx*, 'that which oozes out,' and *oureō*, 'I micturate') is a symptom of various affections of the urinary organs. It consists in a frequent and irresistible desire to pass water, the urine being discharged in small quantity and accompanied with scalding, cutting pains in the uretha, which sometimes extend to the bladder, the kidneys, and the rectum. S. may be caused by idiopathic urethrites, by gonorrhœa, or by such irritating substances as cantharides and oil of turpentine, or by gravel or calculus in the bladder. The principal treatment consists in the removal of the cause; and, in addition, the following means may be adopted. The warm sitz-bath, or hot fomentations over the bladder, should be applied, and an injection of starch and tincture of opium, a wine-glassful of the former to a drachm of the latter, should be administered. Mild, mucilaginous drinks of barley or rice-water may be freely given to render the urine less irritating.

Stranraer', a royal burgh and seaport at the head of Loch Ryan, and the principal town of Wigtownshire, 72½ miles W. of Dumfries by rail. The chief buildings are the castle, erected early in the 16th c., occupied by Graham of Claverhouse in 1677; the new town-hall and court-house, erected 1872-3, opened January 1874, the finest public building in Galloway; the Wigtownshire combination poorhouse, with accommodation for 352 inmates; the self-supporting reformatory, licensed to contain 100, partially burned November 1878; St. John's Church (1841); Sheuchan Church (1842) and St. Joseph's Roman Catholic Chapel. S. has no manufactures, and its prosperity depends entirely on the agricultural interest. The harbour is capable of receiving large vessels only at the East Pier, formed (1861) in connection with the Portpatrick Railway, and from which steamers now ply daily to and from Larne. Since the opening of the railway, connecting S. with Glasgow *via* Girvan (1876), much of the Glasgow and Belfast transit trade, as well as that of the N. of England, has passed through S. by the 'Short Sea Passage' to Ireland. In 1877 there entered 758 vessels of 109,813 tons, and cleared 558 of 99,659 tons. S. unites with Wigtown, Whithorn, and New Galloway in sending a member to Parliament. Pop. (1871) 5941.

Strap, in Carpentry, a band of iron bolted to several timbers to hold them together.

Strass'burg (Fr. *Strasbourg*), a celebrated city of Germany, and a fortress of the first class, capital of the Reichsland, Elsass-Lothringen (prior to 1871 of the French Bas-Rhin), at the confluence of the Ill and Brusche, 2 miles from the left bank of the Rhine, with which it is connected by two canals, 88¾ miles N. of Basel by rail. The pentagonal citadel at the E. end (erected by Vauban, 1682-84), and most of the French fortifications, were demolished by the Germans during the bombardment of 1870, but their reconstruction was commenced in 1873, and has since been actively carried on in conjunction with a system of twelve detached forts, to include Kehl on the right bank of the Rhine, which is here crossed by a bridge of boats and a splendid railway bridge. S. is irregularly built, but contains many fine streets and squares, among these the Gutenbergsplatz with a monument to Gutenberg (1840), the Klebersplatz containing a monumental pillar to General Kleber, and the Brogliesplatz, laid out by Marshal Broglie (1740), and in which stand the Stadthaus and the theatre (destroyed 1870, rebuilt 1873). From the S. end of the latter square, the Blauwolkengasse leads to the Stein Strasse, entirely destroyed in 1870, but newly laid out since, and now the finest street in the city. The principal edifice in S. is the Minster, rising in the middle, one of the noblest examples of Gothic architecture. It was begun by Bishop Werner of Hapsburg in 1015 on the site of a church founded by Hlodwig about 510, and the interior was completed in 1275. The façade, the most admired part of the building, was begun in 1277 by Erwin of Steinbach and completed in 1399, while the spire of the N. tower, which reaches a height of 494 feet, was completed by John Hültz of Köln in 1439; the upper part of the S. tower still remains unfinished. The interior is 363 feet in length and 135 feet in width, the nave 42 feet in width and 99 feet in height. In the S. transept is the celebrated astronomical clock, constructed (1838-42) by Schwilgué to replace a similar clock by Dasipodius (1571), which was in use until 1789. Other buildings are the Church of St. Thomas (begun 1031, the choir 1270, the nave 1313-30), containing a magnificent marble monument to Marshal Saxe (1776); the former Prefecture, now the seat of the government; and the Academy Buildings (1825). The University, which was founded in 1621 and suppressed in 1794, was re-established by the Germans in 1872, and had in the summer of 1878, 710 students. In June 1878 were completed the plans for the new University buildings, which are to be erected at a cost of £525,000 (£112,500 contributed from the imperial treasury, £275,000 from the Elsass-Lothringen share of the war indemnity, the remainder from the contributions of the city, the district, and the two provinces). A library of 300,000 volumes has been formed to replace the town library which was burned in 1870. S. has extensive manufactures of porcelain, faience, gloves, beer, sausages, *pâtés de foi gras*, brandy, morocco and other kinds of leather, cloth, nankeen, linen, watches and clocks, tobacco, cutlery, straw-hats, and chemicals; also important commerce in corn, oil, hemp, and madder. There are (1878) 23 establishments for the making of *pâtés de foi gras*, the annual sales of which amount to £75,000. Pop. (1875) 94,346. S. occupies the site of the Roman *Argentoratum*, and was during the Middle Ages one of the most powerful of the free cities of the German Empire. It was seized by Louis XIV., September 30, 1681, and confirmed in his possession by the Peace of Ryswick in 1697. It afforded the French, in their wars with Germany, an admirable basis for operations against the S., but in the war of 1870 it was invested by the Germans, August 11. The bombardment commenced August 18, and after a gallant resistance, the governor, General Uhrich, was obliged to surrender with 451 officers and 17,451 men. By the Peace of Frankfurt, May 10, 1871, S. was finally restored to Germany. See Brucker's *Inventaire des Archives Communale de S. antérieure à* 1790 (vol. i. 1878).

Strat'egy (Gr. *strategia*, from *stratos*, 'an army,' and *ago*, 'I lead'), the science by which a general manœuvres his army and conducts his campaign so as to secure a probability of victory and to be able to reap its fruits. Strategical skill is required in order to establish suitable bases, to effect rapid and unexpected movements, to concentrate superior masses of troops to those of the enemy at salient points, to destroy the concerted action of the opposing army, and to break down their communications. The word strategy is applied to the operations of an army while beyond the reach of the enemy's fire. On the field of battle, strategy merges into tactics. The nature of a general's strategy depends in the highest degree on the character of a country, such as its roads, rivers, and mountains, and the configuration of its bases and frontiers. See the *Operations of War Explained and Illustrated*, by Colonel Hamley (1866).

Strat'ford-on-Avon, a Warwickshire market-town and Shakespeare's birthplace, 9 miles S.W. of Warwick by rail, stands on a gentle eminence above the right bank of the Avon, which is spanned by a 15th c. bridge of fourteen pointed arches and 1128 feet long. Shadowed by limes, the cruciform church of the Holy Trinity uprears a graceful spire of the 18th c., its transept and tower being Early English, chancel and nave of the Decorated style, with west window, lofty clerestory, and porch of the Perpendicular period. This church, the burial-place of Shakespeare and his family, was lovingly restored in 1840; and his birthplace, in Henley Street, was also renovated at the time of his tercentenary (1864), when a fund was started for the Memorial Theatre now (1878) in course of erection, and intended for the occasional celebration of Shakespeare's birthday, the representation of his plays, and possibly as a dramatic school for young actors. The grammar-school (founded 1482) occupies the upper part of the old Guildhall, adjoining which is the chapel of Holy Cross, late Perpendicular in style. Other buildings are the College School (opened in 1872), the church of St. James (1855), town-hall (1768), and market-house (1821); while in the neighbourhood are Clorton House (Rookwood's residence at the time of the Gunpowder Plot), and a monument (124 feet high) to Mr. Mark Philips, late member for Manchester, erected (1876) at a cost of £5000. S. publishes two weekly newspapers, and has a pop. (1878) of over 6000. See Wheler's *History of S.* (Str. 1806).

Strat'ford-de-Red'cliffe, Viscount, K.G., who as Sir Stratford Canning was for more than thirty years a prominent figure in the diplomatic history of the Eastern Question, was born in London 16th January 1788. He was the son of a London merchant, and cousin of George Canning. From Eton he went to King's College, Cambridge, in 1806, but left the next year on receiving an appointment from the Foreign Office. In 1808 he went to Constantinople, and was appointed Secretary to the Embassy in 1809. Returning to England in 1812, he resumed his studies at Cambridge, and graduated M.A. (1813). After performing high diplomatic service in Switzerland and the United States, and at St. Petersburg and Vienna, he was in 1825 appointed by his cousin, then Foreign Secretary, Ambassador at Constantinople. He was instrumental in fixing the boundaries of the new kingdom of Greece, and retained his post until, after the battle of Navarino, diplomatic relations with Turkey were broken off. Between 1834 and 1841 he represented King's Lynn in Parliament, and in 1841, having twice refused the Governor-Generalship of Canada, he was appointed by Sir Robert Peel Ambassador at Constantinople. This post he held for seventeen years—during the whole of the critical periods before, during, and after the Crimean War. His influence was always exerted to improve the condition of the Christian populations in Turkey, and at the same time to combat the influence of Russia at the Porte. His absence from Constantinople in 1852, at the time of Prince Menschikoff's mission, has been regretted in many quarters, but on the whole his services were great and undeniable (see Kinglake's *Invasion of the Crimea*). In 1852 he was raised to the peerage, and in 1858 returned to England and retired on a pension, only making occasional appearances in the House of Lords on questions of foreign policy, especially at the commencement of the late struggles in the East. In 1814 S. published a successful ode entitled '*Buonaparte*, and in 1873 resumed authorship, publishing a pamphlet entitled *Why am I a Christian?* and in 1876 a drama, *Alfred the Great at Athelney*.

Strath (Gael. 'a broad vale') is a name given in the Highlands of Scotland to the open valleys through which rivers flow, *e.g.*, Strathearn ('the vale of the Earn'), Strathspey ('the vale of the Spey'). In the case of Strathmore (the great S.'), however, it marks not the basin of a stream, but the long plain between the Grampians on the one hand, and the Sidlaws and Ochils on the other, which stretches from Stirling to Stonehaven.

Stratha'ven, a town of Lanarkshire, Scotland, about a mile W. of Avon Water, and 14 miles S. E. of Glasgow by the Caledonian Railway. In the vicinity is the romantic ruin of Avondale Castle, and some 6 miles S.W. are the battle-fields of Loudon Hill and Drumclog. Pop. (1871) 3645, chiefly employed in weaving and in the trade in cheese, cattle, and 'Straven' veal.

Strathclyde', a former kingdom of the Britons, extending N. from the river Derwent in Cumberland to the Firth of Clyde, and inland from the shores of that Firth to the forest of Ettrick. It thus comprehended most of Cumberland, Westmoreland, Dumfries, Ayr, Renfrew, Lanark, and Peebles. 'Galloway,' as the name shows, was in the possession of an intruding race of Gaelic or Irish Celts. The population of S. was Cymric in the south, and, according to Skene, 'a Cornish variety' in the north. The capital was the fortified rock on the Clyde called by the Britons *Alcluith*, and by the Gaelic Scots of Argyllshire, *Dunbreatan* ('the fort of the Britons'), now Dumbarton. The chief place in the south of S. was *Caer Luel*, or 'Carlisle.' The rulers of the Northern Britons were not termed kings of S., but 'kings of Alcluith.' In the year 945, according to the English *Chronicle*, king Eadmund harried 'Cumbraland' (*i.e.* S.), and ceded it to the Scots, who for a century before this had been masters of the whole country N. of the Forth. It never regained independence, but was gradually merged in the expanding Scottish kingdom, though as late as the 12th c. it was held by David, son of Malcolm Ceanmohr, as a separate earldom. During his reign, however, which was marked by the introduction of feudalism into Scotland, it was finally incorporated with the rest of that country. The subsequent troublesome revolts of the 'Gallowegians' settled in the districts now known as Kirkcudbright and Wigtown found no support among the descendants of the S. Britons, who gradually became, through fusion with the Angles of Bernicia and Norman settlers in the reign of David, among the sturdiest defenders of the Scottish nationality. To this region belonged Wallace and Bruce; it is the thrice-sacred 'land of Burns;' and if Skene's interpretation of *Nennius* be correct, it was the scene of those dim and distant fights which have clothed the memory of Arthur with perpetual renown. See Skene's *Celtic Scotland* (vol. i. 1876).

Strathnairn', Hugh Henry Rose, Lord, a distinguished English general, belongs to an old Scotch family, who have now for three generations held the office of Clerk of the Parliaments. Born in 1803, he joined the 19th regiment in 1820, and first served in the diplomatic service in Syria as consul-general (1841), and at Constantinople as chargé-d'affaires (1852). In the Crimean War he acted as Queen's Commissioner at the French headquarters, and was wounded in the trenches. During the Mutiny he commanded with much success the force in Central India, and amongst other achievements captured the town of Jhansi. In 1860 he was appointed commander-in-chief in India, and in 1865 commander of the forces in Ireland. In 1866 he was raised to the peerage, and succeeded Lord Gough in command of the Royal Horse Guards in 1869. He resigned his command in Ireland in 1870, and was created field-marshal in 1877.

Strathspey', a Scotch dance, supposed to have been first practised in the district from which it received its name. It resembles the Reel (q.v.), but moves slower.

Stratio'tes (Gr. 'a soldier,' from the sword-like foliage) is an aquatic sub-diœcious plant, of the order *Hydrocharidaceæ*, growing submerged in ponds and ditches in most countries in Europe; it is native in England, and naturalised in Scotland and Ireland. In appearance it resembles somewhat an American aloe in miniature (hence its name, *S. aloides*); it has also been compared to the tuft of leaves of the pine-apple, thereby receiving the local name of 'water-pine.' The genus consists of this one species only. S. is a curious plant, but is very troublesome if it gains possession in any piece of water, spreading with great rapidity by its runners, and overpowering other vegetation: its rigid leaves make havoc of fishing-lines.

Stra'tum. Aqueous or sedimentary rocks—that is to say, all those formed by the gradual deposition at the bottom of seas or lakes of material brought down to them by rivers, &c.—show such material to be spread out evenly in beds or layers, technically known as *strata*. The term is also applied, though less correctly, to such formations as peat and coal, which have not been deposited in water. Strata, though of course originally horizontal, are almost invariably found more or less displaced. They may, for instance, be *inclined*, *curved*, or even *vertical*; and sometimes are contorted, folded, or crumpled to an enormous extent. The *dip* of a S. is the amount of its deviation from the horizontal: the *strike* is the direction in which the strata extend at right angles to the dip. When one S. has been more or less tilted or inclined previous to the deposition of the succeeding one, they are said to be *unconformable*.

Strau'bing, an old town of Lower Bavaria, S. Germany, on the Danube, here crossed by two bridges, 23 miles E.S.E. of Regensburg by rail. Interesting buildings are Jakobskirche (1492-1512), the Gothic Gymnasialkirche (1430), with a fine monument of Duke Albrecht II., and the Schloss once occupied by Duke Albrecht III. and his beautiful but ill-fated wife, Agnes Bernauer, who was buried in the churchyard of St. Peter. S. has brewing, tanning, silk-weaving, a salt and powder magazine, and a considerable river traffic in live stock and corn. Pop. (1875) 11,614.

Strauss, David Friedrich, was born, 27th January 1808, at Ludwigsburg. His father was a retail merchant, and a man of considerable mental culture. His mother was a highly-gifted and well-educated woman, and her influence told powerfully on her son's character. When fourteen years old S. entered the lower Evangelical Seminary at Blaubeuren, where he had Kern and Bauer as his teachers. In 1825 he became a student at the University of Tübingen. In the Evangelical Theological College his old masters were soon after appointed professors there, and his after life showed the influence of their teaching. At Tübingen he occupied himself in mystical dreams, in the study of Schelling, and in the composition of poems. He afterwards studied

Schleiermacher, and then gravitated, as all German intellect in these days did, to the Hegelian system. In 1830 S. concluded his college life, and after a short time spent at Kleiningersheim as assistant to the parish clergyman, he went as interim professor to the college of Maulbronn. He spent a part of 1831-32 at Berlin, and then settled at Tübingen, where he acted as repetent (assistant) at the Evangelical College. There he published in 1835 his celebrated *Leben Jesu* (Tüb. 1835-36; 4th ed. 1840). The main question of the book is, 'Whether, and how far, all that is told us by our four Gospels really happened?' The answer implies not merely a complete elimination of the supernatural element, but even goes to prove that we can never really be sure whether any special fact is historical or not. 'The greater part of the Gospel records contains either no historical matter at all, or historical matter so disfigured that it is scarcely recognisable as such.' But whence these writings? They are myths: they are not history. They were not purposely invented: they *grew*. Their centre is a human personality glorified by the passionate devotion of his followers, who saw in him the fulfilment of the promises of the older Jewish Scriptures. But if this mythic element be removed, we have 'merely the general outline of the life of Jesus from his public appearance to his death on the cross.' Only of humanity, not of any individual man, can the attributes connected with the conception of Christ be predicated. The *Leben Jesu* produced a powerful impression, and a storm at once arose against its author. He was removed from his office and appointed teacher in the Lyceum of Ludwigsburg, but this post he resigned in the course of a year and proceeded to Stuttgart, where he was engaged in preparing new editions of the *Leben*, and in the publication in three parts of *Streitschriften* (Tüb. 1837-38), a series of brilliant essays in which his critics were sharply criticised. In 1839 he published his *Zwei friedliche Blatter*, and *Charakeristiken und Kritiken*, containing further exposition of his views (Altona 1839, and Leip. 1839). That same year the Zurich Government offered him a theological professorship in the Zurich university, but the storm which immediately arose caused this appointment to be revoked. In 1840-41 S. published *Die Christliche Glaubenslehre*, 'an historical consideration of Christian theology,' carried out on the same lines as the *Leben Jesu*, for 'the true criticism of dogma is its history.' It was not till 1864 that he again published a volume on theological subjects. In the interval he employed himself in literary studies resulting in Schubert's *Leben in seinen Briefen* (1849), the Biography of his friend Märklin (1851), the *Leben und Schriften Nicodemus Frischlin* (1856), the poet and philologist, *Ulrich von Hutten* (1858-60), the *H. S. Reimarus* (1862), and *Kleine Schriften* (1862-66). In 1864 the result of a revived application to theological pursuits was seen in the publication of his *Das Leben Jesu für das Deutsche Volk* (Leip.), followed by *Der Christus des Glaubens und der Jesus der Geschichte* (1865), a criticism on some recently-published lectures of Schleiermacher, and *Die Halben und Die Ganzen* (1865), an attack on the orthodox Hengstenberg and the rationalistic Schenkel. The latter in special is very severely criticised on account of alleged ambiguity, and attempts at a false and unscientific reconciliation between science and religion. His last important work, published in 1872, was *Der Alte und der Neue Glaube*. Here the result of his convictions is stated with unhesitating boldness and uncompromising honesty. He asks, and answers in the negative, the question, Are we still Christians? and then proceeds to propound a materialistic theory of the universe, and a 'religion of the future' founded upon it. Like most books of the kind, the work is strong in its negative but weak in its positive aspects. During the last years of S.'s life he frequently changed his residence, but finally returned to his birthplace, where he died February 8, 1874.

The storm raised by S.'s works was caused, not merely by the fact that he attacked the sacred and cherished convictions of the multitude, but that he was equally hostile to the rationalistic party in the Church, who attempted to reconcile what he believed to be contradictories, and he has powerfully exposed their inconsistency and the unstable nature of their standpoint. In politics, moreover, his views though liberal were not decidedly so, and he thus alienated another party, who, as far as theological beliefs were concerned, occupied the same platform. His works exhibit profound scholarship. The style is clear, direct, and forcible. Sarcasm is employed but sparingly, and always with the best effect. Frequently a phrase expresses in the happiest manner the general aspect of a question, or some aphoristic truth charms and edifies the reader. Personally, S. was a person of modest and retiring disposition. An ardent love of truth and fearless honesty in its expression were among the most prominent features in his character. The following translations into English of S.'s works may be referred to, *Life of Jesus* (3 vols. Lond. 1846, popular revised edition Lond. 1865), *The Old Faith and the New* (2d ed. Lond. 1873). See also Zeller's fine sketch, *S. in seinem Leben und seiner Schriften* (Lond. 1874). See Hausrath's Biography (vol. i. Leip. 1878). A selection from S.'s *Werke* was edited by Zeller (vols. i-vi. Bonn. 1876-77). In 1877 appeared his *Gedenkenbuch*, a collection of pieces of poetry, edited by S.'s son, in which certain fine and even tender susceptibilities are unexpectedly revealed in the great disbeliever.

Straw'berry (Old Eng. *streowberie*, 'either from its straw-like halms, or from their lying strewn on the ground,' *Prior*) or *Fragaria*, so called from the fragrant fruit, is a genus of perennial herbs with creeping stolons belonging to natural order *Rosaceæ*. The leaves are trifoliate, the flowers white or yellow, the calyx persistent, of 5 lobes with 5 bracteoles at the base, and numerous stamens and achenes. Professor Decasne's recent monograph of the genus describes 10 species; but Dr. Hooker says '3 or 4 species.' They are distributed through temperate and mountain regions of the N. hemisphere, occurring also in S. America, the Sandwich Islands, and Bourbon. *F. vesca*, the wild S., is a common British and European plant of shady places, flowering in April and May, and producing a small obovoid or globose, red or whitish, pleasant-tasted fruit, during the summer. From it numerous garden varieties have been raised. Possibly the distinct-looking plant called in cultivation the 'haut-bois S.' is derived from it. The scarlet S. (*F. Virginiana*), the wild S. of Canada and the United States, has been grown in Europe for 250 years. It has many varieties, differing in form of fruit from round to oblong, and in flavour from sugary to brisk acid. *F. Chiloensis*, the Chili S., is more tender than the above, but is of vigorous growth, and yields a good fruit in climates suitable to its growth. By crossing and re-crossing, however, very valuable and sufficiently hardy sorts have been obtained from it, particularly the kind so extensively grown and so well known under the name of 'British Queen.' The S. is much valued for dessert, is of very general use in confectionery, and is recommended medicinally in cases where acid fruits are injurious. The fruit should be gathered when quite dry. All the kinds are propagated by runners planted in rows or beds, and should be so situated as to have free exposure to sun and air. The plantation requires renewal every third, fourth, or at latest every fifth year. Strawberries may be forced with advantage in the peach-house, vinery, orchard-house, or in warm pits. The Barren S. (*Potentilla Fragariastrum*, formerly *Fragaria sterilis*) is something like *F. vesca*, which it often accompanies in Britain, but has no runners.

Straw-Plait' and Straw-Hat' Manufacture. These industries are in England localised in the counties of Bedford, Herts, Bucks, and Essex, the principal centres being Luton, Dunstable, St. Albans, and Hitchin. Straw-plaiting is pursued by the females of the villages, who dispose of their work to dealers, or carry it to the weekly markets of Luton and other towns, where the plait is sewed up into hats, &c. The census of 1871 showed that upwards of 45,000 females and only 3590 males were engaged in the S.-P. industry. The industry at Luton dates from 1605, when James I. brought from Scotland the descendants of straw-plaiters imported into that country from Lorraine by Mary, Queen of Scots. The straw is obtained from the red lammas or white chittim wheat, grown mainly on the northern slopes of the Chiltern Hills, in Bedfordshire, and in Herts, Bucks, Oxfordshire, and Berkshire. To prepare the straw for plaiting, it has to pass through the several operations of having the ears cut away, the sheath stripped off, and the root end removed. The straw is then 'sorted' into different thicknesses by being passed through sieves, cut into short lengths, and bleached by exposure to sulphur fumes in steam-chests. Each length is next 'split' into strips by drawing it through a tube armed with from 4 to 7 steel slitters. 'Milling' under rollers to render the straws less stiff is the next operation, which is followed by 'wetting' to soften them. 'Plaiting' comes next,

after which the loose ragged ends are clipped away, and the plait is 'bunched' or divided into links, each 10 yards long. Two links are reckoned 'a score,' and the market price of it ranges from 2d. to 3d., according to the character of the plait, of which there are several varieties. The straw is usually dyed in the plait, but sometimes when whole before being split. Straw hat and bonnet making is to a great extent a domestic trade, being carried on by families in their homes; but factories are also established at Luton and Dunstable, where females sew the plait into a hat form by machine or by hand, and add lining and trimming; while men stiffen the hats or bonnets with solution of gelatine, and attend the 'blocking' or pressing of them into their final shape in heated zinc moulds by hydraulic power, as well as the 'crimping' or impressing a pattern on the straw, which is also accomplished by pressure into engraved moulds. Tuscan plaits have been imported into Luton for upwards of 60 years without affecting the home plait trade, but during the last few years Chinese plaits, cheap, of inferior quality, and made of whole rice, have been introduced with very opposite results. A very important trade in hats, &c., with Australia, India, Cuba, and S. America, is annually increasing. The annual export of hats from Great Britain, which in 1863 was valued at £444,126, had in 1877 increased to £1,106,556. Straw-plaits and straw-hats are made to a small extent in London. Tuscan straw, of which Leghorn hats are made, is the stalk of wheat grown on poor soil, and cut while milky. The manufacture of Leghorn hats is pursued in the provinces of Vicenza and Bologna, and in Tuscany, where the industry has been established for centuries.

Strel'itzes (Russ. *Strjelzi*, 'to protect'), a Russian body-guard organised by Ivan the Terrible in the latter half of the 16th c., when the S. formed the whole standing infantry army of Russia, and soon amounted to 40,000 or 50,000 men. Their many privileges at length made them arrogant and unmanageable, so that they came to wield an influence in Russia like that of the Prætorian Guards at Rome or the Turkish Janissaries. For an insurrection against Peter the Great, the latter in 1698 disbanded the S., executing several thousands, and banishing the rest to Astrakhan, where they also were destroyed in 1705.

Strength of Mate'rials, in mechanics, forms an important part of the theory of structures, and includes the consideration of all questions relating to the straining of solids. A solid is said to suffer strain when it is in any way altered in volume or figure, and to effect such an alteration external force must be applied. If the strain is not carried so far as to cause disintegration of the solid—that is, if no *fracture* results—the force or resultant of the forces which produce the strain must be balanced by an internal force conditioned by the molecular structure of the solid. This internal force called into existence by the strain is the one aspect of the stress, of which the original force producing the strain is the other. To every strain, then, there corresponds a stress, which is regarded as the resultant of the stresses which act between the elementary portions into which the solid may be supposed to be divided. (See STRAIN.) When the strain is proportional to the stress—in other words, when Hooke's Law (*ut tensio sic vis*) holds—the body strained is said to be perfectly elastic (see ELASTICITY); and the elasticity of every solid, even for such cases as moistened clay, is sensibly perfect when the strain does not exceed a certain limit. For every solid, however, there are limits of strain which, if exceeded, give to the body a *set* or permanent alteration of volume or figure. Hodgkinson has proved that these limits depend on the duration of the strain, so that in all probability any strain if sufficiently long-continued would give a set to any body. There are several distinct kinds of strains to which a solid may be subjected, and these are given with their corresponding fractures in the following table taken from Rankine's *Applied Mechanics* —

	Strain.	*Fracture.*
Longitudinal.	Extension.	Tearing.
	Compression.	Crushing and Cleaving.
Transverse.	Distortion.	Shearing.
	Torsion.	Wrenching.
	Bending.	Breaking across.

The simplest example of resistance to stretching is afforded by a uniform bar subjected to a stress acting along its axis, say a suspension-rod with a mass attached to its lower end. The stress is here measured by the weight which produces the longitudinal strain; and each unit of length of the bar will suffer an extension, which within a certain limiting stress will bear a constant ratio to the stress. In other words, the modulus of elasticity or ratio of the stress to the extension per unit length of the rod will be nearly constant until the stress passes the limit of the *proof-stress*, which is defined generally as the greatest stress of which a strained solid can bear the repeated application without its strength being impaired. After this limit the extension increases faster than the stress until the breaking stress is reached, when the bar is torn asunder. In experimentally determining these constants for a given material, the stresses must be applied gradually; for it is found that a stress, which when suddenly applied produces fracture, can be resisted by the solid when applied gradually. Now, the work done by the stress is measured by the product of the strain into the *mean stress* in its own direction; and hence the work done in straining a solid to the limit of proof-strain is measured by the product of the strain into *half the proof stress* in the direction of the strain, which in most cases may be taken as a measure of the mean stress. In the case of the bar, this product (technically known as the *resilience* or *spring* of the bar) is the extension multiplied by half the proof stress. The strains to which boilers and pipes are subject under the pressure of the contained fluid belong to the same class of longitudinal strains as the stretching of a bar does, but their discussion is necessarily much more complicated. Resistance to compression is sensibly equal to resistance to extension, as long as the limit of the proof-strain is not exceeded. When, however, that limit is exceeded, the various modes in which the *crushing* may occur make the determination of the resistance difficult. Thus the strained body may split into fragments in the direction of the crushing force; or it may yield by bending or by shearing or sliding along oblique surfaces of separation; or it may swell laterally, like lead or wrought iron; or it may crush by crossbreaking, very similar to the crossbreaking of a beam under a transverse load. In these cases transverse strains are introduced, which accordingly fall to be considered. A shear is a strain produced by a tangental stress, which may or may not be constant in intensity and direction. In many ordinary structures in which plates, links, or bars are subjected to a direct pulling stress, the rivets or bolts which fasten them together are under the action of a shearing stress; and in such cases it is of importance that the pieces and their fastenings should be of equal strength. The nature of a simple shear is well shown geometrically by two parallelograms upon the same base and between the same parallels, the alteration of form being simply a sliding of the elementary portions over each other with the displacement proportional to the distance from the base, in the direction of which the shearing stress may be supposed to act. Except in very special cases, shearing invariably accompanies the last two kinds of transverse strains—torsion and bending. For instance, take the case of a horizontal beam in equilibrium under the action of the weight of its load, either applied at detached points or continuously distributed, and the pressures at its props, and consider any transverse section dividing the beam into two parts. The resultant of the forces acting over one only of these parts will have a shearing action at the cross-section, to resist which the particles at the cross-section must be able to exert an equal and opposite shearing stress; and, further, the moment of this resultant, taken with reference to the cross-section, or the *bending moment* exerted at the cross-section, must be balanced by an equal and opposite moment of resistance exerted by the particles at the cross-section. When the beam is bent, the side towards which the resultant external force acts is stretched and the other side compressed. Intermediate to these, there must be some layer in the beam which is neither lengthened nor shortened. This is called the *neutral surface*; and at any other layer a longitudinal stress is called into action, which, within the limits of proof stress, is proportional to the distance of the layer from the neutral surface. This stress is a pull or *tension* if the surface is stretched, a pressure or *thrust* if compressed: and this uniformly varying stress at any given cross-section constitutes a couple whose moment is equal and opposite to the bending moment at the cross-section. In the case of torsion, take a cylinder subjected to the twisting moment of a pair of equal and opposite couples applied to two given cross-sections. Between these cross-sections there is evidently distortion, and similar conditions of stress and strain exist at all

intermediate cross-sections; and the stress in any cross-section is a shearing stress, which is proportional to the distance from the axis. For detailed information on the subject, see Barlow on *S. of M.*, Moseley's *Mechanics of Engineering and Architecture*, Rankine's *Applied Mechanics* and *Civil Engineering*; and in Thomson and Tait's *Natural Philosophy*, vol. i., the subject is treated as a branch of statics.

Strepsip'tera (Gr. 'twisted-winged'), a group of insects usually ranked as a distinct order, and represented by such aberrant forms as the *Stylops*, or bee-parasite. The front pair of wings are represented by a pair of small twisted filaments which have given the group its name. Both sexes may be found living within the bodies of bees from May till June. The larvæ are produced within the female body, and are hatched in the latter month. They then fasten on the bodies of bees, the males issuing during the succeeding summer.

Strepsirhi'na (Gr. 'twisted-nosed'), a division of Monkeys or *Quadrumana* (q. v.) having twisted or curved nostrils, and found chiefly in Madagascar. The Lemurs, Aye-Aye or *Cheiromys*, Slow Lemurs, and Loris, belong to this group, which has also received the name *Prosimiæ*. From their brain-characters as well as from their *placentation*, the Lemurs (q. v.) especially are believed to occupy an intermediate position between carnivora and quadrumana.

Stress is a convenient term introduced by Professor Rankine to express the mutual action between any two portions of matter. Thus the pressure between a table and a book resting on it is of the nature of a S., which has two aspects, according as we fix our attention upon the table or the book. With reference to the former the pressure is *downwards*, with reference to the latter *upwards*, and these two forces, which according to Newton's third law are equal and opposite, form when regarded as a whole the S. Similarly the attraction of the earth for the sun and the attraction of the sun for the earth are opposite aspects of the same S., and the same can be said of all forces which obey Newton's third law, *i.e.*, of all known forces which invariably exist in pairs. The so-called centrifugal force is merely the one aspect of the S. whose other aspect is the force which acts upon the body normally to the path.

Stretch'ing-Course, in masonry and brickwork, a course of stones or bricks laid with their longer dimensions on the face of the wall, distinguished from a *heading-course*, in which the breadths of the stones or bricks are exposed.

Strett'o (Ital.), in music, means closely, concisely, in a quicker style, the opposite of largo. A S. in a fugue is the bringing closely together the subject and its answer; as, for instance, the entry of the answer into the fugue before the close of the subject. A *stretta* is a final coda to a piece taken in quicker time than the preceding movements, or the termination of an operatic finale.

Strick'land, Agnes, born at Roydon Hall, near Southwold, Suffolk, 19th July 1796, with her sister Susanna published *Patriotic Poems*, and by herself *Worcester Field* (1812), then after a silence of twenty years the Byronic *Demetrius* (1833), and a prose romance, *The Pilgrims of Walsingham* (1835). To a number of minor works succeeded *Lives of the Queens of England* (12 vols. 1840-49) and *Lives of the Queens of Scotland* (8 vols. 1850-59), in both of which her sister Elizabeth assisted her. They display a praiseworthy industry, and contain some curious matter in the way of historic millinery, but otherwise hardly deserve their bygone reputation, the copyright of the former fetching £6000. The same may be said of her *Lives of the Bachelor Kings of England* (1861), *Lives of the Seven Bishops* (1866), and *Lives of the Tudor Princesses* (1868); but her *Letters of Mary, Queen of Scots* (1843; new ed. 1873) is valuable so far as the letters themselves are concerned. In 1871 Miss S. received a pension of £100. She died at Roydon Hall, 13th July 1874.

Stric'ture is a term used in surgery to denote an unnatural contraction of a mucous canal such as the œsophagus, the rectum, or the urethra. There may be also S. of the lachrymal, salivary, and gall ducts, and of the ureter; but the term is most frequently applied to the first-mentioned cases, and when used by itself is generally applied to S. of the urethra. S. of the *urethra* is generally caused by a low inflammation of the submucous tissue of the urethra, or cicatrisation, the result of an accident; and the most frequent cause is the persistence of a neglected gonorrhœal discharge, or syphilis. *Traumatic* S., depending on an injury, is by far the most formidable form, the resulting cicatrix being usually very dense, hard, and contractile, so that, even after dilatation, it is very apt to recur. The most common seat of S. is in the bulbous portion of the urethra, but any part may be affected. The symptoms of S. are difficulty in making water, and straining, which may pass into total retention. The existence of a S. leads to gradual loss of tone and dilatation of the part of the urethra behind the S.; of the bladder; the uretus; and finally of the pelves of the kidneys, terminating in absorption of their cortical substance, suppressed secretions of urine, and death from uræmic poisoning. In general, however, the walls of the bladder are thickened, and its cavity perhaps diminished; and in the urethra there is almost always dilatation behind the S., unless relieved by ulceration and urinary fistula. The ureters are generally dilated, and the kidneys are as often affected by inflammation as by distension, resulting in small abscesses scattered throughout the organ. For treatment see URINARY ORGANS, DISEASES OF. For other forms of S. see ŒSOPHAGUS, RECTUM, LACHRYMAL APPARATUS, DISEASES OF.

Strie'gau, a town of Prussian Schlesien, on the S. water, 19 miles S.S.E. of Liegnitz by rail, with manufactures of linens and woollens. Pop. (1875) 10,614.

Stringen'do (Ital.), in music, a gradual quickening of the time; urging on the speed.

Strike. See DIP AND STRIKE.

Strikes and Lock-outs. A strike is the combining together of labourers in any particular branch of industry to discontinue their labour until certain demands made by them on their employers are satisfied. A lock-out, on the other hand, is a combination of the employers to resist such action by stopping their works. From the masters' point of view, strikes are most objectionable; from a labourer's, they appear to be in certain cases almost a necessity. How otherwise, they ask, can they ascertain whether or not their employers are taking an undue advantage of them by paying them less than the just value of their labour? From an economic point of view, strikes necessitate a terrible waste of money and of money's worth. The laws which ultimately govern the rate of wages are indeed beyond the powers of capitalists and labourers, and their temporary successes or failures in dispute. The rate of wages depends generally upon the ratio which the accumulation of capital bears to the increase of the population, and upon hundreds of fluctuations of various kinds. Combinations to resist these laws are expensive and really wasteful. They expose capital and labour to long periods of idleness, often with no satisfaction to either party in the end. Apart from those struggles which have resulted in a decided gain on one side, there have been countless strikes which have been drawn battles, and even in the most successful strikes it usually takes a long period of time before the increase of wages repays the labourer for the wages he has lost, or the diminution of wages the capitalist for the time his capital has been unemployed.

The laws regarding the remuneration of labour which formerly existed in this country were rigid and severe. The first labour statute of English law was passed about the year 1350, soon after the Great Plague had ravaged the country, and by diminishing the population had greatly increased the price of labour. This statute, combined with subsequent legislation, attempted to fix rates of wages, and to give power to levy severe penalties on those who paid or received more than those stipulated. Every man or woman, free or bond, under the age of threescore years, not having landed property or other means of support, was compelled to work for any employer requiring his labour for a fixed sum. A favourite penalty for recalcitrant labourers was the pillory, another the cutting off of an ear. For nearly five centuries, machinery was from time to time devised to fix undeviating rates for payment of wages, and this machinery constantly failed in struggling against those economic causes which really regulate the price of labour. It is to these unjust and selfish enactments that we may partly trace the heart-burnings on the part of the working classes, which have resulted in the wars or armed truces between capital and labour which have unfortunately characterised the present century. Combinations on the part of workmen to obtain a higher rate of wages were formerly treated as conspiracies, and were illegal until the year 1825. This was a

state of things certainly disadvantageous to the workmen. As employers naturally seek to absorb as much profit from labour and capital as possible, a depression in trade is usually followed by a reduction of wages, whilst the converse is seldom the case. Now a solitary workman, in an individual contract with a large capitalist, could have no power of meeting this grievance. If capital and labour, which should work together harmoniously for each other's good, are to be ranked on opposing sides with conflicting interests, it is only by means of organisations of labour that labour can enter the field on equal terms. Hence the necessity, in the eyes of the working classes, for trades unions, and of strikes as part of the machinery of these bodies for enforcing their demands.

The following are some of the more memorable strikes during the last half century. The 'Amalgamated Engineers' struck in the year 1852 against piece-work and overtime. The struggle lasted three months, the masters substantially gaining the day in the long run. It cost the society over £40,000 besides the loss of wages, and there were those who thought it would be the death of that body. On the contrary, the Amalgamated Engineers is now the largest and most flourishing of trade combinations. A gigantic strike of spinners took place at Preston (where a notorious strike occurred also in 1836) in 1853-54. It involved 20,000 persons, and lasted from the 15th October to the 1st of May. The loss of wages to the men was estimated at £3,000,000. The weekly drain upon the union's funds was nearly £3000, and the total actual loss occasioned by the strike was estimated at £628,216. On 6th August 1859, 24,000 labourers in the London building trade struck in connection with the nine hours' movement. This struggle was unsuccessful, and terminated on the 31st August. During the last few years many strikes have taken place in the coal industry, particularly in South Wales. A strike by 50,000 Welsh colliers in 1873, lasting nearly four months, resulted in a virtual gain for the men. Not so a similar strike of 60,000 men in the same district on 1st January 1875 to resist a reduction of 10 per cent. off their wages. The men had to succumb, and gradually returned to work toward the end of May. A strike of railway servants over the greater part of the United States through reduced pay, lasting twelve days and commencing 18th July 1877, was one of the most sanguinary and violent struggles of the kind which has ever happened. It led to encounters with troops, the loss of hundreds of lives, and a destruction of property estimated at £8,000,000. Few more determined strikes have taken place than that of the London masons for increased pay and shorter hours on 31st July 1877. Some firms yielded, but the majority of employers resisted the demands. The masters procured workmen from America, and on the arrival of the latter the unionists 'got at' them, and sent them back again. Little difficulty was experienced, however, in getting German, Belgian, and other foreign workmen, and the strike ended 14th March 1878. The loss in wages was £60,000. A large strike of cotton spinners in Lancashire to resist a reduction of 10 per cent. on wages began 18th April and ended 17th June 1878, the men ultimately submitting. The engineers of Liverpool and Birkenhead and of London struck (31st January 1879) against a reduction of wages, averaging 7 per cent., the masters refusing to compromise or to arbitrate. A late instance of oppression is the strike of the caulkers in Messrs. Elder's shipbuilding yard at Jarrow, because the masters refused to dismiss a man for doing more work a day than is prescribed by the union rules.

Till 1872 the agricultural labourers of England had no organization of any kind, and they were then as now the worst paid workmen in the kingdom. A National Union of Agricultural Labourers, managed chiefly by Joseph Arch, was inaugurated at Leamington, March 29, 1872, and the movement received considerable support from Mr. A. Herbert, M.P., and other influential sympathisers with poor Hodge. Agitation meetings were held in various parts of the country, and a lock-out of labourers belonging to the union began at Alderton, Suffolk, in March 1874, and the union ceased to support the locked-out labourers on 27th July. The agitation subsequently subsided. At present (December 1878) there is a lock-out of farm labourers in Kent and Sussex.

It is worth noting that where strikes have been for an increase of wages they have often succeeded, whereas they have seldom done so where the object of the strike has been to resist a reduction. This clearly shows that masters, as a rule, if loath to raise the wages of their employés, do not reduce them without strong cause. In strikes the masters lose money and the men suffer untold misery, often cheerfully undergone, to gain their purpose. A less favourable feature is the persecution of non-unionists and those willing to work, which is often persistently attempted by those who have struck. The evil of strikes to the community is very great. It primarily falls upon those unfortunate labourers whose labour depends upon the class who have struck. In factories the action of a particular class of workmen will frequently throw ten times the number of people out of employment. It then affects tradespeople dependent on the workmen, while the whole community loses the advantages of production. Strikes have greatly and permanently injured particular seats of industry where they have occurred, from orders being sent, and similar branches of industry being established, elsewhere. Thus Dublin lost its shipbuiling trade, Nottingham much of its lace trade, Macclesfield much of its silk trade. The customers of many English machine-makers have transferred their orders to France and Belgium, and whole branches of the cotton manufacture have been driven to America and other places.

Among the suggested remedies for strikes are Co-operation (q. v.) and Arbitration (q. v.). The former has yet scarcely emerged from theory into practice; the latter has been tried of late years with considerable success. See, besides the works under POLITICAL ECONOMY, *The Wages Question*, by F. A. Walker (New York, 1876); *Lectures on the Labour Question*, by T. Brassey (3d ed. 1878); *Work and Wages*, by the same (1872); and *Conflicts between Labour and Capital*, by G. Howell (1878).

Strogan'off, a noble family of Russia, descended from **Anika S.**, a rich Novgorod merchant of the beginning of the 16th c., who had large possessions in the Ural Mountains, established salt manufactories, and started the trade between Russia and Siberia. His three sons **Yakoff, Grigorij,** and **Semen S.** founded towns and fortified villages ('Ostrogs') on the river Kama, with their own troops defended their possessions against robber neighbours, and built fortresses in Siberia to check Mongol incursions. Semen, the youngest, supported by a nephew and by Yermak Timofeyeff, Hetman of the Don Cossacks, attacked the Mongols and took the capital Sibir (1581), with all Siberia. The S. family received now a monopoly of trade with Siberia, as well as other privileges, and from manufactories, mines, foundries, and gold washing gained great wealth, but in 1722 Peter the Great deprived its then representatives, the three brothers, **Alexander, Nicholas,** and **Sergei S.**, of all their privileges, only conferring instead of them the title of baron.—**Alexander S.** (1734-1811), son of Sergei, imperial chamberlain and privy councillor, was married to a relative of the Empress Elizabeth. He was made a count of the German Empire in 1761, and a Russian count in 1798.—His son, **Count Paul S.**, fought as a general against the French, and distinguished himself in 1814 at the battle at Craonne, where his only son fell by his side. He died in 1817, leaving a daughter heiress of his estates.—**Grigorij S.**, grandson of Nicholas S. (1770-1858), was in 1821 Russian ambassador at Constantinople. He was made a count in 1826, and imperial chamberlain in 1846.—His eldest son, **Sergei S.**, was from 1835 to 1847 curator of Moscow University, and in 1857 was appointed to direct the archæological excavations in Russia, of which he has prepared a series of valuable reports. He is also noted for his earnestness in stimulating art and science, and promoting the internal progress of Russia.—His younger brother, **Alexander S.**, born 1805, was from 1839 to 1841 minister of the interior, and in 1855 became governor-general of New Russia, with the task of restoring order in the Crimea and rebuilding Sebastopol.—His son **Grigorij**, imperial master of the horse, in 1856 formed a morganatic marriage with Maria, Archduchess of Leuchtenberg, eldest daughter of the Emperor Nicholas.

Strom'bidæ, a family of *Gasteropodous* Mollusca, in which the shell has a very deeply notched outer lip, and the *operculum* or plate used for closing the mouth of the shell is claw-shaped. The S. inhabit tropical seas. A very familiar species is the Giant Stromb or Fountain-Shell (*Strombus gigas*) of the W. Indies, which may weigh from 4 to 5 lbs., and is largely used in the manufacture of cameos. The name 'wing shells' is given to the S. from their large and expanded lip.

Strom'boli, the most north-easterly of the Lipari Islands (q. v.), off the N. coast of Sicily, is 12 miles in circuit, and has 1452 inhabitants. Its cone, 3022 feet high, is one of the few volcanoes that are constantly active. At regular intervals showers of stones are ejected, and these almost all fall again within the crater. The ancients regarded S. as the seat of Æolus, and in the Middle Ages it was held to be the entrance to purgatory. The island yields, besides sulphur and pumice-stone, cotton, fruits, and wine.

Strom'ness. See ORKNEY.

Strongyl'idæ. See STRONGYLUS.

Stron'gylus (Gr. 'round'), a genus of *Nematoid* worms belonging to the family *Strongylidæ*, of which this genus is the type. The *S. bronchialis* is a species infesting the bronchial tubes of man, the female attaining the length of an inch. The family characters of this group are a round thread-like body (hence the name), a round or oval mouth, and two terminal *spicules* provided for the male. The *S. bronchialis* is not of frequent occurrence as a human parasite. It was first discovered in 1790. Allied species (*S. paradoxus*) occur in the lungs of the pig, and (*S. micrurus*) in those of the calf. The *S. gigas* (otherwise known as *Eustrongylus gigas*) is notable as being the largest nematoid parasite found in man or other animals. It attains a length of over 3 feet (female), the male measuring 1 foot. Rare in man, *S. gigas* is found in almost all *Carnivora.*

Stron'say. See ORKNEY.

Stront'ium (Sr = 87·5), one of the metals of the alkaline earths, occupying an intermediate position as regards many of its properties to calcium and barium, the other members of the group. S. is less abundant in nature than barium, and occurs as a constituent in the minerals strontianite and celestine, which are respectively the carbonate ($SrCO_3$) and sulphate ($SrSO_4$). In the metallic state it is usually white, heavy, oxidisable in air, and decomposing water at ordinary temperatures. The most important compound is strontia (SrO), from which Davy first obtained the metal in 1808 by electrolysis. It resembles baryta, forming a white soluble hydrate (SrO,H_2O), which is the compound formed when the metal decomposes water. Strontia is best prepared by decomposition of the nitrate by heat; while the nitrate ($Sr(NO_3)_2$) and chloride ($SrCl_2$) are easily obtained by treating the mineral carbonate with nitric and hydrochloric acid respectively. S. also forms a dioxide (SrO_2), which is prepared as the corresponding barium compound is by exposing the monoxide to a strongly-heated current of oxygen. S. and its compounds burn with a very characteristic crimson flame, which gives a well-marked line or banded spectrum.

Stroph'ulus. See RED GUM.

Stross'mayer, Joseph Georg, a Croatian bishop, was born at Essek in Slavonia, 4th February 1815, and studied in the Diakovo seminary, at the University of Pesth, and, after taking priest's orders (1838), in the Vienna Augustinum. As bishop since 1849 of Diakovo (a diocese including Bosnia and Syrmia), he has been the head of the Croatian party in the Vienna *Reichsrath*, and by his statesmanlike strivings for autonomy has incurred the dislike of the imperial government. In Western Europe, however, he is chiefly known as one of the chief opponents of the Infallibility Dogma in the Vatican Council (1870), being one of the 88 who voted 'No.' His speeches there made Dupanloup own him his master in oratory, but their liberal sentiments respecting Protestantism called forth the cry of 'Heretic!' He has passed three winters at Rome since the promulgation of the decree, but has been wisely left to his own beliefs, since his influence over his countrymen has been rendered boundless by a princely liberality, of which his latest instance was his sending £3000 to the Slavonic sufferers in the Russo-Turkish war.

Stroud, a market-town of Gloucestershire, 11¾ miles S.S.E. of Gloucester by rail, lies in a valley sheltered by the Cotswolds, at a point where two streams unite to form the Frome or Stroud Water. It has two churches, St. Lawrence (rebuilt, with exception of the spire, in First Pointed style, 1866–68) and Holy Trinity (1834), an Elizabethan town-hall (restored 1865), a new hospital (1876), a large and handsome building for public meetings called the Subscription Rooms (1830), Temperance Hall (1878), a Corn Hall, Liberal Association Rooms, and Badbrook Conservative Hall. The district is the chief centre of the West of England cloth manufacture, which in 1871 employed 1309 men and 2188 women, and scarlet-dying (employing 43 men) is also a specialty of this valley. S. returns two members to Parliament, and publishes two weekly newspapers. Pop. of parish (1871) 7957; of parliamentary borough, 38,610.

Stru'ensee, Johann Friedrich, Count, the celebrated Danish minister, was born August 5, 1737, at Halle, where he graduated doctor of medicine in 1757. The year after he settled at Altona, and in 1768 he was appointed private physician to Christian VII. of Denmark, over whose counsels he soon gained great influence, and of whose young queen Caroline Mathilde he became an intimate friend. From the fall of the elder Bernstorff (September 13, 1770) S. was the virtual autocrat of Denmark, though for a time content with the simple title of 'Maître des Requêtes.' In July 1771 he was appointed 'Privy Cabinet Minister,' and received the title of Count, with the office of setting forth in written decrees the oral orders of the king. The foreign policy of S. was to make Denmark independent of Russia and an ally of Sweden. At home he freed the press, gave order and economy to finance, abolished torture, and simplified the procedure of law. His freethinking principles provoked the clergy, and his high-handed reforms in agriculture and expenditure enraged the nobles. Even the common people were irritated by his scorn of the Danish speech and nationality, so marked that all decrees and petitions must needs be composed in German. In the night between the 16th and 17th January 1772 he was overthrown by a conspiracy of nobles headed by Juliane Marie, the Queen-Mother. Accused of adultery with the queen and of compassing the kingly power, he was condemned on the 25th and beheaded on the 28th July 1772. See J. K. Köst, *Grev S. og hans Ministerium* (3 vols. Copenh. 1824; improved ed. in German, 2 vols. 1826–27); Jenssen-Tusch (1864). Professor K. Wittich, of Jena, has just completed (October 1878) a biography of S.—**Karl August von S.**, brother of the above, born August 18, 1735, at Halle, from 1769 a counsellor of justice and member of the college of finance at Copenhagen, was after his brother's fall demanded, as a Prussian subject, by Friedrich the Great, by whom he was made director of navigation in 1782, ennobled in 1789, and appointed minister of state in 1791. He died October 17, 1804.

Stru'mous Diath'esis. See TUBERCULOSIS.

Strut, in carpentry, a piece of timber employed to support a rafter. See ROOF.

Strutt, Joseph, painter and engraver, was born at Springfield, Essex, October 27, 1742. When fourteen years of age he was apprenticed to the engraver, W. Wynne Ryland; in 1769 he became a student of the Royal Academy, and in the following year he gained a gold medal for his historical picture, 'Æneas stopped by Creusa.' His attention was turned towards antiquarian investigations by his attendance at the British Museum in 1771; and only two years elapsed before the appearance of his *Regal and Ecclesiastical Antiquities of England from Edward the Conqueror to Henry VIII.*, with 60 plates (new ed. by Planché, 1842). Though he afterwards painted a few historical pieces and engraved a number of paintings by other artists, his energies were almost exclusively devoted to the publication of antiquarian works: *Horda Angel-Cynnan; or, Manners, Customs, &c., of the People of England* (157 plates, 3 vols. 1774–76), *Chronicle of England* (42 plates, 2 vols. 1777–78), *Biographical Dictionary of Engravers* (2 vols. 1785–86), *Dress and Habits of the People of England* (142 plates, 2 vols. 1796–99; new ed. 1875), *Glig-gamena Angel Leod, Sports and Pastimes, &c.* (40 plates, 1801, enlarged by Hone 1830; new ed. 1875). After his death, 16th October 1802, his son published *The Test of Guilt, a Dramatic Tale* (1808), *Bumpkin's Disaster* (1808), and *Queenhoo Hall, a Romance*, and *Ancient Times, a Drama* (4 vols. 1808). *Queenhoo Hall* was completed by Sir Walter Scott.

Stru've, Friedrich Georg Wilhelm von, a celebrated Danish astronomer, was born at Altona, April 15, 1793. After studying at Dorpat University, he entered the observatory in 1813, of which he became director in 1817. In 1834 he was entrusted with the erection of the projected Russian Observatory at Pulkova, and on its completion in 1839 was nominated the

director. Here he continued his researches in sidereal astronomy, cataloguing nebulæ and double stars, and determining parallaxes. He was also intimately connected with the triangulation (1816–19) of Livonia, and with measurement of the arc of the meridian in the Baltic provinces, which he afterwards extended to the North Pole and the Danube in conjunction with Hansteen and General Teuner respectively. His chief works are—*Observationes Dorpatenses* (8 vols. 1817–39), *Catalogus novus Stellarum Duplicium* (1827), *Stellarum Duplicium Mensuræ Micrometricæ* (1837), *Description de l'Observatoire central de Russie* (1845), *Études d'Astronomie Stellaire* (1847), *Stellarum Fixarum, imprimis compositarum Positiones mediæ* (1852), and *Arc du Méridien entre le Danube et la Mer glaciale* (1861). S. died at St. Petersburg, November 23, 1864.—**Otto Wilhelm von S.**, born at Dorpat, May 7, 1819, son of the preceding, succeeded his father as director of the Pulkova Observatory in 1862. His valuable astronomical memoirs appear in the published memoirs of the Academy of Science of St. Petersburg. They include researches into the periods of double stars and of comets, observations of Saturn's rings, and of various nebulæ, and determinations of the mass of Neptune and the parallax of several stars.

Strych'nia, or **Strych'nine**, an exceedingly bitter and poisonous alkaloid ($C_{21}H_{22}N_2O_2$) obtained from *Strychnos nux-vomica*, was discovered by Pelletier and Caventou in 1818. S. is a bitter tonic, and is specially useful in cases where there is general relaxation and loss of nerve-power. S. acts on the spinal motor nerve-centres, and probably on the vaso-motor centres, and also the trophic centres, its special use being in cases of general functional atony and weakness. S. is of great value in cases of *paralysis* dependent upon, or accompanied by, a depressed state of the spinal or other motor nerves; but where there is inflammation and irritation of these nerves it should not be employed. In cases of *hemiplegia* it should not be exhibited until irritation from the clot has ceased. S. is useful also in cases of *lead-poisoning*. The antidotes for S. are chloroform, belladonna, aconite, morphia, tobacco, and hydrate of chloral. See NUX-VOMICA and STRYCHNOS.

Strych'nos, a genus of *Loganiaceæ* (q. v.), comprising trees or climbing shrubs with entire 3–5 nerved leaves, pentamerous, bisexual flowers, tubular or funnel-shaped corolla, valvate lobes, stamens inserted in the throat, fruit a berry with a shell-like rind, and the seeds large, compressed, embedded in a fleshy pulp. The genus is widely spread through the tropics. Species of importance will be found under articles CLEARING NUT, NUX VOMICA, UPAS, and WOORALI. Besides these, *S. Pseudo-quina* of the Brazilian forests yields colpache-bark, largely used in that country for intermittent fevers in place of quinine; its fruit is edible: *S. ligustrina* and other Java species, as also *S. colubrina*, a native of Malabar, are used as remedies for snake-bites; and the fruit pulp of *S. innocua* and *S. spinosa* as an article of food in Africa.

Strype, John, born at Stepney, November 12, 1643, passed from St. Paul's School to Jesus College, Cambridge (1661), but migrated to Catharine Hall, taking his B.A. (1665) and M.A. (1669). For over sixty years he held the living of Low Leyton, Essex, combining with it the lectureship of Hackney, where he died December 11, 1737. Half of his long life S. devoted to the collection of historical materials, his *Memorials of Cranmer* not appearing till 1694. It was followed by Lives of Sir Thomas Smith (1698), Bishop Aylmer (1701), Sir John Cheke (1705), Archbishop Grindal (1710), Archbishop Parker (1711), and Archbishop Whitgift (1718), by *Annals of the Reformation* (4 vols. 1709–31), an enlarged edition of Stowe's *Survey of London* (2 vols. 1720), and by his *magnum opus*, *Ecclesiastical Memorials* (3 vols. 1721), all but the *Survey* collected in the Clarendon Press edition of his works, with a general index (27 vols. 1821–43). Prolix and heavy, the 'colourless' narrative of S. has yet proved, with its faithful transcripts of the most precious documents, a mine to later historians of the Reformation period.

Stu'art, Gilbert Charles, an American portrait-painter, was born at Narragansett, Rhode Island, U.S., in 1756. From Edinburgh, whither he had accompanied a Scotch painter named Alexander, he worked his passage back to America; but on the outbreak of the Revolution he went to London, and there was fortunate enough to find a friend in Benjamin West, whose generosity is still commemorated by his protegé's full-length portrait of him in the National Gallery. In England S. painted portraits of George III., the Prince of Wales, John Kemble, Sir Joshua Reynolds, and other persons of rank, and when he went to France he was permitted to place Louis XVI. on his canvas. Returning to America in 1793, he painted the portrait of Washington, now in the Boston Athenæum. It was followed by portraits of Adams, Jefferson, and a whole host of American celebrities, and the artist was recognised as one of the greatest portrait-painters of his native country. His method was to concentrate all his attention on the face and head, and to let the less important details and accessories take care of themselves. S. died at Boston, 9th July 1828. His daughters, Mrs. Stebbins and Miss Jane S., long followed their father's profession at Boston.

Stu'art, John, LL.D., born at Forgue, Aberdeenshire, in November 1813, studied at the University of Aberdeen, and having passed advocate, was appointed an official searcher of the records in the Edinburgh Register House (1853), and Principal Keeper of the Register of Deeds (1873). His university conferred on him the honorary title of LL.D. (1866), and he was a member of several home and foreign antiquarian societies at the time of his death, which took place at Ambleside, 19th July 1877. A chief promoter of the Spalding Club (1839–70), S. edited for it twelve volumes of records and chronicles, besides the *Sculptured Stones of Scotland* (2 vols. 1856–67), and *Book of Deir* (q. v.). To the proceedings of the Scottish Society of Antiquaries, of which he was secretary from 1854, he contributed the *Records of the Priory of the Isle of May and Records of the Monastery of Kinloss*, and his latest work was *A Lost Chapter in the History of Mary Queen of Scots* (1874), based on his discovery of the dispensation for Bothwell's marriage with Lady Jane Gordon.

Stu'art, Moses, an American theologian, was born at Wilton, Connecticut, 26th March 1780. He was educated at Yale, graduated in 1799, became a tutor at Yale, pastor of a Congregational church at Newhaven, and in 1810 professor of sacred literature in the Andover Theological Seminary. This post he retained until 1848, when he resigned it owing to ill-health. He died at Andover, 4th January 1852. His principal works are his Hebrew and Greek grammars, and his Commentaries on the Epistle to the Hebrews (1827), Epistle to the Romans (1832), Apocalypse (1845), Daniel (1851), Ecclesiastes (1851), Proverbs (1852), as well as a *Critical Defence of the Old Testament Canon* (1845). S. ranks as one of the best and most erudite of American divines.

Stubbs, William, born at Knaresborough, 21st June 1825, proceeded from Ripon grammar-school to Christ Church, Oxford, where, having taken a first in classics and third in mathematics, he was elected fellow of Trinity. Ordained in 1848, he became vicar of Navestock, Essex (1850), Regius Professor of Modern History at Oxford (1866), fellow of Oriel (1867), curator of the Bodleian (1869), and rector of Cholderton, Wilts (1875). In the prefaces to the six important works that he has edited for the Rolls Commission, S. showed his thorough mastery of the Angevin period, these being *Chronicles and Memorials of the Reign of Richard I.* (2 vols. 1864–65), *Gesta Regis Henrici II. Benedicti Abbatis* (2 vols. 1867), *Chronica Magistri Rogeri de Houedene* (4 vols. 1868–71), *Memoriale Fratris Walteri de Coventria* (2 vols. 1872–73), *Memorials of St. Dunstan* (1874), and *Radulphi de Diceto Opera Historica* (2 vols. 1876). His *Early Plantagenets* (Lond. 1876) gives a short, lucid summary of the same period. But the *Constitutional History of England* (vols. i.–iii. Oxf. Clar. Press, 1874–78) has a far wider scope. Combining the latest results of foreign investigation with his own vast researches, he here traces the growth of the English commonwealth through all its stages with a power, insight, and calmness that rank his work among the masterpieces of history. He has also published *Hymnale secundum Usum Sacrum* (1850), *Tractatus de Sancta Cruce de Waltham* (1860), *Select Charters and other Illustrations of English Constitutional History* (1870), &c., and is a member of various learned societies at home and on the Continent.

Stucc'o (Ital.), a technical term for several kinds of plaster composed of fine lime and clean sand; also a composition of plaster-of-Paris and fine glue, used for ceiling decorations, &c.

Stuff'ing is a solid seasoning placed within fowls, game, &c., previous to cooking the food, in order to increase its flavour. It consists usually of flour or bread-crumb and eggs, seasoned with onions, savoury herbs, and spices.

Stuff'ing and Preser'ving An'imals. See TAXIDERMY.

Stuhlweiss'enburg (Hung. *Székes-Fehérvár*, Slav. *Bialigrad*), an historic town of Hungary, situated in a swampy district near the marshes of Sár-Rét, 42½ miles S.W. of Pesth by rail. The chief buildings are the cathedral and the church of St. Maria, built by Stephen I., the place of crowning and burial. S. was the residence of the Hungarian kings from 1027 to 1527, when Bela IV. removed to Ofen. S. manufactures cloth, flannel, cordovan, and knives, and has an important traffic in wool, corn, wine, and live stock. Pop. (1869) 22,683. S. is believed to occupy the site of the Roman *Floriana*. It was held by the Turks at intervals from 1545 to 1688.

Stuke'ley, William, M.D., F.R.S., an antiquary of considerable repute, was born at Holbeach, Lincolnshire, November 7, 1687. In 1703 he entered at Corpus Christi College, Cambridge, whence he graduated M.B. in 1709. After residing for a time at Boston, he betook himself to London in 1717, where he was admitted fellow of the College of Physicians. In 1726 he retired to Grantham, in his native county, where he acquired a good practice, which, however, he abandoned three years afterwards for the Church, being presented to the living of All Saints', Stamford. In 1747 the Duke of Montague gave him the rectory of St. George the Martyr, Queen Square, where he died, March 3, 1765. S.'s antiquarian works are more voluminous than valuable; the best known are *Itinerarium Curiosum; or an Account of the Antiquities and Curiosities of Great Britain* (2 vols. 1724); *An Account of Stonehenge* (1740); and *Palæographia Britannica* (1743-52). S., who was known among his friends as the 'Arch-Druid,' was a credulous and fanciful speculator.

Stu'pa. See TOPE.

Stur'dy or **Gid**, an affection of sheep, identical with *Staggers* (q. v.).

Stur'geon (*Sturio* or *Accipenser*), a genus of *Ganoid* (q. v.) fishes belonging to the *Placoganoid* section of that group. The spine is represented by imperfect ossifications, the *notochord* being retained. The tail is *heterocercal*, or unequally lobed. The S. is a typical fish of the northern hemisphere. It ascends rivers for the purpose of spawning. No teeth are developed, the mouth is curiously placed on the under surface of the head, and at the extremity of a proboscis. The S. is of high commercial importance. From its air-bladder or sound *isinglass* is obtained, the flesh is valuable, and the delicacy known as *caviare* is obtained from the roe. The *Accipenser sturio* is the common S. not unfrequently captured on British coasts, and esteemed a 'royal' fish when passing into the Thames, belonging by hereditary right to the sovereign. Its average length is 6 feet. The Beluga (*A. huso*) is a very large species, which may measure from 12 to 20 feet in length. It occurs in the Black Sea, Caspian, &c., and may weigh 3000 lbs. The sterlet (*A. Ruthenus*) a smaller species, attaining a length of 3 feet, is valued for the delicacy of its flesh.

Stutt'gart (local pron. *Stukkert*), the capital of Würtemberg, is situated in the midst of vine-covered hills on the main Bruchsal-Friedrichshafen line of the Würtemberg State railway. The greater part of S. dates only from this century, the quickening of German national life since 1813 having had a powerful effect upon it, and the Stiftskirche and Altschloss are almost the only ancient buildings remaining. Near the centre of the town is the Schloss Platz, laid out in pleasure-grounds, and adorned with a column of blue-grey granite 59 feet high, erected in 1841 in honour of King Wilhelm I., on the pedestal of which are various allegorical figures. The whole of one side of the Schloss Platz is occupied by the new palace, a magnificent building begun in 1746 and completed in 1807, said to contain 365 apartments. Adjoining this, on the S. of the Schloss Platz, is the Altschloss (1553-70) containing rich art treasures, and in the centre of the inner court an equestrian statue of Count Eberhard of Würtemberg (died 1496). Other important buildings are the Stiftskirche, already mentioned, in Gothic style, built between 1436 and 1495, but with towers still unfinished, containing many fine sculptures; the Königsbau (1555-60), comprising a concert-hall, assembly rooms, cafes, &c.; a new English church and a magnificent synagogue; the Cabinet of Natural History; the Museum of Art, in which is a valuable collection of Thorwaldsen's works; the Baugewerkeschule, where (1877) 644 students receive instruction from 36 teachers; and the Royal Library, containing 300,000 vols., including 3600 MSS. and 2400 specimens of early printing. The statue of Schiller in the Schiller Platz (1839) also deserves mention, and the Anlagen, extensive pleasure-grounds stretching from the Schloss nearly to Cannstatt, a distance of 2 miles. Among the industries of S., cabinetmaking, sugar-refining, and brewing are important; but the town is chiefly noted as a centre of the South German book trade. The neighbourhood is celebrated for its wine and orchard produce. Pop. (1875) 107,573.

Stuy'vesant, Peter, born in Holland in 1602, entered the Dutch service, and as director of the colony of Curaçoa lost a leg in the attack on the Portuguese island of St. Martin. Appointed director-general of the New Netherlands (1647), he concluded peace with the Indians, in 1650 settled the boundaries of the English and Dutch possession, and in 1655 annexed New Sweden on the Delaware. His refusal to admit the protest of a convention (1653) against the revival of obsolete statutes had roused a widespread discontent; and when in 1664 an English fleet appeared before New Amsterdam demanding its surrender, he found himself abandoned by his subordinates, and on 3d September the town was given up to the English, who changed its name to New York (q. v.). S. next year repaired to Holland to give an account of his conduct, but soon returned, and down to his death in August 1682 lived at his farm, the Bowery, on the site of the present Bowery Street.

Stye. See HORDEOLUM.

Style, Old and New. See CALENDAR.

Styli'tes. See PILLAR-SAINTS.

Styp'tics (Gr. *styptikos*, 'astringent') are medicines which arrest bleeding, chiefly used in hæmorrhage from the nose, gums, vagina, and rectum. The more important S. are acetic, gallic, and tannic acids; alum, cinchona, sulphate of copper, ergot, perchloride of iron, pomegranate root, tincture of red gum, and matico.

Styr'ia (Ger. *Steiermark* or *Steyermark*), a duchy of Austro-Hungary, surrounded by the archduchy of Austria, Hungary, Croatia, Carniola, Carinthia, and Salzburg. Area, 8669 sq. miles; pop. (1870) 1,137,990, (707,000 Germans chiefly in the north, 410,000 Slavs in the south). S. is very mountainous in the N. and W., crossed by three chains of the Noric Alps, of which Thorstein rises to 10,649 feet, and Hochgolling to 9594 feet; in the E. and S. it is hilly, with fruitful plains and valleys, above which the Bachergebirge rises to a height of 5005 feet. The chief rivers are the Mur, Drave, and Save. There are few lakes, but numerous mineral springs (mostly acidulous), of which Rohitch and Gleichenberg are the most noted. About 45 per cent. of the surface is forest, 22 per cent. arable land, producing rye, wheat, maize, fruit, and wine. The chief industries are horse and cattle breeding, coal and iron mining (especially in the N.), and the manufacture of iron and steel ware, chiefly sickles, household utensils, and cast-iron goods. In 1876 the iron ore produced in S. amounted to 2,809,381 metric cwts. (in 1873 to 4,701,252). Trade is actively carried on by the Vienna-Trieste railway and its various branches. S. has a university and mercantile academy in Gratz, three *gymnasien*, five *Realschulen*, and 729 *Volksschulen*. It is represented in the Reichstag by 13 deputies. S., an imperial markgrafdom from 955, was given as a fief to the Bavarian Graf Ottokar by Otto I. Ottokar VI., made a duke in 1180, dying childless (1192), bequeathed S. to his father-in-law, Leopold V., Duke of Austria. After many struggles it came to Ottokar II. Przemysl, King of Bohemia, in 1253. He falling (1278) in battle with Rudolf of Hapsburg, the latter in 1283 enfeoffed his son Albrecht in S. It has ever since belonged to the Hapsburgs, and followed the fortunes of Austria. See Muchar, *Geschichte des Herzogthums S.* (7 vols. Gratz 1844 *et seq.*); Gebler, *Geschichte des Herzogthums S.* (Gratz 1862); and *Beiträge zur Kunde Steiermärk. Geschichtsquellen* (published by the Historical Society of Gratz, 1864).

Styx (Gr. *stygein*, 'to hate;' mod. names *ta Mauvaneria*, or *ta Drakoneria*, 'black' or 'terrible waters'), a streamlet in the N. of Arcadia, Greece, rising near Nonacris. It falls over a high precipice, among wild scenery, and flows to the Crathis. It is the highest cascade in Greece. The ancients thought its waters poisonous, and the superstition remains. It is described by Homer (*Il.* xv. 36). Pausanias gives the fullest account, but almost all Greek writers refer to it. To the Greek and Latin poets it suggested the famous river of Hades. A branch of Oceanus, this sluggish river, or 'stygian pool' as it was sometimes called, flowed seven times round hell. Souls of the dead were ferried over it by Charon to Tartarus. The gods swore by S. their most solemn oaths. Personified, S. was a goddess, daughter of Oceanus and Tethy, and dwelling in a grotto at the entrance to Hades. The S. was a prominent feature in the nether world of mediæval as well as classical cosmology. Dante met it in the third round of the seventh circle of hell. Virgil told him its source was in Crete.

Sua'bia. See SCHWABEN.

Sua'kin, an Egyptian port on the Red Sea, built on a coral island 100 yards from the shore, and has a good harbour. Being the port of the caravan route from Berber, on the Nile, S. has an active trade, chiefly in gum and ivory. Pop. 8000.

Suar'ez, Francisco, a celebrated Roman Catholic theologian, born at Granada, 5th January 1548, and studied at the University of Salamanca. The preaching of the Jesuit Ramirez in 1565 determined him to enter the Church. So little promise did he give of his subsequent pre-eminence, that the Order of Jesus nearly refused him admittance into their ranks, but the accomplished rector of Salamanca, Gutierrez, discovering their mistake, encouraged him to place himself under the celebrated Rodriguez at Monterey, where he made such rapid progress that he was soon called upon to fill the office of teacher himself, first at Segovia, and then successively at Valladolid, Rome, Alcala, and Salamanca. Philip II. appointed him professor of theology in his newly-founded University of Coimbra, a chair which he filled till his death with the greatest distinction, being described by his contemporaries as 'alter Augustinus,' 'hujus ætatis prodigium et oraculum.' He died 25th September 1617. His works were published in 23 folio vols. in Lyon and Mainz in 1630 and following years. In 1861 a new edition in 28 vols. was completed at Paris. In theology S. is chiefly known as an exponent of Molinism; in philosophy he followed Aristotle, his commentaries upon whom were long used as a text-book even in Protestant colleges. His own Church described him as 'oculus populi Christiani sed suo judicio nihil.' See his *Life*, by Deschamps (in Latin, Lisb. 1671); also Werner, *S. und die Scholastik der letzten Jahrhundert* (1861).

Súbahdár (from an Arabic word meaning 'province' or 'government'), applied in India to a viceroy under the old Mogul dynasty, and also to a native officer in the Sepoy army who holds a rank corresponding to that of captain.

Sub'altern, in the army, a commissioned officer (lieutenant or sub-lieutenant) below the rank of captain.

Subia'co (anc. *Sublaqueum*), a town of Central Italy, province of Rome, on the Teverone, 19 miles E. of Tivoli. It has a mediæval appearance, and is commanded by an old castle, in former times often occupied by the Popes. It has three monasteries of S. Scolastica, the first founded in 530 by St. Benedict, the second in 1052, and the third in 1235. Pop. (1874) 6990.

Sub'ject. See OBJECT.

Sublapsa'rian (Lat. *sub*, 'after,' and *lapsus*, the 'Fall') is the name applied to a certain view of Predestination (q. v.), which regards the decree of God permitting man to fall as coming before the decree to elect certain out of the fallen race to eternal life, and to pass others by. According to the Supralapsarian (Lat. *supra*, 'before,' and *lapsus*) theory, to which it is opposed, God first decreed the salvation of some and the damnation of others, and then decreed to create those already elected or reprobated, and to permit them to fall.

Sublieuten'ant, a junior rank of commissioned combatant officers in the army and navy. Formerly this title was confined in the army to officers in the royal regiment of artillery and the fusiliers, in which there were no ensigns. Since 1871 it has superseded the rank of ensigns in all regiments. A cadet becomes a S. in the army after passing the prescribed examinations before the Civil Service Commissioners, provided a vacancy permits his being at once gazetted. In the navy, a midshipman becomes a S. after 5 or more years' service. The pay of a S. or 'second lieutenant' in the army is from 5s. 3d. per day in the infantry to 8s. in the cavalry, and 5s. per day in the navy.

Sublima'tion, in chemistry, is a process by which matter converted from the solid into the gaseous state by heat is reconensed into the solid condition by contact with a cold surface. It is applicable only to comparatively few substances, such as sulphur, iodine, arsenious acid, benzoic acid, &c., which may be purified by this treatment. Hoar frost is a well-known example of S., being the condensation into the solid form of the water-vapour of the atmosphere without passing through the intermediate liquid condition.

Sub'marine For'ests, the name given to submerged recent beds of peat, containing the roots and stems of trees in the very positions in which they originally grew. They are not uncommon round the British coasts.

Sub'ordinaries, in heraldry, a class of devices inferior to, and less simple than, the Honourable Ordinaries (q. v.). They are usually held to be sixteen in number; the canton, gyron, inescutcheon, orle, tressure, lozenge, fusil, frette, flanch, mascle, rustre, label, billet, bordure, pile, and flasque.

Suborna'tion. See PERJURY and SUBORNATION.

Subpœ'na is a writ by which the attendance of a witness in court is made compulsory. A witness is allowed travelling expenses, but usually no further remuneration.

Sub Ro'sa ('under the rose,' *i.e.*, under the obligation of secrecy), a term which possibly had its origin, as Sir Thomas Browne suggests, in the closeness with which the rosebud folds its petals, or in the rose with which Harpocrates, god of silence, was bribed by Cupid not to divulge his mother Venus's amours. A rose is often found sculptured on the ceilings of medieval banqueting halls and on confessionals of the 16th c.

Sub'sidies (Lat. *subsidium*, 'an aid'), a term formerly used to denote extraordinary grants made to the king by Parliament for the defence of the nation by sea and land; now almost solely to designate supplies given by one power to another to assist it in the prosecution of a war. S. in their original sense included not only extraordinary supplies, but permanent grants. Taxes on land and goods, and extra custom-duties, were the usual means of raising S. In modern history there have been innumerable instances in which S., in the later sense of the word, have been granted by one nation to another; *e.g.*, in the wars succeeding the French Revolution, Britain subsidised most of the powers which resisted the French arms, 'the gold of the monster Pitt' becoming a proverb in Paris. A nation supplying S. has generally been held to constitute itself a belligerent.

Sub'stance (Lat. *substans*, 'standing under') is a philosophical term meaning the real and permanent element which lies under the deceptive and transitory forms (phenomena) of existence. This definition, however, is only approximate, for each system of philosophy gives, in accordance with its own tenets, a special meaning to and explanation of the term.

Substantia'lia, a disused term in law meaning the same as Essentials. See ERROR IN ESSENTIALS.

Sub'stitute, in a military sense, one who serves in an army in the place of a conscript for a consideration. In most continental countries, where military service is compulsory, many old soldiers who have served their time, but are still eligible for the army, are found ready to undertake this duty.

Substitu'tion is a theological term employed to express the exact nature of what Christ did for the sinner according to the prevalent theory of the Atonement (q. v.). The doctrine of S. teaches that the sufferings of Christ were not merely like those of martyrs, patriots, &c.—endured for the good of others, but were strictly vicarious. He suffered in the room and stead of sinners,

satisfying in his own person all the demands which the law could justly make upon them.

Subtrac'tion, in arithmetic, is the operation of finding the difference between one number and another, the less being *subtracted* from the greater. In algebra the operation is included under addition, the rule for S. being *change the sign and add*. Here there is no convention as to which quantity must be the greater; the algebraic *sign* of the remainder removes any possible ambiguity.

Sub'way is a term applied to an accessible underground passage containing gas and water mains, telegraph wires and sewers, all of which may be readily examined, altered, or repaired as required, without disturbing the street surface and obstructing traffic. Williams of London suggested this plan in 1822, and it has been carried out in the metropolis, Paris, and other large cities. The advantages of subways are so manifest that it is a wonder they are not more widely adopted by all large and wealthy centres, where the expense, certainly great, attending their construction can be no bar. Holborn Viaduct in London has a S. under both of the footways and over the sewer tunnels. The subways are arched, lined with brick, and floored with stone. They are 11½ feet high, and 7 feet wide. Along the bottom of one of the side walls the water-main is laid, and over it on brackets are carried two gas-mains; on the opposite side, at the spring of the arch, the telegraph pipe rests on another set of brackets, and on the floor beneath rails are laid for a travelling crane, by means of which alteration and removal of pipes are greatly facilitated. Openings occur along the sides for the passage of gas and water service-pipes into the houses, and in the arch connections are made with the street hydrants and gas-lamps. Good ventilation for the S. is provided by grated openings in the footway, and by flues leading to the external air through the party-walls of the houses. Ventilating gullies are also furnished for the sewer-channels beneath the subways.

Succes'sion, in Scotch law, means the taking of property by one in place of another. In heritage (see HERITABLE AND MOVABLE) or real estate, Scotch law gives the preference to descendants, giving the S. to the eldest son, and failing him or his issue to the next eldest son, and so on. Failing sons, daughters succeed as Heirs Portioners (q. v.). When there are no descendants, collaterals (see COLLATERAL SUCCESSION) succeed. Thus, the brothers and sisters of the deceased succeed (see BROTHERS, LAW OF SUCCESSION AMONG). If neither descendants nor collaterals exist, the S. ascends, and the father succeeds, but the mother is excluded. Failing the father, his brothers and sisters succeed in their order, and failing them the paternal grandfather and his collateral line, so far as relationship can be traced, failing proof of which the Crown succeeds as *Ultimus Hæres*. Regarding succession to movable estate in Scotland, see EXECUTORS and COLLATION. For the laws of England and of Scotland, see INTESTACY, HEIR, and references in these articles.

Succes'sion Act. See ACT OF SETTLEMENT.

Succes'sion Du'ties. These are imperial taxes on legacies, and on succession to real estate. To any lineal descendant or ancestor of the deceased the duties are £1 per cent.; to a brother, sister, or their descendants £3 per cent.; to an uncle, aunt, or their descendants, £5 per cent.; to a great-uncle or great-aunt, or their descendants, £6 per cent.; to any other person £10 per cent., except in case of a legacy between husband and wife, which is exempt from duty. When the total value of an estate is under £100 there is no S. D., nor is there on any share under the value of £20. S. D. is a first charge on property.

Success'ion Wars, three wars of the first half of the 18th c. (1.) The **Spanish S. W.** (1700-14). The succession to Carlos II. of Spain in 1700 was disputed by Philippe of Anjou and the Austrian Archduke Karl, supported by Holland and England. Philippe was backed by France, with the Electors of Baiern and Köln, and by Savoy and Portugal till 1703. In Spain he gained the victories of Almanza (1707) and Villa Viciosa (1710); but from Germany the French were driven back by the victory of Marlborough at Blenheim (1704), from Italy by Eugene's victory of Turin (1706), and from the Spanish Netherlands by their defeats at Ramillies (1706), Oudenarde (1708), and Malplaquet (1709). The fall of Marlborough and the War Party in England (1710), and the succession of Karl to the German Empire, hastened the Peace of Utrecht (1710), which gave the succession to Philippe as Felipe V., the Spanish Netherlands; Milan, Naples, and Sardinia to Karl VI.; Sicily to the Duke of Savoy; Gibraltar, Minorca, and French North America to England. With these terms Karl VI. coincided at the Peace of Rastatt and Baden (1714).—(2.) The **Polish S. W.** (1733-35). See POLAND.—(3.) The **Austrian S. W.** (1740-48) was waged for the Austrian possessions after the dying out of the Hapsburg male line with the Emperor Karl VI. (20th October 1740). In spite of the Pragmatic Sanction (q. v.), Friedrich II. (q. v.) of Prussia laid claim to 4 Silesian principalities, and began the *First Silesian War* (1740-42), in which Baiern, Sachsen, Spain, Sardinia, and France combined to crush Maria Theresa (q. v.), who yet maintained her position with the support of her Hungarians till English influence brought Friedrich to the Peace of Breslau (1742). In 1743 Sachsen and Sardinia passed over to the side of Austria, George II. defeated the French at Dettingen, and Karl Albrecht (from 1742 Emperor Karl VII.) was driven from Baiern. The Austrians advancing on Elsass, Friedrich broke the Peace of Breslau, and began the *Second Silesian War* (1744), which ended with the Peace of Dresden (1745). The same year Moritz (q. v.) of Sachsen defeated the English and Austrians at Fontenoy, and with the victories of Raucoux in 1746 and Lafeld in 1747 he won the Austrian Netherlands for France. But France was exhausted with the marine and colonial war with England; for English gold a Russian army passed forward to the Rhine; and Maria Theresa, while yielding at the Peace of Aachen (1748) Parma and Piacenza to the Spanish prince Felipe, Schlesien to Prussia, and part of Lombardy to Sardinia, was able to keep all the rest of her inheritance and obtain the recognition of her husband Franz Stephan as Emperor of Germany.

Succin'ic Acid ($C_4H_6O_4$), one of the series of diabasic fatty acids of which oxalic acid ($C_2H_2O_4$) is the first member, is obtained by digesting amber (*succinum*) with alkalies. It is also found in the resins of coniferous trees and in the leaves of wormwood, and has been identified in the urine of dogs and rabbits. It may be made to take up oxygen and become converted into tartaric acid ($C_4H_6O_6$), which in its turn may be deoxidised and converted into S. A.

Succ'ulent Plants, a general name for those flowering plants that are naturally very cellular and juicy. Most of such belong to what is called the Xerophilous group—*i.e.*, plants that can thrive in climates in which the air contains habitually very little moisture. To flourish under these circumstances the concomitants are various. In Dicotyledons—1st, The leaves becoming thick and fleshy, with inner and leathery outer layers, in which the air-passages and stomata are few, and the cells either small or their walls thickened by secondary deposits of cellulose, as shown in *Mesembryanthemum*, *Sedum*, *Cotyledon*, and *Sempervivum*; 2d, The stem condensed into a single, central, unbranched, barrel-shaped or top-shaped mass, which is leafless and armed only with spines, as in *Echinocactus*, *Mammillaria*, and various *Euphorbiæ*, or without spines and bearing fleshy or rigid leaves, as in *Cycads*, *Welwitschia*, and some species of *Vitis*; 3d, Branching fleshy stems, which put on a somewhat leafy appearance, but without proper leaves, as in *Opuntia* and *Phyllocactus*. In Monocotyledons we have two characteristic forms—1st, The large, thick, fleshy-leaved type, as illustrated by *Aloe*, *Gasteria*, *Fourcroya*, *Agave*, and *Bulbine*; and, 2d, The familiar bulb type, as hyacinths, lilies, &c., which push up a flower in a brief season of fertility, and spend the rest of the year in the form of an underground mass of dry or fleshy leaf-scales. The object of cultivation is frequently to develop cellulose tissue, thereby imparting succulency. Of this we have examples in many of the edible fruits, and in such garden plants as the celery, the lettuce, the turnip, and the carrot, the originals of which are hard, stringy, and worthless for food purposes.

Su'chet, Louis Gabriel, Duc d'Albufera, Marshal of France, was born at Lyon 2d March 1770. He volunteered (1792) into the cavalry division of the National Guard of Lyon, and served as a captain at the siege of Toulon (1793). His

battalion was then drafted into the Army of Italy, where he distinguished himself at the battles of Lodi, Rivoli, Castiglione, and Arcola. In 1798 he served with distinction in Switzerland, and obtained the rank of general of brigade. He was next entrusted with the reorganisation of the army of Italy, became general of division (1799), and served brilliantly under Joubert and Massena, his defence of the Pont de Var with 6000 men against Melas at the head of 40,000 Austrians being a really great feat. In the campaign of 1800-1 he took part in the battles of the Mincio, Verona, and Montebello, and at Ulm and Austerlitz (1805) and Jena (1806) he rendered effective service. Appointed (1809) generalissimo of the army of Aragon, in two years he entirely subdued the province. Made a marshal in 1811, he undertook and carried out the conquest of the kingdom of Valencia, and was rewarded in the succeeding year with the title of Duc d'Albufera. In 1813 S. took the command of the united armies of Aragon and Catalonia, but was unable to make head against the allies, and was forced to relinquish his conquests and retire to the frontier. Though made a peer of France by Louis XVIII., he took part with Napoleon on his return from Elba, and was entrusted with the defence of the Savoy frontier. After the battle of Waterloo he lost his peerage, but recovered it in 1819. He died at the Château of St. Joseph, near Marseilles, 3d January 1826. Napoleon is related to have said that if he had had two generals such as S. in Spain he would never have lost it, 'but unfortunately,' he added, '*les souverains ne peuvent pas improviser des hommes comme celui-là.*' The sole literary work of S. is his *Mémoires sur ses Campagnes en Espagne* (Par. 1829-34).

Suck'er or **Sucking Fish**, names given to various *Teleostean* fishes from their habit of attaching themselves by the mouth or by special structures to fixed objects. The *Remora* (q. v.) is one of the most familiar sucking fishes; as also is the Lump Sucker (q. v.) or Cock Paidle of the Scotch. The name S. F. has also been given to species of the genus *Liparus*, of which *L. vulgaris*, the common sea sucker or sea snail, is a familiar species; Montague's Sucker (*L. Montagui*) is another well-known member of the group. The S. F. attains an average length of 3 or 4 inches.

Suck'ling, Sir John, an English poet and Cavalier, was the son of Sir John Suckling of Whitton, near Twickenham, and was born in 1609 in his father's house, at a later date the property of Sir Godfrey Kneller. The elder Sir John was comptroller of the household to James I. and Charles I., and twice represented the city of Norwich in Parliament. His son was sent first, it is believed, to Westminster, and then to Trinity College, Cambridge; and according to the older accounts he displayed unusual precocity; but much of the marvel is owing to a confusion of dates, by which he was reckoned four years younger than he actually was. The comptroller died in 1627, and in 1628 his son set out to travel on the Continent. In 1631 he joined the English forces sent to assist Gustavus Adolphus. Returning to London in the following year, he at first led a gay, reckless life about town, and became notorious as a gambler; but he gradually acquired greater sobriety of conduct, and was the friend of Boyle, Davenant, and other men of mark and merit. In 1639 he spent £12,000 in equipping and maintaining a troop of 100 horse for the king's expedition to Scotland. As member for Bramber he took part in the debates of the Long Parliament; but on the discovery of the plot of 1641 for the release of Strafford he was accused of treason, and took refuge in Paris, where he died 7th May 1641. Two accounts are given of his death: according to one he perished from the results of an accidental wound, but according to another, which is supported by family tradition, he committed suicide by poison. Sir John Suckling's only but sufficient claim to a permanent place in our literature is a few felicitous lyrics, of which the best known are 'Why so pale and wan, fond lover?' and the ballad upon the wedding of his friend Roger Boyle with Lady Margaret Howard—'I'll tell thee, Dick, where I have been.' After his death his memory was attacked by the Puritan party in ballads and broadsheets. His poems and letters appeared as *Fragmenta Aurea*, London 1646 and 1648; his *Last Remains* were published in 1659; Tonson printed his collected works in 1709 and in 1719; and another edition followed in 1770. In 1836 Rev. Alfred Suckling published *Selections* with a Life of Sir John, which is still the chief authority. A complete unemasculated edition was edited by Hazlitt (2 vols. Lond. 1875). See a paper on S. in *Gentlemen's Magazine* for October 1878.

Sucto'ria, a term employed in zoology (1) to indicate a division of *Infusoria* (q. v.), in which the cilia are provided with sucker-like tips; and (2) an order of *Annelides* (q. v.) or worms, represented by the leeches, &c., in which one or two sucking-discs are developed.

Sudam'ina, or **Mil'iary Ves'icles**, are small, round, prominent vesicles, about equal in size to millet seeds. The disorder is accompanied with profuse sweating in the course of certain fevers, and is apparently the result of obstruction of the sweat-ducts, and hence the term S. From the size which they usually present—namely, that of a millet seed—they are sometimes designated M. V. S. often occur in the summer months, in children or adults with very tender skin, in eruptive, simple, remittent, and enteric fevers, and in inflammatory affections. The *treatment* of S. applies to the fever which they accompany. A cool temperature and cooling regimen are the most appropriate measures for the treatment of S.

Sudan', a region of Africa, between the Sahara on the N., Senegambia on the W., Upper Guinea and the parallel of 8° N. lat. on the S., and the Nile region on the E. Its area is estimated at 2,250,000 sq. miles, and its pop. at 40,000,000 or 50,000,000. The S. has for ages been the seat of the Negro race, and most of its inhabitants are now Mohammedans. It may be divided into three large regions, the most westerly of which is drained by the Niger, while the central one forms the basin of Lake Tchad, and the eastern one drains off to the Nile. The leading features and products of the S. are mentioned under the names of the principal states into which it is divided, viz.:—Bambarra, Gondo, Sókoto, Bornu, Baghirmi, Wadaï, and Dar Fur. The last named, and the districts of Kordofan, Sennaar, and part of Lower Nubia on the right bank of the Nile, are now commonly called the Egyptian S.

Sud'bury, a market-town of Suffolk, on the Stour, 16 miles S. of Bury by rail, has three ancient churches, All Saints' (restored 1856), St. Peter's, and St. Gregory's (restored 1860-77). Other buildings are the town-hall, corn exchange (1841), St. Leonard's Hospital (1869), the girls' school (1873), and a free grammar-school (founded 1492; rebuilt 1857). In 1871 straw-plaiting employed 1042 persons; the hair and bristle manufacture 3026; and silk, velvet, farm implements, bricks, &c., are also made here. S. publishes one weekly newspaper. Pop. (1871) 6908. Flemings in the reign of Edward III. established the woollen manufacture at S., and it was the birthplace of Archbishop Theobald (beheaded by Wat Tyler's followers 1381) and of the painter Gainsborough.

Sude'ten Gebir'ge, a range of mountains in Germany running N.W. and S.E. for 120 miles, and separating Bohemia and Moravia from Saxony and Silesia. It comprises numerous diversified mountain-masses which can only be roughly classified here. 1. The S.E. portion—S. proper, or *Gesenke*—extending from the Upper Oder to the sources of the March, and comprised wholly within Moravia and Austrian Silesia. The highest summit of this portion is Altvater (4880 feet high). 2. The Glatzer-Gebirgsland, including the Schneeberg Reichensteiner-Gebirge, Eulen-Zobten, Habelschwerter, Erlitzer-Gebirge, and the Friedländer and Waldenburger Highlands. 3. The district of the Riesen-Gebirge (q. v.), Iser-Gebirge, and Lausitzer-Gebirge, with their spurs diverging into Schlesien. This part contains Schneekoppe (q. v.), the culminating point of the whole range. The rocks of the Sudeten mountains, which are very varied, consist mainly of granite and schist, chalk and sandstone. They are rich in iron, copper, and zinc ores, and contain a little of the precious metals.

Su'dra (from a Sanskrit word signifying 'pure'), the fourth and lowest of the Hindu castes, according to the social organisation of Menu. Theoretically the Sûdras should be altogether slaves, born only to serve and support the Brahmins. But as a matter of fact, as the name is now applied indiscriminately to all Hindus who are not either Brahmins or Rajputs, the different sub-castes have attained to varying degrées of purity. In Bengal there are nine acknowledged S. castes of equal rank, called

Nabasaks, who owe their purity to the circumstance that their several occupations can be traced back to the traditional period. See also CASTES and HINDUISM.

Sue, Joseph Marie, usually called **Eugène,** a French novelist, was born at Paris, December 10, 1804. As military surgeon he served in the Spanish campaign of 1823, and was present at the battle of Navarino in 1828; but the fortune worth about £1600 a year which he inherited from his father enabling him to give up his profession, he finally devoted himself to literature, and before long secured a wide popularity as a novelist. Elected a member of the Legislative Assembly in April 1850, he was expelled from France by the *coup d'état* of the 2d December; but in Savoy, whither he retired, he maintained the same literary activity. S. died at Annecy, 3d August 1857. His best-known works are *Les Mystères de Paris* (10 vols. 1842), and *Le Juif-Errant* (10 vols. 1844-45), both of which have run through countless editions, and have been translated into most of the civilised languages. The complete German translations of S.'s novels reach 114 vols. In *Kernock le Pirate* (1830), his first success, *Atar Gall* (1831), and several other works, he depicts seafaring life; in *Les Sept Péchés Capitaux* (16 vols. 1847-49) he illustrates certain principles of Fourierism; and in many of his other romances he deals with different social questions. *Les Mystères du Peuple ou Histoire d'une Famille à travers les Ages* (16 vols. 1849), was condemned as immoral and seditious by the Court of Assize at Paris. So imperfect and misleading did the members of the naval profession consider his *Hist. de la Marine Française* (5 vols. 1835-37), that they presented him with a medal for 'the history which he had not written.' As a novelist he is second to none in the invention of incident and perpetual renewal of the reader's curiosity.

Sue'ca, a town of Spain, province of Valencia, on the N. bank of the Jucar, 4 miles from its mouth, on the Mediterranean, and 9 E.N.E. of Alcira, on the Valencia and Alicante railway. It has industries in rice, flour, tiles, bricks, &c., and carries on some trade through its port, Cullera. Pop. 11,340.

Su'et (Old Fr. *sieu*, Ital. *sevo*, from Lat. *sebum*, 'tallow,' 'suet'), the pure solid fat which occurs in almost detached masses within the loins of the ox and sheep kind. Mutton S. is more solid and contains more stearin and less palmitin than beef S. S. is universally employed in cookery; and mutton S. is used in the preparation of ointments, plasters, &c.

Medicinal Properties of S.—The S. of the Pharmacopœia is obtained from the internal fat of the abdomen of the sheep, and is prepared by melting and straining.

Sueto'nius Tranquill'us, Caius, lived and wrote between 75 A.D. and 160 A.D. His father was S. Lenis, a tribune of the 13th legion under Otho. S., mainly known to us as a biographer and miscellaneous writer, was educated for the Roman bar. He seems never to have sought public employment, and even when he was offered the post of military tribune, he requested his friend Pliny to secure it for a relative. Pliny speaks in high terms of the writings of S., extols his integrity and learning, and says the more he knew him the more he liked him. S. was married, but, so far as is known, had no children. Nevertheless he obtained, through Pliny's interest, from the Emperor Trajan the *jus trium liberorum*, a distinguished privilege, and attainable in such case only by great interest. S. filled the office of *Magister Epistolarum* to Hadrian, a position which gave him vast opportunities for seeing and utilising many important imperial documents. The date of his death is unknown. S. was a voluminous writer. His works, in part enumerated by Suidas, consisted of grammatical treatises and works antiquarian, legal, moral, and biographical, most of which have been lost. His *Lives of the Twelve Cæsars, Lives of Eminent Grammarians*, and a portion of *Lives of Eminent Rhetoricians*, survive. On the first his reputation rests. It is pregnant with interest, replete with curious information and endless anecdote and scandal bearing on the imperial coterie—a perfect storehouse, in fact, of details of the profligacy and lust of the Cæsar family, set forth with all the sincerity, impartiality, and relish of an arch-gossip. Yet withal there is no reason to doubt his veracity. As a writer his language is brief and precise, occasionally obscure, but without affectation. The fact of the younger Pliny's steadfast friendship for him is a strong point in his favour both as a man and as an author. His *Lives of the Cæsars* still maintains the reputation in which it has been held for centuries. Editions of S. are very numerous. The two earliest were published at Rome 1470, a third at Venice 1471. The editions of Burmann (Amst. 1736, quarto, 2 vols.), of J. A. Ernesti (Leips. 1748), and of Fr. Oudendorp (Leyden, 1751), are well known. The recension by C. L. Roth (Leips. Tauchnitz, 1858) deserves especial mention. See also Becker's *Quæstiones Criticæ de S. Cæss.* (Königsberg, 1862), and Unger's *Suetoniana* (Friedland, 1864).

Sue'vi, an appellation of various Germanic tribes in classic authors, seems to have been used somewhat loosely, as we find it employed to designate peoples widely removed from each other. On six different occasions tribes, probably Germanic, though possibly mixed with Celtic and Slavonic elements, appear in history under this name. (1) Cæsar (*B. G.*, I. 37, 51, 54, &c.) mentions S. living on the E. bank of the Rhine, and possessing 100 villages. (2) Tacitus (*Germania*) places them N. and S. of this, on both sides of the Upper and Middle Elbe. (3) In the second and third centuries they appear along with the Quadi and Marcomanni in Moravia and Bohemia. (4) In 406 S. cross the Rhine along with the Vandals and Alans, and break into Spain, settling more especially in Leon and Castile, whence they were driven by the Visigoths in 584. (5) In 420 another tribe called S. are spoken of in Upper Germany, who left their name to the modern Swabia. (6) In the 6th c. we hear of Nordsuevi, with a village Swevon on the Upper Elbe.

Su'ez, a gulf, isthmus, and town of N.E. Africa. The *gulf* is the western and longer of the two arms in which the Red Sea terminates. Its present length, which is believed to be less than in former ages, is 200 miles, and its average breadth 20 miles. The *isthmus*, uniting Africa and Asia, is 72 miles wide at its narrowest point. It is a sandy and stony waste, with no water save that of salt swamps or lagoons, and the geological indications point to its having been at one time a sea-bed. The isthmus is now intersected by the Suez Canal (q. v.). The *town* of S. is situated at the head of the gulf of the same name, 75 miles E. of Cairo, with which it is connected by railway. The harbour is a safe and roomy roadstead. The surrounding country was formerly a waste of burning sand, but since the construction of the freshwater canal from the Nile cultivation has been successfully commenced along its banks. Owing chiefly to French enterprise, the town is now well laid out and fairly built, with a moderate water supply. Its trade, which revived on the establishment of the Overland Route (q. v.) after languishing for three centuries, is again declining, owing to the competition of Port Said (q. v.). In 1877 the imports of S. amounted in value to £213,896, and the exports, of which ostrich feathers, ivory, gum, breadstuffs, and opium were the chief items, to £123,490. Pop. (1877) estimated at 12,000, of whom 2500 were foreigners.

Su'ez Canal, the artificial strait connecting the Mediterranean and Red Seas. From remote ages the Isthmus of Suez had been traversed by a canal, following nearly the line of the present freshwater canal described below, and joining the eastern or Pelusiac branch of the Nile at Bubastis, the modern Zagazig. The origination of the work is assigned by Aristotle, Strabo, and Pliny to Sesostris, but by Herodotus, with greater probability, to Pharaoh Necho, who reigned about 600 B.C., and the completion of it is variously accredited to Darius, King of Persia, and the Ptolemies. At all times the greatest difficulty seems to have been experienced in keeping the canal from being choked up with sand, a fate which befell it after its reopening by Trajan early in the 2d c. of the Christian era, and again in 767 A.D., after it had been cleared by Amru, the Arab general of the Calif Omar, and had remained open for more than 100 years. Thenceforward the matter was left in oblivion, until Napoleon I. caused a survey of the isthmus to be taken with a view to the reconstruction of the canal. Subsequent surveys were undertaken at the instance of several European governments, notably in 1849 and 1853, and they established the fact that there were no difficulties to be encountered from any difference in the level of the two seas to be connected. Nevertheless, in consequence of the unfavourable report of Robert Stephenson, the celebrated engineer, the canal project was abandoned, and the railway to Suez constructed instead. On 30th November 1854, however, M. Ferdinand de Lesseps, a member of the French diplomatic service in Egypt, who had been investigating the

matter since 1849, obtained from the Viceroy of Egypt a concession giving him the right to construct a canal from Suez to Tineh, on the Mediterranean, near the site of the ancient Pelusium. A year later an engineering commission reported favourably of this scheme, and it is in substance that which has been carried out, except that the Mediterranean entrance was finally fixed some distance to the W. of Tineh, on the narrow ridge separating Lake Menzaleh (q. v.) from the sea, and here was built the town of Port Said (q. v.). In 1858 a company was formed to construct the canal, two-fifths of the capital being found by the Viceroy, and the remainder being subscribed in Europe, and chiefly in France. The work was commenced on an unnoted day in 1860, and on 28th September 1869 M. Lesseps steamed from sea to sea in a small vessel. The formal opening of the canal took place on 17th November 1869, with great state, in the presence of the Khedive, Empress of the French, Emperor of Austria, Crown Prince of Prussia, and other distinguished persons.

The canal runs N. and S., and has a total length from sea to sea of 99 miles, with a width at the surface of 327 feet for 77 miles, and of 196 feet for the remaining 22 miles. The depth, for a width of 72 feet on the bottom, is 26 feet. At Port Said the entrance is protected by two massive breakwaters, respectively 2730 yards and 2070 yards long. Thence the canal skirts the eastern shore of Lake Menzaleh to Kantara (21½ miles), after which it crosses Lake Ballah, a marsh which is frequently dry, to El Ferdane (12 miles). A cutting 9 miles long then brings it to Lake Timsah, a depression 5 miles long, which was filled with water admitted from the Mediterranean. Here is situated the town of Ismailia (q. v.). From the southern end of Lake Timsah to Serapeum (7 miles) some deep excavations had to be made. Then followed two dry depressions, now known as the Bitter Lakes, and respectively 16 and 9 miles long, and 30 and 20 feet below the level of the Red Sea. They were filled with water admitted from both ends of the canal, and as they are of considerable width, the ship channel through them is marked by a double row of beacons. From the Bitter Lakes to Suez (19½ miles) much rock was met with, necessitating a great deal of blasting. Comparatively little difficulty was experienced, after all, from the sand, and the mud in Lake Menzaleh proved a much more serious obstacle. It was literally scooped out with the hands by the 15,000 local fishermen and others who were employed on this part of the work. Concurrently with the maritime canal, a freshwater canal was constructed from the Nile to Ismailia, and thence alongside the maritime canal to Suez. This freshwater canal, which communicates with Lake Timsah by a branch and lock, is navigable by small vessels, while the beneficial influence it has exerted on the climate and fertility of the country which it traverses is very great. The capital originally subscribed was £8,000,000, but the cost to the Canal Company of the entire undertaking, including the harbours, is stated to have been about £19,000,000, in addition to the value of lands and forced labour given by the Khedive, the value of which cannot be accurately estimated, but probably amounted to several millions more.

The S. C. reduces the length of the voyage from London to India from 11,379 to 7628 miles, a saving of 36 days' voyage. Since its completion the carrying trade between Europe and India has been revolutionised, and a class of steamers specially constructed for the new route has sprung into existence. The canal also exerts a marked and annually increasing influence upon the trade of Europe with Eastern Africa, the Malay Archipelago, China, Japan, and Australasia. In 1877 there passed through the canal 1651 vessels, with an aggregate tonnage of 2,251,556. Of these, 1291 vessels of 1,761,687 tons were British, and of the other countries whose vessels used the canal, the chief, in order of precedence, were France, Holland, Italy, Austria, Germany, and Spain. The revenue arising from the canal is yearly increasing, and in 1877 the total receipts of the Canal Company amounted to £1,339,617. In November 1875 the British Government purchased from the Khedive for £3,976,582 the original or founders' shares then held by him, numbering 176,602 out of a total of 400,000, but any interest that might accrue on these shares was already pledged by him up to 1st July 1894. See *Report on the Maritime Canal connecting the Mediterranean at Port Said with the Red Sea at Suez* (Lond. 1870); *The History of the S. C.*, by F. de Lesseps, translated by Sir H. D. Wolff (Lond. 1876), and Blue-Books.

Suffoca'tion. See Asphyxia and Respiration.

Suff'olk, the most easterly of the English counties, is separated N. from Norfolk by the Waveney and Little Ouse, W. by the Lark from Cambridgeshire, and S. by the Stour from Essex, while on the E. it is washed by the North Sea. Area, 949,825 acres; pop. (1871) 348,869. The coast-line, broken by the estuaries of the Stour, Orwell, Deben, and Alde, is generally low, and the sea has made great encroachments, Dunwich having lost six of its seven churches. The geology of S. is simple. The chalk formations of the W. dip under the London Clay of the Eocene and the Red Crag of the later Pliocene, which occupy the south-eastern and eastern portions. The Red Crag is especially characteristic of this part of England, and probably extends under the diluvial deposits which cover the central districts. The surface is level, the climate cold and dry, the soil for the most part a heavy loam, but in the W. a sandy tract is interspersed with fenny offshoots of the Bedford Level (q. v.). A highly-developed system of agriculture is steadily advancing, in spite of the great 'lock-out' of 1874, when 840 labourers left the county. In 1876 there were 383,850 acres under corn crops, 122,968 under green crops, 89,498 under clover, sainfoin, and grasses in rotation 146,524 in permanent pasture, and 32,562 in wood. The area of the wheat crop in 1878 was 147,210 acres. The number of horses in 1876 was 42,869, of cattle 60,281, of sheep 434,333, and of pigs 120,484. The chief manufactures are those of agricultural implements and artificial manure, the yield of coprolites and phosphatic nodules employed in the latter industry amounting (1877) to 69,000 tons in S. and Bedfordshire together. Herring and other fisheries also employ (1878) 809 boats and 3344 persons, belonging to Lowestoft, Woodridge, and Ipswich (the county town). S. returns four members to Parliament. Its antiquities include a Roman castle at Burgh, the abbeys of Bury St. Edmunds, Leiston, Butley, and Bungay, and the medieval castles of Framlingham, Wingfield, Oxford, and Mettingham. The churches are distinguished by their elaborate flint-work tracery, and S. contains many fine examples of Elizabethan domestic architecture. See Suckling's unfinished *History of S.* (1847).

Suff'ragan was originally a designation of every provincial bishop as having a vote (Lat. *suffragium*) in the councils of the Metropolitan (q.v.). In the Church of England, under Henry VIII., it was applied to certain bishops with a limited jurisdiction under the diocesan, similar to the old chorepiscopi, and the office has been revived in recent times.

Suff'rage (Lat. *suffragium*, 'a vote'), the right to vote for any purpose, but especially the right of a citizen to vote in the election of his representatives in the legislative and administrative bodies of his country. One of the most important questions in the theory of representative government is naturally that of the best method of constituting and distributing the S. Most modern writers on political science maintain that the S. should be made as wide as is safely possible, because it is an important educational and moral agent, enabling a man to realise his stake in the country, and encouraging him to take an intelligent interest in national affairs. On the other hand, the theory of the English constitution, and of other constitutions where the S. is limited by a property qualification, is, that in the present state of education it is dangerous to admit the mere proletariat to a voice in the conduct of national affairs. In all countries infants, minors, idiots, and criminals are excluded from the S., as are also women, except in some special elections—*e.g.*, the school-board elections in the United Kingdom. It is maintained by the supporters of female S. in England, that the Reform Bill of 1867 leaves a loophole for female voting by not sufficiently defining whether the word 'man' means male persons, or is merely a generic term equivalent to *name*, and this question is now (1878) about to be put to the test.

Su'fism is the faith of a sect or class of Mohammedan devotees chiefly found in Persia, whose name probably means 'sages,' derived from Greek *sophos*, 'wise' (*cf.* Gnostics, from *gnōsis*, 'knowledge'), and who form a kind of ecclesiastical order similar to the Dervishes (q. v.). S. had its origin (9th c.) in that pantheistic mysticism which for centuries pervaded the East, and which exhibited itself chiefly in a search for metaphysical purity, for the illumination of the mind, for calmness of soul, and for the subjugation of the passions, by the exercise of painful austeri-

ties, and the adoption of an ascetic life. The object of the Sufi is to attain to the light of heaven, towards which he must press forward till perfect knowledge is reached in union with God, or after death in absorption into the Divine Being. In this spiritual journey there are various stages. Starting from his natural state, the devotee passes through science, love, seclusion, knowledge, ecstasy, touch, and union with God, to final extinction. The theological language of S. is to a great extent allegorical and symbolical. Their chief doctrines are taught under the figures of love, intoxication, &c.; and such terms as truth, love of God, &c., have a mystical meaning quite different from their ordinary Christian application. See Malcolm's *History of Persia* (Book I.), and Tholuck's *Sufismus* (Berl. 1821).

Su'gar, in chemistry, the name of a series of carbo-hydrate compounds, characterised by their ready solubility in water and prevailing sweet taste. In composition and properties they are closely allied to Starch (q. v.), which though insoluble may be converted into one variety of S. S. exists abundantly in the juices of plants and ripe fruits, and also in the animal body. *Cane S.*, *Saccharose* or *Sucrose* ($C_{12}H_{22}O_{11}$), the sweetest and best-known variety, is distinguished by its oblique 4-sided prismatic crystals terminated by 2-sided summits. When heated it melts into a glassy mass (barley S.), and at about 400° F. it decomposes, forming an amorphous brown body called enamel. On being absorbed in the animal system, or on undergoing fermentation, it is transformed into *grape S.* or *Glucose* ($C_6H_{12}O_6$), which may also be prepared from starch and vegetable fibre (cellulose) by the action of acids, and exists largely in many dried fruits, besides constituting almost the entire bulk of honey. It has three principal modifications, dextrose, lævulose, and maltose, the latter being the sweet principle of malt. *Lactose* or *milk S.* ($C_{12}H_{22}O_{12}$) dissolves with difficulty, and has little sweetness, and on absorption is transformed into grape S. Inosite or muscle S., Manuite (q. v.), and glycarrhezisi from Liquorice (q. v.), are allied substances.

Manufacture of S.—Three forms of sugar enter into commerce—ordinary or cane sugar, starch sugar (glucose), and sugar of milk (lactose), the two latter being of insignificant consequence compared with the first. Cane sugar is a constituent of very many succulent vegetables and fruits, but its commercial sources of importance are the sugar-cane and beet-root. In China and in the United States of America it is prepared to some extent from the sugar millet (*Sorghum saccharatum*); in India, Ceylon, and Egypt it is produced from the date-palm and several other species of palm; and in the United States and Canada some amount is annually obtained from the trunk of the sugar-maple (*Acer saccharinum*).

The cultivation of the sugar-cane and the art of extracting sugar therefrom have been in practice from remote times in India and China, where primitive processes are in operation to the present day. Sugar was not used by the Greeks and Romans, although some of their writers allude to the cane; and practically the knowledge and use of the substance only became diffused among Western nations after the Crusades. From the Asiatic continent canes were first carried to Cyprus, whence they were introduced into Sicily, in which island, it is known, a large quantity of sugar was manufactured as early as 1148. In 1420 the plants were introduced by the Portuguese into Madeira, and they were carried to America with the earliest settlers.

The sugar-cane (*Saccharum officinarum*) is a jointed grass growing about the thickness of the arm, and to the height of 6 to 12 feet. It is a native of India and China, but its numerous varieties are now disseminated throughout all tropical and subtropical regions. The varieties most extensively cultivated are the Otaheite, Batavia, Creole, and the Violet Java canes. The plants are principally propagated from cuttings, which ripen in from twelve to fifteen months, and in a mature condition they contain about 90 per cent. of juice, having from 12 to 20 per cent. of sugar, the average amount being 18 per cent. In practice, however, not more than ½ of the sugar in the canes is obtained as raw sugar, ¼ being left in the refuse cane, and ¼ going in the form of uncrystallisable molasses, and as skimmings in the preparatory operations.

The operations of preparing raw sugar from canes embrace, 1st, expression of the juice; 2d, defacation and clarification of the juice; 3d, concentration; 4th, granulation and separation of the crystals from the uncrystallisable molasses. Expression of the juice is effected by passing the newly-cut canes between the heavy cast-iron rollers of a sugar-press or mill. The rollers are in a series of three—two lower on one level, and an upper revolving between them. The canes are bruised between the upper and first rollers, and thoroughly exhausted by the squeezing they receive between the upper and second of the two lower rollers. Without loss of time the expressed juice is submitted to the operations of clarification and boiling, as no sooner is it liberated than a process of acetous fermentation is induced. The clarification is effected by adding lime to the juice, which combines with and neutralises the acids, besides otherwise acting on its constituents. The heating of the juice to which it is at the same time submitted causes its albuminoid constituents to coagulate and rise to the surface in the form of a thick green scum. From the first clarifying-pan the juice is passed into a series of four or five more, arranged in a series and heated by one fire, or, as is now generally the case, by steam-heat. The skimming is continued so long as any scum rises; the juice gradually becomes clear and concentrated, till in the last pan the bubbles which rise burst with a cracking noise. The thick syrup now passes into large, shallow pans, in which as it cools sugar crystals form, and after twenty-four hours' time, means for separating the uncrystallised portion are adopted, these being either (1) by use of centrifugal force, (2) by pouring the mass into moulds having an opening through which the syrup gradually drains off, or (3) by the process of claying, in which moist clay is applied to the thick end of the filled mould, the moisture from the clay passing through the sugar and carrying away with it the uncrystallised portions. Improved and modified processes of manufacture are numerous, and in operation in many sugar-producing countries. Bisulphite of lime is very largely used as a defacating agent, and after the clarification of the juice it is frequently the practice to pass it through a bag filter or a charcoal filter, and to evaporate it to the crystallising point in a vacuum pan, as done in the refining process in British refineries. The finished sugar is also commonly freed from molasses by use of the centrifugal machine, and sugar thus treated is ready to pass into use without undergoing the further refining process to which ordinary raw sugars are subjected. The principal varieties of raw sugar from cane are known in commerce by the name of the localities whence they come, with the distinction 'muscovad,' 'centrifugal,' 'clayed,' and 'concrete,' according to the method of finishing. Raw sugar from cane has a pleasing aromatic odour and taste very different from the odours of unrefined beet-root sugar. The ultimate uncrystallisable residual molasses is used for making rum, or it is sold for use as treacle.

Beet-root Sugar.—In the year 1747 the German chemist Marggraf demonstrated the existence of cane sugar in beet-root, and suggested it as a source of the material, but it was not till 1800 that the manufacture was actually commenced in France under the stimulus of the blockade of French ports during war. For many years no great success attended the beet-sugar industry, not more than 13,000,000 lbs. having been prepared from that source in 1811, but now, as will be seen below, the industry has attained dimensions which almost rival the sugar-cane manufacture. The variety of the beet-root (*Beta maritima*) most valued for sugar-making is the white Silesian, and its cultivation for S. manufacture is now a most important industry in France, Germany, Austro-Hungary, and Russia. The proportion of sugar obtained in beet-root may vary from about 9 to 18 per cent., a fair average yield being, however, 10 or 11 per cent., and weather has a great influence on the yield of the roots. The processes employed in the earlier stages of the preparation of beet-sugar differ from those followed in the case of the sugar-cane. They embrace the following operations:—1, Washing and cleaning the roots; 2, Pulping or otherwise treating the cleaned roots, and extracting the juice by hydraulic pressure or by centrifugal force; 3, Clarification of the juice by heat and lime; 4, Removal of the lime by the action of carbonic acid; 5, Filtration of the juice through charcoal; and 6, Evaporation of the juice, and boiling of it to the crystallisation point in the vacuum pan. The subsequent processes are essentially the same as those employed for sugar from canes. The molasses of beet is used for preparing an inferior kind of spirit, or used only for the feeding of cattle.

Refining.—The greater part of the raw sugar produced, both cane and beet, cannot be brought into use without undergoing a

process of refining. For this purpose the raw sugar is dissolved in hot water and filtered through long cotton bags (bag-filters) to remove the mechanical impurities present in the sugar, such as sand, chips of wood, insects, &c. To remove the colouring matter the solution is then passed through a filter of animal charcoal, the stratum of charcoal being several feet in thickness, and the clear pure solution which is thereby obtained is run into a vacuum pan, in which it is evaporated down to granulation point. The object of using a vacuum in the boiling of sugar solutions is to enable the evaporation to be conducted at a low temperature, as where saccharine solutions are submitted to high temperature, a large proportion of uncrystallisable syrup is formed. In the vacuum pan the evaporation goes on rapidly; and as the boiling point is low, in proportion is the uncrystallisable residue small. The evaporated solution from the vacuum pan is introduced into a centrifugal machine, by which the fluid syrup is separated, and dry crystals ready for packing in casks are obtained. When loaf-sugar is to be made, the contents of the vacuum pan are run into a vessel called a 'heater,' in which by the action of steam any crystals which have formed are re-dissolved. The hot solution is then poured into moulds of the well-known form of sugar-loaves, in which the sugar sets and crystallises, care being taken to have the crystals formed of uniform size. From an aperture in the top of the mould the green syrup drains off, and when that draining has ceased the loaves are further purified by 'liquoring,' a process which consists in pouring concentrated solution of pure sugar over each loaf, such solution sinking through the loaves and carrying away any remaining impurity. The 'liquoring' is repeated two or three times, and, when thoroughly drained, the loaves are dried in an oven, and so prepared for the market.

The total production of sugar throughout the world during 1876 was estimated at 3,650,000 tons, of which 2,140,000 tons were from canes, 1,320,000 tons from beet-root, 150,000 tons from the date and other palms, and 40,000 tons from maple and sorghum. Of the total amount of cane sugar about ⅓ was yielded by the island of Cuba, and about ⅔ by the W. Indies (Cuba included) and S. America. Java yielded about 200,000 tons, Manila 130,000 tons, and Mauritius 100,000 tons. The production of sugar from beet-root has developed with remarkable rapidity in Europe, the culture being at present artificially stimulated by a practical system of granting bounties to refiners who export sugar from France and the other principal beet-cultivating countries. During the last ten years the quantity of beet-root sugar made has been doubled, and the following is the estimated yield of the crop for season 1878:—Germany, 370,000 tons; France, 370,000 tons; Russia, 220,000 tons; Austro-Hungary, 245,000 tons; Belgium and Holland, 90,000 tons; in all, 1,295,000 tons. The import of sugar into Great Britain during 1877 was of refined, 3,429.853 cwts., value £5,794,232 (from France, 2,069,543 cwts., value £3,464,915); of unrefined, 16,620,944 cwts., value £21,381,441 (British W. Indies, 2,352,071 cwts., value £3,128,909); of glucose, solid or liquid, 276,627 cwts., value £273,997; of molasses, 298,261 cwts., value £141,315. The English race are by far the greatest consumers of sugar, the quantity used in Great Britain being 62·8 lbs. per head; United States, 37·8 lbs.; Dominion of Canada, 51·4 lbs.; Australian Colonies, 85·9 lbs.; Holland, 25·03 lbs.; France, 15·5 lbs.; Russia, 5·4 lbs.; and Spain, 54 lbs. These enormous variations have a very obvious relation to the nature of the food used by the various races, and are affected only in a minor degree by wealth and luxurious habits.

Medicinal Properties of S.—S. is a demulcent, and is prescribed in catarrhal affections in the form of candy, syrup, &c., and is also employed in pharmacy to render oils miscible with water, and in the preparation of confections and lozenges. It also enters into the composition of several mixtures and pills. Syrups are prepared by dissolving six parts of refined S. in three parts of distilled water with the aid of heat, and when cool adding water to weigh nine. Seven measures of syrup contain six of S. *Saccharum lactis*, or *S. of milk*, is prescribed in cases of phthisis and other pulmonary affections, and in cases of extreme irritability of the stomach, and is also used as a substitute for the milk of the mother, or for mixing with the food of children.

Sugar-Cane (*Saccharum*), a gigantic perennial grass with a solid jointed stem often 10–15 feet in height, sheathed by ribbon-shaped leaves of 4–5 feet long, and surmounted by an elegant, large, and diffuse panicle of soft hairy florets. It is a native of India, China, and the South Sea Islands, in which countries the rough extraction from it of saccharine juice dates back to very remote times. About the middle of the 12th c. the S.-C. is supposed to have been introduced by the Saracens into several islands of the Mediterranean, where for a considerable period an abundance of sugar was made. Its extension westward was continued later on into Spain, the Canaries, and Madeira. Shortly after the discovery of the New World it was transplanted to some of the W. India Islands and the Brazils. The culture has since become general in warm climates. In the United States the profitable cultivation of the cane ceases at 32° N. lat., in China it extends only to 30°. Prolific yields have occurred in Australia as far S. as 28°. Moderate vicinity to the sea is favourable to growth. Rich manuring is necessary to obtain good crops, unless in the best virgin soil; and in order to promote growth upwards, as well as to provide ventilation and access of light to the plants, the superabundant suckers around the base and the lower leaves of the stem must be successively removed. Excessive rains produce a rank luxuriance of the canes at the expense of the saccharine principle. The multiplication is usually affected from top-cuttings, but this cannot be carried on from the same original stock for an indefinite period without deterioration, and as seeds hardly ever ripen, new plants must from time to time be brought from a distance. Thus New Caledonia has lately supplied wild-growing splendid varieties for the replanting of sugar-fields in the Mauritius. The length of time required to ripen the cane varies much according to the situation in which it is planted and the special variety, some sorts becoming ready for practical operations in about ten months, while others require from twelve to twenty months. A Chinese S.-C. named *S. Sinense*, which is hardier and bears drought better than the ordinary kind, and needs renewal only every second or third season, will, if planted early in spring, ripen in seven months. Numerous varieties of the S.-C. are now established, among these the Bourbon is praised as one of the richest in sugar, and the Batavian variety (*S. violaceum*) is content with less fertile soil. The average yield of sugar varies from 26 cwts. to 3 tons per acre. The tops and green leaves of the cane are good food for cattle. *Saccharum* is a large genus, but, excepting the sugar-yielding species, none are of much importance.

Sugar-Mite, a name given to the *Tyroglyphus sacchari*, a species of *Acarina* or Mite (q. v.) found in unrefined sugar. The body is oval-shaped, the mandibles scissor-like, and the feet have suckers. Dr. Hassall of London reported that in 69 out of 72 samples of unrefined sugar mites were discovered. Grocer's itch is caused by these creatures. Over 500 have been found in ten grains of sugar; one pound may thus contain 100,000 sugar-mites.

Sugar-of-Lead. See LEAD.

Suhl, an old town of Prussia, province of Sachsen, at the base of the Domberg, 35 miles S.W. of Erfurt by rail. It lies to the S.W. of the Thuringer-wald, and is sheltered by the Ottilienstein, a cliff of porphyry. Its firearms have been famous for several centuries, and its steel and iron wares are of superior quality. As its name indicates (Sorb-Wendish, 'salt'), it was formerly a salt-mining centre. There are iron mines in the vicinity. A mineral spring rich in chloride of calcium was discovered here in 1878, and the authorities hope to transform S. into a fashionable watering-place. Pop. (1875) 10,721. See Werther's *Sieben Bücher der Chronik der Stadt S.* (2 vols. 1846–47).

Suhm, Peter Frederik, a Danish historian, son of Admiral Ulrik Frederik S., was born 18th October 1728, studied law at Copenhagen (from 1746), and in 1748 became assessor in the Supreme Court. In 1751 he married a rich merchant's daughter of Throndhjem, where he remained for fourteen years in close friendship with the Norwegian historian Schöning, on whose removal to Sorö (1765) he returned to Copenhagen. S.'s great work is his *Historie af Danmark*, 14 vols., of which he only published 7, the rest being published from his MS. by Kall and Nyerup (1806–28). It comes down to 1400, and is the most copious collection of materials for Danish history. S. also continued Langebek's *Scriptores rerum Danicarum.* His *Samlade Skrifter* are published in 16 vols. (1788–89). His library of

100,000 vols. he made over in 1796 to the great Royal Library at Copenhagen for a small liferent. He died September 7, 1798.

Su'icide (Lat. *se*, 'oneself,' and *cædo*, 'I slay') is the act of designedly destroying one's own life. To constitute S., in a legal sense, the person must be of the years of discretion and of a sound mind. The law of England treats S. as a felony involving the forfeiture to the crown of all the personal property which the party had at the time he committed the act, including debts due to him; but it is not attended with forfeiture of freehold, or corruption of blood. The body of the self-murderer was required to be buried without Christian rites in the open highway or cross-roads, and a stake was thrust through it to mark the public detestation. This law was repealed during the reign of George IV., and the only consequences now are forfeiture of goods and deprivation of Christian rites. The burial may take place in a churchyard, but between 9 and 12 P.M. S. was treated as venial by the Romans, and was esteemed a virtue, in certain cases, by the Stoic and Epicurean philosophers. Valerius Maximus, who wrote in the 1st c., states that a poisonous liquor was kept publicly at Massilla, and that it was given to such as presented themselves before the senate and procured its approval of the reasons which prompted them to get rid of life. S. is often set down as furnishing positive evidence of insanity, and it has been affirmed that the suicidal propensity is, in all cases and under all circumstances, a positive sign or symptom of insanity. This, however, is not in accordance with the opinions of many psychologists, nor is it consistent with well-known facts. The law of England very properly treats S. as a felony; and those who commit S. are held to be sane and responsible, unless there be clear evidence to the contrary.

S., however, is a very frequent result of insanity, more especially in Christian countries, and the verdict generally given by coroners' juries is that the person destroyed himself while in a state of unsound mind; not so much, however, from the fact of insanity being thereby established, as that any other verdict would distress the surviving relations and friends of the deceased. Suicidal mania or insanity may be defined as a perversion or reversal of the natural instinct of love of life, leading to its destruction. Drs. Bucknill and Tuke give the following classification of this form of insanity:—'First, there are cases in which the instinct of self-preservation is more especially diseased, being as it were reversed in its operation. There is here a blind, unreasoning, irresistible impulse to commit S., a true suicidal monomania. This form may present the spectacle of an individual perfectly reasonable, influenced by an enlightened religion, physically and morally happy, well aware of the criminality of S., yet impelled to commit it in spite of himself by a force acting automatically and superior to his reason and will. Secondly, S. may be the result, not of an instinctive monomania, but of melancholia. The degree in which the patient is depressed is not the measure of his tendency to S.; at the same time intense depression is, in a large number of instances, the immediate antecedent of the suicidal act. The third division comprises those cases of S. which spring from delusions, hallucinations,' &c. Other and more vulgar causes of S. are the love of notoriety, the force of imitation, and the remorse or fear that follows homicide. See *Anatomy of S.*, by Dr. Forbes Winslow; *Du S. et de la Folie S.*, par Brièrre de Boismont; *Traité du S.*, par M. Bertrand (Par. 1857); *Du S.*, par M. Debreyne; and *Psychological Medicine*, by Drs. Bucknill and Tuke (Lond. 1874). For medico-legal aspects of S. see *Medical Jurisprudence*, by Dr. Alfred Taylor (1873).

Su'idæ, a family of *artiodactyle ungulata*, in which two functional toes are developed, with two rudimentary toes in addition. The canine teeth are large, and in the males form tusks. The tail is short, and the skin sparsely covered with hair. Of the S., the *Sus scrofa* or wild boar, the *Sus Indicus* or Indian hog, and the *Sus Babirusa* or Babyroussa hog, the Peccaries, and Wart hogs are the best-known genus.

Su'idas, the reputed author of a Greek Lexicon, is supposed to have flourished in the 10th c. A.D., but nothing is known concerning him. The work bearing his name is a kind of encyclopædia, with frequent interpolations by later hands, and is only valuable as preserving fragments of authors whose works have otherwise perished. It has been edited by Gaisford (3 vols. Oxf. Clar. Press, 1834) and Bernhardy (2 vols. Halle 1834–53).

Sui Juris, in Roman law, denoted the condition of any one not subject to the *Patria Potestas* (q. v.), and therefore practically his own master.

Suir, a river of Ireland, rises in Tipperary, separates that county from Waterford, and joins the Barrow at Passage, after a course, first S. and then E., of 100 miles. It passes Thurles, Cahir, Clonmel, and Carrick, and is navigable by barges.

Suit in law. See ACTION.

Su'khum Ka'le, a seaport and military station in Asiatic Russia in the government of Transcaucasia, is situated at the foot of the Caucasus on the E. shore of the Black Sea. In 1831 a commercial port was established here, which has, however, been much overshadowed by Poti (q. v.), 48 miles S., but it is still a station on the line of the Black Sea Telegraph, and a shipping place of the Russian steamers. On May 14, 1877, S. K. was captured after bombardment by the Turkish ironclads, and played a somewhat important part during the subsequent conduct of the war as a Turkish base of operations. Pop. (1874) 1161.

Suleimán Mountains, a lofty range forming the W. boundary of the Punjaub and Scinde, and the frontier (1878) of the British Empire in India on the side of Afghanistan and Beluchistan. They run from N. to S. for about 350 miles, stretching from the Khyber Pass almost to the seaboard. The highest peak is the 'Taikh-i-Suleiman,' or 'Soloman's Throne,' 11,000 feet above the sea. The fall is abrupt towards the Indus, but gradual towards the table-land of Sewestan. They give birth to no rivers, and are regarded by the Afghans as their own original home. The principal passes from N. to S. are the Kuram, the Gomal, and the Bolan.

Suli'na, the most important commercially of the delta branches by which the Danube (q. v.) enters the Black Sea. The main branches are the Kilia in the N. and the Tultcha in the S., and the latter separates again into the S. and the St. George. The Kilia and St. George debouch about 50 miles apart, and about midway issues the S., which has a small volume but a deep channel. The construction of concrete 'parallel piers,' 5850 and 4310 feet long respectively (1856–61), transformed the mouth of the S. into the best commercial harbour in the Black Sea. The depth thus secured on the bar was 17 feet, and this was increased to 20 by the extension of the southern pier and the consolidation of the whole in 1872.

Suliots, the Greco-Albanian race who in the 17th c. founded eighteen villages in the mountainous district of Suli in S. Albania, and there established a small democracy. This they defended manfully against the Turks till 1803, when Ali Pasha (q. v.) mastered and almost annihilated them, the remnant taking refuge in the Ionian Islands. Recalled by Ali in 1820 to aid him against the Sultan, they shared his fall, but under Bozzaris (q. v.) again came forward in the Greek war of independence. Their district made definitely over to Turkey by the treaty of 1829, most of the S. migrated to Acarnania and Ætolia in Greece, where their present number is estimated at 12,000. See Perrhæbos' *History of Suli* (Eng. trans. 1823), Ludemann's *Suliotenkrieg* (Leip. 1825), and Finlay's *History of the Greek Revolution* (Edinb. 1861).

Sull'a, Lu'cius Corne'lius, was the son of L. Cornelius S., and was born in 138 B.C. Brought up amid the luxury then prevalent at Rome, he spent much of his time in the pursuit of sensual pleasures. In 107 he was elected quæstor, and served as a cavalry officer in the Jugurthan war under Marius, when he displayed brilliant military talent, taking Jugurtha prisoner in 106. Returning to Italy, he served from 104–101 in the Cimbric war, at first under Marius, but latterly under Catulus. In 92 he went as proprætor to Cilicia. While there he expelled from Cappadocia the usurper whom Mithridates had installed there, marched to the Euphrates, and in an impressive interview with the Parthian king Arsaces, established relations between Rome and Parthia for the first time. In 91 S. returned to Rome, and found himself regarded as a leader of the oligarchy and an opponent of Marius. Bitter feuds which broke out were quenched by the excitement of the Social war, in which S. took a distinguished part, leading the southern army against Samnium in 89. The practical extinction of the insurrection in 88 gave time for the prosecution of the Mithridatic war. The coveted post of leader in this enterprise now became matter of contest between the populace led by a

tribune Sulpicius and the senatorical oligarchy. The latter, whom S. supported, having made him consul, confirmed him in the command of the army he had previously led, which was the one now destined to the Asiatic wars. Sulpicius, however, by a tumult carried the appointment of Marius, whose messengers brought the news to the camp. The troops tore them to pieces, and enthusiastically followed S. to the capital. He entered it amid general alarm, suppressed the Marian opposition, and encamped in the market-place. S. was now master of Rome, but after repealing the Sulpician rogations, and perhaps making other changes in favour of the senate, he hurried to Greece, which was overrun by Mithridates. Soon he defeated Mithridates' general Archelaus, and laid siege to Athens, which fell in 86. The victory of Chaeronea, following shortly after, was rendered fruitless by the sudden appearance of the Roman general Flaccus, sent to supersede S. Flaccus, however, declined battle and crossed to Asia. Next year (85) S. defeated the second Pontic army sent to Greece at Orchomenus, and in 84 Mithridates signed peace at Dardanus, and S. sailed for Europe with a portion of his troops. The Marian party, now led by Carbo, made active preparations to resist him, but when he landed at Brundisium in the spring of 83, multitudes flocked to his side. Young Pompey raised his standard in the N., and S. himself defeated the Marian consul Norbanus at Mount Tifata in Campania. Next year (82) he routed the son of Marius in a great battle at Sacriportus and entered Rome. The Marians struggled on for some time in various parts of the Roman possessions, but a battle at the Colline gate took the life out of all resistance in Italy. On his own recommendation S. was made dictator by the Senate, and continued in that position till 79, though during most of this time he kept up the forms of the constitution, and was annually elected to the consulship as well. Having got rid of all the leaders of the Opposition by the famous 'proscriptions,' S. proceeded to his remarkable re-establishment of the oligarchy. He filled up the thinned ranks of the Senate, making the principal ex-magistrates members *ex officio*; transferred to it the entire legal jurisdiction, which had formerly rested with the capitalists or *equites*; and generally increased the number of magistrates, and discriminated more clearly between civil and military functions. The censors' authority, many of the tribunes' chief powers, farming of revenues, largesses of corn, were abolished. Military colonies were established, and municipal constitutions granted to provincial towns. In 79 S. suddenly resigned his position, retired to Puteoli, spent his remaining days in artistic, literary, and lower pleasures, and died next year (78). For a vivid sketch of his habits and a striking analysis of his character and policy see Mommsen's *Römische Geschichte* (Eng. trans. by Dickson, vol. 3).

Sull'ivan, Arthur Seymour, an English composer, was born in London in 1844, sang when a child in the chapel-royal, and was educated at the Royal Academy of Music. At the age of fourteen he gained the Mendelssohn scholarship, enabling him to pursue his studies under the best masters at home and abroad. He composed the incidental music for the *Tempest*, performed at the Crystal Palace in 1862, and since that time his works have been many and varied. Among the most important are the cantatas of *Kenilworth* and *The Bride of Neath Valley*, a Symphony in E Minor, and two oratorios, *The Prodigal Son*, produced at the Worcester Festival in 1868, and the *Light of the World* (Birmingham Festival, 1873). He has also composed several bright and tuneful operettas, such as *Cox and Box*, *The Contrabandista*, *Trial by Jury* (perhaps his best work for the stage), and the successful two-act comic operas, *The Sorcerer* and *H.M.S. Pinafore* (1878). In the last three works Mr. W. S. Gilbert was his literary coadjutor. Mr. Sullivan is one of the most popular song composers of the day. He conducted the English concerts at the Paris Exhibition, and the Promenade concerts at Covent Garden, in 1878.

Sull'ivan's Island, an island at the N. side of the entrance to Charleston Harbour, South Carolina, 6 miles from Charleston. It is 6 miles long, but very narrow, and is a favourite sea-bathing resort. Upon it is situated Fort Moultrie, a position of importance during the civil war.

Sully, Maximilien de Béthune, Marquis de Rosny, and Duc de, was born at Rosny, of an old but impoverished Huguenot family, 13th December 1560, and at the age of twelve attended Henri de Navarre to Paris. He entered the Collège de Bourgogne, whose principal saved him from the St. Bartholomew, and in 1576 he fled with Henri to the Politique-Huguenot camp. The hope of obtaining from Anjou a confirmation in his ancestors' Netherlandish possessions made him follow that prince to the Low Countries (1581); but by 1585, having married meanwhile a wealthy heiress, he was back with his former master, doing good service against the League. In 1593 he counselled Henri, now Henri IV. (q. v.) as to his conversion; and four years later, favoured by Gabrielle d'Estrées, became his minister of finance. He found a chaos, and established order, not by far-seeing, philosophic methods, but by expedients like taxes on the necessaries of life and on official incomes, still more by his general thrift and terrible punishment of peculation. He further reformed the Arsenal, established a small but well-disciplined standing army, improved the public works, and withal was hated and feared by all men but the king, who trusted him with the conduct of the war in Savoy (1600), made him governor of the Bastille (1602), and raised him (1606) to be Duc de S. In Henri's assassination S. read his inevitable fall; and though the Queen-Mother and her court showed him all due respect, though Louis XIII. created him marshal (1634), he abstained from politics, his one attempt at mediation on behalf of the Huguenots (1621) proving unavailing. He died at the château of Villebon, near Chartres, 22d December 1641, having latterly busied himself with superintending the *Mémoires des sages et royalles Œconomies d'estat Domestiques Politiques et Militaires de Henri le Grand*, which, really printed at Sully in 1634, bears a feigned imprint, Amsterdam. This work, revealing the harsh uprightness and egotistical loyalty of its compiler, is of infinite value to the historian, and in its posthumous continuation (vols. iii.-iv. Par. 1662) occurs the 'splendidly-audacious scheme of a European Amphictyonic Assembly, a Christian Republic composed of fifteen states, from whose number Russia and Turkey should be excluded,' in which were foreshadowed the dreams of Napoleon III. See vols. i.-v. of Ranke's *Französische Geschichte* (2d ed. 1857-62), and vol. iii. of Kitchin's *History of France* (Oxf. Clar. Press 1877).

Sulmo'na, an old town of S. Italy, province of Aquila, in the Abruzzi, picturesquely situated on the Pescara, between two mountains, 35 miles S.W. of Chieti by rail. It has several old palaces with Gothic windows, and a town-hall of the 16th c., the façade of which is adorned with statues of popes. It manufactures paper, leather, dyes, &c. Pop. (1874) 12,594. The *Sulmo* of the Peligni, it was the birthplace of Ovid and his 'cool home abounding in water.'

Sulphocyan'ic Acid ($CNHS$), analogous in composition to Cyanic Acid ($CNHO$), is prepared by heating the sulphocyanide of mercury in a current of dry sulphuretted hydrogen, or hydrochloric acid gas, when the acid distils as a crystallisable colourless liquid. The mercury salt is obtained by precipitating a mercurous salt with sulphocyanide of potassium, which is formed when cyanide of potassium and sulphur are fused together. The potassium salt is a delicate laboratory test for ferric compounds, giving a deep-red colour to the solution.

Sulphovin'ic Acid, or Ethylsulphuric Acid ($C_2H_6SO_4$), is formed by the action of sulphuric acid upon alcohol, an action accompanied by a great evolution of heat. It forms sulphovinates, which are easily decomposed by heat. In the preparation of ether from alcohol and sulphuric acid, S. A. is an intermediate product if the temperature be under 100° C.

Sul'phur ($S = 32$) occurs abundantly in nature in the uncombined state, chiefly in volcanic regions. In combination with hydrogen it exists in many mineral waters, and is besides a constituent of numerous ores. Of the sulphides we have iron pyrites (FeS_2), copper pyrites (Cu_2S,Fe_2S_3), galena (PbS), blende (ZnS), cinnabar (HgS), and crude antimony (Sb_2S_3); and of sulphates the most conspicuous are gypsum ($CaSO_4 2H_2O$), heavy spar ($BaSO_4$), celestine ($SrSO_4$), Epsom salts ($MgSO_4,7H_2O$), and glauber's salt ($Na_2SO_4 10H_2O$). Sulphates are also found as a constituent in vegetable and animal albumen and similar products. Our supplies of S. come mainly from Sicily, where it is found uncombined in beds of blue clay, frequently associated with some native sulphate. The S. is separated from these impurities by distillation, and in the form of *rough* S., still contain-

ing some 3 or 4 per cent. of earthy impurities, it is imported. To separate this residue it is re-distilled, and the vapour is at once condensed as *flowers of S.* or *sublimed S.* upon the walls of a brick chamber. After some time the walls become sufficiently heated to melt the substance, which is allowed to collect and is then cast into wooden moulds, where it cools and forms *roll-S.* or *brimstone*. It is also obtained by ordinary distillation without sublimation, and in this form is preferred for the manufacture of gunpowder. Another important industrial source of S. is from iron pyrites, which when strongly heated parts with about one-fourth of its S. The distillation is effected in conical fire-clay vessels, through a perforated plate, at the smaller end of which the S. vapour passes. Each vessel contains 100 lbs. of pyrites, which yield 14 lbs. of S. Roasting copper pyrites is another effective method for preparing S., which when prepared thus generally contains a little arsenic. S. is also a waste product in the manufacture of Soda (q. v.). In this country vast quantities of S. are annually consumed in the manufacture of sulphuric acid, gunpowder, lucifer matches, vulcanite, and sulphurous acid (used for bleaching purposes). The total imports of S. into the United Kingdom for 1877 amounted to 1,085,614 cwts. (value, £317,596), of which 1,064,591 came from Italy alone, and 17,270 from Belgium. The vast S. beds of Iceland have not yet been utilised, but will probably become of great commercial importance in the future.

S. is a yellow, brittle solid, insoluble in water, but soluble in bisulphide of carbon, oil of turpentine, benzol, and to a slight extent hot alcohol. It inflames at a temperature of 260° C., burning with a pale-blue flame, and emitting the well-known pungent suffocating vapour, sulphurous acid (SO_2). It melts at 120° C., forming a pale-yellow limpid liquid, which darkens and grows viscous as its temperature is raised, till at 220° C. it becomes nearly black and as viscid as thick treacle. Heated still further, the liquid loses its viscosity and boils at 446° C. If the S. be then poured into cold water, it will form into tough elastic semi-transparent strings, the colour of which varies from a pale amber to a deep brown, according to the temperature of the previous liquid, the higher the temperature the darker the colour. If kept for a day or two, this modification of S. gradually becomes yellow, opaque, and brittle. If S. at 120° is poured into water, it falls in isolated drops, solidifying into yellow crystallised buttons of ordinary S. If S., heated till it is completely melted, is allowed to cool slowly, it forms into oblique prismatic crystals, of a transparent yellow hue, differing markedly from ordinary yellow octohedral S. Thus, prismatic S. fuses at 120° C., 5° higher than the corresponding temperature for octohedral S., while the specific gravities of these varieties are respectively 1·98 and 2·05. The prisms obtained by fusion gradually change to an opaque yellow, the particles of S. at the same time arranging themselves into minute octohedra. This structural change is accompanied by the evolution of heat. A fourth amorphous form of S., insoluble in bisulphide of carbon, is obtained as a grey, powdery-residue, when the hard solid mass which results from the cooling of the viscous S. is placed in bisulphide of carbon. All these forms may be distilled, and the distilled S. thus obtained is identically the same, whichever allotropic modification may have been used.

S. forms sulphides or sulphurets with hydrogen and the metals, corresponding in composition to the oxides. *Sulphuretted hydrogen*, or sulphide of hydrogen (H_2S), has already been mentioned as occurring in certain mineral waters. It has the characteristic odour of rotten eggs, from which it is evolved. For laboratory purposes, it is easily prepared by acting upon certain metallic sulphides with a strong acid; for instance, the sulphide of iron with sulphuric acid. Its solution is a useful test in analysis for certain metals, whose sulphide or hydrated sulphide is precipitated from the acidulated solution of the metallic salt which is being investigated. Among these are silver, bismuth, mercury, lead, copper, gold, platinum, tin, antimony, and arsenicum. The bisulphide of carbon (CS_2) is prepared on a large scale by driving S. vapour over glowing coke, and condensing in cooled receivers. It is a poisonous volatile liquid, boiling at 48° C., and giving off an extremely inflammable vapour. It is insoluble in water, but is itself a powerful solvent for oils and fats, and for S., iodine, bromine, and phosphorus. It has never yet been solidified. It combines with metallic sulphides, and forms unstable sulphocarbonates, analogous in constitution to the carbonates. S. forms two compounds with chlorine (S_2Cl_2 and SCl_2), both of which are decomposed by water. The former is a yellow liquid, the latter a red fuming liquid. With oxygen, S. forms two important compounds, sulphurous anhydride (SO_2) and sulphuric anhydride (SO_3). The former has been already mentioned as the sole product of the combustion of S. in air; but it is generally obtained by heating copper with sulphuric acid, when water and the cupric sulphate are obtained, and the heavy pungent gas given off ($2H_2SO_4 + Cu = CuSO_4 + SO_2 + 2H_2O$). It may be condensed to a clear liquid at − 10° C., and solidified at − 76° C. It is uninflammable, and readily extinguishes flame. In the arts, sulphuric anhydride is largely used as a bleaching agent for silk, straw, wool, &c., which would be injured by the more powerful bleaching agent, chlorine. The colour so destroyed may be restored by the action of an alkali or a stronger acid. Another of its uses depends upon its antiseptic properties, so that it is employed to check fermentation in cider and home-made wines. Sulphuric anhydride is also formed as a stage in the manufacture of sulphuric acid from iron pyrites, but is here mixed with a large proportion of nitrogen. Sulphurous acid (H_2SO_3), the solution of sulphurous anhydride in water, furnishes a series of salts known as the sulphites. According as the metal replaces one or both of the hydrogen atoms, we have the bisulphite or sulphite respectively. The sulphite of soda ($Na_2SO_3 10H_2O$), used by paper-makers as an *antichlore* in bleaching, is the most important, and is usually prepared by passing sulphurous anhydride over damp crystals of carbonate of soda, carbonic acid being evolved. *Sulphuric anhyride* (SO_3) may be prepared by bringing sulphurous anhydride and oxygen in a tube in the presence of heated platinum or certain metallic oxides, such as cupric or chromic. Its hydrate (H_2SO_4), known as *sulphuric acid*, is the most important of all acids, and is the basis of our chemical manufactures. It was discovered more than four centuries ago by the alchemist Basil Valentine, who obtained it by distillation of dry sulphate of iron or *green vitriol*, and called it *oil of vitriol* from its oily appearance. Thus prepared, the distilled liquid is a mixture of sulphuric acid and sulphuric anhydride, which latter may be partly disengaged by gentle heating, and is altogether expelled at 338° C., the boiling point of sulphuric acid. Thereafter the whole distils over without alteration. The distillation of sulphate of iron for the manufacture of sulphuric acid has been long conducted at Nordhausen in Saxony, and hence sulphuric acid so prepared is generally called Nordhausen sulphuric acid, and is readily distinguished by its fuming character from the English sulphuric acid, which is manufactured in a very different way.

In making sulphuric acid upon a large scale, sulphurous anhydride is first obtained by burning S. or iron pyrites in a current of air. The stream of heated gases then passes over a mixture of sodic nitrate and sulphuric acid contained in an iron pot, from which arise vapours of nitric acid. The mingled gases next pass into immense sheet-lead chambers, the bottom of which is covered with a shallow layer of water. The following action then takes place:—The sulphurous anhydride is dissolved, and the sulphurous acid quickly reduces the nitric acid to nitric oxide (NO), becoming itself oxidised to sulphuric acid. The nitric oxide, however, at once combines with the free oxygen present in the chambers, and becomes the peroxide of nitrogen (NO_2) which, in the presence of sulphurous acid and water, is speedily reduced to the nitric oxide again. Thus the series of reactions goes on until nothing but nitric oxide and nitrogen are left, and these pass off into the air by a flue. The sulphuric acid collected at the bottom of the chambers is concentrated by evaporation in shallow leaden pans till its specific gravity is 1·72. It is then the *brown* sulphuric acid of commerce, largely employed in making manures, and in Soda Manufacture (q. v.). Its further concentration is conducted in glass or platinum stills. At 338° C. it boils, has the composition H_2SO_4, and in this form can be no further reduced by heating. Its specific gravity is 1·842. It is a dense, oily, colourless, odourless liquid, is intensely caustic, and has a powerful attraction for moisture. When it is mixed with water, much heat is evolved. It is a strong acid, and forms an important series of salts called the sulphates, the chief of which are more specially considered under the corresponding metal.

Medicinal Properties of S. and its Compounds.—S. is officinal in three forms—namely, *S. sublimatum*, or flowers of S.; *S. lotum*, or washed S.; and *S. præcipitatum*, or precipitated S. S. is soluble in

the alkaline juices of the intestines, is capable of absorption, and has been detected in the milk, sweat, urine, and even in the breath. S. acts as a mild laxative, accompanied generally with much offensive flatus of sulphuretted hydrogen. Under its continued use the secretions are slightly increased, and it acts specially upon the skin and mucous membranes. S. is prescribed as a laxative in cases of hæmorrhoids and of chronic rheumatism; and as an alterative in sciatica, lumbago, and other varieties of muscular rheumatism, as also in various cutaneous affections. In the form of natural S.-waters, S. is used externally and internally in both rheumatic and skin diseases. S. is also used as a specific in cases of Itch (q. v.).

Sublimed S. may be given in doses of from 20 to 60 grains or more, as a laxative, in treacle or milk. The pharmaceutical preparations are *Confectio Sulphuris*, composed of sublimed S., 4 parts; acid tartrate of potash, 1 part; and syrup of orange peel, 4 parts;—dose, 60 to 120 grains. *Unguentum Sulphuris*, composed of sublimed S., 1 part, and benzoated lard, 4 parts. A S. electuary, known popularly as 'The Chelsea Pensioner,' consists of S., 6 parts; mustard, 6; powdered guaiacum, 3; rhubarb, 1½; nitre, 1½; with honey or treacle sufficient to make it into an electuary;—dose, a teaspoonful every alternate evening in cases of rheumatism.

Medicinal Properties of Sulphuric Acid.—Sulphuric acid is used in medicine externally and internally. Concentrated sulphuric acid is powerfully corrosive both of animal and vegetable tissues, abstracting the water and leaving the carbon untouched. When taken internally, sulphuric acid is absorbed into the blood, and is supposed to be converted into sulphates, and as such is eliminated by the lower bowel, the skin, and the kidneys. *Concentrated* sulphuric acid, mixed with finely-powdered charcoal so as to form a paste, is used as an escharotic; *diluted*, it is used as a stimulant and astringent in venereal and other indolent ulcers. *Internally*, sulphuric acid is prescribed in cases of night-sweats, and in profuse serous diarrhœas, and as a curative and prophylactic agent in cases of cholera. In cases of acute Lead-Poisoning (q. v.) sulphuric acid is an efficient antidote. Cases of accidental poisoning by sulphuric acid are not uncommon, and when such do occur, the best antidotes are chalk, magnesia, white-wash, and soap, which should be given freely in milk or water. Christison condemns the use of alkaline carbonates as in themselves irritating, but they may be given in cases of emergency.

Medicinal Properties of Sulphurous Acid.—Sulphurous acid is a powerful deoxidising, disinfecting, and antiseptic agent, and is most efficient in destroying the low forms of life which are connected with putrefaction and fermentation. It is a valuable agent for disinfecting purposes. In the form of spray, or as a lotion, sulphurous acid is applied in cases of diphtheria, sore-throat, bronchitis, wounds, ulcers, bed-sores, and burns, and also in cases of parasitic diseases of the skin. Sulphurous acid combines with bases, forming sulphites, bisulphites, and hyposulphites, which are used for similar purposes as sulphurous acid.

Sul'tan (Arab. 'power' or 'prince,' from *salita*, 'to be strong'), a title borne by various Mohammedan monarchs, *e.g.*, of Borneo and Zanzibar, but specially by the ruler of the Ottoman Empire, the *Sultân as-salâtin*, 'ruler of rulers.'

Sultanpore' (*Sûltânpûr*), the chief town of the district of the same name in Oude, British India, on the Gumti River, 92 miles S.E. of Lucknow, and 59 N. of Allahabad. Pop. (1869) 5708. It was formerly the capital of the Bhars, an aboriginal tribe expelled by the Mohammedans, but it is now decaying. The military cantonments lie on the opposite side of the river. During the Mutiny of 1857, the sepoys rose and murdered their officers and the civil officials, but the women had been sent beforehand safe to Allahabad. The *district* of S., which stretches S. along the Gumti River, has an area of 1701 sq. miles; pop. (1869) 1,000,336. The products are wheat, rice, and inferior grains.

Sulu' Islands, an archipelago of 150 small islands, extending from Borneo to Mindanas, and having an aggregate area of 977 sq. miles, and a pop. of 200,000, who are mainly Malays, much given to piracy. The chief island, Cagayan-Sulu, is 36 by 12 miles, and contains Soog (pop. 8000), the sultan's residence, and the great slave-market of Malaysia. The S. I. yield rice, sugar, coffee, spices, teak, &c. The sultan, who is independent, and also holds the S. half of Palawan and the N. part of Borneo, contracted a treaty of protection with a European power in 1878.

Su'mach (*Rhus*), a genus of shrubs or trees with a resinous, sometimes viscous-milky, often caustic juice, widely distributed through the temperate countries of both hemispheres (especially plentiful at the Cape and in N. America), more sparingly within the tropics, and absent from Australia. Most of the species possess poisonous properties; some yield valuable economic products. *R. Coriaria*, the tanner's S., is a shrub or small tree of countries round the Mediterranean and Persia, and is cultivated on a large scale in Sicily for its leaves—known commercially as S. For the first year's gathering the leaves are hand-picked from the carefully pruned young plants of the S. plantation; in subsequent years they are removed attached to the cut branches, which after being dried are threshed, and the leaves are either packed whole, or are ground into powder in a vertical mill. S. is employed extensively for tanning the finer kinds of leather, and has been so used for a long period. The leaves and twigs, fruit and roots, and the bark, furnish black, red, and yellow dyes; the acid fruit is eaten as a condiment by Turks and Persians; and the seeds and leaves are used medicinally. In 1877 the S. imported into Great Britain amounted to 13,409 tons, valued at £224,862, of which Italy alone sent 11,994 tons. *R. cotanus*, called Venetian S., Scotino, and the wig-tree (from the mass of abortive pedicals resembling a white wig), is also a Mediterranean species, extending eastwards (as *R. velutinus*) to the Himalayas. It furnishes the 'young fustic' of commerce. (See FUSTIC.) The crimson downy fruit of *R. glabra* of N. America is officinal in the United States pharmacopœia, as producing a cooling drink; its acidity is due to malic acid and bimalate of lime. *R. tiphina*—the staghorn S.—also N. American, extending N. to Canada, yields from incisions in the bark a kind of copal; the leaves can be used like ordinary S. for tanning. Of *R. semialata*, a native of India, China, and Japan, the fruit-pulp is used in medicine, and galls peculiar to this species are an article of trade. *R. succedanum* is a tree of the same three countries. In Japan its seed is crushed, boiled, mixed with the fruit of some other tree (species not known), and pressed while hot. The result is a beautiful vegetable wax of snow-white colour, from which candles are made. This substance has been introduced into the English market, and it has given to the tree the name of the 'Japan wax-tree.' The 'Japan varnish-tree' (*R. Vernix* of Linnæus) yields the famous lacquer so extensively employed in that country for lacquering articles of furniture, &c. It exudes as a milky-white juice from wounds made in the tree, becoming ultimately black by exposure. The juice of the leaves of this species is highly corrosive, blistering the skin in a dreadful manner; great caution is therefore necessary in collecting the varnish. Candles are made of the wax surrounding the fruit. Of other poisonous species the best known are *R. toxicodendron* and *R. venenata*—the 'poison oak' and the 'poison ash' of N. America. The first, with its variety *R. radicans*, occurs in moist woods from Canada to Carolina, westwards to the Rocky Mountains; the second grows on the margin of swamps from New York to Georgia. Both are very poisonous to persons of peculiar constitutions, causing painful distress even by their emanations, and if handled, resulting in 'swelling of the hands, arms, or sometimes the whole body, accompanied with intolerable pain and inflammation, and ending in ulceration.' Tincture of lobelia allays the irritation. The leaves of *R. toxicodendron* have, however, been used in palsy and cutaneous diseases, and it supplies a homœopathic medicine for rheumatism.

Sumar'okof. See RUSSIAN LANGUAGE AND LITERATURE.

Sumat'ra (Arab. *Srimata*, 'the happy'), the third largest island in the world and the most westerly of the Sundas, is separated by the Strait of Malacca from the Malay Peninsula, from which it stretches in a south-easterly direction, extending for an almost equal distance on either side of the equator. Area, 169,538 sq. miles; pop. estimated at 2,000,000, comprising, besides the native Malays, some Chinese and other Asiatics, and 25,000 Europeans, mostly Dutch. With an extreme length of 1040 miles and a breadth of 265, S. is traversed by a mountain range, the Boukit Barissan, which culminates in Mount Ophir, or Telaman Peak, 9655 feet high, nearly under the equator. This chain runs nearer the W. than the E. coast, and is connected by lofty plateaux with a lower lateral range. The only true highland region in S. lies near its centre, where several ranges converge, and where there are at least six volcanoes. This central region was explored by an expedition despatched in

May 1877 by the Dutch Geographical Society, and its mountains were found to be covered with dense vegetation. Spurs from the main ridge in various places reach the W. coast in beetling cliffs, but for the most part the coast-lands are low, alluvial plains, densely covered with jungle. The geology is wholly unlike that of Java, the prevailing rocks being granite, syenite, gneiss, mica slate, and red sandstone. There are many fine lakes, of which the largest, Singkarah or Sarawang, in Upper Padang, has a length of 17 miles. In the S.E. the island is specially rich in streams, some of which are navigable far inland even for large vessels. These streams, which carry down large quantities of mud, are linked together by natural branches and artificial cuttings, and on their banks, amid luxuriant vegetation, stand the towns and villages. Like Java and Borneo, the level of the whole island is slowly but steadily rising. Except in the malarial plains along the W. coast, the climate is considered healthy. On the coast the heat varies from 82° to 86° F., and in the highlands from 64° to 73° F. at an elevation of from 2500 to 3000 feet. While the monsoons are somewhat irregular, the dry seasons lasts N. of the equator from October to May, and S. from April to October. The natural products of S. are more varied than those of any other island in the archipelago. Its minerals comprise gold, iron, copper, tin, brown coal, &c., and its vegetable growth is specially exuberant. Rice is the chief food, then sago, beans, and roots. The palatable fruits include the mangosteen, durian, rambutan, rambei, guava, citron, orange, lemon, bread-fruit, pomegranate, melon, and pisang; and many of these cannot be acclimatised elsewhere. The *Sideroxylon* (*Kayu-besi*, 'iron-wood'), an admirable substitute for teak, yields the best timber for shipbuilding. There are many varieties of palms as well as satin-wood, ebony, Djati (*Tectona grandis*), the silk-cotton tree, &c. Chief among the commercial plants are cotton, black pepper, caoutchouc, benzoin, guttapercha, various dyestuffs, and camphor. The forests are luxuriantly festooned with many-hued parasites, of which perhaps the most interesting is the unique Rafflesia (q. v.). The Dutch have introduced coffee, tobacco, cacao, and nutmeg, but the plantations of the last do not thrive. The fauna includes the elephant, rhinoceros, tiger, panther, bear, and tapir. Other animals in S. are the orang-outang and other apes, the buffalo, a small hill-horse, goats, sheep, peacocks, and pheasants. The rivers, in which are found the hippotami and crocodile, abound in salmon and other fish. Besides rice, S. exports pepper (from Atcheen alone 7000 tons), benzoin, gums, resins, rattans, cottons, dyestuffs, tobacco, ivory, edible nests, &c. In 1876 there were 1261 miles of telegraph throughout S., and 64 miles of submarine cable connecting it with Java. The Dutch now possess more than half the whole area, with a pop. of 1,630,000. This part consists of the government of the W. Coast, with its capital Padang (q. v.), the Residencies of Bencoolen (q. v.), Lampong, and Palembang (q. v.). Holland also exercises authority over the kingdoms of Jambi, Indragiri, and Siak, and the minor states of Arsahan, Deli, Serdang, &c., on the E. coast. Independent states are Atchin (q. v.), Battak, and Korintji; the natives of the last two, though cannibal, are peaceful and enterprising. S. is regarded as the cradle of the Malay race, and the uncivilised Orang-Koabos, who live in a primitive manner in the forests of the N.W. of Palembang, are probably a remnant of the aborigines. The Malays, who are Mohammedans, write their sonorous language with Arabic letters, and have a comprehensive literature. The Battaks are fetish-worshippers. The remains of Hindu temples, and the presence of Sanskrit words, indicate that the relation with India must formerly have been intimate. Marco Polo landed here in 1290, and was followed by the Portuguese under Alvarez Talesso in 1506, and by the Dutch in 1597. The English held possessions on the W. coast, which were returned to the Dutch in 1783; they again occupied part of S. from 1811 to 1824. The Dutch extended their hold greatly in 1819-45, and by a war with Atchin, 1839-40, made that state an inveterate enemy. The wording of the treaty of 1824 left it uncertain whether England could lay claim to Atchin, but when all dubiety was removed by the treaty of 1871, the Dutch at once declared war against the natives on account of maladministration and piracy. The war, unsuccessful at first, has been carried on with great vigour since Van Swieten received the command in 1873, but the country has not yet been subdued (December 1878). See Müller, *Bydragen tot de Kennis van S.* (Leyd. 1846); Ridder de Stuers, *Vestiging en uitbreiding der Nederlanders ter Westcust van S.* (Amst. 1849); and Petermann's *Mittheilungen* (January and July 1878).

Sumba'wa, one of the lesser Sunda Islands, to the E. of Java, is separated in the W. by Allass Strait from Lombok and on the E. by Sappi Strait from Flores. Estimated area, 6000 sq. miles; pop. 90,000. It is mountainous and volcanic, and yields gold, sulphur, saltpetre, rice, Indian teak (*Tectona grandis*), sapanwood, tamarinds, and a fine breed of horses. The volcano Tamboro, which is still active, burst forth on the 11th April 1815, spreading desolation on every side. The mountain sank from 14,000 feet to 8940, the sea rushed inland, ashes were thrown as far as Sumatra, 840 miles distant, and the number of lives lost is variously estimated at from 12,000 to 42,000. Other but less deadly eruptions took place in 1836 and 1860. S. is divided into six native states under Dutch authority—namely, Tamboro and S. in the N., Bimba in the E., where the Dutch governor resides, and in the S. and W. Dompo, Papekat, and Sangar—whose inhabitants, closely allied to those of the Celebes, are peaceful and industrious.

Sumbulpur' (*Sambalpur*), the chief town of the district of the same name, Central Provinces, British India, on the left bank of the Mahanuddi river, 340 miles E. of Nagpur; pop. (1872) 11,020. The town has lately been much improved. It contains several old temples.—S. *district*, which occupies the extreme E. of the Central Provinces, has an area of 4407 sq. miles; pop. (1872) 523,034. In 1875-76 the exports were valued at £33,000, chiefly piece-goods, lac, salt, opium, and spices; and the imports at £39,000, chiefly rice and other grains, sugar, country cloth, metals, *ghee*, and oil. The only manufacture is the weaving of tussar-silk cloth. The climate is unhealthy. S. forms the centre of a numerous group of feudatory states, of which Kharond is the chief. The direct line of the old Rajahs of S. expired in 1849, when the country was annexed.

Summ'ary Dil'igence, in Scotch law, means issuing execution on a legal document without previous action, as on a bill of exchange by notarial protest.

Summ'er Duck (*Aix sponsa*), a species of American Duck (q. v.) very common in the United States, allied to the Mandarin duck, or Chinese teal (*Aix galericulata*), the colour of the plumage being very similar in summer. The hinder toe is not united by membrane to the other toes. The S. D. perches on trees, like the Chinese teal, and appears to make its nest in tree hollows. It migrates southwards in winter.

Summ'er Islands, a group of twenty islets off the W. coast of Scotland, near the mouth of Loch Broom, an inlet in Ross-shire. The largest, Tanera, is 2 miles long, and has about 100 inhabitants. The others are tenantless.

Summ'ons, in the United Kingdom, is a legal writ directed to a party, calling on him to appear in court, to answer to some charge. In criminal cases, the writ is called a Warrant (q. v.).

Sum'ner, Charles, an American statesman, born at Boston, 6th January 1811, graduated at Harvard in 1830, studied law under Judge Story, and was admitted to the bar in 1834. He edited the *American Jurist*, published 3 vols. of Story's *Decisions*, lectured on law at Harvard in 1835-37 and again in 1843, and annotated Dunlop's *Admiralty Treatise* (1836). He never acquired or even sought much bar practice, and spent the years 1837-40 in a European tour, being received with flattering distinction in England, France, and Germany. On his return he edited, together with J. C. Perkins, 20 vols. of Vessey's *Reports*, and in 1845 delivered the Boston Fourth of July oration, which Cobden pronounced 'the noblest modern contribution to the cause of peace.' His protest against the admission of Texas to the Union (1845), and opposition to the subsequent war with Mexico, turned the tide of his popularity, and his desertion of the Whigs for the Free-Soil party, which he helped to form, led to a determined effort on the part of his opponents to 'crush him, socially and professionally.' But fearlessly he took up a decided anti-slavery position, and by a Free-Soil and Democrat coalition was elected senator for Massachusetts in 1850. In 1852 he began his anti-slavery crusade with an argument for the repeal of the Fugitive Slave Law, and a phrase in the speech, 'freedom national—slavery sectional,' became the watchword of his party. In his able two-days' speech on 'The crime against Kansas' (1856) he made a gross attack on several

senators, on account of which he was challenged but refused to fight, and eventually, after due warning, was severely caned in the Senate by Preston S. Brookes. S. now became the martyr of Abolition, and was applauded in New England and fêted and caressed in Europe, where he sought repose during an illness which lasted nearly four years. He had been unanimously re-elected by Massachusetts in 1857, and returned again in 1863. He spent his last 23 years in active Senatorial warfare. Chairman of the Committee on Foreign Relations from 1861 till 1871, he was the actual leader of the Senate for many years, and as such he opposed the renomination of Grant, and gave his support to Horace Greeley. Having led the Republicans into some of their wildest schemes, in particular having projected the Civil Rights Bill (1873), which attempted to force personal association and social equality with the negro on the Southern people, S. quarrelled with his party on issues never distinctly understood, but well known to arise out of disappointed personal ambition rather than political difference. Keen in debate and pure in motive, he was certainly ill-treated by the party which his passionate temper was constantly endangering. He died 11th March 1874. His Collected Works were published at New York in 12 vols. 1870 *et seq.* See *Memoir and Eulogies*, edited by Dr. Cornell (Bost. 1874), and *Memoir and Letters* by E. L. Pierce (2 vols. Lond. 1878).

Sump'tuary Laws, designed to restrict private expense (Lat. *sumptus*) in matters of food, apparel, &c., were passed in Greece by Lycurgus (*circa* 850 B.C.), and Zaleucus (450 B.C.); whilst at Rome the chief enactments of the kind were the Lex Oppia (213 B.C.), Lex Orchia (181 B.C.), Lex Fannia (161 B.C.), Lex Æmilia (78 B.C.), &c. In England S. L. commenced with 37 Edward III., and ended with 1 Philip and Mary, since which time political economy, confining the action of government to the protection of life and property, has left the individual free to decide in matters solely relating to himself. Hallam has pointed out that while the kings of France and England multiplied laws about the food and dress of their subjects, they were themselves more egregious spendthrifts than any others in their dominions, and contributed far more by their love of pageantry to excite a taste for dissipation in their people than by their ordinances to repress it (*Middle Ages*, ch. ix. part ii.).

Sum'ter, Fort, a strong fortification constructed on a shoal on the S. side of the entrance to the inner harbour of Charleston, S. Carolina, notable as the scene of the first conflict in the American Civil War. On the formal secession of S. Carolina, December 20th, 1860, F. S. was occupied on behalf of the United States Government by Major Anderson with two companies of artillery, amounting in all to 75 men. The fort was at once blockaded by the Confederates, but the little garrison held out until the month of April. On the 12th of that month fire was opened upon the fort by the Confederate artillery; on the afternoon of the 13th terms were arranged; and on the 14th the garrison marched out with the honours of war. Sherman in turn forced the Confederate garrison to evacuate the fort, and the United States flag was again hoisted, April 14, 1865.

Su'my, a town of Russia, government of Kharkov, on the Psol, a feeder of the Dnieper, 92 miles N.W. of Kharkov. It has a great annual fair. Pop. (St. Petersb. Cal. 1878) 14,126.

Sun, The, to an observer on the earth, has two apparent motions, which are caused respectively by the earth's rotation on its axis and its revolution in its orbit. The former diurnal motion is common to all celestial objects; the latter annual motion is peculiar to the S. In virtue of it, the S. appears to describe a great circle in the heavens known as the Ecliptic (q. v.), passing in regular succession through twelve arbitrarily chosen portions called the signs of the Zodiac (q. v.). In reality, it is the earth which moves in an elliptic orbit round the S. which occupies a focus. See ELLIPSE. The semi-major axis of the orbit or the mean distance of the S. from the earth is, according to the latest results, about 92,400,000 miles; and the eccentricity is ·0167712 of this semi-major axis. To determine as accurately as possible this mean distance is one of the most important problems in astronomy, and has occupied the attention of astronomers of all ages. It is the astronomical unit, in terms of which all other great astronomical distances are expressed; and these cannot be absolutely known till it is. This distance, however, is so great compared to the earth's radius, that the sun's parallax, *i.e.*, the angle which the earth's radius would subtend to an observer on the S., is far too small to be directly measured. In fact, the difference in the apparent positions of the S., as viewed by two independent observers at the extremities of the longest possible base-line, the earth's diameter namely, is barely appreciable to our most delicate modern instruments, infinitely less so to the naked eye, to which the ancient astronomers could alone trust. Consequently the estimates of Aristarchus and Ptolemy were very erroneous, and far too small. Kepler and his contemporaries were fully aware of this, but could only guess at the value. Huyghens, calculating what the apparent diameters of Venus and Mars would be as viewed from the sun, and assuming the earth's apparent diameter to be intermediate to these, deduced 99,000,000 of miles as the sun's distance—a remarkably close approximation. Not till 1672, however, was a really trustworthy estimate made, by observation of Mars during its opposition. The *relative* distances of the planets from the S. are easily obtained by means of Kepler's laws, so that if the parallax of one of the nearer planets can be directly determined, the parallax of the S. follows immediately. Mars and Venus, when they come nearest the earth, are the only really suitable planets for the purpose. Now Mars is nearest at opposition, and Venus when it is between the earth and S. In this position, however, Venus is generally invisible, unless it happens to come exactly in the line of the earth and S., when it will appear as a round black spot upon the sun's disc. This *transit* of Venus occurs only four times during 243 years, and consequently, this being the most accurate method we have for directly determining the sun's distance, the importance of carefully observing the phenomenon cannot be over estimated. From the transit of 1769, Encke in 1824 calculated 8″·57 as the solar parallax, a value which passed unquestioned for 30 years, when Hansen, to account for discrepancies in his lunar tables, had to increase the parallax by 1-30th of its entire amount. The observations of the 1874 transit have not yet been reduced; but the conclusion that Encke's distance is too large is supported by the values deduced from recent oppositions of Mars, the Aberration (q. v.) of the stars, and the velocity of Light (q. v.). According to Newcomb, the most probable value of the sun's parallax is between 8″·82 and 8″·86. Taking the sun's distance then at 92,400,000 miles, its mean apparent diameter (32′ of arc) gives 860,000 miles as its absolute diameter. In volume it is equivalent to about 1¼ million times the volume of our earth; but its mean density is only ¼ of that of the earth. It rotates round its axis in from twenty-five to twenty-six days, as is shown by the motion of the *spots*, which are rarely absent from its face. These spots were first observed by Fabricius of East Friesland (1611), and by Galileo (1612), and made the object of continuous scrutiny by Schwabe (1826-51), who established a periodicity in their frequency. Every ten and a half years the frequency of S.-spots attains a maximum, falling off during the interval to a minimum, from which it recovers gradually to the next maximum. This S.-spot periodicity has become of great interest within late years, from its probably intimate connection with meteorological phenomena. There seems no doubt that the frequency of magnetic disturbances and auroras follows the same periodic law, corresponding in its maxima and minima to that of the S.-spots; and there is a strong probability that Indian famines and tropical cyclones, and even commercial crises in this country (see *Nature*, vol xix., November 14, 1878), are subject to exactly the same periodicity. When it is borne in mind that the S. is the great source of heat and light, without which atmospheric changes would be very limited, and life, as we know it, would be impossible, such a connection need surprise none; while to characterise attempts to establish such a connection as an absurdity is, to say the least, essentially unscientific. The spots consist usually of two parts, a dark central portion (the *umbra*), surrounded by a brighter annular portion (the *penumbra*). They assume the most fantastic shapes, and are frequently many thousands of miles in diameter. Before discussing their nature, however, we must first consider the composition of the S., as revealed by the spectroscope.

Of the dark lines which cross the solar spectrum (see SPECTRUM ANALYSIS), a few, as proved by Brewster, are due to absorption by our own atmosphere; but the vast majority are truly solar, caused by the absorptive action of the gases constituting the outer and cooler envelope of the S. upon the light emitted by the *photosphere*, the name given to the luminous uniform disc upon which the spots appear. The continuous nature of the spectrum proves the S. to be a glowing opaque body, probably

highly compressed gas; and from the absorption lines we learn that the outer envelope of gases is composed of hydrogen, nitrogen, and the vapours of iron, nickel, cobalt, copper, sodium, potassium, lithium, calcium, barium, magnesium, chromium, manganese, titanium, &c., probably arranged from within outwards to a certain extent according to their densities. At a total eclipse, the outer stratum of the envelope from which spring the rose-coloured protuberances which fringe the moon's dark limb is visible, and gives a spectrum consisting of three bright lines. These lines, two of which corresponding to hydrogen, and one to an unknown substance called provisionally *helium*, appear as absorption lines in the sun's spectrum; and this *reversal* at the moment of totality, proves the *chromosphere*, as Lockyer calls this outer shell, to be self-luminous. After totality had ceased at the eclipse of 1868, Janssen, who was stationed in Further India, continued to see these bright lines in relief against the solar spectrum. That this should be possible had been concluded by Lockyer two years before, but for want of a suitable spectroscope he had been unable to *see* the bright lines until a few weeks after Janssen had seen them. By employing a sufficiently dispersive spectroscope, the continuous spectrum is drawn out with growing faintness, while the bright chromosphere lines are simply displaced without fading, so that they are at length made to stand out against the fainter background. The protuberances or flames are now a subject of continual study to solar spectroscopists. Outside this chromosphere lies the *corona*, a silvery luminosity which is only visible during total eclipses as a solar appendage. It gives a faintly continuous spectrum crossed by several *bright* lines; and hence the corona shines partly by reflected light, partly by self-luminosity. One of these bright lines (in the green) is persistent at distances from the sun at which the others (the hydrogen lines) have disappeared, so that here we have an unknown substance lighter and even simpler optically than hydrogen. The behaviour of the spots as viewed by the spectroscope is very extraordinary. It is impossible here to enter into details: enough to say that these spots are more absorptive than the photosphere generally, and that the vapours which fill the contiguous region are subject to rapid motions, as proved by the displacement of the spectrum lines (see STARS). In certain cases a rapid downrush of colder gas has been accompanied by as rapid an uprush of warmer gas, so that in S.-spots we have probably grand cyclonic storms, an hypothesis supported by the fact that the spots are very much restricted to two zones lying near the equator on opposite sides of it. A word in conclusion as to the source of the S.'s radiant energy. It is, of course, a cooling solid, whose high temperature has been due partly to its contraction from its probably original nebular condition, partly to the incessant rain of meteors which pour upon it from all sides. Tracing its life-history backwards, we see it growing and growing in dimensions until it embraces the whole system in the nebular unity from which it has developed. From the general discussion of the proper motions of the fixed stars, it has been established by Herschel, Struve, and others, that the S. has a definite motion in space towards the region at present occupied by the constellation Hercules. The chief authorities on the subject are *Researches in Solar Physics*, by Balfour Stewart, De la Rue, and Loewy (1865-66); *The S.*, by Proctor (1871); *Solar Physics*, by Lockyer (1874); and *Le Soleil*, by the late Father Secchi (1875-77). See also Tait's *Recent Advances* (1876) and Newcomb's *Popular Astronomy* (1878).

Sun and Fire Worship is one of the principal and earliest forms of nature worship. When Divine powers came to be imagined as personages, fire, which attracted man's attention both by its mysteriousness and its usefulness, was one of the first to be personified. It is the god Agni (*agni*, Lat. *ignis*, from root *ag*, 'to shine') of the Vedas, which contain the earliest religious conceptions on record. In the same way the sun was personified and worshipped as a sun-god, who is one of the principal deities in almost all primitive religions, *e.g.*, the Hindu Indra, Egyptian Osiris or Serapis and Ra, Greek Apollo, Helios, Dionysus, and Herakles, Roman Janus and Bacchus, Phœnician Baal and Adonis, Syrian Tammuz, Semitic Molech, Milcom, Babylonian Izdubar, Ur-bel, and Sandon, Scandinavian Odin, &c. But some nations continue to worship the shining orb of the sun and fire without the intervention of any deity. The sun was worshipped in this way notably by the ancient Peruvians and Mexicans, and fire by the ancient Persians. See PARSEES, M. Müller, *Introd. to the Sci. of Rel.* (Lond. 1873); Cox, *Myth. of the Aryan Nations* (Lond. 1870).

Su'nart, Loch, an arm of the sea in the W. of Argyllshire, extending E. from the Sound of Mull for 18 miles, with a breadth of from 3½ miles to ⅗ths of a mile.

Sun Bird (*Nectarinia*), a group of *Tenuirostral* birds, occupying in the Old World the place of the Humming Bird (q. v.) in the New World, and rivalling the latter in the iridescent glow of its plumage. It feeds on insects and flower-juices. The female loses its brilliant plumage after the breeding-season. Of the group the fiery-tailed S. B. (*N. ignicauda*) of India, the greater collared S. B. (*N. afra*), the collared S. B. (*N. Chalybeia*), the Javanese S. B. (*N. Javanica*), and blue-headed S. B. (*N. cyanocephala*), are familiar species.

Sun'da Islands, a large group in Malaysia, comprising Sumatra (q. v.), Java (q. v.), Timor (q. v.), and a chain of smaller islands stretching between the last two, belonging almost entirely to the Dutch. The Sunda Sea, between Java and Borneo, is connected with the Indian Ocean by the Sunda Strait, a channel about 90 miles wide, separating Java from Sumatra.

Sun'day. See SABBATH and LORD'S DAY.

Sun'day-Schools at first were simply schools meeting on Sunday, differing in nothing from other schools except that they assembled on the first day of the week; gradually, however, instruction came to be confined to the Bible, teachers ceased to be paid, and the organisation became a branch of the general Christian system for providing the people with religious instruction, as affording a means for systematic catechising on the truths of Scripture.

I. *History.* (1) *The United Kingdom.*—Though individuals at all times of the Church's history arose here and there to give instruction to children in Bible truth on Sundays, of whom Cardinal Carlo Borromeo of Milan is perhaps the most celebrated, S.-S. as an *organised* Christian effort for the religious education of youth owe their origin to Robert Raikes (q. v.). In 1803 the Sunday-School Union, chiefly composed of Dissenters, was formed; it was followed in a few years later by a similar Church Society. In Wales S.-S. were introduced in 1785 by the celebrated Methodist preacher Charles, and produced the insatiable demand for Bibles in the vernacular which led to the formation of the British and Foreign Bible Society in 1804. In Scotland the system of family catechising had already provided in large measure for the adequate training of the young, but as early as 1782 some ladies set up a small school on Raikes' principle, and in 1797 a gratis Sunday-School Society was formed in Edinburgh. For many years S.-S. were much opposed by the Church authorities; but at length the great name of Chalmers won credit for the system, and the high standard of religious knowledge characteristic of the country soon showed its influence in the zeal and efficiency of the Sunday-school teachers. In Ireland, S.-S. were introduced in 1786, and a Sunday-School Society established in 1816. According to the last returns (1878), the number of children under instruction in S.-S. in Scotland are 407,329, with 44,591 teachers. For England and Wales the figures (1876) are, for the Sunday-School Union, 951,000 scholars, and 103,600 teachers, and for the Church of England Sunday-School Institute, scholars 314,298, and teachers 28,875.

(2) *The United States.*—S.-S. were introduced here as early as 1786, and five years later the first society was established at Philadelphia, under the presidency of Bishop White. In 1803, three ladies opened the first Sunday-school in New York city, which led to the formation in 1816 of the New York Sunday-School Union, and ultimately in 1824 to that of the American Sunday-School Union, whose 63,793 schools had 2,745,610 pupils, and 419,796 teachers in March 1876. The peculiarities of the American Sunday-school system are best seen in the far western States. There, as soon as a small settlement of three or four families is formed, a Sunday-school is set up. This forms a rallying-point for any religious zeal there may be in the little community; and as the settlement grows so does the Sunday-school, till the people are numerous enough and rich enough to build a church and call a pastor. But still all classes and all ages continue to attend the Sunday-school, by means of which the minister gets more directly at his people, and the people become more

intimately associated with each other. More or less this description holds true of all American S.-S., the interest in which is kept up throughout the country by means of conventions, jubilee celebrations, services of song, &c., to an extent unlike anything in England.

(3) *Continent of Europe.*—In almost all the Protestant countries of Europe S.-S. have been voluntarily introduced; in Germany in 1824 by Onken at first in connection with the Sailors' Service at Hamburg; in the Netherlands by Dr. Capadose in 1837; in Sweden by Palmquest in 1857; in Switzerland Sunday-school societies exist both in the French and German-speaking parts, having been greatly quickened about 1850 by the efforts of Mr. Woodruff, an American gentleman, who has done more for this cause on the Continent than any other individual labourer. In Roman Catholic countries S.-S. have been used extensively as a missionary agency, and in this form they have done much good in France, Italy, Spain, and parts of Austria. In Russia even beginnings have been made. Of S.-S. in the colonies and at mission stations among the heathen but little need be said; in both the system has been found admirably adapted for maintaining an interest in religion where it is apt to be lost, and for imparting the seeds of divine truth in the hearts of the ignorant.

II. *Organisation.*—In this country S.-S. are divided into Congregational and Mission S.-S., the latter being planted among the more neglected portions of the population, and very much corresponding to Ragged Schools (q. v.). As a rule both are in connection with some congregation, though latterly attempts have been made to establish them on a broader basis. In America the Sunday-school is not so much a distinct agency supported by a given congregation as one form in which for special purposes the entire congregation appears. Besides systematic instruction in the Bible, with which is often joined some Church Catechism, by a staff of teachers headed by a superintendent, from a very early period Sunday-school libraries were established, and have exercised an immense influence for good over the land, besides calling into existence quite a special form of literature; and to this has more recently been added special training in music, the effect of which also has been found most beneficial. For teachers the only provision made in this country is the publications of the various Sunday-school societies, Conventions on the American system, and occasional lectures on teaching; in America they can be trained at regular Institutes established for that purpose. For quickening the churches generally and encouraging isolated workers, the services of a paid travelling agent, now appointed for Scotland, have been found invaluable.

Information as to the history and working of S.-S. is nowhere accessible in a convenient form. Besides the reports of the various societies and church committees, see Watson's *First Fifty Years of the Sunday School* (Lond. N.D. about 1862); Pardee's *Sabbath School Index* (Nisbet, 1868); Tiesmeyer's *Die Praxis der Sonntagschule* (Barmen 1874); and Gregory's *Life of Robert Raikes* (1877).

Sundeep (*Sandwip*), an island at the mouth of the Meghna, the principal mouth of the Brahmaputra, included within the district of Noakolly, Bengal, British India. Area, 420 sq. miles; pop. (1872) 87,016. It is of recent alluvial formation, and liable to be swept by floods. By the disastrous cyclone of 31st October 1876 one-half the population is estimated to have perished either of drowning or subsequent cholera. The crops are rice and betel-nuts. In the 17th c. it was notorious as the home of Portuguese pirates, who devastated all the river coasts of Bengal; and up to a late period lawlessness has prevailed, owing to the difficulties of communication with the mainland.

Sun'derbunds, The (*Sûndarbans*), a wild tract of forest and swamp, which terminates the sea face of the delta through which the united streams of the Ganges and Brahmaputra find their way into the Bay of Bengal. The area is variously estimated at from 7532 to 5570 miles, according as the more settled portions are included or not. The former is the area under the commissioner of the S. The districts of the 24 Pergunnahs, Jessore, and Backergunge form the N. boundary. The population is very sparse; both rice-cultivators and woodcutters come only for the season. There are many Mughs, or immigrants from Burmah. The name is probably derived from the jungles of *sundri* trees, which are much used for boat-building. There are frequent signs of pre-existing settlements; and now, under the inducement of liberal land rules, cultivation is again extending. The firewood annually exported to Calcutta is estimated at 300,000 tons. Tigers are very numerous, as also rhinoceroses and other wild animals. The climate is very dangerous to Europeans; and partly from this cause the settlements at Morrell Gunge and Port Canning have proved failures. Through various natural and artificial channels of the S. is conveyed about half the enormous boat-traffic which Calcutta carries on with E. Bengal. In 1876-77, 130,000 boats were registered as passing Khulna.

Sun'derland, a seaport of England, county of Durham, on both banks and close to the mouth of the Wear, 13 miles N.E. of Durham and 274 N. of London by the North-Eastern Railway. The parliamentary borough includes the conterminous suburbs of Bishop-Wearmouth on the S., and Monk-Wearmouth and Southwick on the N. side of the Wear. The High Street is about a mile long, and separates Fawcett Street from Bridge Street, the latter of which crosses the Wear by an iron bridge of one arch, repaired and widened by Robert Stephenson (1858) at a cost of £40,000. Costing originally £33,400, this bridge, opened in 1796, has a span of 236 feet, and a height of 100 at low water. A new high-level bridge, erected by the N.-E. Railway Company, is 100 feet high and 300 long. The older, low-lying parts of S., though much improved since 1855, are still in a defective sanitary state, and an application was made to the Local Government Board for power to borrow £26,000 for the extension of the drainage system in December 1878. S. has several good public buildings, two theatres, a large infirmary (1867), a spacious workmen's-hall (1868), a subscription library with lecture theatre (1878), a central railway station (1879), three new banks, and a public library and museum (1879), while tramways were laid down in 1879. S. Park, which was enlarged from 12 to 24 acres in 1866, contains statues of Sir Henry Havelock (1861), and the late J. Candlish, M.P. (1875). One of the greatest coaling-ports in the world, S. has also important industries in iron shipbuilding and heavy iron-forging, and in making glass, cordage, earthenware, &c. A new cable-testing establishment is the largest in the world. There are also large marine engineering works, where engines of 65 tons are lifted on board vessels in a finished state. Shipbuilding yards and factories line both banks of the Wear for over 5 miles. The harbour, defended by three batteries, is formed by two piers, in length 590 and 650 yards respectively. The depth on the bar varies from 18 to 21 feet in ordinary tides, and there is a still deeper sea entrance to the docks, independent of the river. The sea-outlet formed by piers, 1600 and 1100 feet long respectively, affords a depth of 26 feet at ordinary high tides. Besides the extension of the South Dock, and the addition to it of graving and timber docks, the Hendon Dock of 11 acres was constructed (1868) with warehouses, staiths, hydraulic machinery, steam cranes, &c. It is the deepest dock along the N.E. coast—29 feet 6 inches. A 'lock,' designed by Mr. H. Wake, and connecting the Hendon Dock with the sea, is in course of construction (January 1879). The largest lock on the E. coast, it is 480 feet long, 90 broad, and 30 deep, admitting the passage of ships in all states of tide. The Hendon Dock has new spouts capable of discharging 400 tons an hour. In the dock and river are four sets of lofty steam shears which lift 70 tons. Altogether the Wear Commission has jurisdiction (1879) over 75 acres of dock and harbour and 225 of land, and 10 miles of river. An extensive area has been recently reclaimed by the construction of a new quay line. In 1877 there entered the port, including coasters, 9691 vessels of 2,333,490 tons (3366 steam of 1,453,613 tons), and cleared 9698 of 2,396,304 tons (3365 steam of 1,490,401 tons). In the same year there were 82 vessels built of 77,479 tons (48 steam of 44,192 tons). The total value of imports (cattle, &c.) was £888,992, and of exports of British produce £706,611; the export of coal alone amounted to 3,409,944 tons. Fishing is a thriving industry. About a mile from S. is the suburb of Roker, a popular watering-place. S. sends two members to Parliament, and publishes five newspapers. Pop. (1871) of municipal borough 98,242; of parliamentary, according to Registrar-General (1879) 114,575. Extant records show that there existed at Monk-Wearmouth in 674 a monastery, in which the Venerable Bede spent the greater part of his life. A charter was granted to S., already a place of commercial importance, by Hugh Pudsey, bishop of Durham, in the 12th c. The town was ravaged by cholera in 1832, and again in 1849.

Sun'derland, Henry Spencer, first Earl of, born in 1623, succeeded to the title of Baron Spencer (q. v.) of Wormleighton by his father's death (1636). On the outbreak of the Rebellion he joined the king, and having gained an earldom by gallantry at Edgehill and a loan to Charles of £15,000, fell in the battle of Newbury, 19th September 1643. By his countess, Dorothy, sister to Algernon Sydney and Waller's 'Sacharissa,' he was father of **Robert Spencer**, the second earl, born about 1641. Having served as ambassador to Spain and France, this nobleman was appointed secretary of state (1679), and attaching himself to the Duchess of Portsmouth, at first was all for excluding, then truckled to, the Duke of York. So well did S. play his cards that on James's accession he became prime favourite and President of the Council, whilst with Father Petre he formed the so-called 'secret council,' feigning conversion (1687). Apologists, Burnet amongst the number, hint that this change of faith was made 'to gain more credit, that so he might the more effectually ruin the king,' and his dismissal (1688) suggests that James himself had doubts of his fidelity. Anyhow, exempted from William's act of indemnity, he spent the two years succeeding the Revolution on the Continent, but, back in England in 1691, soon stood as high in favour with the ruling as ever with the banished king. To his secret advice was due the formation of the earliest ministry (1693), whereby a new machinery of government was fitted to the new order of political life; but he did not himself take office till two years later, when he succeeded Dorset as Lord Chamberlain. His tenure of this post was brief. Lord Norris in the Lower House fell upon him 'as one so scandalous that he could only excuse one crime by charging himself with another,' and in 1697 he withdrew to Althorpe, his splendid Northamptonshire seat, where he died, 28th September 1702. His son, **Charles Spencer**, third earl, born 1674, represented Tiverton as an ardent Whig from 1695 till his elevation to the Upper House in 1702. The Duke of Marlborough's son-in-law, he was one of the secretaries of state (1707-10), and after Marlborough's fall rose by his abilities to be recognised leader of the Whigs. Yet S. on George's coming to the throne found himself shelved with the lord-lieutenancy of Ireland and other minor posts till 1717, when, having achieved the downfall of Townshend's ministry, he was appointed First Lord of the Treasury. His Limited Peerage Bill (1719), meant to curtail the future regal power of the Prince of Wales, his bitter enemy, was thrown out on a second reading, and the bursting of the South-Sea Bubble (q. v.) in 1721 brought S.'s hopes of a great political career to a sudden check. He was indeed acquitted by his peers of having received a bribe of £50,000 from the directors, but the public indignation forced him from office, and after a year of vain intrigues against his great rival Walpole—Pope says with the Pretender—he suddenly died, 19th April 1722, leaving three sons, of whom Charles became Duke of Marlborough (1733). See the Histories of Ranke, Macaulay, Stanhope, and Lecky.

Sun'dew (*Drosera*), a genus of slender, glandular herbs comprising fully nine-tenths of the natural order *Droseraceæ*. They inhabit sandy, peaty, and marshy ground, and are most common in Australia. A deep red-purple dye can be extracted from some. Of the 100 species 3 are natives of Britain, occurring in moist heaths and bogs. *D. rotundifolia* (Round-leaved S.), which is the most common, is at the same time the most interesting, having been used by Dr. Darwin to establish the curious fact of the carnivorous appetite of certain plants. His experiments, those of his son, of Dr. Nitschke, and of others, have determined that this S. manures itself through its leaves, catches insects, and absorbs and assimilates the nitrogenous matter which they contain, and that under the stimulus of a supply of suitable food the cell-contents of the cells of the leaf-glands secrete a substance having very much the properties of pepsin, and an acid fluid closely resembling that produced in the stomach of the higher animals during the process of digestion.

Sun-Di'al. See DIAL.

Sun'fish (*Orthagoriscus*), a genus of Teleostean fishes belonging to the group *Plectognathi* (q. v.), and distinguished by the extreme shortening of the body. There is a single dorsal fin; the pectorals are placed behind the eye; the under margin of the body is bordered by a membranous fin, and there is a small anal fin. The *O. mola* or Short S. F. is often cast ashore on British coasts. The Oblong S. F. (*O. oblongus*) is a second species more rarely found in British seas, but attaining a length of 6 feet, and an immense weight. It is usually captured by a line and harpoon. The liver yields a large quantity of oil.

Sun'flower (*Helianthus*), a genus of coarse, tall, herbaceous plants, with large rough leaves and yellow flowers, belonging to *Compositæ*, and natives of America. *H. annuus*, an introduction from Peru, which has long been grown as a showy and large-flowered annual in gardens, has recently been found to possess high economic value. In Germany, Russia, India, and other countries it is now grown on a large scale. The seed-like nutlets in a natural state are excellent food for poultry and pigs; roasted, they are said to be a good substitute for coffee; crushed and pressed, they yield a limpid bland oil second in value only to olive-oil, either for household purposes or as a lubricator for the delicate machinery of textile fabrics, while the residuum can be used as an oil-cake to fatten cattle; the stalks furnish a good fibre; the blossoms yield a brilliant lasting yellow dye, and the leaves serve as manure. The tubers of the S. artichoke (*H. tuberosum*) are saccharine, and serve culinary purposes. As fodder they increase the milk of cows to an extraordinary degree. The foliage is also a good fodder. (See JERUSALEM ARTICHOKE.) The name S. is taken from the large flower 'resembling the radiant beams of the sun.'

Sunn, or Indian Hemp (*Crotalaria juncea*), a large leguminous annual, rising under favourable circumstances to a height of 10 feet, in appearance resembling somewhat the allied 'Spanish Broom' (q. v.). It is indigenous to S. Asia, and also widely distributed through tropical Australia. In the former country S. has been cultivated from remote times for its fibre, which is manufactured into rope, sackcloth, nets, twine, and paper. It is sown very thickly at the beginning of the rains, so that it may grow tall and slender. When flowering commences the plants are cut near the root, tied in large bundles, immersed in water from four to eight days, beaten on a piece of wood or stone, washed till quite clean, dried, and the broken woody portion separated from the fibre, which is then ready for use. S. is also grown as a fodder plant for cattle. The sub-species, *C. tenuifolia*, furnishes Jubbulpore hemp; *C. retusa* yields a fibre for ropes and canvas, and *C. Burhia* for ropes.

Sunn'ites See MOHAMMEDAN SECTS.

Sun'-Stroke (sometimes called *Heat-Apoplexy*, *Heat-Asphyxia*, *Insolatio*, and *Coup de Soleil*) is a very fatal affection of the nervous system, of frequent occurrence in tropical countries, more especially among Europeans, and in temperate climates during extremely hot summer seasons. There is probably a distinction between S. and heat-apoplexy, but the difference is not generally recognised. S. may be described as acute poisoning of the nerve-centres with superheated blood, the resulting phenomena being an acute paralysis of the nerve-centres, generally implicating principally the centres of respiration and of heart-movements. S. occurs from exposure to the direct rays of the sun in tropical climates, and more especially among those who have the head uncovered or imperfectly covered. Heat-apoplexy most frequently occurs through the fatiguing marches of troops during the heat of the day in a tropical climate; the over-exertion and exposure of tiger-hunters; the overcrowding which frequently occurs in barracks and ships; and the intense tropical heat during calm weather. In S. the affection is sudden, and there may be no premonitory symptoms; but in heat-apoplexy the accession of symptoms is gradual. Dr. Anstie states that two clinical forms are recognised by authorities—the cardiac and the cerebro-spinal. In the former, the course is rapid and the issue fatal, almost from the necessity of the case; in the latter, there is far more chance for life, and at any rate the end does not come so soon. In the cardiac variety, there may be no preliminaries whatever. In the cerebro-spinal variety, which is the commoner, there is usually a distinct train of preliminary symptoms. Very commonly there is mental derangement, usually of the nature of hallucination; the patient is more or less delirious; and occasionally he becomes dangerously furious and homicidal or suicidal. After a short time he becomes drowsy and lies down; he rolls about uneasily, and there is a constant desire for micturition; he then passes into a state of coma with stertorous breathing and gradually-increasing insensibility. In some cases there are convulsions, but in others the patient lies motionless and expires.

Treatment.—The patient should be removed instantly from the sun to as cool a place as possible, and the coldest water pro-

curable should be poured over the neck, shoulders, and chest, and ammonia should be placed to the nostrils. When the immediate danger from syncope is over, an endeavour should be made to reduce the temperature of the blood by the cold douche, or by enveloping the patient in a sheet dipped in water with lumps of ice in it. If available, he may be put into a bath of water at 90°, which may be gradually cooled down, in the course of twenty minutes or half an hour, by the addition of ice or cold water to about 62°. The bath must be so regulated as to keep the bodily temperature as low as 102°, but never to reduce it below 97°. Dr. Parkes recommends the injection of iced water into the rectum. The tincture of aconite may be given in doses of a single drop every five minutes at first; and afterwards at intervals of ten minutes, twenty minutes, and an hour. It is always of primary importance to relieve the bowels by active cathartics or enemata.

Suona'da, an inland sea of Japan, separating the islands of Kiusiu and Sikopf from Niphon, and communicating with the Sea of Japan by Van der Capellen Strait, and with the Pacific by Bungo Strait and Linschoten Strait. It is 250 miles in length and 50 miles at its greatest breadth. Having been closed contrary to treaty, the forts at its entrance were stormed by the British, French, and Dutch fleets, 5th and 6th September 1864.

Supercar'go, an official in a merchant ship having charge of the accounts, the disposal of the cargo, and in general all the commercial concerns of the voyage.

Su'pereroga'tion, Works of, is a doctrine that has its foundation in that of the communion of saints. A distinction appeared to exist between the precepts of Christ regarding all moral and religious duties which were of universal obligation, and the 'counsels of perfection' enjoined on those who could receive them—martyrdom, virginity, and voluntary poverty. These being voluntary works 'over and above God's commandments,' were called W. of S. Again it appeared from Col. i. 12, that a certain amount of suffering had to be endured by the Church, so that whatever was suffered by anyone, diminished by that amount what remained for others. Similarly, as the Church had fellowship with Christ in holiness as well as suffering, it followed on the same principle that the good works wrought by Christ in some, and which he had promised to reward, might avail to supply the deficiencies of others. Hence the belief arose that W. of S. done by saints availed to diminish the temporary consequences of sin in others, and led to the system of Indulgences (q. v.), which gave rise to great abuses.

Su'perfœta'tion is the term used to designate two distinct conceptions, occurring in the same woman, at an interval of greater or less duration. A second conception may, at any time, follow the first, and gestation may go on to its full period, in each instance, independently of the other: so that if a woman were impregnated when in the third month of gestation, she would bear the first child mature at nine months, and the second child, also mature, at the end of twelve months after the first conception. The possibility of S. has been vigorously opposed by Wagner, who termed it a physiological impossibility; and by most of the modern English writers, including Drs. Ramsbotham and Churchill. In a paper by Dr. Bonnar, of Cupar-Fife, published in the *Edinburgh Medical Journal*, January 1865, a number of cases are given, in which children, born in wedlock, succeeded each other with very unusual rapidity. Dr. Duncan believes, from anatomical investigations, that up to the third month of gestation a second conception may follow the first, and he is of opinion that this will satisfactorily account for all the cases of S. on record.

Supe'rior, in Scotch law, is one who, or whose predecessor, has made a grant of heritable (real) property, under condition that the grantee shall annually or periodically pay him a certain sum, or perform a certain service. See DOMINIUM, FEU.

Superiority is, in Scotland, the right of the superior. It belongs to the Crown as overlord of all Scotland; or to a subject superior, as an intermediate overlord of land held by a vassal.

Supe'rior, Lake, the largest freshwater lake, and, with the exception of the Caspian Sea, the largest of all lakes in the world, lies between the United States and the Dominion of Canada, being bounded on the N. and N.W. by the province of Ontario and the State of Minnesota, and on the S. by the States of Wisconsin and Michigan. It is of triangular form, with an extreme length of 355 miles, an extreme breadth of 160, and a mean depth of 1000 feet. It is 627 feet above the sea-level, and 49 feet above Lake Huron, with which it is connected by the St. Mary River. Its area is upwards of 31,400 sq. miles, or about that of Ireland. The northern shores are high and rugged, while the southern are more sandy and flat, though at some points there are cliffs, such as the Pictured Rocks, which are celebrated for their bright colours and fantastic forms. From the S. shore the great Kewenaw Promontory projects into the lake nearly 75 miles. The geological formation around the lake is principally Laurentian and Huronian, with some Lower Silurian on the S. shore. The N. shore and Silver Island are rich in silver deposits, and the S. shore in native copper, native silver, and red hematite iron. There are only a few villages on the Canadian side, but on the United States side there are several busy mining towns, such as Fond du Lac (q. v.) in the W., and Marquette in the E. Navigation between Lake Huron and Lake S. is prevented by the rapids of the Gault Ste Marie, but this difficulty has been overcome by the construction of a canal on the American shore, about a mile in length, and with two locks. Isle Royale, 44 miles long, the largest island in the lake, belongs to the United States, and only a few of the smaller islands along the N. shore are Canadian. The fisheries of Lake S. are considerable, white fish and grey trout being abundant. The water of the lake is very clear and cold, and as it is fresh and so easily moved, the waves run very high during storms, which are frequent. The lake is never frozen over, but the shore ice puts a stop to navigation during the winter.

Sup'ple Jack, a name given to various strong twining and climbing shrubs of the Western hemisphere. The S. J. imported into Europe from the W. Indies for walking-sticks is the barked branches of one or more species of *Paullinia* of the natural order *Sapindaceæ*. From the tough and flexible quality of these branches they are commonly employed as riding-switches in Jamaica. In the United States, S. J. is applied to *Berchemia volubilis*, a rhamnaceous twiner which ascends the highest cypresses (*Taxodium distichum*) in the Dismal Swamp.

Supply', Commis'sioners of, are officers employed in Scotland under the Valuation of Lands Act to assess the Land Tax (q. v.). They make up an annual valuation roll, showing necessary particulars.

Supply', Committ'ee of. See PARLIAMENT.

Support'ers, in Heraldry, are figures placed in the attitude of holding up or protecting a shield, almost always in pairs, one being on the dexter the other on the sinister. They are believed to have been introduced in the time of Edward III. S. belong by right to all peers of the realm, Knights of the Garter, Knights Grand Crosses of the Bath, Nova Scotia baronets, and chiefs of Scottish clans, and are conceded to sons of peers bearing honorary titles of nobility. In England they are granted solely by the sovereign; in Scotland by the Lord Lyon. Of the lion and unicorn that appear as S. in the royal arms of the United Kingdom, the former is from the achievement of England, the latter from that of Scotland prior to the union of the crowns.

Suppura'tion is a morbid process which gives rise to the formation of pus, one of the destructive terminations of the inflammatory action. The phenomena of S. are thus described by Mr. Holmes:—'The inflammatory leucocytes, instead of developing into fibre cells and forming tissue, become developed into pus globules, and the exudation breaks down more or less completely into a creamy fluid called pus, which consists of these globules floating in serum, the liquor puris. Pus globules, as seen out of the body, are but little different in appearance from leucocytes. The leucocyte, when treated with acetic acid, displays the appearance of a nucleus in its interior, that appearance being usually regarded as the result of a shrinking of the protoplasm of which it is composed. The pus globule shows more distinct trace of a membrane, and is frequently many-nucleated when treated with acid, a condition which Rindfleisch regards as indicating a tendency to degenerate and break down. But the same author says that many of the corpuscles of pus display no difference whatever in character from the blood leucocytes, having only single nuclei, showing the same amœboid movements, and being in fact obviously the same things both in structure and function. This should be borne in mind in connection with the fact that S. is not, in most cases, wholly a destructive process,

but serves also as one of the usual modes of repair.' The result of the process of S. is thus twofold, being in part destructive, and in part constructive. S. in the interior of the body usually terminates in the formation of an Abscess (q. v.); but in some cases the matter is diffused through the interstices of the part, and is termed diffuse Inflammation (q. v.).

Su'pralapsa'rian. See SUBLAPSARIAN.

Supra-Re'nal Cap'sules, two bodies of small size, situated one above each kidney, and attaining about 1½ inches in diameter, and a weight of from 1 to 2 drachms. The left supra-renal body is almond-shaped; the right resembles a cocked hat. Each is covered by a thin membrane, and consists of a firm outer portion, and a soft medullary or central substance, composed of clusters of *columns*, each about $\frac{1}{750}$th of an inch in diameter. They are well supplied with blood-vessels and nerves. The prevalent idea regarding the functions of the S.-R. C. is that they must be ranked with the *ductless glands*, of which the *thyroid*, *thymus*, and *spleen* are examples. If this view be correct, the S.-R. C. may be regarded as adjuncts to the circulatory and absorptive systems. They have attracted attention on account of a relationship which Dr. Addison of Guy's Hospital supposed to exist between them and a bronzed appearance of the skin which has received the name of 'Addison's disease' (q. v.).

Suprem'acy, Royal, as a term in English law, is practically restricted to questions affecting the ultimate appeal in matters ecclesiastical. In the early times of the English monarchy the supreme authority here as elsewhere was undoubtedly vested in the crown, but from the time of Stephen onwards appeals to Rome (though by the statute 16 Rich. II. c. 5 entirely illegal) became gradually more frequent, and had to be expressly forbidden by the Act of Appeals (24 Henry VIII. c. 19); the supremacy of the crown in matters spiritual and ecclesiastical being expressly asserted later in the Act of Supremacy (1 Eliz. c. 1). Even in Elizabeth's reign this jurisdiction was vested in the Court of High Commission, whose flagrant abuse of power during the reign of Charles I. led to its suppression in 1640, and from the Restoration to 1832 a special commission was appointed under the Great Seal to decide each case, the members being chosen from a permanent list, which consequently acquired the title of High Court of Delegates. In 1833 it was enacted (3 and 4 Wm. IV., c. 41) that all appeals should be referred to a judicial Committee of the Privy Council, who should report thereon to the sovereign. The most familiar form in which the R. S. appears, is in the nomination to bishoprics and archbishoprics (see BISHOP). By 14 and 15 Vict., c. 60, the Act of Papal Aggression was declared to be an infringement of the R. S., but this statute has been allowed to fall into abeyance. See Blackstone; also Brodick and Freemantle, *Ecclesiastical Judgments of the Privy Council.*

Surabay'a, a seaport on the N.E. coast of Java, and the best harbour in the island, at the mouth of a branch (the Kali Mâs) of the Kedirie River, near the Strait of Madura. The European town, which is on the W. bank, communicates with the Chinese and Javanese quarters opposite by five bridges. S. is the headquarters of the Dutch military, and exports rice, coffee, sugar, cotton, indigo, tobacco, &c. It is connected by steam lines with Sumatra, Batavia, &c., and by a railway (68 miles; opened 16th May 1878) with Passaroean and the Malang coffee district. Pop. 89,000. The Residency of S., which is well cultivated, and includes the island of Madura, has a pop. of 1,218,827, including 4217 Europeans and 7436 Chinese.

Surat', the chief town of the district of the same name, in the Bombay Presidency, British India, and formerly the commercial capital of the W. coast, lies on the left bank of the river Taptee, 15 miles from its mouth, 167 miles by rail N. of Bombay, and 130 S. of Ahmedabad; pop. (1872) 107,149. The town is first heard of in 1512 as sacked by the Portuguese. The first English factory was established here in 1612, and forty years later all the other possessions of the Company were placed in subordination to it. In 1692 the seat of government was transferred to Bombay. Henceforth S. became a bone of contention between the Mogul deputy and Mahratta invaders. In 1759 the English seized the castle; and in 1799, on the death of the last real Nawaub, themselves assumed the administration. In 1842, the titular dignity of Nawaub of S. also became extinct. S. is still a considerable centre both of trade and minor manufactures. The exports are cotton and grain; but the opening of three several railways to Bombay, and the superiority of the harbour at the latter place, has caused S. to be superseded in commercial, as formerly in political, importance. The town is still surrounded by a wall, and the fort or castle yet remains. The streets are narrow, and the upper storeys of the houses overhang with frameworks of wood. Sea-going vessels cannot cross the bar of the Taptee. The river, here 1700 feet wide, is crossed by an iron-girder bridge, recently completed at a cost of £70,000. The English Church dates from 1820, but there are many old European tombs of the 17th c. There are four principal mosques, many Hindu places of worship, two Parsee fire-temples, and a hospital built at the cost of Sir Kawasji Jahangir for £7000. The official buildings are all either within the castle or on the 'Dutch wharf.' The municipal revenue in 1875 was £20,000.—The *district* of S., which lies between Baroda and the Arabian Sea, has an area of 1588 sq. miles; pop. (1872) 607,087. The chief crops are millets of several kinds, rice, pulses, oil-seeds, and cotton. In 1875, 60,000 acres were under cotton. In the same year the total exports by sea and rail were valued at £1,013,000, chiefly cotton (£292,000) and grain (£169,000); the imports were valued at £640,000, principally piece-goods, cotton-twist, and metals. See *Gazetteer of Bombay*, vol. ii. (Bomb. 1877).

Suraj'ah Dow'lah (*Sirâj-ud-Daulah*), the last of the independent Nawaubs of Bengal, and the instigator of the massacre of the Black Hole. In 1756 he succeeded his grandfather, Ali Verdy Khan, a man of great ability, to whom he had behaved as a second Absalom. S. D. began his reign by plundering his wealthy relations, and within two months after his accession marched against Calcutta on some slight pretext. His object was money; and the death of 123 English prisoners in the military dungeon of Fort William was, from his point of view, an unimportant accident. The arrival of Clive and Admiral Watson caused his retreat to Moorshedabad. Peace was at first concluded, but a conspiracy among the Nawaub's officers led to the battle of Plassey. After his defeat, S. D. fled up the Ganges, but he was betrayed by a *fakir* whom he had previously wronged, brought back, and killed by order of the son of Meer Jaffier, the new Nawaub installed by the British. He had not completed his twentieth year, and was only fifteen months on the throne.

Surakar'ta (*Solo*), a trading town on the N.E. coast of Java, near the mouth of the river Solo, opposite the island of Madura, and 150 miles W.S.W. of Samarang by rail (opened in 1870). It is the chief town of the feudatory state of S., and the residence of the emperor and of many of the native princes and nobles. The emperor's palace is a building of great extent and grandeur. The European town, defended by a strong fort, has a trade in rice, sugar, coffee, pepper, tobacco, &c., and a pop. of 110,000. —The Residency of S., with an area of 2366 sq. miles and a pop. of 717,000, is well cultivated and yields abundance of Javanese products.

Surd, in algebra, is synonymous with the term *irrational quantity*. See IRRATIONAL.

Sure'ty. See GUARANTEE.

Sur'face, in mathematics, is the boundary of a solid, and has two dimensions, length and breadth. It may be conceived to be generated by the motion of a straight or curved line, just as a curve is generated by the motion of a point. Of all surfaces, the most important are those of the second order, which are intersected by a straight line in at most two points, and whose curve of section by a plane is a curve of the second order. Hyperboloids, ellipsoids, paraboloids, spheres, cones, and cylinders, and also the limiting case of two planes, are included among the so-called quadric surfaces. See Salmon's *Analytical Geometry of Three Dimensions* (1865, 3d ed. 1874).

Sur'face Grub, a name applied to the larva or caterpillar of the Great Yellow Underwing Moth (*Tryphæna pronuba*), attaining a length of an inch and a half, and of a pale-green colour tinted with brown and spotted with black. The larva is destructive to vegetables. It appears commonly in hayfields in spring and summer. The moth itself is of a pale tawny colour on the upper wings, and has the hind wings of an orange hue.

Surf Duck. See SCOTER.

Sur'geon, Military and Naval. See MEDICAL DEPARTMENT OF THE ARMY AND NAVY.

Sur'geons, College of. The Royal C. of S. of England was founded in 1460-61, in the reign of Edward IV., who 'did, at the supplication of the freemen of the mystery of barbers of the city of London using the mystery or faculty of surgery, grant to them that the said mystery, and all the men of the same mystery of the said city, should be one body and perpetual community.' In 1500, four Masters in Surgery were appointed under the designation of 'Magistri sive Gubernatores mistera barbitonsorum et sirurgicorum.' In order to check unqualified practitioners, it was enacted in the third year of Henry VIII. (1511) 'that no person within the city of London, or within seven miles of the same, shall take upon him to exercise or occupy as a physician or surgeon except he be first examined by the Bishop of London, or by the Dean of St. Paul's, calling to him four doctors of physic, and for surgery other expert persons in that faculty.' In the thirty-second year of Henry VIII. (1540), the Company of Barbers of London and the Company of Surgeons of London were united by the name of 'The Masters, Governors, and Commonality of the Art and Science of Surgery of London.' This extraordinary and incongruous union continued for nearly 200 years after; for it was not till the fifteenth year of George II. (1745) that the surgeons of London were made a distinct corporation under the name of 'The Masters, Governors, and Commonality of the Art and Science of Surgery of London.' This company was dissolved in the fortieth year of George III., and replaced by 'The Royal College of Surgeons of London.' In the seventh year of Victoria (1843) a new charter was granted to the college, in which it is declared 'that it is expedient to create a new class of members to be called *Fellows*,' and 'that from henceforth the corporate name or style of the said College shall be The Royal College of Surgeons of England.' Power was given to the Council to elect not less than 250, nor more than 300, members of the college to be fellows. By an addition to the charter, obtained in 1852, power was given to the council, subject to certain regulations, to appoint members of fifteen years' standing to the fellowship without examination; but those who are admitted to the fellowship by examination are distinguished in the college list by having the letters *Ex.* affixed to their name. The college was likewise empowered to grant certificates of fitness to practise midwifery; and, in 1859, to grant similar certificates to dentists.

The government of the college is vested in a council of twenty-four persons, including a president and two vice-presidents, and all the members of the council must be fellows of not less than fourteen years' standing. There is a Court of Examiners; examiners in medicine; a board of examiners in midwifery, and in dental surgery; professors of surgery and pathology, comparative anatomy and physiology, and dermatology; and a lecturer in anatomy and physiology. The other officials are, conservator of museum, librarian, secretary, and clerk. Three members of council go out annually by rotation, and the vacancies are filled up on the first Thursday of July. The examiners are elected by the council, and the professorships are in the gift of the college. A Hunterian orator is appointed every second year, and the college sends a representative to the General Council of Education and Registration.

There is a museum attached to the college, the most complete in the United Kingdom, the basis of which was the celebrated Hunterian collection, purchased by a Parliamentary vote of £15,000, and presented to the college in 1799. In 1813 the museum was opened, the building having been erected partly from public funds and partly from the college fund, £12,500 having been contributed by Government, and £21,000 by the college. Since that time the building has been repeatedly enlarged. There is a library in connection with the college, and both museum and library are accessible to visitors.

The regulations respecting the education and examination of candidates for the diploma of member may be found in the *Calendar of the Royal College of Surgeons of England.* The Royal College of Surgeons, Edinburgh, received its charter in 1505, and the Faculty of Physicians and Surgeons, Glasgow, was chartered in 1599.

Sur'gery, History of. See MEDICINE AND SURGERY, HISTORY OF.

Suri, the chief town of the district of Beerbhum, Bengal, British India, 109 miles N.W. of Calcutta, and 3 miles S. of the More river; pop. (1872) 9001. It is healthily situated on a gravel ridge, but has no trade or manufacture.

Sur'inam. See GUIANA.

Surmull'et (*Mullus*), the name given to various Teleostean fishes of the family *Mullidæ*, the name 'Mullet' (q. v.) being generally used to designate the members of the family *Mugilidæ*. The surmullets or *Mullidæ* are represented by the *Mullus surmuletus*, by the plain red mullet (*Mullus barbatus*), and by the three-banded mullet (*Upeneus trifasciatus*) of tropical seas, &c. The S. attains a length of 18 inches and a weight of 2 lbs. The mouth is provided with two long barbules. It is sometimes captured in shoals in trawl nets, but at other times is very scarce. The colour is a pale pink, and a general mixture of purple and red prevails, the body being banded with longitudinal stripes. The Romans considered it one of the finest of fish, and it is still in high repute.

Sur'name. See NAME.

Sur'plice (Fr. *surplis*, Low Lat. *superpellicium*, from Lat. *super*, 'above,' and *pellicium*, 'a pelisse') is the name given in the Anglican Church to the vestment which was known in the early Church as the Alb or Albe (q. v.).

Sur'plice Fees are ecclesiastical dues payable to the clergy on marriages, churchings, christenings, and burials.

Surr'ey (Old Eng. *sud-rice*, 'the south kingdom,' *i.e.*, of the 'Saxons'), a county of England, separated in the N. from Middlesex by the Thames, and bounded E. by Kent, S. by Sussex, and W. by Berks and Hampshire. Area 483,178 acres; pop. (1871) 1,091,635. One of the most picturesque of the inland counties, S. is traversed from E. to W. by the ridge of the N. Downs (q. v.), from which the surface slopes gently towards the Thames, the valley of which is in great part well wooded, and in part occupied by extensive market-gardens. The southern part lies within the Weald (q. v.), and the highest point in the county is Leith Hill (993 feet), 4 miles S.W. of Dorking. The central range is formed mainly of chalk and green sandstone, and the northern slope of London and plastic clays, overlaid by rich alluvium along the river banks. There extend from the centre to the W. border the bleak downs of Bisley, Bagshot, Cobham, Epsom, Wimbledon, and Working. Almost all the streams are tributary to the Thames, and of these the principal are the Mole, Wey, and Wandle. On Box Hill grow the finest of English box-trees. S. in 1876 had 97,679 acres in corn crops, 45,882 in green crops, 31,041 in sainfoin, clover, and grasses in rotation, and 109,862 in permanent pasture, exclusive of heaths; while the number of sheep was 89,576, of cattle 42,425, of horses 13,811, and of pigs 31,331. In the same year the crops comprised 39,912 acres of wheat, 18,630 of barley, 27,807 of oats, 3430 of beans, 6529 of pease, 4056 of potatoes, 20,317 of turnips, 9049 of mangold, 2737 of cabbage and rape, 8957 of vetches, lucerne, &c., 167 of flax, and 2194 of hops. S. includes the portion of London S. of the Thames forming the parliamentary boroughs of Lambeth and Southwark. Guildford (q. v.) is the chief town. Besides the varied industries around London, there are many corn, paper, snuff, and oil mills on the Mole and Wandle. Other towns of S. besides those mentioned are Godalming, Farnham, Epsom, Chertsey, Staines, Richmond, Kingston-on-Thames. The county returns four members to Parliament. See Jennings' *S. and Sussex* (Lond. 1877).

Surr'ey, Henry Howard, Earl of, an English poet, grandson of the victor at Flodden, was born about 1517. Of his earliest years nothing is known, but in 1526 he was cup-bearer to Henry VIII., whom he attended on his famous visit to Boulogne in 1532, when the interview took place between the English and French monarchs on the 'Field of the Cloth of Gold.' In 1533 he was present at the coronation of Anne Boleyn, and carried the 'fourth sword with the scabbard upright before the king.' There is no evidence that he was entered either at Cambridge or Oxford, but his poems show an exquisite renaissance culture, which he probably owed to the liberal associations of home. 'His father is said to have been a patron of men of letters; his mother was the friend and protector of Skelton, who celebrates her bounty in the *Crown of Laurel;* and amongst the close circle in whose society his boyhood was passed were such men as Lord Berners, the translator of Froissart, Vere, Earl of Oxford, Lord Stafford, Lord Morley, and others equally distinguished by their literary attainment.' In 1536 S. lost his dear friend and brother-in-law, the Duke of Richmond. To this period belongs the romantic but unhistorical episode in

his career—his visit to Italy in the character of knight-errant to assert the peerless charms of his mistress Geraldine—a story which first appeared in Nash's *Unfortunate Traveller, or Life of Jack Wilton* (1594), and was first exploded by Dr. Nott in his elaborate edition of Wyatt and S. (1815). In 1535 S. was in fact married to the Lady Frances Vere, and his eldest son, Thomas, was born in the following year at the very time the poet is represented as tilting in the lists at Florence in honour of a paramour who was only seven years of age! In 1537 S. was a chief mourner at the funeral of Lady Jane Seymour; in 1540 he took part in the tourneys held at the marriage of Anne of Cleves, and in September 1541 he was appointed along with his father joint-steward of the university of Cambridge. In the wars with France (1544-46) S. was a commander and achieved some brilliant successes, but a disaster that happened to his troops at St. Etienne in January 1545-46 was made the occasion of his recall; the fierce hostility of the Hertford family (then highest in royal favour), encouraged by groundless rumours of S.'s 'designs upon the throne,' resulted in a charge of treason. The soldier-poet was condemned to death 13th January 1547, and on the 21st of the same month was beheaded at Tower Hill in the thirtieth year of his age.

S. will always hold a conspicuous place among English poets. Though not a man of original genius or even great power, he was fortunate enough to introduce a new style of poetry and a new form of verse, both of which have since been associated with some of the noblest achievements in our literature. He is the earliest of that 'subjective school' of which Wordsworth is the greatest. His master was Petrarch, who furnished S. not only with his sentiments but also with the mould in which they were cast. The 'lady' of S.'s sonnets may not have been so real as the 'Laura' of Petrarch's, yet sometimes it seems as if his pulses were stirred by a genuine emotion. S.'s translation of the 2d and 4th books of Virgil's *Æneid* is the first example of blank verse in the English language—unless we consider the earlier effort of Gavin Douglas in the dialect of the Scottish Lowlands entitled to that honour. None of S.'s poems were printed in his lifetime. They were first published along with Wyatt's in Tottel's *Miscellany* in June 1557. Numerous editions appeared during the 16th c., after which S. dropped into oblivion for nearly two centuries. The standard edition of S. is Dr. Nott's (2 vols. 1815); the 'Aldine edition' of 1831 is excellent; and that in Bell's *English Poets* contains a good memoir.

Sur'tees, Robert, born at Durham, April 1, 1779, graduated B.A. of Oxford (1800), and studied law at the Middle Temple till by his father's death in 1802 he came into the Mainsforth property. Thenceforth he devoted himself to writing his *History and Antiquities of the County Palatine of Durham* (3 vols. 1816-23), to the fourth volume (1840) of which, completed by the Rev. J. Baine, a Memoir by G. Taylor is prefixed. Hill Burton records some excellent *bon-mots* of his in the *Bookhunter*, and mentions that he contributed to Scott's *Minstrelsy of the Scottish Border* two 'ancient' ballads of his own composing—*The Death of Featherstonhaugh* and *Barthram's Dirge*. S. died February 11, 1834, and in the same year was founded the S. Society for editing unpublished MSS. chiefly relating to the Northern Counties.

Survey'ing is the art of determining the boundaries and area of a portion of the earth's surface. When the area is small the problem is one of simple trigonometry, and in all cases proceeds upon the method of triangulation. The bounded portion is divided up into triangles as far as possible, and from the direct measurement of the necessary elements the area is calculated. Practically this area may be found in terms of the lengths of the three sides, which are then directly measured by means of the chain; or, more simply, it may be expressed as half the product of the base and height. The one extremity of the height is of course the vertex, and the other extremity is easily obtained by means of the cross-staff, an upright staff with two cross sticks fixed above at right angles to the staff and to each other. By setting the cross-staff so that the one cross stick coincides with the base line and the other points towards the vertex, the extremity of the perpendicular from the vertex upon the base is obtained; and this perpendicular is the height of the triangle, and may then be measured directly by means of the chain. When the boundary is irregular, the area of the residual portions which necessarily lie beyond the limits of the triangulation are estimated by the method of taking Offsets (q. v.). In land S. on a large scale, a theodolite is used for the measurement of angles. A base line is first chosen and carefully measured; and from each extremity, which is marked by some object visible from a considerable distance, the angle between the other extremity and an arbitrarily chosen and convenient point is measured. This may be done directly; or, as is more usual, the geographical *bearings* of the new point with respect to the other points are measured, the orientation of the base-line itself being already known. Thus the base and contiguous angles of the triangle are given; and from these the other sides and area can be easily calculated. Each of these sides is now taken as a new base line, and new triangles constructed upon them by arbitrarily choosing new vertices; and thus, by the simple observation of the necessary angles, and the careful measurement of one base line, a large tract of country is triangulated and surveyed. To test the accuracy of the observations and to fix the limits of error, the last side, whose calculated value depends upon *all* the observations leading up to it, is measured directly as the original base-line was. When the triangulation extends over a whole country, correction must be applied to the value calculated because of the sphericity of the earth. The triangles are not plain but spherical; and the problem is therefore really one of spherical trigonometry. Such a consideration is, however, of small moment in military S., which usually refers simply to the construction of forts or earthworks. This particular branch of S. is in the hands of the Royal Engineers (see ENGINEERS, ROYAL). The great surveys are noticed under ORDNANCE SURVEY.

Su'sa (Gr. *Sousa*, Chal. *Shushan*, mod. Pers. *Sûs*; on the Persian cuneiform inscriptions *Su-s a-an* 'lily'), one of the capitals of ancient Persia, was situated on the Choaspes, and has now been identified with the extensive ruins on the left bank of the Kerkha, about 250 miles S.E. of Bagdad. It had a circumference of 120 stadia, and like Bablylon was built of burnt bricks cemented with asphalt. It was without walls, but its citadel, containing the treasury and mausoleum of the Persian kings, was strongly fortified. The founder of Susa is not known with certainty, but it was at least much enlarged by Darius Hystaspes, the ruins of whose palace, repaired by Artaxerxes Longimanus, have been excavated by Loftus and Williams. From the time of Cambyses S. was a favourite residence of the Persian kings. After Alexander and his successors had fixed their court at Babylon, S. declined in importance, though when besieged by Antigonus in B.C. 315 it was still one of the chief cities of Persia, and even as late as the middle of the 7th c. A.D. it offered under Hormuzan an obstinate resistance to the Saracens; but by the 13th c. it had become a heap of ruins. The most important of these ruins are those of the palace of Darius, the colonnade of which has a frontage of 343 feet, and a depth of 244. In general construction it exactly resembles the Hall of Xerxes at Persepolis (q. v.). References to S. abound in the ancient authors, especially Herodotus, Xenophon, and Arrian. See Rawlinson's *Five Monarchies* (1862-67).

Su'sa (anc. *Segusio*), a small town of Northern Italy, 44 miles W. of Turin by rail, lies at the Italian end of the now almost disused Mont Cenis road, constructed by Fabroni 1802-5. The cathedral church of S. Giusto dates from the 11th c., and has a baptistery of a single block of green marble. Pop. (1871) 3546. A triumphal arch erected in honour of Augustus by the Celtic chief Cottius still remains.

Susann'ah, the History of, or **The Judg'ment of Dan'iel**, is the title of one of the three Apocryphal additions to the Book of Daniel which are found in the Septuagint (q. v.). (See APOCRYPHA.) The design of the story is to celebrate the triumph of female chastity over temptations and dangers, and exalt the wisdom of Daniel, by whose acuteness the innocence of S. was established. It is not unlikely that the Alexandrian translator of Daniel wrought up a tradition already current, and which may have been founded on fact, but it is evident that the form of the story was due to its moral purpose. Early Christian theologians imagined it to be an allegory. S. was the Church, and the two elders were the Jews and the heathens.

Suspen'sion, in music, the repetition of a note in a given chord, having the effect of delaying or suspending for a moment certain notes in the second chord. The ninth is used to suspend

the octave in a common chord, or chord of the sixth; the fourth to suspend the third; and the seventh to suspend the sixth. Chords of S. can only be used on the accented parts of the bar. The note which forms the S. can never be doubled, nor can the note which it suspends appear in any of the upper parts.

Suspensions.

Suspen'sion and In'terdict (in Scotch law). See INTERDICT.

Suspen'sion Bridge, a type of Bridge (q. v.) in which a level platform or roadway is hung by means of suspension-rods from parallel chains, which are pendent from piers, and have their extremities anchored in the ground. Suspension-bridges constructed of flexible supports of different kinds, with a planking laid across them, have been in use in China, Japan, and Thibet from a remote period, and Humboldt also found them in S. America. This primitive plan, however, does not afford a level roadway, but in modern bridges on the suspension principle a perfect level is obtained by suspending the platform from the chains by vertical rods, which gradually shorten towards the centre of the span. The *chains* consist of links of iron pinned together, or more frequently of cables, composed sometimes of as many as 4000 steel wires, each about 0·16 of an inch in diameter, so twisted that each wire bears a portion of the strain on the cable. The *piers* or towers over which the chains pass are constructed of masonry, cast iron, or timber, and the *anchorages* consist of solid underground masonry, through which the extremities of the chains are carried, and secured to an *anchor-plate* beneath. The S. B. is well adapted for large spans, and it presents the advantage of great economy of constructive material over the girder-bridge, a much less mass of material being required to bear a given load. The main disadvantage of the S. B. is its flexibility, passing loads sensibly distorting the structure, and swaying being caused by high winds. Oscillation is somewhat counteracted by means of 'stays' joining different parts of the roadway to the piers and rocks on either side. Sloping instead of vertical suspension-rods also give increased rigidity. A true S. B. is unsuited for the passage of railway trains at high speed, but by combining the girder with the suspension principle the necessary stiffness is effected. Bridges of this description have been constructed in Great Britain and the United States, and in a railway bridge now (1879) in process of erection across the Forth in Scotland, two lattice-girder spans, each upwards of 1600 feet, are to be suspended by chains from piers 600 feet high. In 1741 the river Tees was spanned by a small S. B.; this was the first one in England. Jacob's Creek S. B., Pennsylvania, U.S., constructed in 1796, was the first in N. America, and it was followed within fifteen years by eight others. The Menai Strait (q. v.) S. B., long a world-wide wonder, has been outstripped in span by many structures, both in this kingdom and in the United States, notably by the Clifton S. B., across the Avon near Bristol, span 702 feet, height 248 feet; the railway bridge across the Niagara River, span 821 feet, height 245 feet; Clifton S. B., over Niagara Falls, span 1250 feet, height 190 feet; and Cincinnati S. B., Ohio, U.S., main span 1057 feet, height 100 feet. The East River S. B., connecting New York and Brooklyn, now (1879) in progress, is to have three spans, the centre one being 1600 feet.

Suspen'sion of Arms, a short truce in war, such as is granted for the burying of the dead or humane purposes, or for entering into negotiations regarding proposals for surrender, terms of peace, &c.

Susquehann'a, a river of the United States, of which the E. branch rises in Otsego Lake, State of New York, at an elevation of 1300 feet, while the W. and smaller branch rises in Cambria County, Pennsylvania. The E. branch, which is 250 miles long, flows through the famous and beautiful Wyoming Valley, and being joined by the W. branch (200 miles long) at Northumberland, Pennsylvania, it forms the main S. which flows into Chesapeake Bay at Port Deposit, Maryland, after a course of 150 miles. The S. is not navigable to any extent. A railway bridge 4000 feet long is to be constructed (1879) across the S. at New Cumberland, near Harrisburg.

Suss'ex (*Suth-Seaxna-Rice*, 'the kingdom of the South Saxons'), a maritime county of the S. of England, bounded on the E. by Kent, on the N. by Kent and Surrey, on the W. by Hampshire, and on the S. by the English Channel. Its extreme length is 73 miles, and its extreme breadth 27 miles. Area, 934,006 acres; pop. (1871) 417,456. The North Downs runs E. and W. through the whole county, and the South Downs, on whose fine pastures the famous South Down sheep are reared, along the sea-coast from the borders of Hampshire to Beachy Head, enclosing between them the rich valley known as the Weald. (See DOWNS.) In 1876 there were 209,026 acres under corn crops, 78,371 acres under green crops, 69,807 acres under clover and grasses in rotation, 11,175 of hop-gardens, 267,000 acres under permanent grasses, and (1872) 101,331 acres in wood, including the forests of St. Leonards and Ashdown in the north. In the same year there were in the county 26,259 horses, 97,820 cattle, 547,534 sheep, and 40,083 pigs. The principal rivers are the Arun, the Adur, the Ouse, and the Cuckmere, all flowing into the Channel. The seaports, Rye, Winchelsea, Pevensey, Seaford, Newhaven, Worthing, &c., are small and comparatively unimportant, but the mildness of the climate along the coast has led to the growth of many large and fashionable watering-places, such as Hastings, St. Leonards, Eastbourne, Brighton, Littlehampton, and Bagnor. The county is divided into the parliamentary districts of East and West S., each returning two members, the former consisting of the 'rapes' of Hastings, Lewes, and Pevensey, and the latter of the 'rapes' of Arundel, Bramber, and Chichester. The principal railway of S. is the London, Brighton, and South Coast line, with its branches, but the South-Eastern has also a branch in the county. There are many beautiful country residences in S., the most notable being Arundel Castle, the seat of the Duke of Norfolk, and Goodwood, the seat of the Duke of Richmond. See Lower's *History of S.* (2 vols. Lond. 1871), and G. F. Chambers' *Handbook to S.* (Lond. 1877).

Sustenta'tion Fund is a fund raised by the Free Church of Scotland for the support of its ministers. The first year after the Disruption (1843-44) it amounted to £68,704; for the year ending March 1878 to £177,387. All ministers of fully sanctioned charges receive an equal dividend. Besides which, those ministers whose congregations contribute at the rate of an average of 7s. 6d. per member receive a share of a surplus fund, the proportion received being larger if the contribution amount to 10s. per member. The minimum stipend aimed at is £200, which sum was received this year (1878) by those ministers entitled to a share of the surplus fund; the equal dividend being £157.

Suth'erland, the most north-westerly county of Scotland, bounded N. and W. by the Atlantic, E. by Caithness and the North Sea, and S. by Ross and Cromarty. Area, 1,207,180 acres; pop. (1871) 24,317, or 12½ to the sq. mile. The N. and W. coasts, fringed with islets, are bold and rocky, the chief headlands proceeding from the E. being Strathie Point, Whiten Head, Farout Head, Cape Wrath, and Rhu Stoer, in Assynt. The principal inlets in the N. are Strathie Bay, Armadale, and Naver Bay (a favourite anchorage for yachts), Kyle of Tongue, Loch Eriboll (a magnificent natural harbour), and Kyle of Durness; on the W., Lochs Inchard and Laxford (also good harbours), and Edderachylis Bay. About 30 miles off the coast are the Stack and Skerries, much frequented by seals. The E. coast is low and sandy, except in the N. where it rises to the Ord of Caithness. The N. and W. parts of the country are hilly, but the E. is mainly occupied by undulating moors, edged by continuous hill ranges of moderate height. In the W. are Ben More Assynt (3431 feet), and Ben Hee (2859), and near the centre Ben Clibrig (3164). Other mountains, more or less striking in outline, are Ben Quinnag, Canisp, and Suilven or Sugar Loaf. Near Tongue is Ben Loyal, the prettiest hill in S., and W. of it rises the imposing mass of Ben Hope (3061). S. is rich in streams and lakes, the former flowing through straths to which they give name. The Oykel, Shin, Brora, and Helmsdale Water enter Dornoch Firth; the Fleet flows into the Moray Firth at Little Ferry, the principal harbour on the E. coast; the Strathie, Naver, Borgie, Kinloch, Hope, and Grudie flow N., and the Inchar, Laxford, and Inver to the W. Among the inland lochs are Shin (over 16 miles long), Naver, Loyal, Hope, More, and Assynt. Both rivers and lakes abound in trout and salmon,

and there is abundance of game, including deer. There is a conspicuous absence of wood, except along the E. coast, in the lower reaches of the Oykel, and around Loch Inver and the Kyle of Tongue. Some 1000 acres near Loch Shin were planted by the Duke of S. in 1873-76. S. is almost entirely given up to sheep-farming. Many large sheep-farms, some of 70,000 acres, are without a patch that can be cropped. A sheltered strip along the E. coast, extending to 12 miles wide, is the only arable portion, and here agriculture is in an advanced state. In 1876, 10,383 acres were in corn crops, 5058 in green crops, 6691 in clover, sainfoin, and grasses in rotation, and 6018 in permanent pasture, exclusive of mountain and heath. In the same year S. had 228,503 sheep, 13,057 cattle, 2573 horses, and 1239 pigs. The climate in the W. is humid and inhospitable; in the E. it is much milder. Snowstorms, as in December 1878, occasionally impede all traffic, and cause a serious loss to sheep-farmers. In the W. and N. the prevailing rocks are gneiss, mica slate, Old Red sandstone, quartz, conglomerate, and limestone. Granite appears on the borders of Caithness, and around Golspie occur sandstone, limestone, coal, &c. Veins of quartz, calcareous spar, and tremolite, and traces of bog-iron, coal, and manganese, are found in various parts. Gold of superior quality was found in a burn 10 miles from Helmsdale in 1867, and a number of 'diggers' were attracted to the spot, but owing to the labour required the result was disappointing. The Duke of S. began the reclamation of land on a large scale in Strath Terry, N. of Loch Shin, in 1873, partly to provide for the keeping of more sheep in winter. Prior to that date only 5080 acres had been reclaimed, but in 1876 this was augmented by 2074 acres of arable land, and 9120 of pasture. In October 1876 the works extended over other 2024 acres, on which were employed 400 men, 23 steam-engines, and a newly-designed 'S. Land Cultivator.' The reclamations at Lairg (begun 1873 and ended 1877) extended to 2000 acres, out of which several new farms, large and small, have been formed. The S. railway from Bonar Bridge to Golspie was opened in 1878, and under the name of the 'S. and Caithness' railway has since been continued to Wick and Thurso. It owes its existence mainly to the energy and liberal support of the Duke of S., who has invested at least a quarter of a million in it, and it is now called the 'Duke of S.'s railway.' There are no manufactures, but the coast fisheries, which centre in Helmsdale, yield annually some 50,000 barrels of herrings, besides large quantities of white fish, cod, ling, mackerel, lobsters, &c. The salmon-fishings are also important. Dornoch (q. v.) is the chief town. Almost the whole county belongs to the Duke of S., and the valued rental in 1877-78 was £91,844. S. is the 'Southern Land' of the Northmen, who overran it prior to the 12th c. It returns one member to the House of Commons.

Suth'erland, the ducal title of the Leveson-Gowers, the 'luckiest of the great English families.' The Gowers trace their descent from a Norman named Guhyer, who shortly after the Conquest obtained the manor of Sittenham, in Yorkshire, the seat of a line of 'great squires and good soldiers.' A baronetcy was obtained from James I., and the second baronet, a leading partisan of Charles I., married a daughter of Sir John Leveson of Halling, in Kent, while the fourth baronet was adopted heir of Sir Richard Leveson of Trentham, in Staffordshire. With the Stafford estates the family took the existing name of Leveson-Gower. Sir William, who was one of the bail for the Duke of Monmouth in 1683, married a daughter of John Granville, Earl of Bath, who inherited the family estates. Sir John Leveson-Gower was raised to the peerage by Queen Anne, and was one of the Commissioners who concluded the union of England and Scotland. The second Baron Gower was elected president of the Jacobite 'Board,' *vice* the Earl of Lichfield in 1742, and in the same year Lord-Lieutenant of Stafford and Lord Privy Seal. It is said he held the two offices simultaneously, and in his own time he was regarded as such a turncoat that Dr. Johnson gave 'a Gower' as a synonym for 'renegade,' but abandoned the phrase on the objection of his printer. On the outbreak of '45 he raised a regiment of foot for King George, and as a reward was created Viscount Trentham and Earl Gower, 8 July 1746. He continued to hold the Privy Seal till his death, 25th December 1754. His eldest son, Granville, Lord Trentham, was made Lord Privy Seal in 1755—'a great promotion,' says Walpole, 'for so young a man.' Acting with the Bedford party, he became President of the Council (1767), an office he retained under Lord North. But in 1779 he resigned, disapproving of the continued war with the colonies. In 1782 he was asked by the king to form a new cabinet. This invitation, and a similar one in 1783, he declined; but when Pitt became First Lord of the Treasury he volunteered his service, and at once was made President of the Council, and in 1784 received the Privy Seal, which he held till 1794. On the recommendation of Pitt he was created Marquis of Stafford in 1786. He had married a daughter of Scroop, first Duke of Bridgewater, and died 26th October 1803. George Granville, the second marquis (born 1758), eclipsed the fortune of all his ancestors. On the 4th September 1785 he married Elizabeth, Countess of S. and Baroness of Strathnaver, Scotland, heiress of William, 17th representative of the Earldom of S., the oldest in Great Britain, dating from 1275. The title of the Countess, who had been an orphan from an early age, was disputed, but after various proceedings the House of Lords confirmed it in 1771. The Marquis thus became possessor of one-half of Sutherlandshire, and shortly purchased most of the country remaining. The famous 'S. clearances' were effected with the view of devoting the county to sheep-farming. The evictions, though causing hardship to individuals, were conducted in a kindly spirit, the old tenantry receiving grants in more fertile parts of Scotland and in Canada. The result has been an increase in the population and wealth of the county as well as a rise of rentals. The death of Francis, Duke of Bridgewater, in 1803, brought to the Gowers the estates of that family in Lancashire, Shropshire, Stafford, &c., which descended to Lord Leveson-Gower, who was created Earl of Ellesmere in 1846. Throughout early life the Marquis acted with Pitt, on whose death he attached himself to Lord Granville, but eventually joined the Liberal party. After the Reform crisis he was created Duke of S., 14th January 1833, and died 19th July following. His eldest son, George Granville, second duke, was a consistent Whig, but took little part in public affairs. The Duchess, a daughter of the Earl of Carlisle, swayed the great power of the house, a power increased by her position as Mistress of the Robes. Her large family were singularly fortunate in alliances, and the third and present Duke, George Granville William (born 1828), who succeeded in 1861, stands at the head of a family group which includes the Duke of Argyll, the Duke of Leinster, the Duke of Westminster, the Earl of Ellesmere, and Earl Granville. In 1841 the Duke married Anne, heiress of John Mackenzie, Esq., of Newhall and Cromartie, and in 1861 she was created Countess of Cromartie, Viscountess Tarbat, and Baroness Macleod and Castlehaven, with remainder to her second son, Francis, Viscount Tarbat by courtesy. The Duke, who lodged Garibaldi at Stafford House in 1864, has contributed £336,000 to the opening up of the northern counties by railway. In 1878 the estates amounted to 1,176,837 acres, of which only 26,837 were cultivated, but it is estimated that the arable portion may be increased to 50,000 acres. The Duke is at present engaged in a great work of land reclamation, described under SUTHERLANDSHIRE. See *The Great Governing Families of England*, by Sanford & Townsend (2 vols. Edin. 1865).

Sut'lej (*Satlaj*), the easternmost of the five rivers of the Punjaub, in N.W. India, identified both with the Zaradras and the Hypanis of the Greeks. It rises in the lake of Manasavara, amid the central Himalayas, nearly 20,000 feet above the sea-level, and first flows N.W. for about 200 miles through stupendous mountain gorges; it is then joined by the Spiti, a tributary larger than the main stream, and turns S.E. In this part it is occasionally crossed by suspension-bridges of rope and of iron. Passing Rampur and Bilaspur, it enters the plains of the Punjaub at Rupur, where it is 30 feet deep and more than 500 yards wide in the rainy season. It receives the Beas a little above Sobraon (q. v.), after a total course of 550 miles. Thenceforth the united stream is known as the Charra, taking the new name of the Punjnud after its junction with the Chenaub, up to the point where it finally empties itself into the Indus opposite Mittunkote. The principal town on its banks is Ferozpur. Its waters are largely used for irrigation, and the Sirhind Canal (q. v.) will afford, when completed, a navigable communication with the Jumna. It is celebrated in history as forming the E. frontier of the Punjaub, within which Runjeet Sing was confined. The crossing of the S. after his death by the Sikh army occasioned the first Sikh war of 1843, and on its banks many bloody battles were fought. The Upper S. canals have a total length of 213

miles, and irrigate 135,439 acres in the districts of Lahore and Montgomery. It is proposed to extend this system by a dam across the river at Ferozpur, at an aggregate cost of 3½ millions sterling. The Lower S. and Chenaub canals, in the Multan district, are 632 miles long, and water 242,504 acres.

Sut'ler (Old Dut. *sœteler*, 'a smaller trader'), a person who follows an army in order to purvey to them provisions, liquors, &c. In the British army a S. requires permission from the Quartermaster-general to follow the army, and, like all camp-followers, is subject to martial law and the Articles of War. The sutlers attached to regiments in the French army are called vivandiers.

Suttee' (Sansk. *sati*, 'a virtuous woman'), the term applied in India to the wife who immolates herself on the tomb of her deceased husband. This practice is known to have prevailed from remote antiquity, though it is now alleged to be based upon a mistranslation of a text in the Vedas. There are sacred spots throughout the country dotted with little pillars commemorating the self-sacrifice; and there can be no doubt that it is still looked back upon with half-approval by the great mass of the Hindu community. On 29th December 1829, Lord William Bentinck, with the advice of Mr. B. Bayley and Sir C. Metcalfe, promulgated the celebrated enactment making it a punishable crime to aid or abet a S. It is said that 600 victims before that date used annually to perish in Bengal alone. Now it is believed that the practice is eradicated even in the native states of Rajputana, where it lingered longest; though even in British territory a widow occasionally violates the law by stealth. A provision against S. figures prominently in the treaties made by the British with the feudatory Rajahs. On the death in 1877 of Jung Behaudur, the prime minister of Nepal, several of his wives are said to have committed S.

Su'ture (Lat. *sutura*, 'a seam'), the name applied in anatomy to the lines of union of the cranial bones and those of the skull. The sutures in man's skull are observable in adult life, and also in the skulls of mammals save the lowest; but in birds the bones of the cranium become firmly anchylosed, and thus obliterate the S. The sutures of the human skull are divisible into three series—those at the vertex, those of the side, and those at the base. Of the first mentioned, the *sagittal* or *interparietal S.*, the *coronal S.*, and *lambdoidal S.* are examples. Those at the side of the skull are also three in number—*spheno-parietal*, *squamo-parietal*, and *masto-parietal*; and the sutures of the base include the *Basilar S.*, the *petro-occipital*, *masto-occipital*, and others on each side.

In *Surgery* a S. designates various modes of sewing up wounds so as to maintain the opposite surfaces in contact, and thus secure union with the smallest possible cicatrix or mark. Needles of various shapes and sizes are employed, according to the various peculiarities of the parts to be operated on, but the round form of the ordinary sewing-needle is objectionable, as it leaves a large mark. The bayonet-pointed needle, used by glovers, perforates the skin much more readily, and leaves a much smaller cicatrix than the ordinary form of needle. Various kinds of material are used for the formation of the S., such as silver-wire, catgut, horse-hair, silk, cotton, and hemp. The silver S. is now in universal use, and is superior to any other if the S. is to be allowed to remain long in; but if it is to be removed soon after the operation, silk is preferable, as it can be removed without pain or difficulty.

Suvor'off-Rymnik'ski, Count Peter Alexei Vasiljevitch, Prince Italijski, Russia's most celebrated general, was born in Finland, November 25, 1729, of a family of Swedish extraction. He distinguished himself in the Russian service during the Seven Years' War, in Poland in 1768, against the Turks in 1773, and especially in the war of 1787-92, in which, in conjunction with an Austrian army, he gained the victory of Fokshani (1789). The same year, alone, his troops decisively defeated the Turkish grand vizier at Rymnik, for which he received the surname of Rymnikski, and in 1790 he stormed Ismail with fearful bloodshed. After the peace he was made governor of the provinces taken from the Turks. Having completed the subjugation of Poland in 1794 with the bloody capture of Praga, Warsaw's strongly-fortified suburb, he wrote the despatch announcing his victory to Catharine in but three words in his peculiar laconic manner: 'Praga, Hurrah! Suvóroff!' which drew from the Empress the answer: 'Bravo! Field-marshal! Catharine!' Violent and unyielding as S. was in battle, in peace he was mild and gentle. On his estate he delighted to live a patriarchal life in the bosom of his family. In 1799 the Emperor Paul set S. over the Russo-Austrian army, with the command to drive the French from Italy, and that he did by the victories of Cassano, Trebia, and Novi (April-August 1799), which were rewarded with the title of Prince Italijski. Variance between the Russian and Austrian generals leading to the decision that each nation should undertake an independent war, S. proceeded to Switzerland against Masséna. Though he there displayed all his former ability and activity, the Russians suffered great losses. He evacuated Switzerland, and was recalled to Russia with all his forces. His enemies influencing the pliant mind of Paul, S. fell into disfavour, the bitterness of which aggravated a sickness from which he suffered, so that he died (May 18, 1800) sixteen days after his return to St. Petersburg. See his correspondence, edited by Fuchs (2 vols. Glogau, 1835), and the biography of Polevoi (Ger. trans. Mitau 1853), and Rybkin (Mosc. 1874).

Su'zerain (Fr. from *sus*, Lat. *susum*, *sursum*, 'above,' on the analogy of *souverain*), a title borne in the days of Feudalism (q. v.) both by the king and his immediate vassals—by the former as original holder, according to legal fiction, of all the realm; by the latter, as grantors in their turn to *arrière*-vassals.

Swale, a tributary of the Yorkshire Ouse, rises on the borders of Westmoreland and Yorkshire, under Shunner Fells, and after a south-easterly course of 60 miles, unites with the Ure at Aldborough to form the Ouse. It is navigable for 8 miles above its junction with the Ure.

Swall'ow (*Hirundo*), a genus of *Insessorial* birds, exemplifying the *Fissirostres* or 'cleft-beaks,' and serving as a typical example of the family *Hertundinidæ*, in which the bill is shut with a broad base, the nostrils rounded, the wings long, with their first quills longest, and the tail forked. Of this genus the chimney S. (*H. rustica*) is the familiar species. Its average length is about seven inches, the back and wings are of a steel-blue colour, the top of the head is a ruddy chestnut, the tail and secondary feathers are black, and the throat is chestnut-brown. White and pied swallows are occasionally found. The S. is swift and active in all its movements. It pursues its insect prey on the wing, and is assisted in its captures by the bristles which fringe the wide 'gape.' The song is a mere twittering note. The nest is built usually in a disused chimney or some similar situation, and is made of mud or clay, lined inside with feathers and soft grasses. The eggs number from 4 to 6. They are of a white colour spotted with red, and two broods are usually produced in the year. The S. migrates to Africa at the end of October, but some members of the species remain in Europe all winter. In April the flight northward takes place. The house martin or window S. (*H. urbica*) is known by its white under colour. The nest is built under the eaves of houses. In America the *H. erytrogaster* or red-bellied S. takes the place of the common S. of Europe. The fairy S. (*H. ariel*) is a S. Australian species. The white-bellied S. (*H. viridis*) is also common in the United States. Other genera of Fissirostral birds including swallows are *Collo-calia*, to which belongs the *C. nidifica* or esculent S. of the Chinese; *Progne*, including the *P. purpurea*, the purple S. or purple martin of N. America; *Cotile*, including *C. riparia*, the sand S. or Sand Martin (q. v.). Other birds to which the name of S. is applied are the fern S., also known as the 'sea S.,' and the name wood S. is given to the *Artamus sordidus*, a dentirostral bird nearly allied to the Shrike (q. v.).

Swall'owing, Act of. See DEGLUTITION.

Swallow-Tailed Butterfly and **Moth**, the name of the *Papilio Machaon*, a large and beautiful genus of butterflies, and of the *durapteryx Sambucaria*, a common British moth. In both insects the hinder wings are prolonged to form pointed tails or projections, from which their popular names are derived. The larva of the S.-T. M. is of a reddish colour, and is usually found on such trees as willows and elders.

Swall'ow Wort. See ASCLEPIAS.

Swamm'erdam, Jan, a Dutch naturalist, was born at Amsterdam, February 12, 1637. He studied chiefly at Leyden and Paris. Settling at Amsterdam, he devoted himself mainly to the study of natural history. He made important investigations into the development of insects, and was the first to preserve vessels of dissected bodies by injecting with wax. Towards the

close of his life he came under the influence of Madame de Bourignon, a religious fanatic, gave up his studies, and died, a victim of melancholy, at Amsterdam, February 15, 1685. S. was the author of several treatises on respiration, on the natural history of animalculæ, on generation, &c.; but his great work is *Biblia Naturæ, sive Historia Insectorum in certas Classes redacta* (3 vols. 1737-38; Ger. trans. 1752, English 1758, French 1758), a work which, left unfinished, was completed by Thevenot, and published by Boerhave.

Swan (*Cygnus*), a genus of *natatorial* birds, having a bill of moderate length, a soft cere, the hinder toe unwebbed, and no under-lobe. The cere extends in the S. quite to the eyes, and the wings have their second and third quills longest. The legs are short, and the neck extremely long, the cervical vertebræ numbering twenty-three. The *Cygnus olor* is the common mute or tame S., and is the only species resident in Britain. The plumage is white, but that of the young or *cygnets* is a bluish-grey. Bewick's S. (*C. minor* or *Bewickii*) has an orange patch at the base of the bill. The whistling or hooper S. (*C. ferus*) is so named from the shrill grating note, produced by the peculiar and contorted shape of the *trachea* or windpipe. It arrives in Britain in winter, and migrates northwards in March and April. The average length of the common S. is three or four feet. The eggs are of a greenish-white colour, and number from five to seven. Other species of S. are the Polish S. (*C. inimitabilis*), the black or Australian S. (*C. atratus*), the American S. (*C. Americanus*), the trumpeter S. (*C. buccinator*), also an American form; and the black-necked S. (*C. nigricollis*) of S. America. From an early date the S. has been protected by royal decree. In Henry VII.'s time the theft of a swan's egg was punished by imprisonment, and the bird was deemed 'royal,' no subject being allowed to preserve it save by special permission of the sovereign. A mark or badge was granted to those who enjoyed this right, and the ceremony of 'S.-upping' or S.-marking is carried out to this day on the Thames on the first Monday in August of each year on behalf of the Crown, of the University of Oxford, and several of the London companies or guilds.

Swan'age Clay, a thin deposit of Middle Purbeck age, very remarkable for the fossil remains of mammalia which it contains, about fifteen species having been described by Dr. Falconer and Professor Owen. Only about eight species besides have been obtained from the whole range of Secondary rocks. They appear for the most part to be referable to insectivorous marsupials.

Swan River, a considerable stream in W. Australia, to which settlement it originally gave name. It enters the Indian Ocean in 32° S. lat., and is there 1000 feet wide. A rocky bar prevents large vessels from entering, but the anchorage inside is safe. The town of Freemantle (pop. 3500) is situated at the mouth of the S. R., and Perth (q. v.), the capital of the colony, 12 miles higher up.

Swan'sea (Cymr. *Abertawe*), a seaport of Glamorganshire, and the capital of S. Wales, 32½ miles W.S.W. of Merthyr Tydvil by rail, stands on the W. bank of the Tawe, at its entrance into S. Bay. It has nine Anglican and two Roman Catholic churches, besides innumerable chapels, but none of them are ancient or of much architectural beauty. The public buildings include a Corinthian guildhall (1827-46); the Royal Institution of South Wales, Ionic in style, with a library, theatre, and museum (1840); a post-office (1857); public hall (1864); market (1830), 320 by 220 feet, and fishmarket (1847); infirmary (1867); and Bishop Gore's School (founded 1682; rebuilt at a cost of £10,000, 1852-62), which in December 1878 had 5 masters and 87 boys. A public park of 45 acres, the third belonging to S., was presented by Mr. J. D. Llewellyn, 3d October 1878; and the Great Western Company completed (1879) a new station, in Early English style, with platforms 430 feet long. Besides the tidal harbour, 215 feet wide and formed by two piers 900 and 300 feet in length, there are the N. Dock of 10½ and S. Dock of 13 acres, the total cost of the harbour works having nearly reached £500,000. In 1877 there entered 5075 vessels of 704,914 tons, and cleared 6857 of 975,079 tons; and on 31st December 293 ships of 81,472 tons were registered as belonging to the port, besides 144 fishing-boats. The exports amounted to £674,660 (in 1873, £1,855,712); the customs to £10,458; and the imports to £2,122,737, the last including 93,375 tons of copper, 13,850 tons of iron or copper pyrites, 22,240 cwts. of saltpetre and cubic nitre, 331,237 cwts. of corn, 123,579 cwts. of potatoes, 84,083 loads of timber, 11,200 lbs. of wool, &c. Copper-smelting is the great industry of S., which receives three-fifths of the copper-ore imported into the United Kingdom; next ranks the export of minerals from the surrounding districts—viz. (1877), coal to the value of £344,623, and iron to that of £174,312. There are also important breweries, potteries, shipyards, iron and brass foundries, chemical and patent fuel works, &c., but S. is suffering greatly from the general depression of trade and the great colliery strike of 1875. It publishes three weekly newspapers (of which the *Cambrian* is the oldest in the Principality); and with the neighbouring towns of Neath, Longhor, Aberavon, and Kenfig returns one member to Parliament. Pop. (1871) 51,702. In 1113 Henry Beaumont, Earl of Warwick, erected S. Castle, whose massive square tower alone remains; but S. owes its present importance to the establishment of copper-works in 1719. See Nicholas' *History of Glamorganshire* (Lond. 1874).

Swat'ow, or **Chau-Chou**, a seaport of China, province of Quang-tung, 212 miles E.N.E. of Canton. It was opened to foreign trade by the Treaty of Tien-tsin, and exports sugar, rice, tobacco, &c., in exchange for opium, woollens, cottons, cotton yarns, and metals. In 1874 the total exports amounted to £1,311,532 and the imports to £3,318,508. The trade direct with foreign countries amounted to £2,234,567, and to other treaty ports to £2,395,473. Of the imports, £2,062,839 worth were from Hong Kong. S. is situated at the mouth of the Han, on a sheltered bay, and has a pop. of some 400,000.

Sweat (Old Eng. *swát*; comp. Lat. *sudor*, Gr. *hydor*, Sansk. *svaidas*), the name given to the *perspiration* or skin-secretion separated from the blood by the *sudoriparous glands* or S. *glands*. (See SKIN.) The ordinary perspiration is named *insensible* on account of its being continually given off from the skin by evaporation; the increased secretion of S. dependent on exertion, and which appears in the form of drops of fluid collected on the surface of the skin, being named *sensible* S. This secretion consists of water, carbonic acid, urea, mineral matters, and *sebaceous matter*—the latter obtained from the glands of that name existing in the skin. The principal salts in S. are the chlorides of sodium and potassium, with alkaline phosphates, and sulphates. Traces of oxide of iron also occur in the secretion. The quantity of watery vapour daily excreted by the skin under ordinary circumstances amounts to between 1½ and 2 lbs. Occasionally in some diseases (*e.g.*, jaundice) the S. may be coloured by other secretions, whilst *sanguineous* or *bloody* S. is not unknown; the cause of its production being, however, obscure.

Sweat'ing Sick'ness, The, an extremely fatal epidemic disease which made its appearance in England in August 1485, and which ravaged Europe throughout the 15th and 16th centuries. Its true origin is unknown; but it may have sprung from some of the epidemics which prevailed on the continent of Europe about the time of its appearance in England. In 1477 the bubonic plague broke out in Italy, and raged without interruption till 1485. Following in the train of drought and famine, malignant epidemics appeared in Switzerland and Southern Germany; and putrid fever, with phrenitis, in Westphalia, Hessen, and Friesland. In 1482, after two years of famine, France was the scene of a devastating plague of inflammatory fever with delirium, probably identical with that which, at the same time, ravaged the N.W. of Germany. In 1484, Germany and Switzerland were again the scene of devastating epidemics. At this period England was free from any great epidemic disease. On the 25th July 1485, the Earl of Richmond, at the head of 2000 men composed of a small subsidy of French troops and wandering freebooters, sailed from Havre, and seven days after landed at Milford Haven. At about the middle of August, the army, which had been augmented to about 5000, encamped in a low, damp situation at Litchfield, till it broke up for the neighbouring field of Bosworth, and at this period the S. S., or, as it was first called, 'the new disease,' made its appearance. After the victory of Bosworth, Henry hastened to London, attended only by a select body of followers; and the remainder of the army halted in the neighbouring towns, and were probably disbanded according to the custom of the age. On the 21st September the S. S. appeared in London as a violent epidemic, and continued to the end of the following month, a period of about five weeks. Hecker says:—'By the end

of the year, the disease had spread over the whole of England, and visited every place with the same severity as the metropolis.'

The S. S. is described as a violent inflammatory fever, which, after a short rigor, prostrated the powers as with a blow, and amidst painful oppression at the stomach, headache, and lethargic stupor, suffused the whole body with a fœtid perspiration. All this took place in the course of a few hours, and the crisis was always over within the space of a day and a night. The internal heat which the patient suffered was intolerable.

The treatment then adopted was, 'not to resort to any violent medicines, but to apply moderate heat, to abstain from food, taking only a small quantity of mild drink, and quietly to wait for four-and-twenty hours the crisis of this formidable malady. Those who were attacked during the day, in order to avoid any chill, immediately went to bed in their clothes, and those who sickened by night did not rise from their beds in the morning, while all carefully avoided exposing to the air even a hand or foot. Thus they anxiously guarded against heat or cold, so as not to excite perspiration by the former, nor to check it by the latter, for they well knew that either was certain death.'

In the years 1506, 1517, 1528, and 1551 this mysterious epidemic again ravaged England, with varying degrees of violence. In 1528 the French army was destroyed before Naples by a pestilence, probably a *malignant petechial fever*, and France was decimated by a highly inflammatory fever called *Trousse-Galant*. On July 25, 1529, the S. S. broke out in Hamburg, where it destroyed within twenty-two days 1100 inhabitants. The total mortality in Hamburg was estimated at 2000. The disease subsequently raged with great virulence in Lubeck, Zwickau, and at the beginning of September it broke out at Stettin, Danzig, and other Prussian cities, Augsburg, Köln, Strassburg, Frankfurt, Marburg, Göttingen, and Hanover. Towards the close of September it appeared in the Netherlands, Denmark, Sweden, and Norway, and spread over the Scandinavian Peninsula. It likewise penetrated into Lithuania, Poland, and Livonia, and probably into Russia. No trace of the epidemic is to be discovered later than December 1529, the disease having lasted about three months. Hecker says that the alarm which prevailed in Germany surpasses all description, and bordered upon maniacal despair. The history of the epidemic in England in 1551 was written by Dr. John Kaye or Caius, who was present in Shrewsbury during the prevalence of the epidemic. See *Epidemics of the Middle Ages*, by Dr. J. F. C. Hecker, translated by the Sydenham Society (Lond. 1864).

Sweden (Swed. *Sverige;* Norw. and Dan. *Sverrig*), a kingdom of N. Europe, occupying the E. part of the peninsula of Scandinavia (q. v.), bounded N. by Norway and Russia, W. by Norway, the Cattegat, and the Sound, S. by the Baltic, and E. by the Baltic, the Gulf of Bothnia, and Russia. It lies between 55° 20′ and 69° 4′ N. lat., and between 11° 9·8′ and 21° 9′ E. long., its extreme length being 990 miles, and breadth 264 miles. S. is divided into län or provinces, whose area and population were as follows, according to the census of 31st Dec. 1877:—

Län.	Area in sq. miles.	Pop. (1877).	Län.	Area in sq. miles.	Pop. (1877).
Götaland—					
Malmöhus	1846	543,074	Stockholm	2994	140,606
Christianstad	2506	230,869	Upsala	2052	107,121
Bleking	1164	134,005	Södermanland	2630	143,929
Halland	1899	133,988	Vestmanland	2622	126,753

The only colony of S., St. Bartholomew in the Antilles, was purchased by France, October 31, 1877. The emigrants from S. in 1861–70 averaged 1690 annually, in 1870 numbered 29,003, and in 1876, 9418.

Physical Aspect.—From Kjölen Mountains (q. v.), the watershed between S. and Norway, S. stretches in terraces to the Baltic. The descent from 4500 to 2000 feet occupies a fifth part of its entire breadth. Under this lies a zone 60 miles broad and 2000-800 feet high, with river-valleys 2½–5 miles wide, and numerous lakes. This again is succeeded by another still broader, and 800–300 feet high, from which a strip 28 miles broad stretches down to the Baltic shore, here in gradual declivity, there in sudden falls of from 65 to 160 feet. The gradual rise of S. from the sea has been estimated by Sir Charles Lyell at an average of about 40 inches in a century during the historical period. From Lake Fämund on the Norwegian frontier extends the chief mountain chain of S., first E., then South, throughout Central and South S. Although so much lower than the cliffs, the mountains of S., owing to their more northern latitude, are covered with perpetual snow, but the round-topped granite summits give to the inland mountain scenery an appearance of tameness and monotony. South of the great lakes of the Svealand lowlands rise the wooded ridges of Tiveden, Tylöskogen, and Kolmarden, averaging 515 feet high. The part of Götaland to the south of Lake Vetter forms the plateau of Smaland (1164 feet), from which the country slopes E. to the Baltic, W. to the Cattegat, and south to the plain of Skaane (1133 feet high). Near the Norwegian boundary rise Sulitjelma (6489 feet), and Syltoppen (6180 feet), the highest peaks in S. Areskutan in Jemtland is 5098, and Städjen in Dalarne 3399 feet high. Numerous small islands ('Skärgard') skirt the coast of S. Their aggregate area is 868 sq. miles. S. is peculiarly rich in lakes, which amount in area to 13,913 sq. miles. The greatest of these is Vener, the largest lake in Europe after Ladoga and Onega. Others are Vetter, Mälar, Hjelmar, Siljan, Storsjön, and the great lakes of Lapland. The rivers of North S. run parallel to each other from N.W. to S.E. Chief of these are the Tornea, forming the boundary with Russia, the Kalixelf, Luleelf (272 miles), Piteelf (225 miles), Byskeelf, Skellefteelf, Umeelf (270 miles), Angarmannaelf (285 miles; 60 navigable), Indalself, Ljungan, Ljusnelf (225 miles), Dalelf (308 miles), S.'s largest river, and the Motalaelf, which discharges into Lake Vetter. The rapidity of all of these makes them of small importance for navigation. The Götaelf, the exit of Lake Vener, is through the Göta Canal the most important river of S., being thereby rendered navigable in its upper course (the Klarelf). Of the rivers of South S. the chief are Viskan, Attran, Nissan, Lagan, Helgean, and Emman. Of the numerous waterfalls formed by the rivers and lakes of S., especially noteworthy are Njommelsaska or Harspranget in the Luleelf (391 feet high), and Trollhättan (110 feet) in the Götaelf; the falls in the Motalaelf and Mölndalsan supply valuable water-power.

Climate, Geology, and Mineralogy.—The Swedish shore, on the Gulf of Bothnia, is now rising at the rate of 3 feet in a century, while in the south of S. it is sinking. The climate of S. is very diverse, by reason of its great length and varying elevation. While at Lund and Götheborg the mean temperature is 43°–45·5° F., and in Skaane as in Gotland the vine and mulberry can endure the winter, the N. parts of Lapland have a mean temperature of 30°–27° F., and at a height of 3000 feet no tree can grow. On the E. coast the winter is colder and the summer warmer than on the W. The annual rainfall in Central S. averages 20⅞ inches. Granite, gneiss, and eurite, yielding lime and aluminous slates, occur in Vestergötland, Nerike, Östergötland, Öland, Dalarne, Jemtland, Gotland, and Skaane. In the N.W. of Skaane occur Secondary formations containing coal. Iron is found in Örebro, Kopperberg, Värmland, Vestmanland, Upsala, Stockholm, and Gefleborg. The mine of Gellivara in Norrbotten consists wholly of magnetic iron ore. In Smaland iron ore is found in mosses and lakes. The copper mines, of which the largest are the 'Great Mine' in Dalarne and Atvida in Östergötland, yielded, in 1874, 28,828 metric tons. More important is the production of nickel (at Klefva in Smaland and Sagmyra in Dalarne), lead, sulphur, vitriol, alum, and especially zinc (in Nerike and Östergötland). Other mineral products are cobalt, manganese, porphyry, and marble.

Botany and Agriculture.—After Russia and Finland, S. has more forest land in proportion to its area than any country of Europe. The forests covered in 1876, 40,704,934 acres, or 40 per cent. of the surface, and consist chiefly of pine and fir, with birch, alder, and ash. In 1877 were exported 640,000 planks,

and 100,000 logs. The oak grows no farther N. than the Dalelf, and the beech is not found farther S. than Lagan. The flora of S. is singularly rich, and consists of over 2300 species in 463 genera, probably more than any other country of Europe. Agriculture is the chief support of the people, though only 5¾ per cent. of S. is arable land. In 1876 the crop of oats in S. was 35,637,911 bushels, of rye 16,138,522, of barley 11,820,332, of wheat 2,716,357, of mixed corn, 4,430,916, of potatoes 46,040,731, and of beans and pease 1,580,828. The chief other products are beet, flax and hemp (57,981 cwts. of fibre in 1876), hops, rape, and tobacco.

Zoology and Live Stock.—The wild animals of S. include the bear, wolf, lynx, glutton, fox, marten, ermine, and otter. The elk is found in Central S., deer, squirrels, and hares abound, and lemmings roam on the mountains. Moor and mountain fowl, the snipe, wild goose, and swan are common. The rivers of S. are rich in salmon. Cod and sprats are caught in the Baltic. The herring-fishery of Bohuslän, last century considerable, is now succeeded by that of cod, mackerel, flounders, lobsters, and oysters. In 1876 S. had 460,757 horses, 2,189,216 cattle, 1,588,541 sheep, 431,671 pigs, and 120,234 goats.

Industries.—S. had, in 1873, 2549 manufactories, employing 53.334 workpeople, and producing goods to the value (in 1874) of £10,472,000. The mining industry is one of the most important, and is making great progress by the introduction of new machinery. In 1876 there were produced 18,996,654 cwts. of iron ore from mines, besides 351,354 cwts. of 'marsh iron' from lakes and bogs. In the same year were produced 8,083,551 cwts. of pig-iron, 4,466,355 cwts. of bar iron, 1,402,835 cwts. of steel, 571,528 cwts. of cast-iron goods, 22,468 cwts. of copper ore, 744,388 cwts. of zinc ore, and 1734 lbs. of silver. The iron industry occupied, in 1876, 24,174 persons (421 females), 5887 being employed in the mines, 6093 in the foundries, and 7496 in the rolling mills. The furnaces in blast numbered 205. The best Swedish iron is manufactured at Dannemora (q. v.). In the latter half of 1877 the 'Iron Goods Co. Limited' of Tunafors started a cutlery factory, which by the end of the year had produced 25,303 dozen knives and forks. The average annual production of sugar in the period 1871–75 was 39,202,679 lbs., or 65 per cent. of the whole consumption in S., and that of cotton yarn 14,479,573 lbs., while that of cloth was valued at £717,496, of glass at £151,192, of porcelain at £116,298, lucifer matches at £243,144, and paper £416,525. The other industries of S. are shipbuilding, distilling, brewing, and the manufacture of woollens, linens, and tobacco.

Commerce, Railways, &c.—The trade of S. is steadily improving, mainly owing to the gradual departure from the protective tariff that obtained till 1857. In the period 1856–75 the average value of the imports of S. was £7,788,575, and of the exports £6,981,914. The customs in 1877 amounted to £1,444,500. The commerce with Great Britain is twice as great as that with any other country. In 1877 the exports of S. to Great Britain amounted to £7,859,812, including wood and timber valued at £4,390,417, iron and steel at £1,127,341, oats at £1,329,359, wheat, barley, and other cereals at £181,635, butter at £238,575, cattle at £103,235, and paper at £100,080; while the imports from Great Britain were in all worth £3,902,324, including iron valued at £507,958, coal at £413,913, bacon and hams at £365,790, coffee at £343,720, raw cotton at £256,208, cottons and cotton yarn at £211,705, woollens and woollen yarn at £221,122, unrefined sugar and molasses at £156,330, and machinery at £175,581. The total burden of Swedish vessels which entered and cleared at ports in the United Kingdom in 1877 was 1,090,563 tons (steam vessels 446,465 tons), while the total tonnage of vessels of all nations entered and cleared in S. in 1875 was 5,279,849 tons (66 per cent. foreign bottoms). The aggregate tonnage of the Swedish merchant navy at the close of 1877 was 507,049 tons (steam vessels 83,007 tons). At the close of 1877 there were 1011½ miles of state railways in S., and 2104⅜ of private lines. The Diet of 1878 has voted for an extension of the state railways £369,445, and £166,600 for the completion of those already in use. There are in S. 466 miles of navigable canals, of which the chief is the Trollhätta and Göta Canal, between the Baltic and the Cattegat. In 1877 there were 5135 miles of telegraph in S., with receipts amounting to £73,804.

Government and Legislature.—The constitutional laws of S. are the Acts establishing the form of government (1809), the hereditary succession (1810), the liberty of the press (1812), and the national representation (1866). The king must be a member of the Established Lutheran Church. His person is inviolable. The executive is in his hands, acting under the advice of a council of ten ministers, seven of whom form the cabinet. The Diet consists of two Chambers, the first composed of 133 unpaid members, or one to every 30,000 of the pop., the second of 198 salaried members, in the proportion of 1 to every 10,000 in towns, 1 for every *domsaga* or rural district with less than 40,000 inhabitants, and 2 for every *domsaga* that has more than that number. The supreme court of S. is composed of the king and sixteen counsellors of justice. Under it are three courts of the second instance (at Stockholm, Jönköping, and Christianstad), and the military high court.

Finance.—The revenue is derived one-third from direct taxes and Government property, and two-thirds from indirect taxation, customs and excise duties, and the tax on spirits. The budget of 1878 showed an expenditure for 1877 of £4,782,778, and the estimate for 1878 put the revenue at the same amount. On January 1, 1878, the public debt was £10,119,838, exclusively spent on railways.

Army and Navy.—The army is composed of (1) *Värfvade* troops enlisted for six years; (2) *Indelta*, or national militia, paid and kept by the landowners; (3) the *Gotland militia*; (4) the *Beväring*, or conscripts, levied from the male population between twenty and twenty-five. At the close of September 1877 the entire forces were 122,122 infantry, 8011 Gotland militia, 8569 cavalry, 7542 artillery (serving 234 guns), and 836 engineers, in all 147,180 men. There is also a body of volunteers, first organised in 1861, amounting (September 1877) to 13,166 men. At the same date the fleet consisted of 14 ironclad vessels (4 monitors with 8 guns), 25 unarmoured ships of the line, 7 sailing vessels, and 89 galleys, having in all 380 guns and 5296 men, while the naval *Beväring* numbered 40,000 men.

Education and Religion.—Education in S. is gratuitous and compulsory. In 1875 there were 8123 primary schools, with 606,875 pupils, and in 1872, 98 secondary schools, with 12,356 pupils and 976 teachers. S. has two universities, at Lund (q. v.) and Upsala (q. v.), 31 agricultural and 9 technical schools, 8 schools of forestry, 9 of navigation, and 2 large industrial schools in Stockholm and Gotheborg. The vast majority of the people are Evangelical Lutherans, the enumeration of 1876 showing but 6440 dissidents, of whom 573 were Roman Catholics and 1836 Jews. The followers of Swedenborg (q. v.) are tolerated within the National Church.

History.—The earliest inhabitants of S., as of all Scandinavia (q. v.), appear to have been Finnish peoples, who in prehistoric times were driven northwards by Teutonic races from Ey-gotaland or the Danish islands. According to the *Ynglinga Saga*, Odin founded the empire of the Svea, named by him the lesser Svithjód, and built a temple at Sigtuna, near Lake Mälar. He found in S. a people named Gota or Gauta, who also had originally come from Svithjód. The two peoples settled side by side as the two free nations of the Svea and the Göta. The Svea gradually became the more powerful, and their chiefs came to be regarded as chief kings by all the Smaa-kongar of the Goths as well as Swedes. Frey-Yngve built a temple on the ruins of that at Sigtuna and called it Upsala ('high halls'), and founded the dynasty of the Ynglingar, which ruled in S. until the death of Juggald Ill-raada, who lost his life by vengeance for the burning alive of six Smaa-kongar. Ivar Vidfadme, ruler of Skaania in South S., was now chosen king. In the Icelandic sagas he is said to have conquered Denmark. The great victory of Bravalla gained by Sigurd Ring over the Danish King, Harald Hildetand, gave Denmark to Sigurd, whose son, Regner Lodbrog ('leather leggings'), is a favourite hero of the Scandinavian skalds. Bjorn Jernside, son of the latter, succeeded to S., which was long ruled by his descendants, most famous of whom was Erik Sejrsoel ('Victorious'), who died in 993. His son, Olaf Skötkonning ('Lap-King'), who ruled from 993 to 1024, was the first Christian king of S., and was baptized probably about 1000. The line having died out in 1056, disputes as to the succession arose between the Svea and Göta, but the former were able to set up Stenkil Jarl, of Vestergötland, a Christian, who reigned until 1066. For nearly a century after his death S. was torn by factions and religious wars, while Christianity went backward, until, in 1135, Sverker Karlsson mounted the throne. After a reign of twenty years he was succeeded by his

cousin, Erik Jedvardsson, surnamed 'the Saint,' who belonged, through his father, to the Bondar or peasant class. He was the first to erect a church at Upsala, and to enact a general code of laws. He was killed in battle by Magnus Henriksen in 1160, and for nearly a century disorder and misery reigned in the land from the struggles for the crown between his descendants and those of Sverker. In 1222 the last of the Sverker race died out, and Erik Läspe mounted the throne. With him ended in 1250 the Bondar line. He was followed by his nephew Valdemar, of the Folkungar family, who was dethroned in 1276 by his brother Magnus. The latter was followed in 1290 by his son Birger, who was deposed in 1319 in favour of his nephew Magnus Smek, who in turn was deposed by the Diet in 1343, his son Erik being substituted. On the death of Erik in 1359 Magnus was reinstated upon the throne, but he was finally deposed in 1363, and succeeded by his sister's son, Albrecht of Mecklenburg. Albrecht, however, was as unpopular as his predecessor, and accordingly the throne was offered to Margrete (q. v.), Queen of Norway and Denmark, who formed the three realms into a confederate monarchy by the Union of Kalmar in 1397. She was followed in 1413 by her grand-nephew, Erik of Pommern, but his tyranny greatly irritated the Swedes, who expelled the Danes in 1433. The next ninety years were occupied by the struggles of successive Danish kings to establish their hold on S. The last Danish king of S. was Christiern II., who, aided by the Primate Trolle, put down the patriotic party under Sten Sture, and massacred in the great market-place at Stockholm, November 8, 1520, ninety-four prelates and nobles. 'The Union of Kalmar was drowned in the blood bath' of Stockholm, for the Swedes flew to arms under Gustaf Erikson Vasa, son of one of the victims, and drove out the Danes, crowning their leader King Gustaf I. (q. v.) in 1523. The Lutheran doctrines had been introduced in 1519 by Olaus Petri, and had found a congenial soil in S. The Lutheran doctrines were adopted by the nation at the Diet of Vesteraas in 1527. Gustaf was succeeded by his son, Erik XIV., who was deposed in favour of his brother Johan in 1568, whose efforts to restore Catholicism were imitated by his son Sigismund, who succeeded in 1592, having been elected King of Poland in 1587. In 1593 the Augsburg Confession was adopted as the national creed. After a stormy reign of eight years Sigismund was deposed, and the crown of S. given to his uncle, Karl IX. (q. v.). This led to the Polish War of Succession (q. v.), which smouldered on until 1660. Karl was succeeded by his son, Gustaf II. Adolf (q. v.), the most famous king of his times. At the close of the great eighteen years' struggle, in which S. won so much glory, her gains from the war were the possession of Western Pommern, Rugen, Stettin, Weimar, and Bremen, and the promise of five million rix-dollars. Gustaf was followed by his eccentric daughter Christina (q. v.), who abdicated in 1654, and was succeeded by her cousin, the warlike Karl X. (q. v.), who filled the throne until 1660. Under his son, Karl XI. (q. v.), a long peace gave S. time to recover from her prostration, and the royal power was gradually augmented at the expense of that of the nobility. Karl XII. (q. v.) succeeded his father in 1697. At his death in 1718 the crown fell to his sister, Ulrika, who in 1720 resigned it to her husband, Prince Friedrich of Hessen. His long reign was a period of humiliation, yet the people found means to deprive the weak monarch of his absolute power, and at the Diet of 1720 obtained a 'royal assurance' of constitutional government. Disastrous intrigues rent the court, the two principal parties being the *Hattar* ('hats') or French party, and the *Natmössor* ('night-caps') or Russian party. The temporary power of the former led to the fatal war with Russia in 1741, by which S. was stripped of E. Finland. Adolf Fredrik of Holstein-Gottorp was followed in 1771 by his son Gustaf III. (q. v.), who destroyed the factions of the nobles and recovered much of the power of the crown. He was assassinated in 1792, and followed by his son Gustaf IV. (q. v.), who was succeeded in 1809 by his uncle, Karl XIII. (q. v.). The war with Russia was closed (1809) with the loss of Finland, E. Bothnia, and Aland. In 1810, on the election of a Crown-Prince, the choice of the Estates fell on Bernadotte, Prince of Ponté-Corvo, who mounted the throne as Karl XIV. (q. v.). In 1814 the crown of Norway was united with that of S. Karl XIV. died in 1844, and was succeeded by his son Oscar I. (q. v.), followed in 1859 by his son Oscar II. (q. v.), who on his death in 1872 left the crown to his brother Oscar III. (q. v.), the present king. The long peace that S. has now enjoyed has greatly developed her trade and increased her prosperity, and the liberal policy of the government has saved the country from discontent. In 1866 a Reform Bill was passed, and in February 1870 were removed the civil disabilities of dissidents and Jews. A new reorganisation of the fleet began in 1875; but from 1867 to 1877 repeated bills for army extension have been thrown out by the strong majority of the cheese-paring 'Landmann Party' in the Lower House. See Törnebohm, *Geographie der Schwedischen Hochgebirge* (Stock. 1873); *Illustreradt Sverige* (ib. 1875); *Statistik Tidskrift* (ib. 1877); and for the history, Fryxell, *Berättelser ur Svenska Historien* (40 vols. 1823-71); E. G. Geijer, *Svenska folkets Historia*, vols. i.-iii. (new ed. Stock. 1876), continued by Carlson, vols. iv. and v. (1855-75); and *Sveriges Historia fran äldsta til vara Lagar* (1876 *et seq.*) by Montelius, Hildebrand, Alind, and others.

Swe'denborg, Emanuel, was born at Stockholm on the 29th January 1688. His father was Dr. Jesper Swedberg, afterwards Bishop of Skara; his mother was Sara Behm, daughter of Albrecht Behm, Assessor of the Royal College of Mines in Sweden. S. was educated at the University of Upsala, and took his degree of Doctor in Philosophy in 1709. The next year he visited England and Holland, and returned after fifteen months' absence. His favourite studies at this time were mathematics and mechanics, by which he gained the good opinion of Charles the Twelfth, and was by him appointed Assessor of the Royal College of Mines in 1716. In 1719 the Swedberg family were ennobled by Queen Ulrica Eleonora, and their name changed to S. In 1721 S. went abroad a second time, and published in Holland some scientific pamphlets. The years from 1722 to 1733 he spent in active discharge of the duties of his office. Of his *Opera Philosophica et Mineralia* (3 vols. Dresden and Leipz. 1734), the first vol., the *Principia*, is a remarkable cosmogony. By the publication of this work S. gained a high reputation among men of science of the time, not only by its acute and comprehensive reasoning, but also by the foreshadowing of many scientific truths then unknown and afterwards brought to light and confirmed, when the scientific merits of the author were forgotten, and his name was commonly associated with visions and fantastic dreams. The years 1736-40 he spent in travelling through Europe from Sweden to Italy and back again. In 1740-45 he published his last scientific works, the *Economy of the Animal Kingdom* and the *Animal Kingdom*. The principal aim and scope of these was, according to the author himself, to obtain a true knowledge of the soul by a thorough examination of the anatomy and physiology of the human body. In this he was, of course, unsuccessful. But the time was at hand when another and surer way of attaining his object was to be opened to him.

In a letter written in 1769 S. gives the following account of this opening: 'I have been called to a holy office by the Lord himself, who most graciously manifested himself to me his servant in the year 1743, when he opened my sight to a view of the spiritual world, and granted me the privilege of conversing with spirits and angels, which I enjoy to this day. From that time I began to print and publish various arcana that have been seen by me or revealed to me, as respecting heaven and hell, the state of man after death, the true worship of God, the spiritual sense of the Word, with many other most important matters conducive to salvation and true wisdom.'

S. spent accordingly the remainder of his life in writing and publishing books on these subjects. He resigned his office, and began to study the Hebrew Bible. The first results of his illumination and study were the *Arcana Cœlestia* (1749-56), a spiritual interpretation of Genesis and Exodus, in eight quarto volumes. Then followed other works in quick succession, such as *Heaven and Hell* (1758), *On the Earths in our Solar System*, *On the New Jerusalem and its Heavenly Doctrine*, *Angelic Wisdom concerning the Divine Love and Divine Wisdom* (1763), *Angelic Wisdom concerning the Divine Providence* (1764), *The Apocalypse Revealed* (1766), *Conjugial Love and its Chaste Delights* (1768), and *The True Christian Religion* (1771). Besides, during twenty years, he kept minute notes of his intercourse with the spiritual world in what is called his *Spiritual Diary*, which was published after his death, as also several other works which he had left. S. wrote and published his books in Latin, but nearly all of them have been translated into English and many other languages. The latter part of his life S. spent partly in Sweden

and partly in England, and died in London, 20th March 1772. The most comprehensive of S.'s doctrines is the science of correspondences. The world and all natural things are produced from a spiritual origin; as the house is a visible production of the idea in the mind of the architect, so the visible universe is a material expression of the spiritual world. There is not a bit of stone, a blade of grass, an animal, or a particle in the human body, which does not express a spiritual principle, and would not have existed but for its spiritual counterpart or correspondent. This science of correspondences was, according to S., well known to the ancient world, but as the thoughts of man became more and more material this science was lost. It was S.'s principal mission to restore it to humanity. The Bible, or those portions of it which are inspired, is entirely written by correspondences, the only means of conveying spiritual truths to natural beings. Thus the first chapters of Genesis do not contain an account of the material creation of the universe, but of the spiritual creation by the Lord, or the regeneration of man, until all the evils of his nature are subdued, and he becomes an angel; the minutiæ of the Jewish worship are all expressive of spiritual ideas. The literal sense has therefore within it the spiritual sense, and both are united by correspondences, like soul and body.

The distinctive features of S.'s theology are—Jehovah God, the creator and preserver of heaven and earth, is one in essence as in person, in whom there is nevertheless a divine Trinity: the Father, the essential divinity; the Son, the divine humanity; and the Holy Spirit, the divine proceeding, answering to the soul, body, and operative energy in man. The Lord and Saviour Jesus Christ is this God. He took upon himself human nature in order to remove from man the powers of hell, by which man would necessarily have been conquered unless divinity itself had come to his assistance. Herein is the great work of redemption. Man receives life from the Lord, who is love itself and wisdom itself, but it is received differently by every one, according to his quality and power of reception. Even while in this world the spirit of man is, unknown to himself, either in heaven or in hell, and is acted upon by influences from both, and his free will consists in having the choice of lending himself to the influences of either. Man is born into evil with tendencies towards it; he must therefore be regenerated or created anew by the Lord, submitting of his own free will to the regenerating influx from the Lord; every one is capable of doing this according to his condition. His future state will therefore depend upon what use he has made of his choice, and what he has made his ruling affection in this life: if good, he will enter into the society of angels, that is, heaven; if bad, he will flee from their society and enter hell.

S. never separated himself from the Lutheran Church in which he was born, but his followers formed themselves into a Church called the 'New Jerusalem Church.' It has numerous societies both in Great Britain and America. S. has also a large number of readers and admirers, and, it is said, not a few disciples, in many of the Christian communions. There are biographies of S. by Garth Wilkinsor (1849), Paxton Hood (1854), and White (1867). Also Tafel's *Documents concerning S.* (Lond. 1875–77).

Swedish Language and Literature. *Language.*—The S. language is the modern literary representative of the Swedish dialects of the *dönsk tunga*, *norræna tunga*, or *norrænt mál*, once common to all Scandinavia (q. v.). Of this language are the Runes (q. v.) of over 2000 extant Scandinavian inscriptions, nine-tenths found in Sweden. These go back to the 9th c., belong mostly to the 11th and 12th, and come down even to the 14th. The earliest extant form of the S. language has these deviations from the old Scandinavian: (1) the diphthongs *ai*, *au*, *ey* are replaced by the single vowels *e*, *ö*; (2) *a*, with *u* (*v*) in the following syllable, by *ö*; (3) *h* is lost before *l*, *n*, and *r*; (4) *fn* is changed to *mn*; (5) *d* is inserted between *l* and *r* or *m* and *r*, as likewise *b* between *m* and *l* or *m* and *r*; (6) many inflections give place to separate words; and (7) for the reflexive form in *sk* (*-st*) appears a form in *s*, with a passive meaning. By the 16th c. *g*, *b*, and *d* tended to supersede *k*, *p*, and *t*, *þ* before *t* was changed to *f*, the German *ch* was adopted, substantives had lost all case-inflections save the genitive *s*, the Danish *e* was used in the infinitive, and the suffixes *-het*, *-inna*, *-nar*, *-eri*, and *-era*, and prefixes *be-*, *bi-*, *unt-*, *for-*, and *för-*, were in common use. In the 16th and 17th centuries, *k*, *p*, and *t* were replaced for *g*, *b*, and *d* within words, the Danish ending *e* was succeeded by *a*, many Latin, French, and especially German words and idioms were introduced, and the German prefixes *an-*, *här-*, and even *ge-* and *er-*, became general. By the beginning of the 18th c. the Swedish language, except in orthography, had essentially its present form. See DANISH LANGUAGE; Södervall, *Hufvudepokerna af Svenska Sprakets Utbildning* (Lund. 1870); Rydqvist, *Svenska Sprakets Lagar* (5 vols. Stockh. 1850–74); *Ordbok öfver Svenska Spraket* of the Swedish Academy (1870 *et seq.*), and its *Ordlista* (3d ed. 1875).

Literature.—The oldest extant Swedish writings are the *Landskapslagar* ('provincial laws'), especially those of Westgöta and of Upland (c. 1296), and the remarkable work of unknown authorship, *Um Styrilsi kununga ok Höfdinga* (14th c., critical ed. by Geete, 1878), which, save for St. Bridget's (q. v.) *Revelationes*, is the only production of Swedish mediæval speculation now extant. About the same time appeared the first Swedish translation of the Pentateuch, probably by Birgitta's father confessor, Canon Mattias of Linköping (*d.* 1350). Soon afterwards history had a weak beginning in the *Rimkrönikor*, of which the chief are the *Gamla* or *Erikskrönikan* (1320), the *Nya* or *Karlskrönikan* (1452), and the *Sturekronikar* (1496), from which the Latin history of Ericus Olai, *Cronica regnum Gothorumque* (1615), is mainly translated. Noteworthy also are the versified romances translated (1303–12) into Swedish by direction of the Norwegian queen Eufemia, *Herr Ivan Lejonriddaren*, *Hertig Fredrik af Normandie*, and *Flores och Blanzeflor*. The greatest poet of Sweden in the Middle Ages was Bishop Tomas of Strengnäs (*d.* 1443), author of poems *Om Engelbrekt*, *Om Friheten*, and *Öfver Erik Puke*. Of the Swedish *Folkvisor* only a small number belong to the 'Catholic Period.'

Under the rule of Sten Sture the Elder printing was introduced into Sweden, and a university was founded at Upsala (1477). But even more important was the Reformation, and the freedom it gave to intellectual life. The Reformers did great service to the literature by their hymns and histories, but most of all by their translation of the Bible (Upsala, 1540–41), which, though marred by Germanisms, helped greatly to develop Swedish prose. Olaus Petri's *Tobie Comedia* (1550), the first Swedish drama, served as a model to many imitators. Almost contemporary with these appeared the Latin histories of Johannes and Olaus Magnius (q. v.), and the useful though uncritical *Scondia Illustrata* of Messenius (*d.* 1636). All the first rulers of the Vasa dynasty favoured science, but it was the munificence of Gustaf II. Adolf to the University of Upsala, with the closer contact with the rest of Europe that his policy occasioned, that gave the rein and spur to a national interest in literature. The entrance of foreign culture did not promote writing in the mother tongue, and the language of the learned continued to be Latin. Therefore this period is poor in great productions, if indeed these were possible in an age when intolerant theologians persecuted all originality as heresy, and philosophic study was fast bound by scholasticism that knew not yet of the free spirit of Cartesian doctrine. Save in the important *Bibelvärk* (1711–28; new ed. 1863–65) of the two Gezelii, theology was productive only of homiletical works. The rude state of the language was an offence to song, yet it was now that 'the muses first learned to speak the Swedish tongue' in Stjernhelm's verse, which was successfully imitated by 'Lucidor' (*d.* 1674) and Runius (*d.* 1713), as licentious in their poetry as in their life. Stjernhelm (*d.* 1672) would better have deserved the name of 'father of Swedish poetry' had he not wasted his energies on too various fields. This also was the fault of Rudbeck (*d.* 1702), who obscured his merits as a writer on medicine and botany by the adventurous antiquarian hypotheses he aired in his *Atland eller Manheim* (1679 *et seq.*), a work by which the whole course of historical inquiry was perverted for many decades till it was at length restored by Dalin (1708–1763). Before his time Girs (*d.* 1639) and Tegel (*d.* 1636) had written Swedish history under the Vasa kings. The so-called 'Period of Freedom' that began with the death of Karl XII. was not deficient in scientific works, but it was not till the age of Gustaf III. that literature first reached a great development. The 18th c. gave impulse chiefly to the natural sciences, yet the rest were not neglected, as show the names of Rydelius (*d.* 1738) in philosophy, Ehrenstrale and Calonius in jurisprudence, Rosén von Rosenstein, Palmblad, and Murray in medicine, and Nohrborg (*d.* 1767) in theology. As a botanist, Linné (q. v.) gained world-wide fame, and found able disciples in Sparrmann, Thunberg, and Löfling. In chemistry and mineralogy the chief were Vallerius, Bergman, Gahn, and,

above all, Scheele (q. v.). History was written by Dalin, Lagerbring (*d.* 1787), and Hallenberg (*d.* 1834); and poetry was cultivated with success by Dalin, Fru Nordenflycht (*d.* 1763), Creutz (*d.* 1785), and other members of the Societies *Tankebyggare-orden* and *Utile Dulci.* Under Gustaf III., who by the foundation of the Swedish Academy made a new epoch in the history of the literature, appeared Kellgren (*d.* 1795), equally distinguished as a critic and poet, and Bellmann (q. v.), who freed himself wholly from the bonds of French tradition that bound Gyllenborg (*d.* 1808), Oxenstjerna (*d.* 1818), and Leopold (*d.* 1829). An interesting feature of this period are Fru Lenngren's (*d.* 1817) miniature pictures of the ridiculous in everyday life. An eager declaimer against the prevailing taste was Thorild (*d.* 1808), who fancied himself equally a political, social, and literary reformer, and in 1810 a regularly organised struggle began in the starting of two new periodicals, Askelöf's *Polyfem* and Atterbom's *Phosphorus,* in opposition to the classical organ, Wallmark's *Journal för Litteraturen och Theatern.*

The leading members of the 'New School,' generally named the 'Phosphorister,' were Hammarskjöld (*d.* 1827), Dahlgren (*d.* 1844), Livijn (*d.* 1844), Palmblad (*d.* 1852), and Atterbom (*d.* 1855). It is a common remark that the influence of the Phosphorister on the Swedish literature was negative rather than positive. Before them Franzén (q. v.) and Wallin (q. v.) had begun to turn the course of poetry into a deeper channel, without directly combating the prevailing tendency, and side by side with them rose the 'Göthiska Forbund,' led by Tegnér (q. v.), Geijer (q. v.), and Ling (*d.* 1839), who held a neutral course, laying stress on the significance of a national feeling in literature, and confining their poetry and history to Swedish life and scenery. At length the two schools began to lose their individuality in the subsidence of their strife, from which many of the most gifted poets had kept wholly aloof. Not only was this the case with Franzén and Wallin, but also with Stagnelius (*d.* 1823), whose excellence in almost every branch of the poetic art is marred by his passion for abstract subjects. Another poet, eminent alike as a lyrist and a satirist, was Sjöberg ('Vitalis') (*d.* 1828), whose originality went far beyond his friend Nicander (*d.* 1839), the 'poet of perfect form.' The choicest products of the more recent Swedish literature are the works of Runeberg (q. v.). Of the other Swedish poets that have died in the two last decades, the greatest names are Silfverstolpe (*d.* 1853), Von Braun (*d.* 1860), Fahlcrantz (*d.* 1866), Von Beskow (*d.* 1868), Sturzen-Becker (*d.* 1869), Grafstrom (*d.* 1870), and Strandberg (*d.* 1877). Of living poets, Böttiger, Sätherberg, Nybom, Topelius, and Snoilsky are the chief. Von Beskow and Borjesson (*d.* 1866) have written excellent tragedies; Stagnelius, Almqvist (*d.* 1866), and Nicander dramatic poems unsuited for the stage; and comedy has been successfully cultivated by Blanche (*d.* 1868), Hodell (*b.* 1840), and Jolin (*b.* 1818).

The first Swedish novel, *Adalriks och Gjöthilda's äfventyr,* was published by Mörk in 1742-45. Not till the 19th c. did he find successors in Livijn and Cederborgh (*d.* 1835). The historical novel of Scott has been imitated by Gumælius, Palmblad, Sparre, Kullberg, Mellin, Ridderstad, Topelius, Starbäck, Rydberg, Crusenstolpe, and Almqvist. The later fiction of Fredrika Bremer (q. v.), and the tales of Wetterbergh ('Onkel Adam') (*b.* 1804), are marred by excessive display of 'purpose.' Popular lady novelists are the Baroness Knorring (*d.* 1848), Fru Carlén (*b.* 1807), and Fru M. S. Schwartz (*b.* 1819). The greatest historian of Sweden is Geijer (q. v.). History has also been written by Fryxell (q. v.), Carlson (*b.* 1811), Styffe (*b.* 1817), K. G. Malmström (*b.* 1822), Tengberg (*b.* 1832), and Odhner (*b.* 1836); and the history of literature by Wieselgren (*b.* 1800), Atterbom, Böttiger, B. E. Malmström (*d.* 1865), and Ljunggren (*b.* 1825), Dalin (*d.* 1873), Säve (*d.* 1876), and Rydqvist (*d.* 1877), are names distinguished in Scandinavian philology, as are Lindfors, Torneros, Palmblad, and Cavallin in classical study, and Norberg, Tullberg, and Tornberg (*d.* 1877) in Oriental learning. Of scientific writers in the 19th c., the greatest are Berzelius (q. v.) in chemistry, Fries (q. v.) in botany, Stal (*d.* 1878) in entomology, and in physics, Berzelius, Rudberg, Wrede, Theorell, Hyll, Edlund, Angström, and Thalén. The chief literary periodicals of Sweden are *Svensk Tidskrift för politik, ekonomi, och literatur* (Lund. 1866 *et seq.*), *Framtiden* (Stock. 1868-71, and 1876 *et seq.*), and *Tidskrift för hemmet* (*ib.* 1859 *et seq.*). See Wieselgren, *Sveriges Sköna Literatur* (5 vols. Stockh. 1843-49), B. E. Malmström, *Grunddragen af Svenska Vitterhetens Historia* (5 vols. 1866-68), Klemming, *Sveriges Dramatiska Literatur* till 1863-70), Ljunggren, *Svenska Dramat Intill Slutet af Sjuttonde Arhundradet* (1864), and *Svenska Vitterhetens Häfder Efter Gustaf III.'s Död* (vol. i. 1873; vol. ii. 1875-77; vol. iii. part i. 1878), and Claëson, *Öfversigt af Svenska Sprakets och Literaturens Historia* (4th ed., 1878).

Sweet-Briar. See ROSE.

Sweet'meats comprise all ordinary articles of confectionery, as well as many of the lighter fancy *confitures* prepared by the pastry baker.—*Sweets,* an indefinite term sometimes applied to British wines, and sometimes to articles of fancy confectionery.

Sweet-Pea'. See LATHYRUS.

Sweet-Pota'to. See BATATAS.

Sweet'-Sop (*Anona squamosa*), a large shrub or tree of stunted irregular growth with spreading branches, indigenous in the W. Indies and much cultivated in other tropical countries. It is completely domesticated over a great part of India. The fruit is about the size of an orange, of a glaucous yellowish-green colour, covered with projecting scales; pulp white with a tinge of yellow, very sweet. The acrid seeds and the leaves are an insecticide. See ANONA and CUSTARD-APPLE.

Sweet-Will'iam. See PINK.

Sweet'-wood, a name locally applied to the timber of 10 or 12 different trees of various genera. S.-W. bark is a spurious cascarilla bark from *Croton Eluteria.* See CASCARILLA and CROTON.

Swell, in music, a gradual increase usually followed by a corresponding diminution of tone. In the organ, a certain number of pipes with a key-board arranged so that the intensity of their sounds may be augmented by the action of a pedal.

Swiete'nia. See MAHOGANY.

Swift (*Cypselus*), a genus of *Fissirostral* birds, closely allied to the Swallow (q. v.), and included in the Swallow family (*Hirundidæ*). The wings are relatively long and curved. The tail is forked. The toes are strong, and the hinder toe is turned forwards. In their internal anatomy, the swifts bear a close resemblance to the humming-birds, and there is little doubt that these apparently dissimilar groups have had a common ancestor. The common S. (*C. apus*) attains a length of 6 or 7 inches, and is of a sooty black colour, with a white patch beneath the chin. Its flight is sharp and quick. The nest is built in holes in rocks and in walls, and the eggs are of a white colour. The S. leaves Britain at the end of August. The white-bellied S. (*C. melba*), also known as the Alpine S., is a second species. The N. American chimney S. is the *Acanthylis pelagia* of ornithologists. Swifts and swallows, nearly allied as they are in habits, very rarely inhabit the same localities.

Swift, Jonathan, was born in Dublin, 30th November 1667, a day that he ever kept as one of mourning. His father, a feeless lawyer come of a Yorkshire family, had died seven months before; and S. at the age of six was sent by an uncle to Kilkenny school. In 1682 he entered as pensioner Trinity College, took a creditable B.A. (1685), and three years later was driven from Dublin by Tyrconnel's outbreak. He found his way to his mother's Leicester home, and in 1689 became private secretary to Sir William Temple, his mother's connection by marriage. At Moor Park S. was initiated into Whig politics, and quickly developed such statesmanlike abilities that Temple once sent him to argue with William III. in favour of the Triennial Bill; there too he found Esther Johnson, a child of seven, the 'Stella' of after years. His taking orders (1694) led to a passing quarrel with his patron, but after two years of absence he returned from the Irish prebend of Kilroot to Surrey, there to remain till Temple's death (1699). During this second sojourn he wrote the *Battle of the Books,* a burlesque on Sir William's opponents in the Ancient *v.* Modern controversy, also the Rabelaisian *Tale of a Tub* (1704), proclaiming war in it against half Christendom. Having edited Temple's posthumous works, S. went to Dublin as chaplain and secretary to Lord Justice Berkeley, but, superseded in the latter post, and disappointed of the deanery of Derry, accepted discontentedly the living of Laracor, Meath, and in 1701 invited to Ireland Stella, and Mrs. Dingley her dear friend. During S.'s absence they occupied his vicarage or Dublin residence, which on his return they quitted for lodgings of their own, an arrangement that lasted through seven-and-twenty years. And scandal, if scandal there

were, blew quickly over, since in 1703 the Rev. W. Tisdell, S.'s old acquaintance, made Stella an offer of his hand. With a congregation of but half a score, S. easily visited London once a year, and though the *Tale of a Tub* blasted his chances of preferment with the Queen, it did him honour with Addison, Steele, and the other Whig wits forming the little senate of Will's. His intimacy with them, dating from 1705, continued close and convivial till his adhesion to the new Tory ministry (1710), an adhesion prompted in part by personal pique, but also by his aversion to the belligerent Whig policy and his obtaining from Harley the remission of 'first-fruits' which Godolphin had denied. Whatever his motives, a Tory S. became, and by his *Examiner* (1710–11), *Conduct of the Allies* (1712), and such like pamphlets, inflicted on Marlborough his first defeat, prepared the way for the Treaty of Utrecht, and earned for himself St. Patrick's deanery (1713). During this period he also penned the wonderful *Journal to Stella*, 'which has,' says Forster, 'no parallel in literature for the historic importance of the men and events that move along its pages,' whose 'little language' expresses a loving playfulness dating from Stella's childhood. But in this *Journal* are faint allusions to the rival Esther—'Vanessa,' or Miss Vanhomrigh, the orphan daughter of a rich Dutch merchant, S.'s pupil and blind worshipper. Her fruitless court to him is described in *Cadenus* (decanus) *and Vanessa*, S.'s finest poem; and when on Anne's death and the consequent Tory downfall he withdrew to Ireland, she followed him. As least of two evils, he is said to have privately married Stella (1716); the news of this marriage reaching Vanessa, from whom up to 1720 S. held aloof, killed her (1722); and Stella herself died 28th January 1728, described as a 'spinster' in her will, while Forster sees no evidence for any marriage. Meantime, as patriot, S. by the *Drapier Letters*, denouncing Wood's patent for a copper coinage, impeached the Government and became Ireland's idol; next, as misanthrope, in *Gulliver's Travels* (1726) indicted mankind itself, and was rewarded by the world's applause. Men's virtues here are looked at through an inverted telescope, their vices placed beneath a microscope; men to the cynical Dean at last seem lower than the brutes, human Yahoos than equine Houyhnhnms. Not seldom caricatures delight the caricatured, and S. on his two last visits to London (1726–27) found himself fêted by Arbuthnot, Pope, and Gay; but the sighed-for mitre never got further than Hounslow Heath, and its would-be wearer was doomed to learn how near a man may come to a Yahoo. 'Deaf, miserable, and full of pain,' he passed five years guarded by keepers, and died in Dublin, 19th October 1745. His Complete Works, edited by Scott (19 vols. 1815), contain the gravely-ironical *Arguments against the Abolition of Christianity*, the serious *Advancement of Religion* (S.'s only acknowledged work), *Thoughts on Religion* ('a series of excuses for not professing disbelief,' as Thackeray styles them), the incomparable *Directions to Servants*, the gruesome *Modest Proposal* (viz., to keep down the Irish population by eating Irish babies), &c. Of the poems may be noticed *Baucis and Philemon* (as altered by Addison), the *City Shower*, and *Hamilton's Bawn*. See the unfinished Life of S. by Forster (vol. i. Lond. 1875), which reaches only to 1711; the Lives by Johnson, Scott, Wilde, &c.; and Thackeray's *English Humourists* (Lond. 1858).

Swill'y, Lough, a sea-loch and brook on the N. coast of County Donegal, Ireland. The lough is about 1½ miles in average breadth; it extends N. and S. for 24 miles, and forms a safe and commodious harbour. The stream, about 15 miles long, discharges a considerable volume of water into L. S.

Swimm'ing, the art of propelling one's self through water by motions of the arms and legs, is a highly useful art and a gymnastic exercise of the first order. It is remarkable that S. as a branch of physical education has hitherto been so neglected, and its utility ignored even by maritime communities. It is a well-known fact that among seafaring men the proportion of expert swimmers is exceedingly small. The sense has, however, been awakened of the need for a general cultivation of the art, and in most large cities S.-baths have been established where S. may be practised and professional instruction obtained if desired. Moreover, S. has been introduced as a feature of physical training in some public schools. Keeping in view the fact that the human body has a less specific gravity than that of water, the art may be easily acquired with confidence and self-command, and attention to a few simple rules which are fully laid down in many cheap manuals. There are numerous mechanical aids to the teaching of S. in the form of cork-floats, cork-jackets, and many inflated india-rubber contrivances. In midsummer 1875 Captain Boyton paddled himself, clad in a dress of the latter description, across the English Channel from Cape Grisnez to S. Foreland; but the most wonderful S. feat on record is that of Captain Webb, British Mercantile Marine, who in August 1875 swam from Dover to Calais without artificial floats. The distance as the crow flies is 22½ miles, but owing to tides and currents the course traversed by Webb was at least 15 miles longer, and the time occupied was 21¾ hours. Two years later a similar feat was accomplished by Mr. Cavill in 12 hours, Cape Grisnez and S. Foreland being the points of departure and landing.

Swin'burne, Algernon Charles, one of the greatest English poets of the 19th c., is the son of Admiral S. and of Lady Jane Henrietta, daughter of the Earl of Ashburnham. He was born in London April 5, 1837, entered Balliol College, Oxford, in 1857, but did not remain long enough to take his degree, though his poems show that he has both the spirit and the culture of a scholar. On leaving the university S. visited the Continent, and in Italy became intimate with Landor (q. v.), for whose genius he still entertains an almost idolatrous veneration. His first works were two plays, *The Queen Mother* and *Rosamond*, both published in 1861, but neither of which attracted much notice. The splendour of his genius first blazed out in his *Atalanta in Calydon* (1864), a tragedy framed on the Greek model, and worthy to be ranked with the masterpieces of antiquity. The passionate delight in sensuous life, the pathetic yet noble resignation to the despotism of fate, and the strange reverence for gods that are either helpless or harsh, which mark the Hellenic creed, were set forth with a subtlety, strength, and freshness of imagination, a simplicity and grace of words, a full-flowing, swift-changing melody of verse that announced infallibly the advent of an original poet of the first order. Since then S. has written *Chastelard, a Tragedy* (1865), *Poems and Ballads* (1866), a volume which has given rise to the fiercest strife in contemporary criticism, *A Song of Italy* (1867), *Siena, a Poem* (1868), *Ode on the Proclamation of the French Republic, September 4, 1870*, *Songs Before Sunrise* (1871), *Bothwell, a Tragedy* (1874), *Erechtheus* (1875), another drama on the Greek model, and a second series of *Poems and Ballads* (1878). Besides these he has published several prose works, *Notes on Poems and Reviews* (1867), a defence of his art and his ethics against the strictures of critics; *William Blake, A Critical Essay* (1867); *Notes on the Royal Academy Exhibition* (1868), in conjunction with W. M. Rossetti; *Essays and Studies* (1875), and *A Note on Charlotte Bronte* (1877). The superb qualities that first revealed themselves in the *Atalanta* are present even in greater richness in S.'s later works. His genius burns with a hotter flame, but it sends forth brighter and more dazzling lights. His power of dramatic expression becomes more intense and direct, his perception of character more subtle and far-reaching, his lyric ardour more irresistible and magical, but there is also a wilder licence and revelry of imagination. In *Chastelard and Bothwell* we are conscious of a fatal decline from the tone of *Atalanta*. The fault is no doubt partly due to the *dramatis personæ*, who contrast miserably enough with the pure and majestic figures of legendary Greece, but the poet seems to joyously surrender his own soul to the Circean sorceries of his muse, and his highest raptures are reserved for the celebration of visionary lusts. Through the *Poems and Ballads*, many of which are miracles of music and beauty, there runs a shuddering sympathy with sin. He loves to dream of unpermitted delights, and his mouth is full of their praise; yet he knows and proclaims in every variety of verse that their end is grief and shame. When this unhealthy mood has passed away, we may fairly hope that so great a master will return to work in which the nation can feel an unalloyed pleasure.

Swind'ling, a popular term used to denote fraudulent procedure—especially when the deception is gross and the rascality marked. See FRAUD.

Swin'don, a market-town of Wiltshire, 77¼ miles W. of London by rail, has a parish church, designed by the late Sir G. G. Scott (1847), with a lofty spire, four chapels, good schools (1871), a town-hall (1852), corn-exchange (1867), and assembly rooms (1850). There are large oolite quarries, but no manufactures,

S. publishes two weekly newspapers. Pop. (1871) 4092.—**New S.**, 1½ miles N. of the old town, contains the junction station of the Great Western Railway, one of the largest in the kingdom, as also the Company's engineering works, which cover 82 acres, employ 5400 men, and in the first six months of 1878 turned out 16 engines. The chief buildings are the church of St. Mark (1845; enlarged 1876), a Roman Catholic and four other chapels, schools (erected by the Company, 1873), and a mechanics' institute (1843), with a library of 6000 vols. New S. publishes one weekly newspaper, and has large sewing and milk and cheese factories. Pop. (1871) 7628.

Swin'emünde, a fortified seaport of Pommern, Prussia, on the island of Usedom, 1½ miles from the mouth of the Swine, one of the three channels by which the Oder (q. v.) empties itself into the Baltic. It is 43 miles from Stettin by water, and 68¾ miles by rail. Founded in 1740, S. owes its importance to its being the port for the heavier vessels trading with Stettin. It has also become a favourite watering-place. At the mouth of the Swine are two massive breakwaters ¾ of a mile in length, forming the entrance to the harbour. On the E. bank are new docks, and a lighthouse 210 feet high. S. has no export trade. In 1877 the imports were:—from Great Britain, coal, 251,212 tons; beer and spirits, 492 gallons; from other countries, wine and spirits, 26,863 gallons; chalk, 11,251 tons; timber, 8905 tons; corn, 6261 quarters; and herrings, 5207 barrels. In the same year there entered the harbour 2908 vessels of 702,926 tons, of which 1439 of 273,846 tons were German, and 699 of 311,548 tons were British, the latter being 50·39 per cent. more than in 1876, and 108·25 more than the average of the ten preceding years. Pop. (1875) 7977.

Swith'in, St., Bishop of Winchester from 852 till his death on July 2, 862, was at his own request buried in Winchester churchyard, 'where passers-by might tread above his head, and the dews of heaven fall on his grave.' On his canonisation a century later, the chapter resolved to translate his relics to a stately shrine within the cathedral, but were hindered from their purpose by a rain that, commencing on July 15, stayed not for forty days. Out of this legend arose the popular notion that a wet St. S.'s Day will be followed by forty days of rain, the feast of St. Gervais (19th June) being marked in France by a similar superstition.

Switz'erland (Ger. *Schweiz*, Fr. *Suisse*, Ital. *Svizzera*), an inland country of Europe, situated between 45° 48′ and 47° 49′ N. lat. and 5° 55′ and 10° 30′ E. long., and bounded N. by Wurtemberg, Baden, and Elsass, W. by France, S. by Savoy, Piedmont, and Lombardy, and E. by the Tyrol. Its greatest length from E. to W. is 180 miles, and its greatest breadth from N. to S. 130 miles. Area, 15,976 sq. miles; pop. (1876) 2,759,854. The following table shows the area and population of the cantons into which S. is divided—

Cantons.		Area in sq. miles.	Pop. July 1, 1877.

Physical Features.—The physical features of S. are very remarkable, affording greater contrasts than those of any other country in Europe, offering to the eye within an area ¼ that of England sublime snow-capped mountains and glaciers alternating with the most beautiful valley, river, lake, and woodland scenery. Two groups of mountains cover a great part of its surface, the Jura on the W. and N.W. and the Alps on the S.E. and centre. Thus the whole surface divides itself into three physical regions—the narrow belt of the Jura occupying 12·3 per cent. of the whole, the broad belt of the Alps covering 57·5 per cent., and the hilly plateau which separates them and forms 30·18 per cent. of the whole surface. The Jura is made up of six parallel ridges lying S.W. and N.E., and extending from Geneva along the boundary between France and the Pays de Vaud, through Neuchâtel, Soleure, and Aargau to Schaffhausen (see JURA). The Swiss Alps radiate from a central nucleus near the Grimsell Pass, two parallel chains running S.W. to the Lake of Geneva and Savoy, the northern known as the Bernese Alps, the southern as the Pennine Range; and two running E. to the Tyrol, and enclosing within them the sources of the Rhine and the Inn. The southern of these, which is really a continuation of the Pennine, is successively known as the Helvetian or Lepontine range and the Rhaetian or Grisons range (see ALPS). The area covered by glaciers is estimated at 900 sq. miles. They extend from Mont Blanc to the Ortler, and are 540 in number. To the Grisons belong 225, to Bern 155, and Valais 130. The largest glacier mass is the Bernina, the longest the Aletsch glacier, 15 miles in length. The great table-land of S. is its most fertile and productive region. With an average elevation of 1400 feet, it slopes from S. to N., from the base of the Alps to the Rhine and the Bodensee, including the cantons of Vaud and Freiburg, the greater part of Bern, Lucerne, and Aargau, and the whole of Zurich, Zug, Thurgau. The river system of S. corresponds with the peculiar physical character of the country. The chief watershed is the St. Gothard, in the Lepontine Alps, from which flow to the S.W. the Rhone, N.E. the Rhine, to the N. the Aar and the Reuss, to the S. the Ticino and Tosa. From the Rhaetian Alps flow the Inn N.E. to the Danube, and the Adige S.W. through Lago di Como to the Po. Most of the rivers are very rapid, and pass in their courses through deep lakes. The largest of these are the Lake of Geneva, Bodensee or Constance (q. v.), and the Lake of Neuchâtel (q. v.).

Climate, Botany, and Agriculture.—From the physical constitution of S., its climate is necessarily very varied. The part S. of the central Alpine chain enjoys the most favourable climate. At the N. end of Lago Maggiore, the average temperature is 55° F., the long summer and short winter allowing the cultivation of the fig, almond, pomegranate, and orange. Equally fortunate are the S. part of Valais and the N. banks of the Lake of Geneva. The average temperature of the plateau is 46°-48° F., rising as we travel from the Alps, and reaching its maximum in the N.E. The rainfall amounts at Basel to 25 inches, at Bern to 46, at Zürich and at Neuchâtel to 33. The prevailing winds are a warm and rainy wind from the S.W.; a cold and dry from the N.E.; and a peculiar warm wind, experienced chiefly in the E. part of S., from the S. across the Alps, called the *Foen*. The vegetation of S. is divided into five zones, from the lowest valleys to the limit of perpetual snow. These are—(1) The lower region, embracing the central plateau, the great agricultural region, and the lower hills, from 700-2000 feet above the sea-level. Here are found deciduous trees, chiefly the chestnut, oak, and beech, while the cultivation includes all the ordinary European grains. (2) The region of the lower mountains, from 2000-4000 feet. The hardier deciduous trees, as the beech, ash, and maple, are found, and the cereals and hardier fruits are successfully cultivated. (3) The sub-Alpine region, from 4000-5500 feet on the N., and from 4000-6000 feet on the S. This is the region of conifers and of the rich grassy pastures of the Alps. (4) The Alpine region, from the limit of trees (6000 feet) to that of perpetual snow (9000 feet). The principal plants are the Alpine roses, reaching to 7000 feet, and the creeping azaleas, junipers, willows, and alders, besides the many species of delicate Alpine plants, many of which grow to 10,000 and 11,000 feet. The characteristic animals are the chamois, steinbock, the lämmergeyer, and the marmot. (5) The region of perpetual snow, which has its lowest limit in the Bernese Alps at 8800 feet, in the Grisons from 9200-9400 feet, on the S. slope of the Alps from 9000-9800 feet. In 1877 the

area under woods and forests was 1,905,407 acres; under all kinds of crops, fallow, and grass, 5,339,720 acres: while 75,335 acres were occupied by vineyards. In 1876 there were in S. 100,935 horses, 592,463 cows, 443,467 other kinds of cattle, 367,549 sheep and lambs, 334,515 pigs, and 396,055 goats (see ALPINE FARMING).

Industries, Commerce, &c.—S., though mainly an agricultural country, has extensive industries. At the census of 1870, 1,095,446 persons were supported either wholly or in part by agriculture, while 216,468 were employed in manufactories, and 241,425 in handicrafts. The principal manufactures are silk stuffs at Zürich, silk ribbons at Basel, watches and jewellery in the cantons of Neuchâtel, Geneva, Vaud, Bern, and Soleure, and embroidery and cottons in the cantons of St. Gall and Appenzell. Printing and dyeing are carried on in Glarus. The principal *exports* of S. are machinery, cheese, tobacco and cigars, cottons, manufactured silk, watches and jewellery, hides and wool; the principal *imports*, coal, grain, wine, sugar, salt, raw cotton, flour, oils, iron, coffee, and agricultural implements. In September 1878 S. had 1547 miles of railway, while in 1877 there were 4040 miles of telegraph lines belonging to the Federal Government. The number of telegraph messages sent in 1877 was 2,722,408, of which 1,950,546 were internal messages; the receipts were £79,418, and the expenses £79,150. In the same year the post-office forwarded 65,374,646 letters, of which 46,531,718 were inland letters; while the receipts amounted to £579,797, the expenditure to £557,775.

Government, Finance, Army, &c.—The republic of S., formerly a Staatenbund or league of semi-independent states, has been since 1848 a Bundesstaat or united confederacy. The constitution was revised in 1874, and as it now exists, vests the supreme legislative and executive power in the 'Bundes-Versammlung,' or Federal Assembly, which alone has the right to declare war, make peace, and conclude treaties with other powers, and which consists of two chambers, the 'Ständerath' or State-Council, and the 'Nationalrath' or National Council. The Ständerath consists of 44 members, two for each of the 22 cantons. The Nationalrath of 135 members, one for every 20,000 souls. General elections take place every three years, every citizen above twenty years having a vote, and every voter, not a clergyman, being eligible as a representative. The Bundes-Versammlung after each election nominates seven members for three years as a kind of cabinet, called the 'Bundesrath,' or Federal Council, in whom the chief executive authority rests, whose seven members act as ministers or heads of the seven administrative departments of the state, and whose president and vice-president, both elected for one year by the Bundes-Versammlung in a general meeting, are the first citizens of the republic. Disputes between the various cantons are settled by the 'Bundes-Gerecht,' or Federal Tribunal, which consists of eleven members, elected for six years by the Bundes-Versammlung, and is divided into the three sections, the 'Anklagekammer' (chamber of accusation), the 'Kriminalkammer' (the jury department), and the 'Cassations-Gerecht' (court of appeal), each consisting of three members, the remaining two members acting as president and vice-president. Its seat is at Lausanne, while the two chambers sit at Bern. Each canton has its local government, resting in a Grosse Rath chosen by universal suffrage, but in the cantons of Appenzell, Glarus, Unterwald, and Uri, all the male citizens of full age assemble at stated periods in the open air and exercise their powers directly in making their own laws. These assemblies are called 'Landesgemeinde.' The public revenue (mostly derived from customs) in 1877 was £1,631,570, and the expenditure £1,705,035. The public debt amounted at the end of 1876 to £1,104,000, but is balanced by property belonging to the state valued at £1,271,332. The Swiss army consists of the regular army, formed of men between the ages of twenty and thirty-two, and the Landwehr of those between thirty-three and forty-four years, and in 1878 had a total of 211,765 men, of whom 91,728 belongs to the Landwehr, and 119,982 to the regular army. The army expenditure in 1878 was £531,936.

Religion, Education, &c.—Of the population of S. 58·7 per cent. are Protestant, and 41 per cent. Roman Catholic. At the census of 1870 the number of Protestants was 1,566,347, Catholics 1,084,369, other Christian sects 11,435, Jews 6996. The Protestant church is Calvinistic and Presbyterian, the Roman Catholic is under the government of 5 bishops and upwards of 6000 regular and secular priests. Complete religious toleration is provided for by the constitution of 1874. Education is compulsory and widely diffused, especially in the N.E. cantons. In 1871-72 there were 5088 schools, 32 training-schools for teachers, 67 gymnasien, 41 real and industrial schools, a polytechnic school at Zürulha, a military academy at Thun, a fine-art school at Geneva, 3 academies at Geneva, Lausanne, and Freiburg, with 45 professors and 370 students, and 4 universities at Basel, Zürich, and Bern, which had, in 1877, 230 professors and teachers, and 974 students.

Inhabitants, Language, &c.—The population of S. is made up of three elements, the German, French, and Italian. German is spoken by three-fourths of the inhabitants, and is the official language of the country, but French is the principal language spoken in Geneva, Vaud, and Neuchâtel, and a part of Bern, Freiburg, and Valais. The inhabitants of Ticino and a part of the Grisons speak Italian, but in the sequestered valleys of the latter canton, two-thirds of the inhabitants speak Romaunsch and Ladin, peculiar old Latin dialects.

History.—The earliest-known inhabitants of S., supposed to have been Celts, were the Helvetii in the N.W., and the Rhaeti in the S.E. The former were conquered by the Romans, B.C. 58, the latter B.C. 15. Under the Roman rule, Eastern S. belonged to the province of Rhaetia, Western S. to that of Gaul. About the beginning of the 5th c., S. was overrun by the Alemanni, the Burgundians, and the Ostrogoths who became Christian about the end of the century, and were gradually subdued by the Franks. When the Franconian empire was divided among the sons of Hludwig the Pious in 848, the E. portion of S. fell to Hludwig the German, and was afterwards attached to the Duchy of Swabia, while the W. portion was joined to the Kingdom of Burgundy. On the death (1032) of Rudolf III., the last King of Burgundy, the greater part of S. passed to the Emperor Konrad II., whose successors granted it in fief to the Dukes of Zähringen, but after the death of the last duke in 1218, several parts were granted to other vassals, who waged continual warfare on one another, and harassed the country by their rapacity and extortion. The Swiss acknowledged their allegiance to the emperor, but brooked with difficulty the galling yoke of the imperial vassals. Many of the towns formed unions to protect their liberty, and Bern, Soleure, Basel, and Schaffhausen, obtained imperial charters, while the cantons of Uri, Schwyz, and Unterwalden placed themselves under the protection of Rudolf, Count of Hapsburg, in 1257, and Zürich in 1264. The 3 cantons of Uri, Schwyz, and Unterwalden, the Waldstätten or forest cantons, had not acknowledged the delegated authority of any of the imperial governors until 1209, when Otho IV., on his way to Italy, induced them to accept the Count of Hapsburg for their Landvoght or bailiff, the latter swearing at the same time to maintain their privileges. But they obtained from the Emperor Friedrich II. their liberty in 1231 and 1240 by a charter, in which the people of the three cantons are termed freemen, 'who owe no allegiance but to the emperor, by whom they are received with open arms, having submitted of their own free will to the empire, from which they shall not at any future time be detached or alienated.' This was confirmed by Rudolf on his election to the imperial throne, and at his death in 1291 the Forest Cantons formed their first league for mutual protection. Albrecht, reversing the policy of his father Rudolf, attempted to deprive the great towns of their privileges, but was obliged to retire from the walls of Bern and Zürich, while the people of the Waldstätten, goaded to desperation by the cruelty and pride of his ministers, took up arms to assert their independence. To this period belongs the doubtful stories of William Tell (q. v.), and of Stauffacher, Fürst, and Melchthal. After the murder of Albrecht by his nephew Johann of Swabia in 1308, his son Leopold continued the war, but was utterly defeated in the famous battle of Morgarten (1315), and subsequent Austrian attempts to recover the supremacy were frustrated by defeats at Sempach (1386), Näfels (1388), and at the Stoss (1405). In 1322 Lucerne joined the confederacy of the Forest Cantons, in 1351 Zürich, in 1352 Glarus and Zug, and in 1353 Bern. In 1415 the Swiss wrested Aargau and Thurgau from the Austrians, and inflicted severe defeats on Charles the Bold, Duke of Burgundy, the greatest captain of his age, at Granson (1476), Morat (1476), and Nancy (1477). In 1499 the Swiss victory over 15,000 Austrians at Dornach put an end to the Swabian war. This was the last of the series

of glorious victories by which Swiss independence was so bravely won. Meanwhile Freiburg and Soleure had joined the confederation in 1481, in 1501 Basel and Schaffhausen, and in 1513 Appenzell, thus completing the thirteen cantons, which existed until 1798. Geneva, Neuchâtel, Valais, and the Grisons were allies without a vote. In 1523 Zürich adopted the doctrines of the Reformation under the influence of Zwingli (q.v.), and was followed by Basel, Schaffhausen, and Bern, while the Forest Cantons remained firmly attached to the Church of Rome. In 1531 war broke out between the adherents of the two faiths, and the Protestants were defeated at Cappel, where Zwingli was slain. A second religious war broke out in 1653, and a third and last in 1712. In 1535 the Pays de Vaud was wrested by Bern from the Duke of Savoy, who was, however, obliged to acknowledge the independence of Geneva in 1603. In 1648, at the Peace of Westphalia, the independence of S. was formally ratified by the Emperor. From this period S. began to decline, and many of her citizens, disheartened by civil discords at home, sold their swords to foreign powers. The popular discontent with the government, and the contagious principles of the French revolutionists, created a large anti-national party within S., by whose influence the French invaded the country and subdued it, in spite of a heroic resistance on the part of Bern and Unterwalden. By the Peace of Lunéville (1801) the French were obliged to evacuate S., but in 1802 the Act of Mediation, framed by Napoleon (then First Consul of France), and accepted by the Swiss, constituted S. a republic of nineteen equal cantons. under the protection of France, to which, however, Geneva, the Valais, and Neuchâtel were annexed. The Congress of Vienna in 1815 restored its independence to S. within its former limits, and constituted twenty-two cantons, represented in a Federal diet which assembled once a year alternately at Bern, Zurich, and Lucerne. During the fifteen years that elapsed between 1815 and 1830 S. enjoyed profound tranquillity, but in the latter year disturbances broke out, in consequence of the infection of the French revolution, and most of the cantons were obliged to grant universal suffrage. The town of Basel, however, held out, and consequently Basel was divided into two half-cantons, the town remaining conservative while the country became democratic. General dissatisfaction, however, still prevailed, and in 1832 the three Catholic cantons of Schwyz, Uri, and Unterwalden formed the League of Sarnen, which was afterwards joined by Lucerne, Freiburg, Zug, and Valais. In 1839 the Diet passed a law to make education independent of the clergy, in consequence of which the Jesuits became the direct objects of liberal antagonism. A body called the Free Corps was organised to carry the law into effect, but was defeated on its entrance into Lucerne. The League of Sarnem was now dissolved, and the Sonderbund or separate League of the Seven Catholic Cantons formed (1846) for mutual defence against the Free Corps. The Diet having declared the Sonderbund illegal (July 29, 1847), decreed the expulsion of the Jesuits (September 3), and on the refusal of the Sonderbund, the federal army under General Dufour invaded the Catholic cantons, and forced them to submit after defeats at Freiburg (November 13) and Lucerne (November 24). The Catholic cantons were now compelled to eject the Jesuits, to suppress the monasteries, and pay the expenses of the war. On September 12, 1848, a new Federal Constitution was promulgated, similar in many respects to that of the United States, but which has been considerably modified by the changes of 1874. By a treaty, signed 26th May 1857, the principality of Neuchâtel (q. v.), which had descended to the kings of Prussia from its adjudication in 1707 to Friedrich I., was resigned to S. notwithstanding the opposition of Friedrich Wilhelm IV., while it received a constitution similar to that of the other cantons. Since that period, with the exception of her having protested in 1860 against the transference of Savoy to France, and as a neutral power interned the army of Bourbaki under General Clinchant in 1870, S. has taken no part in foreign politics, but devoted herself to her internal affairs, and has enjoyed a tranquil and well-deserved prosperity. See J. Meyer, *Land, Volk und Staat der Schweiz Eidgenossenschaft* (2 vols. Zür. 1861); J. Garster, *Atlas der Heimathskunde der Schweiz* (Bern 1872); Max. Wirth, *Allegemeine Beschreibung und Statistik der Schweiz* (3 vols. Zür. 1871-76); *S. and the Swiss*, by an American Resident (New York 1875); George Grote, *Letters on the Politics of S.* (Lond. 1876); Gourdault, *La Suisse* (Par. 1878); and for history, Johannes von Müller, *Geschichte der Eidgenossenschaft* (13 vols. Leip. 1806-51); Vogelin, *Geschichte der Schweiz Eidgenossenschaft* (4 vols. Zür. 1861); Dagnet, *Histoire de la Confédération Suisse* (6th ed. Neuchâtel 1867).

Swiv'el, a link of a chain which turns round on a pin or axis fixed to the next link; also applied to a cannon adjusted to turn on a pivot, or to run on concentric rails, so that it may be fired in any direction. S.-joints assume many varieties of form adapted to special uses.

Sword, a weapon for cutting and thrusting, used by all nations from the remotest times. It is composed of the *blade* and the *hilt*. The blade is single or double-edged, and varies in form (see RAPIER, SABRE, SCIMITAR, CUTLASS). The hilt embraces the *grip* or handle, which covers the *tang* of the blade, the *pommel*, the *guard* for protecting the hand, sometimes with branches termed *quillons*, and the *counter-guard;* these parts are seldom all found together on one hilt. Ancient swords had no guard. Bronze swords with lanceolate blades were carried by the Belgic Britons. Damascus blades were formerly highly esteemed. Toledo and Solingen at present excel in the manufacture of swords.

Sword'-Fish (*Xiphias gladius*), a species of *Teleostean* fishes belonging to the *Scomberidæ*, or Mackerel family. The upper jaw is very long and pointed in the form of a sword, which the fish has driven in some instances entirely through the keel of a vessel. The dorsal fin is long and spongy, but the ventrals are wanting or small. The tail-fin is prominently forked. The S.-F. attains a length of from 10 to 15 or even 20 feet. It is common in the Mediterranean Sea and Altantic Ocean, but comparatively rare round the British coasts. Its flesh is highly palatable. The *Histiophorus bimaculatus* is another species of S.-F., often named the purple-finned S.-F. or sail-fish and fan-fish.

Syb'aris, a city of Magna-Græcia, near the western shore of the Tarentine Gulf, between the rivers Sybaris (*Coscole*) and Crathis (*Crati*). Founded by Achæans (720 B.C.), it was the earliest of the Grecian colonies, and reached its zenith in the 6th c. B.C., holding sway over twenty-five tributary cities, and enjoying a wealth and luxury that are yet proverbial. Its fall was as sudden as its rise was rapid. A demagogue Telys, having driven its oligarchs from power, called on Crotona, where they had taken refuge, to give them up, and marched with an army of 300,000 men to enforce the demand. The Crotoniats, with scarce a third the number, defeated him utterly on the banks of the Trais (510 B.C.), and razing S. to the ground, diverted the Crathis so that its waters flowed where the city once had stood. See CROTONE.

Syb'el, Heinrich von, German historian, was born at Düsseldorf, December 2, 1817, and studied history at Berlin under Ranke. In 1841 he published a *Geschichte der ersten Kreuzzugs*, and was appointed professor at Bonn. After the publication (1845) of his *Entstehung der deutschen Königthums*, he removed to Marburg, became a member of the assembly of the estates Hessen-Kassel in 1847, and in 1850 its representative at the Reichstag at Erfurt, but soon retired for a time from public life to the preparation of the first part of his great work, *Geschichte der Revolutionszeit 1789-95* (3 vols. 1853-57; 3d. ed. 1866) *und 1795-1800* (1870 *et seq.*). In 1856 S. started the *Historische Zeitschrift*, became professor at Munich, and secretary of the historical commission for the publication of a series of German records. He returned to Bonn in 1861, was from 1862 to 1864 a member of the Prussian Landtag, and in 1867 of the first North German Reichstag, where he went with the national Liberal Party. S. was in 1875 appointed director of the archives at Berlin. His chief other works are: *Die Erhebung Europas gegen Napoleon I.* (1860), *Prinz Eugen von Savoyen* (1861), *Die deutsche Nation und das Kaiserreich* (1863), *Kleine historische Schriften* (2 vols. 1863-69), *Oesterreich und Deutschland in Revolutionskrieg* (1868).

Syc'amine in old authors means the woodbine. The S.-tree of the New Testament is supposed to be the black mulberry.

Syc'omore, or **Syc'amore** (*Ficus Sycomorus*, or *Sycomorus antiquorum*), of the Orient is a large spreading fig-tree, planted in villages and along the roadsides in Egypt and parts of W. Asia for the shade it renders, its crown extending to a width of 120 feet. It is believed to attain a great age. Its figs, produced in racemes, are sweet with a somewhat aromatic flavour. The

wood was used by the old Egyptians for mummy cases. The S. of St. Luke (xix. 4) into which Zaccheus climbed is this tree, and it is probable that in the sacred dramas of the Middle Ages the broad-leaved umbrageous *Acer Pseudo-platanus* was used to represent the same in Europe, thus acquiring its present name of S. In America, S. is a current name for the plane (*Platanus occidentalis*).

Syd'enham, a town and suburban district of London, forms a chapelry in the parish of Lewisham, county of Kent, 7 miles S.E. of the metropolis, with which it is connected by several lines of railway. The town occupies an elevated position, and has greatly extended since the removal from Hyde Park to S. Park of the Crystal Palace, the wonderful glass and iron structure of the Great Exhibition in 1851, at a total cost of £1,500,000. The building is 1608 feet by 312, and has besides two wings of 574 feet each. The height of the great transept is 198 feet, that of the water-towers 284, at the top of which are tanks holding 357,675 gallons for supplying fountains throwing 120,000 gallons a minute. In addition to the various art and science courts, the Palace contains two concert-halls, the larger of which can accommodate 5000 performers. The N. wing, containing the Alhambra, the Oriental and other courts, was destroyed by fire in 1866, and the damage amounted to £150,000. The great aquarium of the Palace was opened by Professor Owen in 1872. The grounds occupy more than 200 acres. Pop. of the district parish of S. (formed 1866) in 1871, 2962; of that of St. Bartholomew or Upper S., 5201.

Syd'enham, Thomas, traditionally distinguished as the 'prince of English physicians,' was born in 1623 at Winford Eagle in Dorsetshire, studied at Oxford from 1645, was elected a fellow of All Souls, and in 1648 took the degree of M.B. Desault, the author of *Recherches curieuses sur les Escholes en Médecine de Paris et de Montpellier* (Par. 1651), appears to be the only authority for the statement that he studied at Montpellier. At some date between 1649 and 1661 he settled in London as a medical practitioner, where he died 29th December 1689. S. was magnificently endowed with common sense. Though there is little doubt that he was ostracised more or less rigidly by many of his fellow-practitioners, he was the intimate friend of Boyle, Locke, and other eminent men of his time, and his memory has been revered by such physicians as Boerhaave, Stahl, Pinel, and Haller. The chief of his improvements in the healing art were the adoption of cinchona in intermittent fever, and the cooling regimen in smallpox. The following are his principal works:—*Methodus Curandi Febres* (1666), *Observationes Medicæ* (1676), *Epistola Responsoria* (1680), *Dissertatio Epistolaria* (1682) (on confluent smallpox and hysteria), *Tractatus de Podagra et Hydrope* (1683), *Schedula Monitoria* (1686). A collected edition—*Opera Universa*—appeared in 1685; and there have been numerous foreign editions both of individual treatises and of the whole works, at Leipzig, Geneva, and Venice. A new edition was published in 1844 by the first Sydenham Society (instituted 1843, dissolved 1858), under the editorship of Dr. Greenhill; and an English translation—for S. published, if he did not write, in Latin—*The Works of Thomas Sydenham*, 2 vols., followed in 1848. A new Sydenham Society for the publication of medical works was instituted in 1858. See Life of S., by R. G. Latham, prefixed to the English translation; and Dr. John Brown, 'Locke and Sydenham' and 'Dr. Andrew Brown and Sydenham,' in *Horæ Subsecivæ* (8th ed. Edin. 1873).

Syd'ney, the capital of New South Wales, and parent city of Australia, is situated on the southern shore of the beautiful inlet of Port Jackson (q. v.), about 4 miles from its entrance. S. was founded 26th January 1788, when the settlement intended to be formed at Botany Bay (q. v.) was removed to Sydney Cove. Alike for beauty and suitability for commerce, the situation of S. is one of the finest that can be imagined. The numerous bays and islands of Port Jackson, with their rocky and wooded borders, form a charming landscape, while the depth of the water allows the largest ships to discharge alongside the wharves by which Sydney Cove and Darling Harbour in particular are lined. As a rule the streets are straight, running at right angles to one another, but are narrower than those of Melbourne. The houses and shops compare favourably with those of British cities, and some of the banks are very elegant. The city is well paved, lighted with gas, efficiently drained, and well supplied with water. Among the principal buildings are the Post Office, opened in 1874; the new Town Hall (1868-78), in Renaissance style, 254 feet long by 153 broad, with clock tower 190 feet high, and containing a great hall 132 feet by 62, and 50 high; the University, whose great hall would rank among the largest of its kind in Britain; the Museum, Treasury, and Anglican and Roman Catholic Cathedrals. The University, which has an annual grant of £5000 from the public funds, possesses a royal charter, and confers degrees in arts, law, and medicine. Theological instruction is given at the three colleges of St. Paul (Anglican), St. John (Roman Catholic), and St. Andrew (Presbyterian). A new synagogue was opened in 1875 at a cost of £16,000. S. also possesses a grammar-school and other educational institutions. The S. Mint in 1877 coined 1,590,000 sovereigns. The 23 suburbs of S., though virtually composing part of the city, are under distinct municipal government. They abound in handsome villas in whose gardens semi-tropical plants flourish, and the city has also fine parks and a beautiful botanical garden. The commerce of S. with the United Kingdom, the Australasian colonies, Polynesia, China, and the United States, is very extensive, and is increasing with the progress of settlement in the interior, with which S. is connected by several lines of railway. The manufactures of S. are important, the chief being those of iron, shipbuilding, bricks, and leather, besides other extensive industries, such as flour-dressing, sugar-refining, meat-preserving, and wine-making. The situation of S., in the centre of the largest known coal-field in Australia, marks out for the city great prosperity as an industrial centre. In 1871 the pop. of S. proper, which returns four members to the colonial parliament, was 75,945, and of the suburbs 58,813, making a total of 134,758. An International Exhibition is to take place here in August 1879 under the auspices of the Agricultural Society of New South Wales.

Syd'ney or **Sid'ney, Algernon**, grand-nephew to Sir Philip, was born in 1622, and accompanied his father, the Earl of Leicester, on embassies to Denmark (1632) and France (1636). In 1641 he commanded a royalist troop of horse in Ireland, of which the Earl was then lord-lieutenant, but two years later crossing to Liverpool cast in his fortunes with the Parliament. With the rank of lieutenant-colonel he fought and was wounded at Marston Moor (1644), next served as lieutenant-general of the horse in Ireland (1646), and, returned to Parliament by Cardiff, acted as one of Charles's judges. That he withheld his hand from the death-warrant was probably due to family motives, for ten years later he justified the king's execution as 'the justest and bravest action ever done in England.' Cromwell's protectorate offending this hot republican, he withdrew to Penshurst, the Leicesters' Kentish seat, but re-emerged with the Long Parliament remnant (1659), and was sent to Denmark to patch up the Swedish war that again broke out after the Peace of Roeskilde. With the Restoration his brief diplomatic career came to an end, and seventeen years of exile in Germany, Italy, and France began. During this period, about 1665, having vainly endeavoured to bring about a Dutch invasion of England, S. sought to obtain 100,000 crowns from Louis XIV. for the re-establishment of an English commonwealth; and when in 1677 a royal pardon let him return to England, he became a pensioner of Barillon, the French ambassador, whilst leaguing with Russell, Essex, and Shaftesbury to further the claims of Monmouth, the son of his cast-off mistress. In 1680 the Countess of Sunderland, his sister Dorothy, writes:—'Mr. Algernon is busy, about what, God knows. Last night he was called out of my chamber by a Quaker'—Penn, possibly, who consulted S. on his Pennsylvanian constitution. His business, at any rate, alarmed the court, and on the first announcement of the Rye-House Plot, S., like Russell (q. v.), was arrested and brought to trial for high treason. 'Whether he was less guilty than Russell may be doubted,' says Ranke, 'but the proofs against him were still more unsatisfactory;' they were, however, sufficient for Jeffreys and a packed jury of the times. On 7th December 1683 he died upon Tower Hill, by his unjust death earning the little-merited title of 'martyr in freedom's cause.' His *Discourses concerning Government* were published by Toland (1698; 4th ed. 1772), and his Life has been written by Meadley (Lond. 1813); Van Santvoord (New York 1851), and Ewald (2 vols. Lond. 1873). See also vols. ii. and iii. of Ranke's *History of England* (Eng. trans. Oxf. Clar. Press 1875).

Sye'ne. See ASSOUAN.

Sy'enite, an important rock, the type of one great division of the Plutonic series, as granite is of the other. S. differs from granite in containing little or no quartz, in having hornblende in place of mica, and in not containing more than 50 or 60 per cent. of silica. The name is derived from Syene, the Greek form of Assouan (q. v.).

Syll'ogism (Gr. *syn*, 'with,' and *logos*, 'reason') is the name given in the science of logic to that process of reasoning whereby we infer one thing from another through means of a middle term. Thus the following reasoning—all men are mortal; poets are men, therefore all poets are mortal—is a S.: 'men' is the middle term, and by predicating of it the attribute mortality, and then bringing all poets under it, we are enabled to arrive at the conclusion that the attribute mortality belongs to all poets. The parts of a S. have various technical names; thus in the above example the predicate (viz., mortal) of the conclusion (therefore all poets are mortal) is called the major term, the subject (poets) is called the minor term, whilst the first premiss or statement is called the major, and the second the minor premiss. A S. must belong to one of four *figures*, and these are determined by the position of the middle term, which of course must occupy one of four positions. In the first figure it is subject in the major premiss and predicate in the minor; in the second it is predicate in both; in the third it is subject in both; in the fourth it is predicate in the major and subject in the minor. Rules are given by logicians to try each figure, and the result is that nineteen valid *moods*, as they are called, remain after those which involve a breach of rule are cleared away. There are four in the first figure, four in the second, six in the third, and five in the fourth. These are generally committed to memory by a curious system of mnemonic lines, and the moods are named from the words in these lines. The one we have given is called Barbara. We owe the first three figures to Aristotle, and the fourth to Galen. They are professedly a complete analysis of the reasoning process, and it was maintained that all human reasoning must of necessity be expressed by means of them. J. S. Mill and others have denied this. They affirm that all valid inference is from the known to the unknown, whereas in a S. the conclusion only tells us what we knew before, for of course we start with the assumption that we are assured of the truth of the premisses. Mill maintains the S. is merely of use as a record of knowledge; that it is a convenient form, but not essentially an instrument of discovery. The inquirer will find full details of the nature and functions of the S. in any of the ordinary logical text-books. Jevons' *Lessons in Logic* (4th ed. London 1874) may be mentioned as a particularly good compendium. For discussions as to the more recondite points, the Logics of Hamilton, Ueberweg, (translated by Lindsay), and J. S. Mill may be consulted.

Sylphs, in the Paracelsian mystic system, are the fair, tricksy Elemental Spirits (q. v.) inhabiting the air. They figure in Montfaucon Villars' *Comte de Gabalis* (1670); and in Pope's *Rape of the Lock* we find them, both male and female, with 'fluid bodies' and 'transparent forms.' Now the word *sylph* has always a feminine signification.

Sylves'ter, the name of two Popes.—**S. I.** (314-35), according to Roman Catholic tradition, played a prominent part in the ecclesiastical controversies of his time, had precedency given to his legates at church synods and at the Council of Nicæa, converted the Emperor Constantine to the faith, and was rewarded with the famous 'donation' of land and supremacy over all the West. History tells next to nothing of S. I., who is a saint of the Roman Catholic Church, his feast falling on the 31st December.—**S. II.** (999-1003), originally called Gerbert, was born of poor parents at Auvergne in France, acquired extraordinary learning, became abbot of Bobbio, and was by the ignorant regarded as a sorcerer on account of his knowledge of chemistry and physics derived from Spanish Arabs. The Emperor Otto II. entrusted to him the education of his son, afterwards Otto III., and he was also tutor of Robert, son of the French king Hugo Capet. Through the influence of Otto III. he was elected first Archbishop of Ravenna (998), and then Pope (999); but no sooner had S. gained the Papal chair than he forgot all the liberal views of the relation between Pope and Councils which he had previously defended, and his early death alone prevented a conflict with the emperor. A century before the first Crusade, he planned a general levy of Christendom to drive the infidel from Palestine. See Hock's *Gerbert oder Papst. S. II. und sein Jahrhundert* (Vien. 1837) and Büdinger's *Ueber Gerbert's wissenschaftliche und Politische Stellung* (Kassel 1851).

Sylves'ter, James Joseph, F.R.S., a distinguished mathematician, was born at London, September 3, 1814. He graduated second wrangler at Cambridge in 1837, but being a Jew, was disqualified from entering for the Smith's Prize. He was professor of natural philosophy in University College, London, till 1855, when he became professor of mathematics at the Royal Military Academy, Woolwich. In 1876 he was appointed to the mathematical chair at John Hopkin's University, Baltimore, U.S. His numerous valuable papers are of great originality; and to him and Cayley the development of the higher algebra is mainly due. His last and best work is the application of the chemical atomic theory as an illustration of the theory of invariants and covariants of binary quantics, published in the *American Journal of Mathematics* (parts I. and II., 1878), which is edited by S.

Sylves'ter, Joshua, an English poet, born in 1563, died at Middelburg, in Holland, in 1618. Of the numerous translations and poetical effusions with which he occupied the leisure of a mercantile and wandering life, two only can be said to have escaped oblivion—*Tobacco Battered and the Pipes Shattered by a Volley of Holy Shot thundered from Mount Helicon*, and his translation of the once all-famous *Divine Works and Days* of the French poet Du Bartas, which is thought to have afforded some suggestions to Milton for his *Paradise Lost:* and even of these two little more is known to the ordinary student of English literature except the titles. Two editions of S.'s works appeared respectively in 1633 and 1641. A reprint of the 1641 edition forms part of Mr. Grosart's *Chertsey Worthies' Library* (privately printed 1878).

Sylvi'adæ, a family of *Dentirostral* Insessores (q. v.) including the various species of warblers; *e.g.* the chiff-chaff, willow-warbler, white-throat, wood-warbler, blackcap-warbler, and other forms.

Symbol'ic Books of a church are the creeds and Confession of Faith of that church, containing its distinctive principles. Symbol (Gr. 'a sign') was the title applied to the Confession of Faith of the early Christians, as a sign of what they believed. It was afterwards applied in the sense of a watchword, and at Alexandria of a pass-word of the initiated.

Syme, James, a celebrated Scotch surgeon, was born in Fifeshire in 1799, and educated at the University of Edinburgh. While still an undergraduate, he was appointed by Liston demonstrator in anatomy, and in 1825 began his lectures on surgery, at first as an extra-mural teacher, but from 1833 as occupant of the chair of surgery, which, with a six months' interval spent in London in 1847, he filled with the greatest distinction till his death, June 26, 1870. Both as an operator and as a teacher, S. had few equals. Perhaps his most wonderful operation was his method of amputating the foot at the ankle-joints. The most important of S.'s works is his *Principles of Surgery* (1st ed. 1832; new ed. 1863; Philadelph. 1866). See Paterson's *Memorial of J. S.* (Lond. 1874).

Symm'achus, Quintus Aurelius, a Roman statesman of the 4th c. A.D., and one of the last great advocates of Paganism, was educated in Gaul, and after serving as quæstor and prætor became Corrector of Lucania and the Brutii (365) and Proconsul of Africa (373), and member of the pontifical college. His petition to Gratian, urged on the senate's behalf, for the restoration of the altar of Victory, proved unavailing (382), as did the extant letter addressed by him when præfect of the city (384) to Valentinian. The failure led him to side with the pretender Maximus (387), and for so doing he was impeached of treason, but pardoned, and raised to the consulship (391). His death must have taken place after 404, and we have by him ten books of letters (Leyd. 1653), and fragments of nine orations, the latter discovered and edited by Mai (Mil. 1815). 'Even saints,' says Gibbon, 'and polemic saints, treat S. with respect,' though Prudentius likened the use to which he applied his talents 'to one digging in mud with an instrument of gold and ivory.' See Morin's *Études sur la Vie et les Écrits de Symmaque* (Par. 1847).

Symm'etry, a word used in zoology to denote (1) the general plan or type of arrangement of the elements of the body. Thus in star-fishes, sea-urchins, &c., these elements are arranged

in a *radial manner;* in *Annulosa* in a *zonal* manner; and in Vertebrata, &c., in *bilateral* fashion. (2) S. *of organs* denotes the disposition of such organs in Vertebrate animals as are disposed symmetrically in the body (*e.g.*, lungs).

In botany, S. is the orderly and similar distribution of a certain number of parts in plants. It generally expresses this numerical relationship between sepals, petals, and stamens.

Sympathet'ic Ink. See INK.

Sym'pathy (*sympatheia*, 'fellow-feeling') is an original principle of our nature which causes us to take a lively interest in the joys, sorrows, actions, &c., of our fellow-men, and which moves us to act in accordance with that interest. Brown, Hume, Smith, and other English moralists have founded their ethical theories on S.

Sym'phony (It. *sinfonia*), the most important class of instrumental compositions, a work in sonata form for the entire orchestra. From the etymology of the word (*sun*, 'with,' and *phōnē*, 'voice') it is evident that the voice anciently entered into the S. The S. as known now, as a colossal orchestral work, did not exist till the 18th c., the *Concerte Grossi* of Corelli being the first attempt of the kind. To Haydn's great erudition, wealth of melody, and command of the orchestra, we owe the popularising of the S. Mozart's brilliant genius assisted in its development. Beethoven is the greatest of all composers in this form, his nine symphonies being among the most stupendous products of musical art. Mendelssohn, Schubert, Schumann, and Rubinstein are among the modern masters of the S. which offers the grandest opportunities to composers for the display of every musical resource. A S. has usually four movements similar to those described under SONATA. The word was formerly applied to an overture, and is still used to designate the instrumental passage introducing or closing a vocal piece, or occurring during pauses of the voice.

Syn'agogue (Gr. *synagōgē*) had in the Septuagint (q. v.) the special meaning of 'an appointed meeting of people either for civil or religious purposes,' being used in that sense as synonymous with *ekklēsia* ('church'). In the New Testament both words are used for a congregation or assembly for public worship, either of Jews or Christians (S., Jewish, Acts ix. 2; Christian, James ii. 2; church (*ekklesia*), Jewish, Matt. xviii. 17, Christian, Rom. xvi. 5), as well as for the place in which the congregation met (James ii. 2 and 1 Cor. xi. 18). When the Christian Church separated itself completely from the Jewish, the name S. was applied exclusively to the worshipping assemblies of the Jews and the buildings in which they met, and church to those of the Christians.

The following description is that of the Jewish S. at the time of Christ. According to the Jewish canons, the S. had to be built on the most elevated ground in the neighbourhood. But the riverside outside the city was also deemed a suitable locality on account of the quietness and of the supply of water, which was needed for baptism and ablutions (*cf.* Acts xvi. 13). The building was generally in the form of a theatre, with the door so placed that the worshippers had their faces turned towards Jerusalem; and it was generally, like the Temple, roofless (*cf.* Juvenal, *Sat.* xiv. 98). The S. of each town was governed by the members of the local Sanhedrim (q. v.), who were hence called 'elders' (Luke vii. 3), shepherds (Acts xx. 28), 'overseers' (Eph. iv. 11), 'pastors,' and rulers of the S. (Mark v. 22). The president of the sanhedrim was the head of the S., and was assisted in the administration of the law by two judicial colleagues. Other officials were (1) three almoners (deacons), (2) the legate of the S., one of the congregation who was delegated on each occasion to go before the Ark and conduct divine service. (3) The interpreter, who was required to explain the Scriptural Hebrew in the Aramaic, which was the vernacular of later times. (4) The chazan in the time of Christ held the position of sexton or beadle, but in the 6th c. A.D., when the ancient practice of appointing a legate at each meeting for worship was discontinued, he became the regular reader of the liturgy. (5) The ten Bathanim or Men of Leisure: no place could legally have a S. in which there were not ten independent men who could come to the S. and form the legal congregation when required. There were regular meetings for worship, at which there had to be present at least ten men above the age of thirteen every Monday and Thursday, on which days pious Jews fasted (*cf.* Luke xviii. 12), every Sabbath, and on festivals and fasts. A liturgy, compiled largely from the Psalms, was used in public worship, lessons were read from the Law and the Prophets, and on certain days homilies were delivered by the Rabbins. See Buxtorf, *Synagoga Judaica* (Basel, 1680), Zunz, *Der Ritus des Synagogalen Gottesdienstes* (Berl. 1859), and Ginsburg in Kitto's *Cyclo. of Bib. Lit.* (3d ed. Edin. 1876).

Syn'agogue, The Great, denotes the council at Jerusalem, after the return from Babylon (B.C. 536), which was appointed by Nehemiah towards the close of his life, probably about B.C. 410. According to tradition it consisted of 120 members belonging to five different classes: (1) the chiefs of the priestly divisions (Neh. x. 1–8, *cf.* 1 Chron. xxiv. 7–18); (2) the chiefs of the Levitical families (Neh. x. 9–13, *cf.* ix. 4, 5; Ezra viii. 18, 19, 24); (3) the heads of the Israelite families; (4) elders or representatives of cities, and (5) Doctors of the Law. Afterwards, however, the number of members diminished, so that when, on the death of Simon the Just (B.C. 300), the G. S. was changed into the Great Sanhedrim (q. v.), the number was only 70. The members came under a solemn oath (1) not to intermarry with heathen; (2) to observe the Sabbath and (3) the Sabbatical year; (4) to pay annually a third of a shekel to the sanctuary; (5) to supply wood for the altar, and (6) regularly to pay the priestly dues (Neh. x. 28–39). Their after work was (1) the formation of the canon of Scripture, (2) the compilation of the synagogue ritual, (3) the establishment of schools for the study of the Law, and (4) the definition of the precepts thereof. See De Wette, *Die Einleitung in die Kanonischen und Apokryphischen Bücher des Alten Testamento* (8th ed- 1869); Herzog, *Real-Encyclopædie* xv. 296 *et seq.*, and Ginsburg in Kitto's *Cyclo. of Bib. Lit.* (3d ed. Edin. 1876).

Syncli'nal Ax'is. See CURVES ANTICLINAL AND SYNCLINAL.

Syncopa'tion (Gr. *sun* and *kopto*, 'to cut off') in music, an inversion of the musical rhythm, having the effect of placing the accent upon the usually unaccented part of the bar. This is usually done by the introduction of a driving note.

Syn'cope. See FAINTING.

Syn'cretism (Gr. *syn*, 'together,' and Lat. *cerno*, 'to perceive') was a term first used by the Calvinist, David Pereus, in his work *Irenicon* (1614), in which he made an attempt to allay the spirit of dissension to which the Reformation had given rise. The Lutheran George Calixtus (q. v.), however, took a more prominent part in the work of reconciling the separated parties, and gave rise to the so-called Syncretistic Controversy. The real aim of the teaching of Calixtus was to induce the three leading branches into which the Church was divided—the Roman Catholic, Reformed, and Lutheran—to abstain from their mutual hatred and enmity, and to cultivate mutual love and goodwill. His opponents supposed or represented it to be that he wished the three to unite and form one body. See Gass, *G. Calixt. und der Synkretismus* (Bresl. 1846).

Syn'dic (Gr. *syndikos*, from *syn*, 'with,' *dikē*, 'justice'), the title up to the Revolution in various towns of Southern France of the chief magistrate, as formerly also at Geneva. It is now borne by officers charged with the task of watching the interests of a company or association, or by persons appointed to manage a bankrupt's property. In the University of Cambridge, syndics are chosen from the Senate for the transaction of special business, such as the forming of laws, regulation of fees, &c.

Synec'doche (Gr., 'understanding one thing by means of another') is that figure of speech in which a part stands for the whole, or *vice-versa; e.g.*, 'ten *sail* of the line,' 'fifty *head* of cattle.'

Syner'gism (Gr. *synergeia*, 'co-operation') is a theory of Regeneration, nearly the same as Semi-Pelagianism (q. v.), according to which it is maintained that the human will cooperates with the Holy Spirit in the renewing act. A controversy arose in the Lutheran Church in the 16th c., called the Synergistic Controversy, between the strict Lutherans, who held the impotence of man to regenerate himself, and those—including Melanchthon in his later writings—who held that some agency of the human will accompanies the influence of God's Spirit.

Syne'sius, the Philosopher, was born of Heracleid descent about 370 A.D., at Cyrene, a city of the Libyan Pentapolis. There he passed his boyhood, and after brief military service repaired to the famous Alexandrian schools, where he became Hypatia's favourite pupil. A visit to Athens ended in disappointment, 'Athens retaining nothing of splendour but a name that once was famous;' he returned to Cyrene, and in 397 was sent on an embassy to Arcadius at Constantinople, his residence for the next three years. The extant oration, *Peri Basileias*, a bold discourse on a ruler's responsibilities, received the emperor's approbation, and won great privileges for the Pentapolis. At Constantinople he may have heard St. Chrysostom, and when in 403 he revisited Alexandria, the Patriarch Theophilus induced him formally to become a Christian neophyte, and marry a Christian wife. This marriage, and his still semi-pagan opinions, stood in the way of his accepting the bishopric of Ptolemais, to which he was elected in 409; but when Theophilus consecrated him a twelvemonth later, he seems to have renounced the married state. His episcopate, marked by the fearless excommunication of Andronicus, tyrannical governor of the Pentapolis, and by his steadfast opposition to the Arians, was short, since he died, according to Druon, in 413. The 'Squire Bishop'—as Kingsley styles S. from his love of field-sports—became, like Tillotson, 'a father of the Church without having been her son;' and his works, those even after his conversion, retain the literary cult of Paganism. We have by him two homilies, ten hymns, 157 charming letters (394-413), some fantastic Neo-Platonic treatises, &c., but of the dramas mentioned by himself not one survives. The best complete edition is Morell's, with Petavius' Latin rendering (2d ed. Par. 1640), and there is an excellent French translation by H. Druon, with a biography prefixed (Par. 1878).

Syn'od (Gr. *synodos*, 'a public feast'), as used in the Christian Church, meant at first an assembly of the faithful, but was afterwards exclusively applied to a meeting of bishops or Church Council. In this sense the chief kinds of S. are the following:—(1) Œcumenical (q. v.), to which the bishops and principal dignitaries of the whole Church were summoned; (2) general—either of the Eastern or the Western Church; (3) national—as Spanish, &c.; (4) provincial—convened by a metropolitan from his province; (5) united—of several provinces; (6) diocesan—of a bishop and his clergy. In the Presbyterian Church, the S. is the court next to the General Assembly (q. v.), when there is one, and is composed of the members of all the Presbyteries (q. v.) within a certain district.

Synod'ic, in astronomy, is the term applied to the orbital revolution of a planet or the moon when the period of revolution is measured between two successive conjunctions or oppositions. The S. month is the same as the lunar month, or lunation.

Syn'onyms (Gr. *syn*, 'with,' and *onoma*, 'name'), words apparently identical in meaning, as 'rich' and 'wealthy,' 'country' and 'land.' In Mythology (q. v.) it has been pointed out how the number of roots must at the beginning of human speech have been almost infinite, and how the same object might be designated by a great variety of names—a snake, for instance, being called *serpens* ('creeper') or *anguis* ('throttler'). Such names applied to the same object, though each originally conveying a different conception, would with lapse of time come to be regarded as absolutely identical in meaning, would in fact become synonymous. Then the principle of conservation of energy steps in, and men begin either to drop superfluous S. or to establish slight shades of meaning, the latter process being especially noticeable in the case of S. due to foreign borrowings. Thus in English 'ox' and 'beef,' or 'sheep' and 'mutton,' are now no longer synonymous; while 'ship' and 'skiff,' 'crab' and 'crayfish' (Fr. *écrevisse*), etymologically the same, have likewise been differentiated or desynonymised.

Syno'via and **Syno'vial Mem'brane**. S. is a glutinous fluid secreted by synovial membranes. Synovial membranes are simply modifications of serous membranes, and they invest the tendons and sinews that play over joints and otherwise assist articulations. The synovial fluid is therefore merely a secretion from a serous membrane. It appears, however, to differ in certain particulars from ordinary serous secretions, and is more dense and viscid than ordinary serum. Hence S. is often popularly named 'joint-oil.' In S. an abundance of albumen is present. Synovial membranes also invest the *bursæ*, or little pads which underlie such tendons as those of the extensor muscles of the thigh, in which tendon the *patella* or knee-cap is developed. Synovial membranes are liable to inflammation, known as *synovitis*.

Syn'tax (Gr. *syn*, 'together,' and *taxis*, 'an arranging') is that division of grammar which concerns itself with the proper construction of sentences. The rules of S. are statements of the ways in which the words of a sentence are related to each other. Uninflected languages have necessarily a much less elaborate S. than inflected ones; and much error and nonsense abound in manuals of English grammar owing to the persistent folly of applying to our S. the Latin rules of concord and government.

Syn'thesis, in chemistry. See CHEMISTRY.

Syn'tonin, a substance very closely allied to *Fibrin* (q. v.), and which is obtained from *myosin* by the action of dilute acids. *Myosin* itself is the substance which is found in a coagulated state in muscles after death. S. is an albuminoid substance containing carbon, hydrogen, oxygen, and nitrogen, with traces of sulphur. It appears to exist as an essential element of all contractile tissues.

Syph'ilis is, according to Dr. Farr, a disease belonging to the enthetic order of Zymotic Diseases (q. v.). It may be defined as 'a specific disease produced by the contagion of the same disease in another person, and characterised (1) in its primary form by the appearance on the part inoculated of one of two different kinds of sore or *chancre*, and (2) in its secondary or constitutional form by various eruptions on the skin, by sore throat, affections of the eye, the glands, the bones, and almost every other tissue of the body.' The contagion may be conveyed by direct inoculation during sexual intercourse; accidentally, in other forms of personal contact; and purposely, by inoculation for medicinal or experimental purposes. There are two kinds of chancre, and in one the disease is merely local, never affecting the constitution; but in the other the constitution is affected, and the disease may break out after long intervals of health, and may be transmitted from one generation to another through the blood of the mother or the semen of the father.

The *local* form of S. appears in three principal varieties—(1) *The common soft chancre unaccompanied by bubo;* or *suppurative syphilitic inflammation.* Three or four days after inoculation the sore appears and begins to suppurate at once. The sore has a punched-out appearance, its edges are slightly undermined, and its base is thickened by inflammation of the parts underneath it. The sore heals with no remaining induration in three or four weeks. (2) *The sore with suppurating bubo;* or *ulcerative syphilitic inflammation.* The sore is ragged and has a worm-eaten appearance, the glands and the absorbents are affected, and specific abscesses may form in the course of the latter, but no part of the body beyond the gland is affected. In these two forms the treatment consists in keeping the part clean, applying a mercurial wash, poulticing the bubo, and opening it as soon as it suppurates. (3) *Sloughing and gangrenous sores.* In this form the sore may slough and become gangrenous as soon as it is formed, or a previously formed sore may take on a sloughing action. The absorbents are not affected, nor is it followed by secondary symptoms, but the sloughing may proceed with great rapidity, and may prove fatal from exhaustion or hæmorrhage. The treatment consists in poulticing with charcoal or yeast, and if the sloughing action does not extend deeply, nitric acid may be applied; but if the slough is deep, lotions of nitric acid or carbolic acid, or iodoform, may be applied.

The *constitutional* form of S. is distinguished by the appearance on the part affected of a sore called the *hard* or *Hunterian* chancre, and by a chronic engorgement of the lymphatic glands, forming a bunch of hard knobs under the skin. The sore may appear in from three to five days after exposure to contagion, and it may vary as the disease is derived from a primary or a secondary sore. Lancereaux found that the mean period of incubation with matter from secondary sores, in cases of experimental inoculation, was twenty-eight days; but in two cases, in which the disease was derived from a primary sore, the period was eighteen days. Mr. Holmes says:—'Slight itching is first noticed at the part, then redness, and a small vesicle forms, which soon cracks, and induration shows itself at the base of the crack; the sore spreads and becomes excavated and glazed, with little or no granulation on its surface. Its natural secretion, if examined microscopically, is found not to be purulent, but to con-

tain only a little granular matter, though the sore can be made to suppurate by the friction of the clothes or by irritating applications. The hardness at the base of the ulcer, from which the sore takes its usual appellation, is of a peculiar kind different from that which is found at the base of a phlegmonoid soft sore, in this that in the Hunterian chancre the hardening feels as if due to a layer of parchment or other hard material let into the tissues; that is to say, it is of limited thickness, and abruptly ceases where the healthy tissues commence; while the hardness at the base of the phlegmonoid sore being due to the infiltration of lymph from common inflammation of the cellular tissue, is of a much less defined character, extends further, and fades away much more gradually into the healthy tissues.' Besides the Hunterian chancre, Mr. Lee describes two forms of infecting S., unassociated with ulceration; viz., (1) a pimple, the cuticle appearing as if peeled off the upper part of the glans penis, or a circumscribed patch remaining for days together, with a separation of epithelial scales mixed with lymph-globules from the surface, but with no specific induration; and (2) an indurated tubercle formed below the skin or mucous membrane without any visible loss of substance.

The general opinion of the medical profession is that the *constitutional* form of S. can be treated efficiently by mercury only, and that the treatment should commence as soon as the disease declares itself. The mildest form is the blue pill, which may be given in doses of 3 or 5 grains twice a day in combination with ¼ or ½ grain of powdered opium. This should be continued for about six weeks, or until the sore has been cured, and all hardening around it and around the bubo has disappeared. Mercury may also be given endermically by inunction or fumigation.

The *secondary* symptoms of constitutional S. do not usually appear till after the primary sore has healed; but the period is quite uncertain, though, in the majority of cases, it is under half a year. The secondary symptoms are sometimes ushered in by what is termed the syphilitic fever; but they are generally in the throat, the sore-throat being due to an eruption on the mucous membrane of the mouth or fauces; or in the skin, being usually either roseola, lichen, acne, mucous tubercle, pityriasis, psoriasis, or lepra. These eruptions are distinguished from other eruptions, which are not specific, partly by their coppery colour, and by their circular or horse-shoe form, and by their tendency to disappear at the centre and spread from their edges. The eye and the larynx are affected in the later secondary stage. Periostitis or nodes are also seen at this period. Other secondary symptoms are the development of mucous tubercles—flat, raised, oval patches, generally situated at or near the junction of the skin and mucous membrane, and yielding a contagious secretion, probably a fertile source of inoculation. The mucous tubercle generally disappears rapidly under the local application of calomel. Syphilitic vegetations and condylomata are also contagious.

In the treatment of secondary S., it is now generally admitted that the administration of mercury is necessary for the complete eradication of the syphilitic diathesis. Mr. Holmes says, 'No hesitation need be experienced in prescribing mercury in cases where there is no ulceration or suppuration; but when this is the case, mercury is generally held to be contra-indicated. . . . The administration of iodine and mercury together is a very successful plan of treating secondary S. Thus the iodide of potassium may be given in doses of from 5 to 10 grains while the patient is undergoing a course of mild mercurial fumigation.'

The *tertiary* stage of S. is distinguished from the secondary by the occurrence of an interval of health of longer or shorter duration—days, months, or even years—and is characterised by a reproductive process. Lancereaux describes this stage as that of gummatous products, or tertiary and quaternary affections. The affections of the skin are of the suppurative and ulcerative type, such as rupia and ecthyma. The tissues of the bone rapidly soften, and become carious or necrosed. The glands are also deeply affected, even the great secreting and blood glands—the liver, spleen, thyroid, &c. The nervous system is also affected by tertiary deposits in the nerve-structures or their membranes, leading to irritation or paralysis. The treatment of the tertiary stage must be conducted on the same principles as that of the secondary stage.

Infantile or *congenital S.* is transmitted to the fœtus *in utero*, either through the blood of the mother or the semen of the father, or both, and is a form of secondary S., differing from it only in that the primary sore has occurred on the body of the parent instead of the infant itself. The disease is characterised by a persistent coryza, a reddish or coppery eruption—roseola or lichen—especially on the genitals and on the palms and soles. Crescentic patches of mucous tubercle are common on the interior of the mouth, the lips, and anus, and there is a peculiar yellowish complexion. The treatment of congenital S. consists in the administration of mercury; 1½ or 2 grains of grey powder with 3 grains of compound chalk powder may be given twice a day, and should be continued for about six weeks, and for a fortnight after all traces of the disease have disappeared. See Holmes' *System of Surgery; A Summary of the Evidence adduced before the Committee appointed to inquire into the Pathology and Treatment of the Venereal Disease*, by Mr. Venning, in 5th vol. of the *St. George's Hospital Reports*, 1867; *Treatise on Syphilis*, by Lancereaux, translated for the New Sydenham Society; and *Lectures at the Royal College of Surgeons*, by Mr. Lee (1875).

Syphilisa'tion is the term used to designate the process of inoculating a patient from the original sore in three or four places in a different part of the body, usually the thigh; from these on another part, and so on, until sometimes the whole body is covered with the marks of chancres, the object aimed at being to eradicate syphilis already existing in the body, and to secure immunity from future attacks. In 1844, Auzias Turenne, a French physician, experimented on certain of the lower animals with the view of testing John Hunter's doctrine that syphilis could not be communicated to them. By inoculation with the human virus he succeeded in producing venereal sores in monkeys, and from them he inoculated rabbits, cats, and horses. By repeated inoculations he found that a period was reached at which no further sores could be produced in the same animal, and he concluded that by prolonged inoculation the system became protected. Sperino of Turin carried out the experiments of Turenne on the human subject, and by inoculating patients suffering from syphilis by virus from a chancre, and repeating the inoculation once or twice a week, he reached a point at which the poison ceased to have any effect, and all the other sores healed. In 1851, Professor Boeck of Christiania commenced his investigation on this subject, and finally announced his belief that S. is the proper method of treating syphilis in all its stages, and that in no disease have we a more certain method of cure. This mode of treatment was followed out for a long time in some Continental hospitals, and received a full trial at the female Lock Hospital in London. As a method of treatment S. is now abandoned, at least in this country; but it is still practised as a means of diagnosis.

Sy'ra (anc. *Syros*), the most important island of the Cyclades, in the Ægean Sea, lying S. of Giura and between Thermya and Mykono. Area 42 sq. miles; pop. 40,000. The surface is hilly, but the soil is fertile, especially in the numerous narrow valleys, which yield abundant wheat, barley, cotton, figs, and olives. Wine and honey are also produced, while cattle, pigs, and goats are extensively raised. S. dates its prosperity from the Greek war of independence, during which it preserved its neutrality, and consequently became the place of refuge of thousands of the most enterprising and industrious natives of the surrounding islands.—On the E. coast is the capital **Hermopolis** or **New S.**, the seat of government of the nomarchy of the Cyclades, and one of the most important manufacturing and seaport towns of Greece. It has telegraph communication with Athens, the chief islands, and Turkey, and owns one-third of all the trading vessels of Greece with more than one-third the total tonnage. In 1841 the revenues of the municipality were £4303; expenses, £4395. In 1870, revenues, £21,645; expenses, £30,393. S. has numerous flour-mills, foundries (employing 1000 men and boys), a weaving and rope factory, and ten tanneries (employing 1500 workmen, who produced in 1875 manufactures worth £500,000). In 1876 were built at S. 65 vessels of 7359 tons (the tonnage of 21 of which amounted to 6488 tons). In the same year in the coasting trade there entered 3995 vessels of 182,595 tons and cleared 3980 of 181,550 tons; and in the foreign trade there entered 2103 vessels of 622,044 tons, and cleared 2061 of 617,003 tons. Of those that entered, 98 of 96,537 tons, with cargoes worth £306,581, were British, and of those that cleared, 97 of 96,403 tons, with cargoes worth £41,700. The total value of imports in the same year was £788,814, and of exports £238,563.

Syr'acuse, a celebrated city of Sicily, lies on the islet of Ortygia, close to the E. coast of the island, 54½ miles S.S.E. of Catania by rail. It is crossed lengthwise by two winding main streets, in the middle of the westmost of which is the cathedral, on the side of a Doric temple of Pallas, 192 feet long by 72 broad, of which 22 columns (28 feet high by 6½ thick) are imbedded in the masonry of the church. Facing the cathedral is the museum, and between this and the S. point of the islet is the Fountain of Arethusa. The 'Porto Maggiore,' to the W., is large, sheltered, and deep. S. is the see of an archbishop, and has a lyceum, a gymnasium, a technical school, and a seminary for teachers. It carries on a small trade in wine, oil, salt, &c. In 1876, 2 British ships, of 1679 tons, entered, and 10, of 1761 tons, cleared. Pop. (1876) 23,287. S. was the largest of the Hellenic cities, having, according to Strabo, a circumference of 20 miles, and a pop. of 500,000. It consisted of five distinct parts:—(1.) *Ortygia*, the primitive settlement; (2) separated by the 'small harbour' (now sanded up), *Achradina*, on the precipitous limestone cliffs to the N., with impregnable walls; (3) *Tyche*, occupying the N.E.; (4) *Epipolæ*, the W.: and (5) *Neapolis*, the S.E. corner of the steep triangular plateau to the W. of Achradina. The last four were inclosed by a wall of huge stones (402-385 B.C.). The most noteworthy sights of S. are the ruins of the Roman Amphitheatre (231 feet long by 132 wide); the Altar of Hiero II. (640 feet by 25); the Latomia del Paradiso, with the 'Ear of Dionysius,' a rock-hewn grotto 210 feet deep, 74 high, and 15-35 wide; the Greek Theatre (480-406 B.C.), 495 feet in diameter, and the fort Euryalus (Mongibellini), all in the W. part; and in the E. the campanile of Sta. Lucia (11th c.); the Latomia de Capuccini, where languished the 7000 Athenian captives of the Sicilian Expedition (413 B.C.); the ruins of the church of S. Giovanni, and the Catacombs, extending in several stories to a total length of 9 miles. To the S.W., on the Anapo, are the mutilated columns of the famous Olympeium.—S. was founded in 734 B C. by Dorians under Archias. The colony rapidly increased, and from the time of Gelon (q. v.), who changed its aristocratic government into a *tyrannis*, and defeated Carthage at Himera (480), it was the chief city of Sicily. After Hiero I. (q. v.) and Thrasybulus it became (466) a democratic republic, which strove for the hegemony of the Sicilian cities, and broke the Athenian power in 413 B.C. New attacks by Carthage called Dionysius (q. v.) to the head of affairs (405), whom Dionysius the Younger (q. v.) succeeded (369). After him the democratic party prevailed (343), but was put down by Agathocles (q. v.). Under Hiero II. (q. v.) S. was an ally of Rome in the first Punic War. His grandson Hieronymus (murdered 213), joining Carthage, occasioned the great siege of S. by the Romans, which all the skill of Archimedes (q. v.) could not save from capture in 212 B.C. S. was taken by Belisarius in 535 A.D., by the Saracens in 878, and by the Normans in 1085. In 1865 it was made the capital of the province of S. See Cavallari, *Zur Topographie von S.* (1845); Baedeker's *South Italy, Sicily, &c.* (6th ed. 1877).

Syr'acuse, a city of the State of New York, U.S., on the Erie Canal and New York Central Railroad, 150 miles W. of Albany. It has 44 churches, a university, 20 schools, and 3 daily and 9 weekly newspapers. The State Idiot Asylum and a large State Armoury are situated at S. It has the largest salt-works in America, producing annually from 7,000,000 to 8,000,000 bushels of salt. There are also manufactures of hardware, machines, and agricultural implements, carriages, &c. Pop. (1870) 43,051, estimated (1876) at 54,000.

Syr'ia (Turk. *Suristan*, Arab. *Es-shan*), a vilayet of Asiatic Turkey, extends along the Mediterranean from the Gulf of Eskanderum to El-Arish, on the Egyptian frontier. It stretches inland as far E. as the Euphrates, and passes gradually in the E. and S. into the Arabian desert. The district of Lebanon (q. v.) was placed under a separate governor in 1861, and that of Palestine (q. v.) under the central government of Constantinople in 1873. S., therefore, comprises now only the seven sandjaks of Damascus, Beyrout, Acre, Belka, Hauran, Hamah, and Tripoli, with a pop. estimated (1877) at 1,100,000, including the resident Arabs and Beduins in the E., who number 100,000. The pop. of S. proper is about 2,000,000, and the area 146,000 sq. miles. S. consists of a seaboard of from 10 to 15 miles broad, and beyond the coast-ranges, of an interior comprising three areas of continental drainage—viz., that of Aleppo, that of Damascus, and that of the Jordan valley (*El Ghur*), the last, which is the largest, sinking far below the sea-level, at Merom to 120 feet, in the Sea of Galilee to 620, and in the Dead Sea to 1312 feet. The limestone mass of Lebanon forms two parallel ranges, or rather groups of ranges, Libanus and Anti-Libanus, the latter and more easterly containing the headwaters of the Jordan (q. v.). Between them lies the valley of the Cœle-S. (q. v.), whence the Orontes flows N. and the Leontes S. The highest point, Jebel Timarun, in Libanus (10,533 feet), is covered with all but perpetual snow. Some forty small streams descend to the Mediterranean, but most of these are dry in summer. Various parts of S. are markedly volcanic, and earthquakes frequently occur; Safed was terribly devastated in 1837, and Antioch in 1872. The so-called 'Syrian Desert' in winter is covered with coarse grass, and attracts not only antelopes, wild asses and boars, but Beduins with their flocks and herds. The climate of S. is generally hot and dry; summer rains are rare, while along the coast and in El Ghur the temperature often rises above 100° F. Though some of the grand old forests have disappeared, the mountain sides are still in many places clad with fine cedars, pines, and firs. Wheat, barley, and beans are the common cereals, but other products are rice, dhurra, pease, and lentils. Cotton, tobacco, silk, hemp, madder, indigo, capsicum, olives (for oil), and fine fruits are cultivated extensively. Of minerals, some coal is found in the S., abundance of salt, bitumen, sulphur, &c., in El Ghur, and a little iron in Lebanon. The only manufactures, besides coarse articles for home use, are fine silks, gold and silver thread stuffs, carpets and arms. In the opinion of several recent travellers S. is capable of great development under better government. In 1876-77 the estimated revenue of S. amounted to £526,734, and the expenditure to £526,772. Damascus has always been the chief city. Other places are Beyrout, Tripoli, Latakia, Hamah, and Jafa. The Maronites (q. v.) of the hill-country between Lebanon and the sea have belonged to the Latin Church since the 12th c., and number 200,000. Between them and the semi-heathen Druses (q. v.), about 50,000 strong, there is a deadly feud, which often breaks forth, as in 1860, in scenes of violence. Although the Turk rules, the Semitic race prevails. Syriac has all but given place to Arabic, and Greek is freely spoken in the ports. S. was a prosperous and populous land long before its conquest by the Hebrews under David, who seem merely to have made its princes tributary. Together with Palestine S. was joined successively to the empires of Assyria, Babylonia, Media, Persia, and Macedonia. The Greeks here formed the flourishing empire of the Seleucidæ (q. v.). Pompey made it a Roman province (69-64 A.D.), and on the division of the empire it fell to Byzantium. In 632 it was overrun by the Arabs, and from about 661, when Damascus was made the capital of the Mohammedan empire, Antioch (q. v.) began to decay. The dominion of the Crusaders (q. v.) was of short duration, for in 1291 the Mameluke rulers of Egypt drove out the knights, and the subsequent invasion of Tamerlane left the country a wilderness. In 1517 Selim I. conquered S., which still forms part of the Turkish empire. Religious bigotry and oppressive taxation have gained S. an evil distinction even within the dominion of the Porte, and the first act under the Anglo-Turkish Convention introducing reforms into Asia Minor was the appointment (December 1878) of Midhat Pasha as governor-general of S. for a fixed period of twelve years. The construction of the Euphrates Valley railway will bring the country directly under the influence of Western Europe. See Wortabet, *S. and the Syrians* (2 vols. 1856); Cooper, *Sects in S.* (1860); Porter, *S.'s Holy Places* (new ed. 1867), and *Giant Cities of S.* (1869); Burton and Drake, *Visits to Unexplored S.* (2 vols. 1872); Isabel Burton, *Inner Life of S.* (2 vols. 1875); the Handbooks of Murray (new ed. 1875) and Baedeker (1875); Bogué, *Syrie Centrale; Architecture Civile et Religieuse du I. au VI. Siècle* (Par. 1869-77) and *Inscriptions Semitiques de la Syrie* (Par. 1869-77); and Käït Bey, *Travels in Palestine and S.* (1878).

Syr'iac Language and Literature.—The Syriac language belongs to the Northern or Aramaic branch of the Semitic Languages (q. v.). In the 1st c. A.D. it was developed by Christians into a written language, but from that time it was gradually supplanted by Arabic, and it now exists only in the corrupt dialects about the lakes Urmiah and Van, kept alive by the

efforts of missionaries. The best grammar of this 'modern S.' is by Nöldeke (Leip. 1868). From the Syriac chirography, which in its oldest form, the 'Estrangelo,' was once widely diffused in Asia Minor, were derived not only the Kufic Writing (q. v.) of the Arabs (from which the Arabic, Persian, and Turkish alphabets have sprung), and the Zend and Pehlevi writing of the Iranians of the time of the Sassanidæ, but also through the medium of the Nestorians (q. v.), the chirography of the Ugrians, Mongols, Kalmuks, and Mantchus. The extant Syriac literature is almost exclusively Christian, composed after Greek models, and containing many words of Greek origin. Its oldest classic specimen is the Peshito (q. v.). Its poetry wholly consisted of unrhymed hymns, of which the chief writers were Bardesanes (q. v.) and his son Harmonius. The golden age of Syriac literature dates from Jacobus, Bishop of Nisibis (died A.D. 350) to Ibas, Bishop of Edessa (died A.D. 470), the great schools of which two cities were, down to the Middle Ages, the centres of Syriac learning. The greatest writer of this period was Ephraem Syrus (q. v.). From the 4th c. Syriac literature is mainly translations of Greek philosophical and scientific works, which formed the basis of the Arabian writings of the 8th and 9th centuries, that through Spain carried Eastern learning to Western Christendom. From the 10th c. it declined, and in the 13th its last great writer was Bar-Hebræus (see ABULFARAJ). The chief collections of Syriac MSS. are in the Vatican, the Bibliothèque Nationale, the Bodleian, and the British Museum. The best Syriac grammars are by Uhlemann (2d ed. Berl. 1857); Hoffmann (2d ed. by Merx, 1867-70); the best Syriac chrestomathies (with vocabularies) by Bernstein and Kirsch (2 vols. Lond. 1867); Rödiger (2d ed. Halle 1868), and Martin (Par. 1875). A comprehensive *Thesaurus Syriacus*, embodying the incomplete works of Quatremère, Bernstein, Lorsbach, Ernesti, and Field, is preparing by R. Payne Smith, S.T.P.R. (Fasc. i.-iv., Clar. Press, Oxf. 1868-77).

Syr'iac Ver'sions. These, given in the order of their probable antiquity, are the following:—1, *Curetonian* (middle of 2d c.?) fragments of the Gospels contained in one of Tattam's Nitrian MSS., and first published by Dr. W. Cureton in 1858. 2, *Peshito* (end of 2d c.?), a revised text of both Old and New Testaments, possibly based on (1), though the relation of the two is still subject of controversy among scholars. 3, *Philoxenian* (A. D. 508), a version of New Testament made at the instance of Philoxenus, Bishop of Hierapolis. The discovery of a MS. at Beyrout containing the gospels in this version, and the remainder of the New Testament in (2), was announced by Hall in August 1877. 4, *Harclean* (616), a revision of (3) made by Thomas of Harkel, with valuable marginal readings. 5, *Hexaplar*, made (617) from Origen's version of LXX. 6, *Jerusalem Syriac* (5th c.?), found only in a Vatican MS. recently edited by Erizzo. 7, *Karkaphensicn*, contained in a little-known Vatican MS., but apparently resembling (2). The most accessible edition of the Peshito is Bagster's Polyglott, the rest are best consulted in Adler's *Novi Testamenti Versiones Syriacæ* (Copenh. 1789).

Syr'ian Rite, Church of the, is composed of those Christians in Syria who use the Syriac Liturgy of St. James. This liturgy was originally composed for the Patriarchate of Antioch, which included the churches of Palestine and Mesopotamia, and according to tradition by the Apostle James. There is no Greek MS. of it in existence of an earlier date than the 10th c., but the Syriac Liturgy of the same name almost exactly answers the description given of it in various writers. After the Mohammedan conquest (638) the orthodox Syrians were drawn into closer association with the Patriarchate of Constantinople, and then adopted the Liturgy of St. Chrysostom, which was used by the rest of the Eastern Church. By the orthodox Greek Church of Jerusalem, then, the Liturgy of St. James is used in the Greek form only once a year, namely, on the Festival of St. James. But it is still used in its Syriac form by the Monophysites or Jacobites (q. v.), as well as by the Maronites (q. v.). The latter renounced the Monothelite heresy (1182), and entered into communion with the Church of Rome, to which they were formally reunited at the Council of Florence (1445); but notwithstanding this union they have always retained a kind of independence, and especially their own liturgical customs. A Maronite college was founded at Rome, 1584, for the education of their clergy, where worship is conducted according to the S. R. See Etheridge, *Syrian Churches* (Lond. 1846); Assemanni, *Bibliotheca Orientalis* (Romæ 1687-1768); Neale, *Hist. of the Holy Eastern Church* (Lond. 1873).

Syringe', a form of pump, consists of a cylindrical tube, in which a piston works as nearly air-tight as possible. Water or other liquid is first sucked by retraction of the piston, and then forcibly expelled by the return stroke. In the *condensing* S., a form of air-pump, the piston has a valve opening inwards, so that the air which enters during the back stroke may be compressed into a vessel with which the S. is in connection.

Syrrhap'tes, a genus of birds belonging to the order *Rasores* (q. v.), and to the Grouse family (*Tetraonidæ*). *S. Pallasii* is the familiar species, inhabiting Central Asia, near Lake Baikal. Pallas termed this bird *Tetrao paradoxus*. The legs are short and feathered, and the toes united through the greater part of their length. The flight is stronger than in Rasorial birds generally.

Syr'tis Ma'jor and Min'or, the names applied by the Greek geographers to two gulfs on the northern coast of Africa, the modern Gulfs of Sidra and Khabes. So called from the sandy desert (Sem. *sert*) which fringed the shores, they were feared by the coast-hugging sailors of antiquity for their shallows and sunken rocks.

Syr'up (from the Sem. root *Srb*, through the Latin). The ordinary or golden S. of shops consists of the uncrystallisable residue finally separated from crystallised sugar in the process of refining, either by the draining of sugar in loaves, or forcibly ejected by the centrifugal apparatus in preparing moist sugar. In the sugar manufacture, however, the term S. is applied to all strong saccharine solutions which contain sugar in a condition capable of crystallising out, and the ultimate uncrystallisable fluid is distinguished as molasses or treacle. In pharmacy simple S. (*Syrupus simplex*) is a saturated solution of pure sugar, and a numerous class of medicinal preparations are in use, which, under the name of syrups, consist of that substance with the special therapeutic agent or compound added to it.

Syzran', a town of Russia, government of Simbirsk, on the Volga, 148 miles E. of Penza by rail. It is the centre of a rich agricultural district, and has a large river trade in corn. Pop. (*St. Petersb. Cal.* 1878) 19,443.

Sy'zygy, in astronomy, occurs when the sun, moon, and earth are in one line, so that when the moon is new or full it is said to be in S.

Szarvas', a town of Hungary, on the Körös, a tributary of the Theiss, about 90 miles S.E. of Pesth. It lies in the centre of a swampy district. Bee-keeping is one of the principal industries of the inhabitants. Pop. (1870) 18,917.

Szathmar'-Nemeth'e, a town of Hungary, lying on both sides of the Szamos, 64 miles E.N.E. of Debreczin by rail. It manufactures earthenware, canvas, and slibowiz, a kind of brandy distilled from plums. Pop. (1870) 18,353.

Sze-Chuen ('Four Streams'), a large province in the W. of China, bounded N. by the Kin-Long-Shan Mountains, E. by the Snowy Mountains, S. by Yunnan and Quei-Chu, and W. by Hu-nan and Hu-he. It is watered by the Yang-tse-Kiang (here known as the Kin-Sha-Kiang) and its numerous tributaries, is indifferently fertile, but has some metallic wealth. Area 185,053 sq. miles; pop. estimated at 35,000,000.

Szeg'edin, an imperial free-town of Hungary, at the confluence of the Maros and the Theiss, 171 miles S.E. of Pesth by rail. It is composed of the town proper and five suburbs, and is strongly fortified. The most important buildings are the Greek Oriental church of the Franciscans, the town-house, and the great salt magazine. There are several monasteries, a gymnasium, a real-schule, a theatre, &c. S. has manufactures of soap, tobacco, cloths, &c., the largest wharves on the Theiss, and carries on a great trade in agricultural produce with Transylvania and the Banat. Pop. (1870) 70,179.

Szentes', a town of Hungary, near the Theiss, 29 miles N.N.E. of Szegedin, with a large export of wine. Pop. (1870) 27,658.

Szolnok', a town of Hungary, on the Theiss, 64 miles E.S.E. of Pesth by rail, with trade in wood, salt, and fruits. Pop. (1870) 15,847.

T.

the twentieth letter of the English alphabet, derived through the Latin from the Semitic and Greek Tau, and exceptionally constant both in character and pronunciation. It is a thin or sharp dental, closely allied to TH (which is properly a letter by itself), D and Z. Its chief irregularity of pronunciation in English is when it is followed by I and another vowel, as in 'militia,' where it takes the soft sound of C, according to the usage of post-classical Latin. Its common interchanges are with one or other of its cognates mentioned above, and with S. Thus Latin *tu* = Greek *su*; German *du* = English 'thou *y*' Latin *pater* becomes *padre* in Italian and Spanish; Latin *natio* becomes *nazione* in Italian; English 'ten' is Latin *decem* and German *zehn*. Under this letter may be mentioned the double consonant TH, which is a mere variation of T. In English it has two distinct sounds, the one soft as in 'thing,' the other hard as in 'that.' The former of these two is its proper phonetic value, representing the Greek Theta and the Semitic Teth. The latter is almost peculiar to English, and forms a great stumbling-block to foreigners. The modern Greeks, however, pronounce their D in the same way. In French and in German TH has come to be pronounced merely as a hard T; *cf.* our 'Thomas;' in recent German printing there is a tendency to omit the unsounded H. As an abbreviation in Latin T. stands for Titus, but Ti. for Tiberius.

Taba'nus, a genus of *Diptera* (q. v.) or Flies including the gad-flies, clegs, &c. The *T. bovinus*, or Large Gad-fly, is a familiar species, which greatly irritates cattle. These flies abound in spring and summer. Their proboscis is esserted, and the antennæ are 3-jointed. In tropical countries the species of this genus attain their largest size.

Tabard (Low Lat. *tabardum*), a kind of tunic worn over armour in the 15th and the 16th c. Reaching to the loins, but open at the sides, it was embroidered with the arms of the wearer or of his lord, and is still the official dress of heralds, who bear the armorial ensigns of their sovereigns.

Tabb'y (Fr. *tabis*), the name of a silk or other stuff having a wavy or 'watered' appearance produced by pressure between engraved rollers, a mode of calendering called *tabbying*.

Tab'ernacle, of the Congregation (Lat. Vulg. *Tabernaculum fœderis*; Heb. 'a tent, a dwelling'), described in the Book of Exodus (xxv.–xxxix.) as erected by the Israelites during their sojourn at Sinai, on the way from Egypt to Canaan, was an oblong tent 30 cubits (about 55 feet) long by 10 (about 18 feet) in width and 10 in height, standing lengthwise E. and W. The framework of the structure was composed of upright acacia boards, gilded on the inside, and held together by bars of the same material, which passed through rings of gold fastened in the boards. The roof of the tent was composed of curtains stretched across this framework. The innermost, the material of which was byssus, displaying the four colours, blue, purple, scarlet, and grey, and images of cherubim, so as to be symbolical of God descending from heaven (*cf.* Ezek. i. 4–28), was composed of ten small ones. Over this curtain were stretched other three: one of goats'-hair cloth, one of rams' skins dyed red, and the fourth of badgers' (dolphins'?) skins. The eastern end or entrance was closed by a curtain stretched on five pillars, and at the distance of 10 cubits from the western end, another curtain, of the same material as the ceiling-curtain, was suspended on four pillars, so as to divide the sanctuary into two apartments. The inner apartment, or 'Holy of Holies,' contained the Ark of the Covenant (q. v.), the two tables of the Law (Exod. xxv. 16), Aaron's rod which budded (Numb. xvii. 10), and a pot of manna (Exod. xvi. 33, 34); *cf.* Heb. ix. 4, where the latter articles are spoken of as *in* the Ark. The outer apartment, or Holy Place, contained, in the middle, the golden altar of incense, in the N.W. corner the table of show-bread, and in the S.W. corner a seven-branched lampstand (Exod. xxv. 23–40; xxx. 1–10; xxxvii. 25–29; Lev. xxiv. 5–9). The T. stood in an enclosure 100 cubits long by 50 wide (formed by curtains suspended on pillars 5 cubits high), 20 cubits from either side and the west end, so as to leave a clear square of 50 cubits at the east end. Near the entrance of this court, which was also in the east end, stood the brazen altar of burnt-offering, and between it and the T., the laver for the ablutions of the priests (Ex. xxvii. 1–19, xxxviii. 1–8).

Tab'ernacles, Feast of, was the great autumn festiva among the Israelites, corresponding to the Passover or spring festival, and was celebrated from the 15th to the 22d Tishri (September), or after all the crops of the year—both grain and fruit—were gathered in; hence its name 'Feast of Ingathering' (Ex. xxiii. 16). In the earliest times, the people marched out in procession to the open fields, bearing ripe fruits and branches of trees, and there built arbours in which they dwelt during a certain period of rest and rejoicing (Lev. xxiii. 40–42), from which the festival received its name F. of T. The sacrifices appointed for the festival consisted of thirteen bullocks (on the first day, diminishing by one to seven on the last), two rams, fourteen lambs, and a goat, with meat- and drink-offerings (Num. xxix). After the Captivity the processions to the fields were abandoned, but booths were set up on the roofs of the houses, in the market-places, &c. (Neh. viii. 15–18). In the Temple special ceremonies were performed on the occasion. On the morning of the 15th, the great ceremony was the drawing of water by a priest from the pool of Siloam, to be poured on the altar along with so much wine. While this was being done the people brought willows to decorate the altar. On the evening of the 15th and five succeeding nights the people in the court of the Temple celebrated the rejoicing of the drawing of water by the light of four great candelabras and many torches (*cf.* John viii. 32). With the exception of the ordinances, which only applied to the Temple, and the adaptation of some of the rites to their altered circumstances, the Jews still continue to celebrate the F. of T. in the same way as before the dispersion.

Ta'bes Dorsa'lis is a disease of the spinal cord, called by some physicians *Posterior Spinal Sclerosis*. The earliest symptoms are darting pains from the feet up the legs and thighs, the pains being most severe at night and in damp, cold weather. They appear and disappear rapidly, and move suddenly from one place to another. After a time peculiar sensations are experienced in the feet. When walking the patient complains that the ground feels as if it were covered by fur or a padded cushion, or as if the shoes were filled with sand, or as if he were walking in the air. In general there is neither loss of muscular power nor sensation, but only a perversion of tactile sensibility, and that only limited to the sense of contact. Awkwardness of gait is an early symptom; the feet fly out and are planted with a kind of jerk, the heel touching the ground first; and the individual totters, and is eventually unable to walk at all without support. The disease may last from five to twenty years. Atrophy of all the muscles of the extremities generally takes place towards the end of the disease, and bed-sores and arthritic troubles are the painful forerunners of death. Professor Erb of Heidelberg first described about three years ago a new form of spinal disease

which he called spasmodic spinal paralysis, and which Professor Charcot, in the latest fasciculus of his work on the *Diseases of the Nervous System*, speaks of as T. D. *spasmodique*. This disease appears to be one which is by no means uncommon, the essential features being loss of power associated with spastic rigidity of the paralysed muscles, without modification of sensations or of the functions of the bladder. The chief causes of T. D. are dissipation, onanism, venereal excess, syphilis, injury, and exposure to rain and cold.

Tab'inet, a kind of Poplin (q. v.), used for window curtains, &c.

Ta'ble-Lands, or **Plateaux**, are elevated plains, such as those of Castile and Leon in Spain (from 2000 to 3000 feet), of Quito in Mexico (10,000 feet), of Desaguadero in the Andes (13,000 feet), the Oregon Territory and the great salt plain in the United States, and the Pamir Plateaux of Central Asia.

Ta'ble-Money, allowances granted to leading military and naval officers in special localities to cover the expenses of hospitality. They seldom exceed £3, 3s. per day.

Ta'ble Mountain, a prominent height in the S.W. of Cape Colony, overlooking Cape Town, is a rugged granite mass, 3600 feet high. It is flat-topped, and the phenomenon of the 'tablecloth' is due to a difference of 13° in the temperature of summit and base. In summer a S.E. blast, after sweeping the level top, sends the mist down the precipices on the N. side like drapery; but this drapery never descends beneath a certain level, for it is dispelled on coming in contact with warmer air.

Ta'bles, in mathematical science, pure or applied, are lists of numbers giving the values of a function of a variable for different values of that variable. The function may be a physical property common to different substances, as in T. of densities, specific heats, &c.; or it may be a mathematical function of a continuously varying variable tabulated for definite successive values of that variable, as in T. of logarithms, sines, tangents, and astronomical T. generally.

Ta'ble-Turning. See SPIRITUALISM.

Ta'bor, or **Ta'bour**, a musical instrument resembling a tambourine, but without jingles. It was used in old times in England to accompany the morris dance, being slung round the neck and beaten with a stick.

Ta'bor, Mount (mod. *Jebel el Tur*), stands by itself on the N.E. border of the plain of Esdraelon (q. v.). It is remarkable for the symmetry of its form, which resembles a truncated cone, from certain points appearing almost hemispherical. The top measures about half a mile across, and is about 1300 feet above the level of the plain. T., which is now crowned by a confused mass of broken walls, towers, &c., has a history extending from the invasion of Canaan by the Israelites (Josh. xix. 12, 22; Judg. iv.) down to the present time. It is not mentioned in the New Testament, but there is a tradition that it was the scene of the Transfiguration. This, however, is rendered impossible by the town on the top.

Ta'borites. See HUSSITES.

Tabriz' (anc. *Taurus*, 'the mountain-town'), one of the principal cities of Persia and capital of the province of Azerbijan, is situated 320 miles S.S.E. of Tiflis, at a height of 4500 feet above the sea, on the left bank of the Ajichai, and at the W. extremity of a wide plain, which is bounded on the S.W. by Lake Urumia, and surrounded on the other sides by barren ranges of red sandstone hills. T. is surrounded by a double wall of sunburnt bricks, and is divided into eight quarters, each of which has a gate. The principal edifice is the Ark Ali Shah, 80 feet in height. T. has twelve public baths, many excellent bazaars and caravanserais, and a spacious British consulate. Its present importance depends on its being the principal emporium through which the trade between Persia and Western Europe passes. Goods are conveyed by caravan to Trebizond and to Tiflis, thence by rail to Poti. In 1877-78 the value of exports (chiefly coloured cottons, shawls, silks, carpets, tobacco, drugs, dyes, and dried fruits) and of imports together amounted to £796,400, as against £1,707,389 in 1873-74, a falling off due to the Russo-Turkish war. Pop. estimated at 50,000. The Russian government has arranged to extend as soon as possible the Poti-Tiflis railway to Teheran, *via* T. and Kasbin, according to a despatch of January 1879.

Tabu', more correctly **Tapu'**, a Polynesian word denoting an institution which was formerly in existence throughout Polynesia and New Zealand, but has now to a large extent disappeared before the spread of Christianity and civilisation. The word signifies something set apart, either as consecrated or accursed, the idea of prohibition being conveyed in either case, whence the English word, *tabooed*, *i.e.*, forbidden. For example, in New Zealand the person of a chief was strictly *tapu*, and hence might not be touched; while the volcano Tongariro was *tapu* as being the supposed residence of demons, and even to look upon it was at one time forbidden. The system seems to have had its origin in a superstitious dread of the unseen powers of evil, and the chiefs, quick to perceive the power which it would place in their hands, appear to have adopted it from remote times as a political engine, the priests readily co-operating with them for the sake of the influence which it gave them likewise. The chiefs were themselves amenable to the regulations of the T., but in a much less degree than their subjects, and possessed a wide discretionary power, which was limited only by precedent, of declaring objects to be T. The T. could be removed only by the person by whom it was imposed, or by one greatly his superior in rank, but courtesy usually kept the latter power in abeyance. So potent was the superstition, that Scherzer states that among the Maories even hostile tribes were in the habit of leaving unharmed all persons and things protected by the T.

Tacahout', or **Tacout'**, the name for small, irregularly-rounded, tuberculate galls produced by a species of *Cynips* on the twigs of a *Tamarix* (probably *T. articulata*) in Algeria and Morocco. They contain a large quantity of gallic acid, and are imported for use principally in photographic preparations. The above-named species of *Tamarix*, as also *T. gallica* and *T. dioica*, supply a similar gall in India—the Mahi of the Punjaub and Sakun of Sindh—which is collected for sale and used as a mordant in dyeing and in tanning.

Tac'amahac, or **Tacamaha'ca**, a balsamic bitter resin obtained from several species of *Calophyllum*, natives of the E. and W. tropics. *Icica tomentosum* and *Elaphrium T.* (both belonging to *Burseraceæ*) are also said to yield a commercial T. The leaf-buds of *Populus balsamifera* of N. America, called the T. poplar, are used to make an ointment, and to prevent rancidity in other ointments.

Tacc'a, a tropical genus of monocotyledonous herbs, some of whose species have a large tuberous root; *e.g.*, the *T. pinnatifida*, a plant of the shores of the South Sea Islands. Its tubers, which resemble new potatoes, contain a large proportion of starch, and this being separated by rasping and maceration, is largely used as an article of food. It bears the name of South Sea, Tahiti, and Fiji arrowroot, and Otaheiti salep, and is also esteemed as a medicinal agent in dysentery and diarrhœa.

Ta'cit Reloca'tion. See RELOCATION, TACIT.

Taciturn'ity is, in Scotch law, a mode of extinguishing an obligation by making no claim under it. Usually the law follows the periods of Prescription (q. v.) in applying the doctrine of T.

Ta'citus (1) **C. Cornelius**, the historian. The time and place of his birth are unknown, but it is conjectured from the expressions of the younger Pliny in his Epistles that the date was not later than A.D. 51 or 52. In 78 he married the daughter of Agricola, who had been betrothed to him the year before during the consulship of her father. This illustrious alliance probably furthered his public advancement, for at the beginning of his *Historiæ* he tells us that his elevation was 'begun by Vespasian, augmented by Titus, and still further advanced by Domitian;' and as Vespasian died June 23, 79, he probably was elected to the office of ædile early in that year, and to the tribuneship of the people under Titus in 80 or 81. We know from his own testimony that he was prætor, 88, in which year Domitian celebrated the Ludi Sæculares. He was absent from Rome together with his wife from 89 or 90 till after the death of Agricola, which took place August 23, 93, but it is certain that he was in Rome during the closing period of the reign of Domitian, who was assassinated September 18, 95. In 97, during the reign of Nerva, T. was appointed consul suffectus, in the place of Virginius Rufus, who had died within the year, and whose funeral oration he pronounced. 'Fortune,' says Pliny, 'reserved her last favour to him, that of being commemorated by the greatest of living orators.' In 100,

together with Pliny, he conducted the impeachment of Marius Priscus, proconsul of Africa. The date of his death is unknown, but he appears to have survived Trajan, who died 117. The extant works of T. are (1) the *Dialogus de Oratore*, probably his earliest work, sometimes ascribed to Quintilian or the younger Pliny; (2) the *Agricola*, the most perfect specimen of ancient biography, published 97; (3) the *Germania*, a description of the political institutions, the religion and the habits of the various tribes known as Germani; (4) the *Historiæ*, the first 4 books of which are extant in complete form and a part of the 5th, comprehending the period from the second consulship of Galba, 68, to the death of Domitian, 96, written between 103 and 106; (5) the *Annales*, commencing with the death of Augustus, 14, and comprising the period to the death of Nero, 68, a space of fifty-four years. The greater part of the 5th book, the last, is lost, as well as the whole of the 7th, 8th, 9th, 10th, the beginning of the 11th and end of the 16th. We learn from St. Jerome that the *Annales* and *Historiæ* together contained 30 books, and related the events of about 70 years from the death of Augustus to the accession of Nerva. His original intention was to write the history of Nerva and Trajan, but he seems later to have abandoned this idea and to have had the intention of writing the history of the reign of Augustus. T. stands first among Roman writers in vividness of imagination, in insight into the intricacies of human character, and in the breadth and comprehensiveness of his historical faculty. A stern love of truth is everywhere visible. His *Annales* are filled with highly dramatic scenes, in which appear before the reader lurid figures, Titanic in their crimes, whose characters are portrayed with the most elaborate analysis. His style is in keeping with the prevailing mood of his mind—it is nervous, precipitate, often abrupt, always vigorous. He studied brevity and condensation, but by the highly diversified cadence of his periods and the wide compass of his vocabulary he strove to vary the monotonous record of imperial despotism. The best edition of his complete works is that by Orelli (2 vols. Zür. 1846-48). Excellent translations are those by Church and Brodribb—the *Historiæ* (Lond. 2d ed. 1873), *Annales* (ib. 1876), *Agricola* and *Germania* (ib. 1877).—(2) **M. Claudius**, Roman emperor, succeeded Aurelian, September 25, A.D. 275. He claimed a descent from the great historian, and ordered his works to be placed in all public libraries. Elected emperor at the age of seventy by the senate, he was persuaded with difficulty to accept the dignity. During his brief reign he endeavoured to repress the prevailing luxury by sumptuary laws, while he himself set an example of simplicity and virtue. His death took place at Tarsus or at Tyanum, April 9, 276.

Tack is the name applied to the windward clue of a fore-and-aft sail, or of a course also to the rope affixed to this clue for the purpose of hauling the sail (see SAIL).—*Tacking* is the method of navigation usually adopted by sailors when endeavouring to sail against the wind, and consists in beating to windward by a zigzag course. Tacking depends on the principle of the Composition and Resolution of Forces (q. v.). The portion of the wind resolved in the direction perpendicular to the sail has a resolved portion blowing in the desired direction. The sails are close-hauled, *i.e.*, braced to that amount of obliquity to the direction of the ship's keel necessary to make this useful resolved portion as great as possible. When the ship has sailed as far as may seem desirable before this wind, the helm is put about and her head is brought to the wind. At the same time the yards are 'hauled aback,' *i.e.*, swung at right angles to the direction of the keel, and then again braced obliquely to the keel, in the opposite direction to that which they formerly occupied. The ship proceeds before this wind till her head is again brought to the wind, and so on. When the wind blows on the starboard side the ship is said to be on the starboard T., when it blows on the port side she is on the port T.

Tack'ing of Mort'gages, in English law, is a mode of adding a postponed to a preferable mortgage, by which a preference over an intermediate mortgage is acquired for both. See MORTGAGE.

Tac'na, in full, **San Pedro de Tac'na**, a town of Southern Peru, in a fertile valley, 2000 feet above the sea, has a considerable trade. A railway 39 miles long connects it with the port of Arica (q. v.). Pop. 15,000.

Tac'tics, Mil'itary, the art of handling troops, and the skilful use of military resources, on the field of battle or in the face of the enemy. *Elementary tactics* consist of methods of drill and minor tactical formation. *Grand Tactics* deal with the manipulation of large bodies of troops in action, with the view to be the stronger at a decisive point, notwithstanding any inferiority of numbers along the whole line.

For tactical purposes, the army is divided into infantry, cavalry, and artillery, and these branches are respectively subdivided into battalions, squadrons, and batteries. Battles are defensive when an army awaits in a selected position the attack of the enemy, offensive when an attack is made upon the enemy's position, and mixed when both armies are advancing and suddenly confront each other. In general tactics, remaining on the defensive is not advisable, and on a protracted scale is a sure sign of weakness. Where it is possible to choose the ground for a battle, the position should be so selected that any advantage which the enemy possesses may be neutralised as far as possible, and that any arm in which the army is stronger than the enemy may be effectually employed. It should also be favourable to observing the movements of the enemy, while it obscures the movements of the general's own troops. With the beginning of an engagement, the individuality of the general asserts itself. The main features of the campaign may have been sketched previously, but in the actual conflict a thousand incidents and accidents call for his personal attention, and success or failure often hangs upon his skill, determination, and resource in dealing with them. The disposition given to the troops for a manœuvre in action is called an order of battle. The order may be parallel, oblique, perpendicular, concave, convex, in echelon, or a combination of these.

Infantry and *cavalry* may be employed in extended order or thin lines, in lines of battalion columns, in deep columns, or in squares or other formations. The greatest difference has existed in the history of war as to the depth of lines of battle. In ancient warfare these lines became gradually more slender, diminishing from the Greek method of nearly twenty ranks to the depth of six ranks used by the later Roman legions. In modern warfare, owing to improvements in range, accuracy, and rapidity of fire, this has been still further diminished. The general infantry formation now is a first line of skirmishers, a second line, and a reserve. A deep column should never be formed within range of the enemy's artillery, and is only useful for bursting through the enemy's line. If a column breaks the opposing line they deploy right and left, rolling up the enemy's flanks, while cavalry and fresh bodies of infantry pour in through the gaps. The old defensive formation of the square may almost be considered a thing of the past. The main objection which can be taken to extended orders of battle is their immobility. Pushed to the extreme, open order constitutes every man a tactical unit, a state of affairs only desirable when the average intelligence of each soldier is very high.

Cavalry is a body which does not enter greatly into tactics, as although useful for reconnoitring, for harassing a defeated and disorganised enemy, and for various *strategical* military operations, its duties are not so important on the battle-field. While infantry is an effectual force both by fire and impulsion, cavalry is effective only as regards the latter, and can seldom break through a well-armed body of infantry, though effective in fleeting moments of attack. Long lines are seldom used in cavalry attacks on troops, which are usually made in open column or in echelon. In cavalry attacks on batteries a formation in skirmishing order is probably best.

Artillery tactics should be such as to clear a path for the other branches of the service. The position of the guns and their distance from one another on the field of battle depend altogether on the nature of the ground. As guns frequently fire over the heads of their own infantry, a tolerably high position is often required, but a very elevated position is in most cases of advantage to the enemy. The position should be favourable either for advance or retreat. Every avenue of approach should be commanded, and the flanks well protected. A frequent change of position is to be deprecated. In batteries, concentration of fire is the essential point to be gained; while enfilade fire by which the enemy is taken in flank is the most destructive method on the field. As infantry fire does no harm to the guns but only to men and horses, as many available guns as possible should be brought into play, while part of the available men and horses

should form a reserve. It is common in the British army for each waggon to follow its own gun. In the German army all the guns go first, then the waggons. Field artillery should only fire at a good range, say on open ground at 4000 yards, which prevents column formation.

In the wars of Napoleon artillery tactics assumed great prominence. In that between France and Austria in 1859 the artillery decided the battle of Solferino. The Austro-Prussian war of 1866 proved the immense value of the breech-loading rifle. In that struggle the artillery was not prominent, the Prussian artillery being too much in the rear, while the Austrian was not well served. In the great war of 1870 artillery came, however, again to the front. The Germans at the beginning of an engagement sent all their available guns into action, and under a concentrated artillery fire carried on their infantry attacks and flanking movements. The recent Russo-Turkish war conveys few lessons of artillery tactics, as the Turks never attempted fighting in the open, and the Russian artillery was not first class. See Hamley's *Operations of War Explained and Illustrated*, and the works of Jomini, Marmont, Napier, Moltke, &c.; also Taubert's work *On the Use of Field Artillery*, translated by Colonel H. H. Maxwell; Lieut.-Col. Middleton's *Changes of Tactics consequent on the Improvement of Weapons* (1873), and *Lecture on Artillery Tactics*, delivered by Colonel Brackenbury at the Royal United Service Institution 1876.

Tac'tics, Naval, the art of bringing ships of war into action, and of handling them in the presence of the enemy. N. T. have greatly varied from time to time according to the means of propulsion and the armament of vessels. Up to the battle of Lepanto in 1571, when naval combats were chiefly confined to the placid waters of the Mediterranean, war-ships were propelled by oars, and battles were conducted on the same principle as those of the ancients; that is to say, they consisted of ramming and hand-to-hand struggles, the vessels being drawn up 'line abreast,' with their rams to the enemy. The early Greeks had great faith in ramming, and manœuvred so as to gain the weather-gage, and thus increase the force of their attacks. Subsequently grappling with the enemy and boarding her came into favour. The galley was in the Middle Ages for a long time the unquestioned type of a perfect ship of war. The order of battle was usually crescent-shaped, and the guns were so mounted on the galleys as to deliver a destructive bow-fire. From the date of the battle of Lepanto to that of Lissa in 1866, when the wind was the means of propulsion, and vessels carried their armaments in their broadsides, 'line ahead' was the formation of battle, in order to present the broadside to the enemy. James II. was the originator of the tactics which for a long time characterised the English navy, and the class of ships in use at his time differed little from our men-of-war of twenty years ago. Paul la Hoste published his *L'Art des Armées Navales* at Lyon in 1697, the study of which made French naval officers superior to English tacticians during the 18th c. They profited by the weakness of the British constantly striving after the weather-gage, at whatever loss and in whatever circumstances. In 1782, John Clerk of Eldin printed his famous *Essay on N. T.* The two great tactical manœuvres advocated by him were *doubling on the enemy's rear* and *cutting the enemy's line*, according to principles clearly and minutely explained. They were put into operation with brilliant effect by Lord Rodney on the 16th April of the same year, in the action off Dominica. Our glorious victories in the wars with revolutionary France were won by these tactics, as well as great courage. Nelson was a disciple of Clerk of Eldin, and his surpassing qualities as a tactician were as remarkable as his dazzling gallantry. For modern ironclads, rams, and torpedoes, the formation of 'line ahead' is most suitable. Sir Howard Douglas suggests *oblique echelon* for attack. No great battles have yet been fought between ironclad fleets. The American war, the battle of Lissa, and the Russo-Turkish war teach us little but the power of ramming. Instead of close actions, battles will in future probably be fought at long ranges, and thus the practical effect of rams and torpedoes is doubtful yet. An unceasing vigilance must be maintained by the Admiral of the fleet to guard his ships against submarine attacks. (See TORPEDO.) The present is, however, a time of transition in N. T., and the true method of conducting a naval battle may be considered *sub judice*. The strength of the guns of modern ships of war is enormous, the guns of the *Inflexible* being 81 tons weight, while two vessels in the Italian navy are armed with 100-ton guns. There is no armour afloat that could resist such ordnance.

A large fleet is divided into squadrons, each consisting of at least four vessels. The Admiral-in-Chief commands the entire fleet, the admiral second in command the van (or right when in line), the third admiral the rear (or left in line), and the fourth admiral the centre. There are various orders or formations for navigating, entering and leaving port, anchoring, &c., practice in which constitutes elementary N. T. See Essay on the 'Past and Future of N. T.,' in No. 278 of the *Edinburgh Review*, October 1872, which contains a list of the best authorities on the subject.

Tade'ma, Laurenz Alma, an English artist of Frisian origin, born at Drouryp, W. Friesland, 8th January 1836. He devoted himself to the study of Roman and Egyptian antiquities at Leeuwarden, and completed his art education at Antwerp under Baron Leys. Made a member of the Academy of Amsterdam in 1862, he received a gold medal at Paris in 1864, a second-class medal at the Exposition of 1867, and a gold medal at Berlin in 1872. He settled permanently in London in 1870, and was appointed a member of the Water-Colour Society in 1873, and of the Berlin Academy in 1874. Among his principal works are 'The Grandchildren of Clotilde' (1861), 'How they Amused Themselves in Egypt 3000 Years ago' (1863), 'Catullus at Lesbia's' (1865), 'The Mummy' (1867), 'The Siesta' (1868), 'Pyrrhic Dance' (1869), 'Claudius Imperator' (1870), 'Last Egyptian Plague' (1872), 'Fishing' (1873), 'Autumn' and 'On the Steps of the Capitol' (1874), 'Sculpture Gallery' (1875), 'Audience at Agrippa's' and a 'Bacchanti' (1876), 'Seasons' and 'The Bath' (1877). Alike in water-colour and oil, T. is noted for the care and finish by which he contrives vividly to recall the ancient life of Egypt and Rome. His archæological accuracy is ably seconded by technical skill in rendering textures, draperies, and marbles. Although occasionally cold and conventional, his art at times, catching inspiration from the subject, glows with dramatic intensity.

Tad'mor. See PALMYRA.

Tad'pole. See FROG.

Tael, a Chinese money of account, equal to 10 *mace*, or 1000 *tseen* or cash, the sole current coin, and valued at 5s. 10d. sterling.

Tæ'nia and **Tæ'niadæ.** See TAPEWORM.

Tae'pings, the name of the rebels who desolated several of the richest provinces of China in the outbreak of 1850. See CHINESE EMPIRE.

Taff'ety, or **Taff'eta** (Pers. *taftah*, Ital. *taffeta*), a rich glossy silk stuff, plain or variously figured, of Oriental origin, and introduced into England as early as the 14th c. In Queen Elizabeth's time it was a favourite stuff for dresses.

Taff'rail, or Tafferel (Dutch, *taffereel*, Ger. *tafel*, 'a table'), the upper part of the stern of a ship, which is usually 'flat like a table.' Perhaps from a supposed connection with rail, it is also applied to the rail extending round the stern over the stern timbers.

Tafilet', or **Tafililelt'**, a division of the empire of Morocco, to which it has given the reigning dynasty. It has about 3000 fortified villages, and the chief place, Abuam, has a very large fair. Rain seldom falls, and the district is irrigated by water from subterranean streams. The dates of T. are well known in commerce.

Taganrog', a Russian seaport on the N.E. shore of the Sea of Azov, in the government of Jekaterinoslav. It has a citadel and harbour, the latter, however, too shallow to allow of large vessels lading at the quay, and various mechanical, educational, and industrial establishments. A life-boat association was founded here in 1872 by the Cesarevna, and has now four stations in the bay completely provided with apparatus. The foundation of a lighthouse, to be constructed on the most advanced scientific principles, was laid in the autumn of 1877 on the high table-land overlooking the T. mole. The principal exports are wheat, linseed, wool, and box-wood. Owing to the strict blockade of the Azov ports from the middle of May 1877, the returns of shipping and commerce for that year are far below the average; even in 1876 the total value of the exports was

£3,694,251, as against £5,602,704 for the previous year. Pop. (1870) 48,186. S. was founded by Peter the Great in 1696.

Taglio'ni, Maria, perhaps the most famous danseuse of the century, was the daughter of an Italian ballet-master of some note, **Filippo T.**, and was born at Stockholm, 23d April 1804. She appeared at Vienna in 1822, at Paris in 1827, and at London in 1838. One of her greatest successes was in her father's ballet, *The Sylphide*, in which she seemed to be borne by wings. She married the Comte Gilbert de Voisins and retired from the stage in 1847, living partly at Venice and partly at Lake Como. After the Franco-Prussian war, through which she had lost all her property, Madame T. came to London, where she gave lessons in deportment, and where she still (1878) resides. Her brother, **Paul T.**, born at Vienna in 1808, was ballet-master of the Royal Theatre, Berlin, and has composed many successful ballets, including *Flick and Flock* and *Satanella*.

Ta'gus (Sp. *Tajo*, from the Phœnician, 'river of fish'), the largest river in the Spanish Peninsula, rises in the Sierra Albarracin between Castile and Arragon, and flows W. by Toledo and Abrantes to Lisbon, where it enters the Atlantic by an estuary 20 miles long and in some places 5 broad. Its total length is 552 miles, over 115 of which it is navigable. The scenery along the T. is frequently imposing, particularly at Toledo, where it forces its way through a precipitous ravine 200 feet high. Its principal affluents are the Jarama, Alberche, and Zezere, from the N.

Tahi'ti (formerly written *Otaheite*), the largest of the Society group in the S. Pacific, is 32 miles long and 120 miles in circumference. The eastern portion is separated from the main island by an isthmus 2½ miles in width, and submerged at high tide. T. is mountainous, richly watered, and luxuriantly fertile. Its chief town is Papeete, which has a good harbour. In 1876 the imports into T. were officially valued at £130,000, and the exports (of which cotton, copra, pearl-shell, and oranges were the principal items) at £124,000. Pop. 14,000, of whom 1000 are Europeans and Chinese. See SOCIETY ISLANDS.

Tail and Tailzie. See ENTAIL.

Tail'or-Bird (*Orthotomus longicaudus*), a species of *Dentirostral*, found in India and E. Asia, and noted for its habit of weaving or sewing leaves together in the formation of its nest. The leaves of the tree are either joined together, or the nest may be ingeniously constructed of one large leaf. The bill is used in piercing holes, and the thread is formed by plant fibres.

Tai-Yuan', a town of China, capital of Shan-si, on the Fuen-Ho, an affluent of the Hoangho, 250 miles S.W. of Pekin. For many years the residence of the emperors, it is noted for its magnificent mausoleums. The chief manufactures are sword-blades and knives. Pop. estimated at 300,000, has been greatly reduced by the famine of 1875-78.

Tain (Norse, *Thing*, 'the place of assembly;' its Gaelic name is *Baile Duich*, 'St. Duthic's Town'), a royal Scottish burgh, county of Ross and Cromarty, on the S. shore of Dornoch Firth, 25 miles N.N.E. of Inverness by rail. It has a ruined chapel of the 13th c., a collegiate church of date 1471, an academy incorporated by royal charter, and a public hall erected at a cost of £2500 in 1876. There are some wool-carding, dyeing, and iron-founding, but the harbour has suffered from the silting common throughout the Dornoch Firth. Morich More, the famous golfing links, have been partly reclaimed for cultivation of late years. Pop. (1871) 2287.

Taine, Hippolyte Adolphe, a French author and critic, was born, 21st April 1828, at Vouziers (Ardennes), received his education at the Collége Bourbon and the École Normale, and devoted himself especially to philological pursuits. By his essays, *De Personis Platonicis* and *Sur les Fables de La Fontaine* (1st ed. 1853; 3d, 1860), he obtained the degree of docteur de lettres, and his *Essai sur Tite-Live* (1854; 2d ed. 1860) was crowned by the French Academy. Since then work after work has flowed from his pen—*Essais de Critique et d'Histoire* (1858; 3d ed. 1874), *Essais Nouveaux de Critique et d'Histoire* (1865), *Histoire de la Littérature Anglaise* (4 vols. 1864; 3d ed. 5 vols. 1873-74; Eng. trans. by Van Laun, Edin. 1871-72), *L'Idéalisme Anglais; Étude sur Carlyle* (1864), *La Fontaine et ses Fables*, a development of his former essay (1860), *Les Philosophes Français du XIXe Siècle* (1857), *Philosophie de l'Art en Italie* (1866), *Philosophie de l'Art en Grèce* (1869), *De l'Idéal dans l'Art* (1867), *De l'Intelligence* (1870; Eng. trans. by Haye, 1871), *Notes sur l'Angleterre* (1872), *Voyages aux Pyrénées* (5th ed. 1875), *Les Origines de la France Contemporaine, Tome I. L'Ancien Régime* (1875; Eng. trans. by Durant, 1876), *Tome II. La Revolution* (1878). In 1878 he was elected a member of the French Academy. As a writer, T. has attracted the notice of Europe by the brilliancy of his style, the boldness of his generalisations, and the vivacity of his arguments. In his historical researches he is as minute and painstaking as a very Dryasdust—ransacking contemporary documents and accumulating facts; but he sends through the fragmentary heaps the electric current of strong intellect and passion, and every atom is incorporated in a system which has the solidity if not the flexibility of life. In England the work which has attracted most attention is naturally the history of English literature; it is there that he emphasises what he regards as the three great factors of a national literature—the *race* of the people, their natural and social *environment*, and the *period* or duration.

Tait, Peter Guthrie, a Scottish mathematician and physicist, was born at Dalkeith, April 28, 1831. He was educated at the Edinburgh Academy, and after studying for one session at the University of Edinburgh, proceeded to St. Peter's College, Cambridge, where he graduated as Senior Wrangler and First Smith's Prizeman in 1852, and was shortly after made a fellow of his college. In 1854 he became Professor of Mathematics at Queen's College, Belfast, and in 1860 was elected to the natural philosophy chair at Edinburgh. His experimental investigations into the thermal conductivity of metal bars, and into the thermo-electric relations of metals through wide ranges of temperature, are published in the *Transactions* of the Royal Society of Edinburgh. He is best known, however, for his more purely mathematical researches, including many quaternion applications and an elaborate paper on *Knots* (*Transactions* of the Royal Society of Edinburgh, 1876-77). In conjunction with Steele he has written *Dynamics of a Particle* (1856, 4th ed. 1878), is joint author with Sir W. Thomson of the first volume of a projected exhaustive *Treatise on Natural Philosophy* (1867; 2d ed. 1879), and with Shairp and Adams Reilly of *Life and Letters of Principal Forbes* (1873). His *Quaternions* (1867, 2d ed. 1872) is the best introduction to the subject, and his *Thermodynamics* (1868, 2d. ed. 1877), and *Recent Advances* (1876; 2d ed. 1877), are models of two distinct scientific literary styles—the one designed for science students, the other for general readers. *The Unseen Universe* (1874; 7th ed. 1878), and its sequel, *The Paradoxical Philosophy* (1878), by Balfour Stewart and T., aim at proving, from consideration of the physical principle of 'Continuity,' that science and religion are not inconsistent with each other. A treatise on *Heat* is announced for 1879.

Taiwan', or **Taiwanfu'**, the capital of the Chinese possessions in Formosa (q. v.), lies in a plain, 4 miles from the sea, with which it is connected by canals. These, however, are only navigable for boats, and ships have to anchor 2 miles from land. Girt by a wall 30 feet high and 12 feet thick, the town contains the ruined fortress of Sak-kan, built by the Dutch, is intersected by numerous canals, and carries on a considerable import trade in opium, tobacco, woollen and cotton goods, &c.; sugar is the staple article of export. In 1877 there entered and cleared 284 vessels of 84,461 tons, with cargoes valued at £851,315, about one-half of the trade being in British hands. Some 25 miles to the E.S.E. is the port of Takow, where most of the Europeans in Formosa live. A land telegraph line between Takow and T. was opened in 1877, and the materials for the Wusung railway were landed at T. in 1878. Together, the two towns have an estimated pop. of 235,000. See Petermann's *Mittheilungen* (May 1876).

Talave'ra de la Rey'na, an old walled town of Spain, province of Toledo, on the Tagus, 75 miles S.W. of Madrid by rail. It is situated amid vineyards and olive-groves, and still retains some of its once great industry in silk and earthenware. Pop. 9285. Here the French, under Joseph Bonaparte and Marshals Jourdan and Victor, suffered a severe defeat at the hands of the allies, commanded by Sir Arthur Wellesley, 27th and 28th July 1809. The name T. means 'the town on the wood-clearing.'

Tal'bot, a great historic family descended from Hugh de T., governor of Plessey in Essex (1118). **Sir John T.**, born at Bletchmore in Shropshire in 1373, was appointed lord-justice

of Ireland in 1412, and two years later its lord-lieutenant. In 1419 he entered upon a magnificent career of arms in France, which only Jeanne Darc could stay. She forced him to raise the siege of Orleans, and at Patay (1429), after performing prodigies of valour, he was taken prisoner. On his release he reassumed the command of the English forces, and for his rare success was created Earl of Shrewsbury (1442). In 1452 he was again despatched to France to aid a Gascon insurrection; but on attempting to raise the siege of Chatillon, he was slain with his son, Lord Lisle, 20th July 1453. Shakespeare, in *Henry VI.*, records the valour of this 'great Alcides of the field,' the conqueror in forty battles and dangerous skirmishes.—**Charles**, the twelfth earl (born 1660, died 1st February 1718), was created Duke of Shrewsbury (1694). He was one of the seven who invited over William of Orange; and under him, Anne, and George I. he held high office, being at the same time Lord-lieutenant of Ireland, Lord High Treasurer of Great Britain, and Lord Chamberlain. The dukedom expired with him, but the earldom passed to his cousin, the Rev. Gilbert T., a Catholic priest (died 1743). The senior male line becoming extinct (1856), the earldom was claimed, and after a memorable trial obtained (1858), by Henry-John Chetwynd, descended from a younger nephew of the first earl. His grandson, **Charles Henry John T.** (born 13th November 1860), succeeded his father as twentieth earl, 10th May 1877.

Tal'bot, William Henry Fox, was born at Chippenham, Wiltshire, February 11, 1800, educated at Harrow, and graduated at Trinity College, Cambridge, in 1821. He was member for Chippenham in the reformed Parliament of 1832–38; and about this time began the series of experiments which led him independently to the discovery of photography, and for which he received a medal from the Royal Society in 1842. (See CALOTYPE and PHOTOGRAPHY.) Subsequently he applied himself to antiquarian and philological studies, and was one of the first who successfully deciphered the Assyrian cuneiform inscriptions. His versions were published in the *Transactions* of the Royal Asiatic Society, of the Society of Biblical Archæology, and of the Royal Society of Literature. His chief works are *Hermes*, or *Classical and Antiquarian Researches* (2 vols. 1838–39), *Illustrations of the Antiquity of the Book of Genesis* (1839), *The Pencil of Nature* (1844–46), and *English Etymologies* (1846). He is also the author of a number of mathematical papers of marked originality published in the *Philosophical Transactions* and the *Transactions* of the Royal Society of Edinburgh. T. died September 17, 1877.

Talc, a hydrated silicate of magnesia, containing four equivalents of the base to five of silica. It is of common occurrence as a mineral, being found in large foliated masses, or, like mica, in thin scales. It may be distinguished from the latter mineral by its greater softness and its want of elasticity. T. also occurs as an important constituent of other rocks, *e.g.*, T.-schist and talcose granite, &c. Its specific gravity is about 2·8, and it is translucent, infusible, and unctuous to the touch. T. is used for mixing with porcelain clay, for fulling, and in the manufacture of crucibles and crayons.

Tal'ent, originally a Greek denomination of weight, but from being used in reference to a weight of gold and silver applied to designate a quantity of current money. It was divided into 60 minæ, 6000 drachmæ, and 36,000 oboli; but of these only the last two were coined, the highest coin used by the Athenians being the tetradrachm. The chief varieties in use among the Greeks were the Æginetan, Euboic, and Attic talents, the last of which, introduced by Solon, soon supplanted the others. Its value was nearly 57 lbs. avoirdupois, and as a money designation was reckoned in silver currency. The Italian and Sicilian Greeks used a *gold T.*, also known as the *Sicilian T.*, which was much smaller, being about ⅔ths of an ounce avoirdupois. This is about the value which must be ascribed to the T. as used by Homer. The value of the Æginetan T. (95 lbs. avoirdupois) proves it to have been introduced from the East, probably by the Phœnicians. The modern use of the word as an equivalent of intellectual ability has its origin probably in Christ's parable (Matt. xxv. 14–30).

Talfourd, Sir Thomas Noon, born at Doxey, near Stafford, January 26, 1795, was educated by Dr. Valpy at Reading, studied law under Mr. Chitty, was called to the bar at the Middle Temple in 1821, and rapidly rose in his profession. He represented the borough of Reading from 1835 to 1841, and again from 1847 to 1849, and in the latter year was appointed justice in the Court of Common Pleas. While charging the grand jury at the Stafford assizes he was struck with apoplexy, and shortly after expired, March 13, 1854. T. was an eloquent, able, and laborious lawyer, but his fame rests mainly on his four tragedies—*Ion*, produced by Macready at Covent Garden in 1836; *The Athenian Captive* (1838); *Glencoe, or the Fate of the Macdonalds* (1840); and *The Castilian*, which never appeared on the stage. All these bear witness more or less to the author's deep and fervent study of the Greek drama on the one hand and the poems of Wordsworth on the other—*Ion* being perhaps the finest of the four. He also edited the letters and works of Charles Lamb, and wrote a sketch of his life—*Memorials of Charles Lamb* (2 vols. new ed. 1849–50). A collection of his *Critical and Miscellaneous Essays* appeared at Philadelphia in 1842. See *Memoir of T. N. T.*, by a member of the Oxford Circuit (1854).

Tal'ipat Palm (*Corypha umbraculifera*) of Ceylon and the Malabar coast is a noble tree with a straight cylindrical stem of 60 or 70 feet, surmounted by a crown of enormous leaves, each leaf measuring 10 feet or even more in diameter, and composed of 40–50 segments united beyond the middle and bifid; it is attached to the stem by a prickly root-stalk of 6 or 7 feet long. The tree is consequently admirably adapted for shade and shelter. At the age of thirty to forty years, from the centre of the crown arises an immense erect-compound panicle of bisexual hexandrous flowers. An abundant supply of fruit follows, and after the seed ripens the vegetation of this terminal shoot is completed and the tree dies. Fans, mats, and umbrellas are made of the leaves, and their segments, as also those of the closely-allied species *C. Taliera* (which grows in Bengal), are used for writing upon with an iron style.

Tal'isman (Gr. *telesma*, 'consecration'), any portable object inscribed at certain astrological conjunctions with magic formulæ, that guard its wearer from dangers in general and sorcery in particular. Talismans long used throughout the East assume a multiplicity of forms, but as a rule may be distinguished from Amulets (q. v.) both by their astrological character and by their being only of stone or metal, whilst an amulet may be of any material. Se Lenormant, *La Magie chez les Chaldéens* (Par. 1873).

Tall'age (Fr. *taille*, Low Lat. *tallagium*, from *talea*, 'a tally of wood,' on which the amount of tax was scored), according to Coke, is a general term, including all subsidies, taxes, tenths, &c., but generally it was restricted to taxes received by the king.

Tallahassee, capital of Florida, U.S., 180 miles by rail E. of Pensacola, is well laid out and finely situated, has 5 churches, a state capital, the W. Florida seminary, a cotton factory, machine shops, two weekly papers, &c. Pop. (1870) 2023.

Tallart, Camille, Comte de, was born of an ancient Dauphiné family, 14th February 1652, and entering the army, rose rapidly, thanks to his natural talents and to his cousin, Marshal Villeroi. As early as 1674 he commanded a corps at Mülhausen, and having served under Turenne in Elsass, been wounded at Rheinfelden, and raised to the rank of major-general (1688), he led an army over the frozen Rhine (1692), and mastered the Rheingau at a blow. As skilful a diplomatist as soldier, he helped to negotiate the Peace of Ryswyk (1697), and was employed by Louis to bring England over to the Partition Treaty. It failed to avert the War of the Spanish Succession, in which, under Boufflers, T. signalised himself at Kaiserswerth (1701) and Nymwegen (1702), capturing Trier, forcing Alt-Breisack to capitulate, and stripping the Prince of Hessen-Kassel of the Palatinate. Created Marshal (1703), and with Marsin despatched to command the French troops in Bavaria, T. lost against Marlborough and Prince Eugene the battle of Blenheim (1704), where with 15,000 of his men he fell into the hands of the English. During seven years' captivity in London he managed to secure the favour of Queen Anne, and largely contributed to the recall of his conqueror Marlborough; so when in 1711 he was released without either ransom or exchange, Louis XIV. welcomed him with the title of Duc d'Hostun. He became Minister of State (1726), and died May 30, 1728, leaving behind him the *Campagnes du Maréchal de T.* (Amst. 1762).

Tallegall'a or **Brush Turkey** (*Tallegalla*), a genus of *Rasorial* birds occurring in Australia, and belonging to the family of the *Megapodiidæ* or Mound birds. The *T. Lathami* is the familiar species, and is named the New Holland vulture and wattled T. The average size is that of a turkey, and the colour is a general blackish brown. The 'egg mound' is a collection of decaying vegetable matter, within which the eggs are deposited. The wattles of the male bird are of a bright or orange-yellow colour. The T. feeds on seeds and insects during the period of incubation. The male attends the mound very assiduously, and the young appear to leave it on the third day after hatching. The T. has been domesticated and bred in the gardens of the Zoological Society of London.

Talleyrand-Périgord, Charles Maurice, Comte de, was born in Paris 13th February 1754. His family was one of the most ancient in France, and many of its members had distinguished themselves either in the Church or the army, to the latter of which professions his father, Charles-Daniel, Comte de T.-P., belonged. T. was the eldest of three sons, but having been lamed by an accident while under the care of the foster-mother with whom he spent his early years completely neglected by his parents, he was disinherited and forced to undergo the severe training of the St. Sulspice, the Sorbonne, and the College Rheims, with a view to entering the Church. This he actually did, though he had been principally noted during his student-years for gross licentiousness and love of intrigue. Introduced into Parisian society at the coronation of Louis XVI. in 1774, the youhg Abbé de Périgord, as he was called, made himself notorious for his vices, as well as famous for the polish and suavity of his manners and the brilliance of his wit. In 1775 he was preferred to a rich Abbacy in the diocese of Rheims; in 1778 he was among the first to welcome Voltaire to Paris on his famous and fatal visit, and in 1780 he began his political career in the influential post of Agent-General of the clergy of France. This position brought him into contact with Mirabeau, Calonne, Necker, and other prominent figures of the critical period which preceded the Revolution. Mirabeau at one time writes of him:—'You will never find a man more trustworthy, more religiously devoted to the dictates of friendship and gratitude;' but shortly afterwards his tone changes, and he says:—'For money he would sell his soul, and he would be right, for he would in such case barter dirt for gold.' In 1788 the king unwillingly preferred him to the see of Autun, and on the convocation of the States-General in the following year, he was elected to represent the clergy of his diocese. Appreciating with keen foresight the whole merits of the situation, he identified himself with the popular party, though he was always at heart the haughtiest of aristocrats. He advocated amalgamation with the *Tiers État*, was one of the framers of the Declaration of Rights, and proposed the scheme to nationalise Church property. On the 16th of February 1790 he was elected President of the National Assembly on the 14th of July he, in his clerical capacity, played the leading part in the ill-starred Feast of Federation in the Champs de Mars, and on the 28th of December he was among the first to swear fealty to the new constitution. At the same time he resigned his bishopric, but in the next year we find him consecrating the first two of the new constitutional bishops, in consequence of which he was declared by the Pope a heretic and schismatic. Meanwhile he was doing good service to the State in minor matters. His report on public instruction (September 1791) was an able piece of work; he pointed out forcibly the dangers of the *assignat* system, and promoted the adoption of the present system of uniform weights and measures.

In February 1792 he was sent to the Court of London, nominally in the train of the ambassador, M. de Chauvelin, though he was in reality himself the ruling spirit of the embassy. That even his diplomacy could effect little or nothing was attributable to the position of affairs, which was altogether too unfavourable. It was fortunate for him, however, that he was out of France in December 1792, when a letter discovered in the famous 'Iron Chest,' and supposed to implicate him in Royalist schemes, led to his proscription, and would certainly have led to his death had he been within reach of the Government for the time being. The 'Alien Act' drove him out of his asylum in England, and on the 3d of February 1794 he embarked for America. Here he remained for more than a year, chiefly in Philadelphia, making good use of his opportunities for political observation, as his work on the relation between the United States and England subsequently proved. At the close of the Reign of Terror he returned to France, and on the 15th of July 1797 he was appointed to the Ministry of Foreign Affairs. With his unfailing sagacity he now discerned the importance of Bonaparte, to whom he at once attached himself. Driven from his ministry in June 1799 by the unpopularity accruing partly to the Directory as a whole, partly to certain special acts of venality and corruption, he concerted with Bonaparte the plan of the *coup d'état* of the 18th Brumaire. Throughout the following years he co-operated in all the schemes of Napoleon, promoted the establishment of the empire, and carried out other political measures far too numerous to mention. For these services he was created Vice-Grand-Elector of the Empire and Prince of Benevento (1806); but falling into disfavour shortly afterwards, he resigned his portfolio 9th August 1807. Meanwhile he had acquired immense wealth. It is said that when Napoleon questioned him as to how it had been amassed, he replied—'The simplest thing in the world, General: I bought stock the day before the 18th Brumaire, and sold it again the day after.' From 1807 till 1814 he remained 'in opposition.' On the downfall of the emperor he was again appointed Foreign Minister. At the Congress of Vienna he was the French plenipotentiary, but was again forced to resign his portfolio on the 28th of September 1815. For fifteen years he now remained under a cloud. After the July Revolution of 1830 Louis Philippe appointed him Ambassador at the court of St. James's. This post he held for five years, and was instrumental in bringing about cordial relations between France and England. He returned to France in 1835, and died at Paris, May 17th, 1838. A diplomatist of extraordinary genius, T. was perhaps even more notable for his total lack of principle. His methods of policy may be described as Macchiavellian, perhaps even more justly than those of Macchiavelli himself. To him is often attributed the famous maxim, *La parole n'a été donnée à l'homme que pour d'equiser sa pensée*, though it belongs originally to the English poet Young. He is said to have left *Mémoires* of his life, with directions that they should not be published till forty years after his death. That period has now (1878) arrived, and there have been rumours of the approaching publication of the volumes, but as yet nothing definite is known of them. For T.'s life and character see the historians of the Revolution *passim:* also Salle's *Vie Politique du Prince C. M. de T.* (Berl. 1838); Touchard Lafosse's *Histoire Politique et Vie Intime de T.* (Par. 1848); Sainte Beuve's *Monsieur de T.* (Par. 1870); Pichot's *Souvenirs Intimes sur M. de T.* (Par. 1878); *Reminiscences of Prince T.* (Lond. 1848; and Baron Dalling and Bulwer's *Historical Characters* (5th ed. Lond. 1876).

Tallicoo'nah Oil. See CARAPA.

Tallien, Jean Lambert, was born in Paris in 1769. His talent for writing and speaking soon brought him to the front at the Revolution. After being for some time connected with the *Moniteur*, he became editor of the *Ami des Citoyens*, a journal after the fashion of Marat's *Ami du Peuple*. A prominent Jacobin, he became after the 10th of August secretary of the Insurrectionary Commune, was one of the leading 'Septembrists' (q.v.), and afterwards eloquently defended the massacres he had promoted. His 'services' on this occasion gained him a seat in the Convention, where he of course joined the Mountain, and was an earnest defender of Marat, and a savage advocate for the execution of the king. Sent by the Convention to Bordeaux and the western departments in 1794, he at first distinguished himself by a cruelty and profligacy worthy of the most infamous of the Terrorists. In the prison of Bordeaux, however, he met the beautiful Madame de Fontenai, *née* Senhora Tereza de Cabarrus, for whom he conceived a violent passion. He liberated her from prison, and drew down upon himself the suspicion of the central authorities by relaxing the cruelty of his persecutions. Recalled to Paris, he managed by an assumption of revolutionary fervour to avoid an immediate downfall, but the hatred and suspicion of Robespierre were not allayed. Madame de Fontenai was imprisoned. 'Shut in the horrid pinfold of death,' says Carlyle, 'the senhora smuggles out to her red-gloomy T. the most pressing entreaties and conjurings: Save me; save thyself!' This could only be accomplished by the ruin of Robespierre (q. v.). T. placed himself at the head of the party afterwards known as the Thermidorians, vigorously attacked the

triumvirate of terror, and ultimately brought about its downfall. From this point his political influence declined. Madame de Fontenai, on the other hand, whom he now married, became the most prominent personage in Parisian society, her salon, thronged by the party known as the *jeunesse dorée*, being the most brilliant of the brilliant period of the Directory. T. continued in the Legislature till 1798, when he accompanied Bonaparte to Egypt in the character of *savant*. The ship in which he was returning was captured by an English cruiser, and he was *fêted* by the Whig party in London in 1801. In 1802 he was divorced from his wife, who afterwards married the Prince de Chimay, and died November 16, 1831. T., after holding for some years the post of French consul at Alicante, died at Paris, November 16, 1820, in poverty and obscurity.

Tall'is, Thomas, the father of English cathedral music, was born about 1529. During the reigns of Henry VIII. and Queen Mary he was a gentleman of the chapel-royal, a position more important than his salary of 7½d. a day might indicate. On the accession of Queen Elizabeth T. seems to have embraced the Reformed faith, and to have become organist of the chapel. He published in 1575, in connection with Byrd, *Cantiones Sacræ*, a collection of anthems and hymns, which was protected for twenty-one years by the first patent of the kind ever issued. He set to music the portion of the English liturgy which is now sung, including the morning, evening, and communion service, and the litany and responses. His style was learned, grave, and devout, and he may be considered altogether the greatest English composer before the days of Henry Purcell. That he was a master of counterpoint is proved by his extraordinary *Song of Forty Parts* (8 separate trebles, 8 mezzo-sopranos, 8 counter-tenors, 8 tenors, and 8 basses), which, abounding with subjects of fugue and imitation, extends to 138 bars in *allabreve* time. There are extant his *Order of Daily Service* (edited by Bishop, 1843, and by Rimbault, 1847), *Full Cathedral Service* (edited by Rimbault, 1847), and *Order for Morning Prayer, with the Litany Noted* (new ed. 1854). T. died November 23, 1585, and was buried in the old parish church of Greenwich.

Tallow. See OILS.

Tallow Tree (*Excœcaria*, or *Stillingia sebifera*) is a small tree indigenous and cultivated in China and Japan, and introduced into the Southern United States, &c., where it thrives luxuriantly. It belongs to *Euphorbiaceæ*, and has dry, smooth, fruit of ½ inch diameter, containing three seeds inclosed in a thick layer of white fatty substance. In Japan and China this fatty material is separated by boiling in water. It is then made into cakes and pressed, 'when the pure tallow exudes in a liquid state, and soon hardens into a white, brittle mass.' It is harder than animal tallow, and candles are made of it, which are coloured, and generally used in Chinese temples. The seeds (after the tallow is removed) yield a liquid oil, and a black dye is made from the leaves.

Tall'y (Fr. *tailler*, 'to cut'), a piece of wood bearing notches or other marks indicative of a commercial transaction. In the Exchequer peeled hazel or willow rods, split so that each part contained one-half of every notch, were the regular form of acquittance till 1782, the part given to the payer being called the *stock*, that retained by the Exchequer the *counterstock*. This ancient system was abolished by 25 Geo. III. c. 82; and by 4 and 5 William IV. c. 15 old tallies were ordered to be destroyed. The burning of the Houses of Parliament (16th October 1834) arose from the stoves being overheated with these discarded tallies.

Tal'ma, François Joseph, one of the greatest of French tragedians, was born in Paris, January 15, 1763. His childhood was passed in London, where his father was a dentist, and he was himself destined for the medical profession. Returning to Paris at the age of fifteen, however, he began to frequent the Théâtre Français, and was seized with an enthusiasm for the stage. He shortly afterwards took part in the performances of some French amateurs in London, which created such an impression that Lord Harcourt and other gentlemen begged him to devote himself to the English stage, offering him an engagement at Drury Lane, which he would probably have accepted had not family circumstances recalled him to Paris. He made his *début* at the Théâtre Français on November 21, 1787, in the part of 'Séide' in Voltaire's *Mahomet*. His success was complete, though he could not be said to 'have taken the town by storm.' As early as April 1, 1789, he became a *sociétaire* of the National Theatre. From this time forward his career was a series of triumphs, which lasted through the Revolution, the Empire, and well on into the Restoration. He performed for the French stage the service which Kemble did for the English stage, in introducing historical correctness in costume and decoration. It is related that when he first appeared in the *foyer* of the Français dressed in correct Roman costume, one of the actresses exclaimed '*Voyez donc Talma, qu'il est ridicule! Il a l'air d'une statue antique*'—a piece of unintentional but well-deserved flattery. He was a personal favourite of Napoleon, in whose train he visited Germany. In Brussels, too, he was exceedingly popular, and two performances which he gave in London in 1817 excited immense enthusiasm. T. died at Paris, October 19, 1826. Among his principal parts were Charles IX. in Chénier's drama, Egisthe in *Agamemnon*, Othello and several other Shakespearean characters in Ducio's adaptation, &c. See Moreau's *Mémoires Historiques et Littéraires sur F. J. T.* (Par. 1826), and an Autobiography, edited by A. Dumas (4 vols. 1849–50).

Tal'mud, The (Heb. *lāmād*, 'to learn'), is the whole body of Jewish civil and theological law. It is the outcome of the *Midrāshîm*, those expositions and disquisitions on Biblical topics customary during the 300 years that elapsed from the rise of the Asmonean dynasty till the age of Hadrian. At first these were simple, but gradually through disputation, the search for hidden meanings in the letter, and the like, they became more complicated, and were distinguished into two classes, the *Halacha* (q. v.), or 'rule,' and the *Haggada* (q. v.), which were more homiletic. Oral transmission was long the only means of preserving either; to write down Halacha or Haggada was sacrilege, and, when practised, was only partial and clandestine. The official Halachic redaction forms the *Mishna* (q. v.). But many Halachas, known as *Boraitas* and *Toseftas*, were omitted in the Mishna. These with the Haggadas were redacted in the T., or rather Talmuds, for there are two, the *Jerusalem* and the *Babylonian*. Each of these consists of two parts, the Mishna, which is the same in both, and the *Gemāra*, 'completion' (Heb. *gamār*, 'to complete,' less likely from Aramaic *g'mar*, 'to learn'), or commentary on the Mishna, in which they mutually differ much. The present recension of the Jerusalem T. was made, according to Moses ben Maimon, by Rabbi Jochanan of Tiberias, about 279 or 282 AD. Probably the plan is due to him, but the work was completed by his scholars or other learned men, most likely at Jerusalem about 400. The Babylonian T., which is about four times the size of the Jerusalem, was mainly the work of Rabbi Ashe of Sura, in Babylonia, between 350 and 430, when Tiberias and the other Palestinian schools were all but extinct, and the Babylonian academies of Nisibis, Nahardea, Pumbaditha, and Sura rivalled one another in extraordinary zeal for Rabbinic study. The two last-mentioned schools completed the work, probably in the 6th c. The language of both Gemaras is Aramaic, that of the Jerusalem being somewhat near to Syriac, while that of the Babylonian is purer both in grammar and vocabulary, and therefore easier. But, on the whole, it is true of both, that the style is all but 'unconquerably difficult,' and the language 'frightfully rough.' In both the Gemara follows the Mishna with extreme closeness through the 6 *sedarim* or orders, 63 *massictoth* or treatises, and 525 *perakim* or chapters into which it is divided; giving explanations, differences of opinion, final judgments according to majority or minority of voices, and so on. Its contents are most heterogeneous, not only religious and philosophical, but treating of jurisprudence, medicine, history, &c., often legendary and fabulous, trivial, ridiculous, even all but blasphemous. It is certainly a monument of human folly as much as of human learning and wisdom; but it is only fair to admit that it contains a most important mass of laws and opinions, that its ethics, as in the justly-renowned *Pirke Aboth* (sayings of the fathers), are often very high, and that many, perhaps most, of its apparently flagrant absurdities are merely the parabolic clothing of a hidden meaning, as in the invectives against the Christians, and the like; while the rest are due to that superstitious veneration for the mere words of the wise men of the past, which prevented the Jewish redactors from abridging and omitting as they ought. The T. is comparatively useless for Old Testament interpretation, but the light which it sheds on many points of the New Testament, and on the early

history of the Christian Church, is simply incalculable. See article 'Thalmud' in Herzog's *Real-Encyclopädie für Theologie und Kirche*; Grätz, *Geschichte der Juden*; Emanuel Deutsch, *Literary Remains*; Canon Farrar, articles in the *Expositor* (1877-78); Rabbinovicz, *Législation Civile du T.* (Par. 1878); and Dr. Barclay, *Translations from the T.* (1878).

Tal'pa and **Tal'pidæ**. See MOLE.

Tálúk', properly **Taallu'qah**, an Arabic word implying dependence, used through India for a species of land-tenure. In Bengal Proper the T. is an estate subordinate to the *zemindary* or estate in chief; one class pays its revenue direct to Government, the other only through the *zemindar*. In the N.W. Provinces the term is applied to an estate divided between several proprietors, superior and inferior, of whom the latter pay revenue through the former. In Oude the term is used of the great landholders, some of whom have the title of Rajah or Maharajah, and immense incomes. In Madras, a T. is merely a large revenue division. The holder of a T. is called a *talukdar*. See Wilson's *Glossary of Indian Terms* (Lond. 1851).

Tam'ara Spice, a compound of cinnamon, cloves, coriander, anise, and fennel-seed, esteemed as a condiment in Italy.

Tam'arin (*Midas*), a genus of Platyrhine or New World monkeys of small size, having a short muzzle and a beautiful soft silky fur. The silky T. (*M. rosalia*), and the *M. leonina*, or little lion monkey, are two familiar species. The former is of a golden hue, and the latter derives its name from the great development of hair on the neck and head.

Tam'arind (*Tamarindus Indica*), a lofty tree of the *Cæsalpineæ* sub-order of *Leguminosæ*, and the sole species of the genus. It reaches a height of 80 feet or more, and has a short thick trunk surmounted by a magnificent, broad, and high shady crown of pinnated leaves, mixed in the following season with racemes of sweet-scented flowers. The pendulous pods vary from 3 to 8 inches in length, by about 1 inch broad, containing within their brittle brown shell a layer of acid pulp traversed by strong fibres. The tree, which is presumably a native of tropical Africa and Asia to N.W. Australia, is cultivated in the tropics of the New and Old World principally for the pulp of the legume, which is used locally in cookery and for other purposes, and is exported to Europe for service in medicine. That from the W. Indies is usually preserved in small kegs between layers of sugar, hot syrup having been poured over the whole; the E. Indian comes in the pods, sometimes cured in salt. The grateful acidity of the pulp depends upon citric, malic, and tartaric acids; it is also rich in humic and butyric acid. The T.-pulp acts medicinally as a gentle laxative. Infused in water, it makes a refreshing beverage; and boiled with milk and strained, a pleasant cooling whey is produced, given occasionally in fevers. A very good gargle for sore throat may be prepared from the pulp of the fresh pods. The wood is yellowish-white, hard, and close-grained, with a very durable dark-coloured heart-wood, which polishes well, and is highly prized for many purposes, such as wheels, mallets, tent-pegs, oil-presses, sugar-crushers, furniture, &c. T. is Latinised from the Arabic *tamer-hindy*, 'Indian-date.'

Tam'arisk (*Tamarix*), a genus of about 20 species of shrubs or small trees, with inconspicuous often scale-like leaves, and dense spikes of small white or pink flowers. The genus, which is the 'type' of the natural order *Tamaricaceæ* or *Tamariscineæ*, is widely diffused in cold, temperate, and hot regions, often in sandy or saline situations. *T. gallica* is the best-known species. It is a native of S. Europe, N. and tropical Africa, S. Asia (as *T. Indica*), ascending in the Himalayas to 11,000 feet, and reaching China and Japan. This shrub adapts itself to the most diverse localities. It is also one of the most tractable plants in culture, as it is readily multiplied from cuttings which strike root with remarkable ease and push forth stems with unusual vigour. Hence it is one of the most eligible shrubs for planting on coast sand to stay its drifting, or for lining embankments. In India the wood is much used for fuel. *T. germanica* is likewise available for arresting the ingress of shifting sand and for solidifying precipitous river-banks. *T. articulata* or *orientalis*, of N. and Mid. Africa and S. Asia, grows into a fair-sized tree. Its wood serves in India for ploughs, wheels, &c., and its bark is used for tanning. T.-manna is produced on the twigs of several species of T. by the puncture of an insect. For T.-galls see TACAHOUT.

Tambour' (Fr. *tambour*, a 'drum'), a circular frame on which muslin or other stuff is stretched for the purpose of being embroidered. This kind of needlework, known as 'tambouring,' was formerly a domestic female industry in Scotland. T., in architecture, denotes the naked ground of the Corinthian and Composite capitals on which the leaves are placed, also the walls of a circular temple surrounded with columns, and further the vertical part above and below a cupola. T., in fortification, is a small work, intended to defend a road, gate, or other entrance, and is usually constructed of wood and provided with loopholes.

Tambourine' (*Tambour de Basque*), a musical instrument of percussion very popular in the S. of Europe, particularly in Italy and Spain. It is formed of a hoop of wood, like one end of a drum, over which parchment is stretched. Small pieces of metal called jingles are inserted in the hoop, to which also tiny bells are sometimes attached. The effects produced by striking the T. with the knuckles are called 'flamps' or 'semi-flamps,' that obtained by drawing the fingers over the surface of the skin, the 'travale' or the 'roll.' The ancient *tympana*, representations of which are found at Pompeii, resembled this instrument.

Tambov', a government in the S.E. of Russia. Area 25,583 sq. miles; pop. (1870) 2,150,971. It consists mainly of an elevated plateau sloping gradually to the S., more than half of which is under cultivation, the remainder chiefly in forest. In 1873 T. possessed 495 industrial establishments, of which distilleries were the chief; ironfoundries, spinning-mills, and sugar-refineries also employing a large number of hands. It contains, besides the capital, about a dozen flourishing towns of upwards of 7000 inhabitants, but the remoter villages are very poor, the walls of the houses being often formed of interwoven branches.—**T.**, the capital, lies on the Zna, has 15 churches, and manufactures shawls, sailcloth, tallow, &c. Pop. (1870) 26,403.

Tame Animals, Laws Regarding. See ANIMALS, CRUELTY TO; and under DOG, *Laws Regarding Dogs*.

Tam'erlane. See TIMUR.

Tamil', a language belonging to the Dravidian (q. v.) branch of the Turanian family of speech. It is the most highly cultivated member of that branch; and according to the Census of 1871 is spoken by nearly fifteen million persons in the S.E. of the Madras Presidency. See Grant, *Bibliotheca Tamulica* (Leip. 4 vols. 1854-65); and Caldwell's *Comp. Grammar* (Lond. 2d ed. 1875).

Tamm'erfors (Finn. *Tampere*), a thriving town of S. Finland, Russia, government of Abo-Bjorneburg, on Lake Naesi, 92 miles N.W. of Abo, with manufactures of cottons, woollens, paper and machinery. Pop. (1875) 8443.

Tamm'uz was a Syrian deity for whom the Jewish women held an annual lamentation (Ezek. viii. 14), doubtless borrowing the practice from the Phœnicians. T. has generally been identified with the Phœnician sun-god Adonis (q. v.), or the Egyptian god Osiris (q. v.). The Adonia or feast in honour of Adonis commenced with the new moon of July, when on a certain night an image of the god was laid out on a bed by women, and bewailed in woful ditties. After a time spent in this way lights were brought in, and the mouths of the mourners anointed by the priest, who whispered, 'Trust ye, communicants, the god having been saved, there shall be to us, out of pains, salvation.'

Tamm'y (Fr. *étamine*, from *estame*, 'worsted'), a thin glossy stuff wholly of wool, or of wool mixed with silk or cotton. Originally applied to an all-worsted fabric, the manufacture of which can be traced many centuries back, the name T. is now borne by different kinds of glossy fabrics of English and French production.

Tampan', a species of Tick (q. v.) described by Dr. Livingstone as occurring in Angola, and notable for its irritating bite. It usually selects the interspaces of fingers or toes, and adheres to the skin by means of a well-developed proboscis, drawing a large quantity of blood, and causing symptoms resembling those of acute inflammation.

Tampi'co, a seaport of Mexico, state of Tamaulipas, on the Panuco, 5 miles from its mouth, on the Gulf of Mexico. The harbour is not accessible to large vessels on account of the river-bar, but the trade in the roadstead is considerable and is increasing. The exports are chiefly hides, salted meat, bones, and tallow. T. is healthier than Vera Cruz, but is scantily supplied with good drinking-water, and is liable to attacks of yellow fever. Pop. 7000.

Tam-Tam, an Oriental instrument of percussion of the gong species, oval in shape.

Tam'worth, a market-town on the border of Staffordshire and Warwickshire, stands at the confluence of the Tame and Anker, 6½ miles S.E. of Lichfield by rail. It has a fine old church, of different styles, from Norman to Perpendicular, and a modernised Norman castle, other buildings being the 17th c. town-hall, a grammar-school (1868), while in the market-place is a bronze statue of Sir Robert Peel (1852). There are manufactures of paper and small-wares, and coal and fire-clay pits, with market-gardens employing many persons. T. publishes one weekly newspaper, and returns two members to Parliament. Pop. (1871) of municipal borough, 4589; of parliamentary, 11,493.

Tan'ager (*Tanagra*), a genus of *Insessorial* Birds, belonging to the family *Fringillidæ* (q. v.). The bill is triangular, and arched at its tip. The hinder toe is well developed, and the claws are strong. The T. occurs chiefly in tropical America. Its food consists of seeds, berries, and insects. The Organist T. (*T.* or *Euphonica musica*) is so named from the clearness and volume of its song. The Scarlet T. (*Pyranga rubra*) occurs in summer in the United States, but migrates southwards in winter.

Tananarivo. See ANTANANARIVO.

Tan'cred, son of the Marquis Odo the Good and of Emma, Robert Guiscard's sister, was born in 1078, in 1098 assumed the cross, and with his cousin Bohemond (q. v.) set out upon the First Crusade. Through the Byzantine empire they marched to Constantinople, whence T. crossed the Bosphorus disguised as a common soldier, that so he might escape from swearing allegiance to the emperor. Alexios followed the Crusaders, and T. reluctantly, yielding to Bohemond's counsel, took the required oath. At Dorylaion (4th July 1097) his bravery saved the camp of priests and women; his banner was the first to float from the towers of Tarsus, though Baldwin's jealousy dislodged it thence. In the siege of Antioch he slew, say chroniclers, 700 infidels; with Robert of Normandy he first set foot in the Holy City, 15th July 1099. Appointed by Godfrey de Bouillon prince of Galilee, he founded churches in Nazareth, in Tiberias, and on Mount Tabor, and helped at Ascalon to guard the new Christian kingdom against the Fatimite calif. His efforts on Godfrey's death (1100) to secure the crown of Jerusalem to Bohemond only roused Baldwin's jealousy again; but his own principality he held successfully against both Turks and Greeks, even Edessa owning his supremacy. He was busy with plans for bringing the Syrian chieftains under his sway, when he died at Antioch of a wound received in battle (1112). Valiant and, for the age in which he lived, humane, T. stands forth as type of 'a very gentle perfect knight;' in him was embodied the chivalrous spirit of the Crusade. See Schmerbauch, *T., Fürst von Galiläa* (Ef. 1830); Von Sybel, *Geschichte des ersten Kreuzzugs* (Düss. 1841); and G. W. Cox, *The Crusades* (Lond. 1874).

Tandah, a town in the district of Fyzabad, Oude, British India, 3 miles from the left bank of the Ghogra River, 60 miles S.W. of Lucknow. It is the seat of the largest weaving colony in the province, who manufacture both coarse cloth and fine muslin. Pop. (1869) 13,543.

Tanganyik'a, a large lake of Central Africa, discovered by Burton and Speke, 13th February 1858. It is situated between 3° 20' and 8° 47' S. lat., its centre being in 30° E. long. T. is 390 miles long, from 15 to 60 miles broad, and 2710 feet above the sea-level. Its waters are deep and fresh, though insipid, and abound with fish, hippopotami, and crocodiles. The lake is hemmed in by lofty cliffs, and the surrounding country is mountainous, well wooded, and thickly peopled. On its W. shore is Ujiji (q. v.). The name T., according to Cameron, signifies 'the mixing place,' referring to the great number of streams which empty into the lake; according to Stanley, 'the plain-like lake,' having reference to its size. The lake has no present outlet, but as its level is rapidly rising, Mr. Stanley predicts that before long it will discharge by the Lukuga, a creek on its western shore, into the Lualaba or Upper Congo.

Tan'gent is a right line which touches but does not cut a given curve. In modern analysis it is regarded as the limit of a line cutting the curve as the two contiguous points of section approach each other indefinitely, and may therefore be defined as the line passing through two consecutive points on the curve. On a surface there are an infinite number of tangents through a given point corresponding to the infinite number of possible plane sections of the surface through that point, and these tangents all lie upon a plane, called the T. plane at the point. (See CONTACT.) In Trigonometry (q. v.) the T. of an angle is the length of the T. drawn at the one extremity, and intercepted by the radius produced through the other, of the subtending arc obtained by describing round the angle a circle of unit radius.

Tan'ghin (*Tanghinia veneniflua*), the 'ordeal' bean of Madagascar, stands foremost among inflammatory poisonous plants. It belongs to the dog-bane family, and has an ellipsoid fruit 2 or 3 inches long containing a hard nut surrounded by a thick fibrous flesh. The fruit or the kernel only (for accounts differ) is used as a test of crime. If the accused retained the poison in the system, death quickly resulted—a proof of guilt; but if the stomach rejected the dose little harm supervened,—and innocence was established.

Tangier', or **Tanja**, a seaport of Morocco, situated near the W. entrance of the Strait of Gibraltar. It has a fair harbour, and numerous fortifications. The streets are narrow and dirty, and the houses mean. The trade of T. is considerable, the imports in 1877 amounting in value to £370,300, and the exports to £148,333. A red light was placed on the pier in 1876, and a spacious fondack or bazaar was opened in 1878. T. was held by Portugal from 1471 to 1662, and by Britain from the latter year to 1684. Pop. 12,000.

Tangle, a common name for *Laminaria digitata* and *L. saccharina*, two large *Algæ*, with plain ribless fronds, found on the coasts of northern seas growing on rocks exposed only at low-tides, but often found washed ashore. Formerly T. was largely collected for Kelp (q. v.), and is still used under Stanford's process for manufacturing seaweed products. It also serves for manure and for feeding cattle. The young stems and fronds of *L. saccharina* are still sometimes brought to market as an article of food.

Tan'istry, a custom of succession among the Gaelic Celts, according to which the right of succession was not in the individual, but in the family to which he belonged; *i.e.*, succession was hereditary in the family, but elective in the individual. The family or clan or nation could choose its head. This held good also in regard to monastic offices. See Skene's *Celtic Scotland* (vol. ii. cap. 2).

Tanjore', the chief town of the district of the same name, in the Madras Presidency, British India, 50 miles due E. of Negapatam, on the Coromandel coast, and 215 S. of Madras by the new S. Indian railway. Pop. (1871) 52,175. It is a large town, with a wall 4 miles in circumference, numerous temples, and narrow streets. The chief buildings are the great pagoda (200 feet high and highly ornamented) and the palace of the Princess of T., a descendant of a brother of Sivaji the Great. The manufactures are cloths of silk and cotton, carpets of cotton, wood-carving, brasswork, jewellery, and pith models.—The *district* of T., which occupies the delta formed by the Cauvery and Colerun rivers and the flat plain to the S., has an area of 3739 sq. miles. Pop. (1871) 1,973,731, of whom a considerable proportion are native Christians. This is the populous and most fertile tract in S. India, being irrigated by means of the anicuts or weirs further up the Cauvery river, in Trichinopoly District (q. v.). In addition, there are more than 20,000 miles of minor embankments, which saved this region from the famine of 1877. The staple crop is rice, which is annually exported to the amount of 75,000 tons. Other products are sugar-cane, cotton, tobacco, plantains, and betel-nut palms. The total exports by sea in 1874-75 were valued at £847,000; the imports at £358,000. The seaport is Negapatam; the civil headquarters are at Combaconum. This tract first came under British administration in 1799. The last Mahratta Rajah of T. died in 1855, but the family

are still in receipt of a pension, and their claims to re-instatement have been strongly urged of late years.

Tank-Worms, the name given to those *Scolecida* (q. v.) which occur in water-tanks in India and other tropical countries. The young or embryo of the Guinea-worm (q. v.) is supposed to be represented by one of the T.-W.

Tann, Ludwig, Freiherr von, a general in the Bavarian army, was born at Darmstadt, June 18, 1815, and entered the Bavarian service as lieutenant in 1833. In 1840 he became first-lieutenant of the staff, and in 1844 of the adjutant to the Crown Prince Maximilian, whom he accompanied on his travels in Greece. In 1848 he led a troop of volunteers in the revolt of Slesvig-Holstein against Denmark, and distinguished himself at Hoptrupp and at Düppel. Shortly before the conclusion of the war he returned to Bavaria, where he became successively colonel in 1850, major-general in 1855, general adjutant of the king in 1859, and in 1860 lieutenant-general and commander of a division. In the war of 1866 he acted as chief of the staff of Field-Marshal Prince Karl, and in 1869 became general of infantry with the command of the First Bavarian army corps, which took a distinguished part in the battles of Wörth, Beaumont, Sedan, and Orleans. He was, however, forced to retreat from Orleans, and received on the 9th November a severe defeat from General Aurelle, losing 10,000 prisoners and two guns, and being driven back to Artenay. The arrival of reinforcements under the Grand Duke of Mecklenburg enabled the German army to recover their position, and T. earned fresh glory for himself at Baroches-les-Hautes, Orleans, and Beaugency. Since the war he has resided at Munich as general-commandant of the first army corps.

Tann'ah, the chief town of the district of the same name, in the Bombay Presidency, British India, 24 miles N. E. of Bombay by rail; pop. (1872) 14,299. The first railway in India was opened from Bombay to T. in 1853. The *district* of T., which lies between the E. Ghauts and the Arabian Sea, has an area of 4052 square miles; pop. (1872) 847,424. It produces abundant grain, especially rice; other crops are sugar-cane, plantains, cocoa-nuts, and ginger. The *district* includes the islands of Bassein and Salsette.

Tann'ahill, Robert, a Scottish poet, was born at Paisley, June 3, 1774. The son of a weaver, he was apprenticed to the loom when twelve years of age, and with the exception of two years spent in England, the rest of his short life was consumed in the simple routine of his craft, amid the homely circumstances of his native town. In 1805 he ventured to publish a volume of verse entitled *The Soldier's Return: a Scottish Interlude in Two Acts, with other Poems and Songs, chiefly in the Scottish Dialect*. It was successful; his ambition was kindled, and all his dream was how to establish the poetic fame which he had begun to win. Disappointments came; his mind gave way; and on the 17th May 1810 the gentle-hearted poet was found drowned in the canal. T. is not great, but he is immortal. Many a poet who has reached a far higher heaven of invention might be glad to exchange his forgotten glories for the ever-living charm of *The Braes o' Gleniffer*, *Gloomie Winter's noo awa'*, *Jessie the Flower o' Dunblane*, *Thou Bonnie Wood o' Craigie Lea*, and *The Lass o' Arranteenie*. The best edition of T.'s works was prepared for his centenary, with a *Life* by the late David Semple (Pais. 1874).

Tann'er, Thomas, born at Market-Lavington, Wiltshire, 25th January 1674, after studying at Queen's College, Oxford, obtained an All Souls' fellowship. He became rector of Thorpe in Norfolk (1701), canon of Ely (1713), archdeacon of Norfolk (1721), canon of Christ Church (1724), and Bishop of St. Asaph (1732), dying at Oxford, 14th December 1735. Besides preparing the second edition of Wood's *Athenæ Oxonienses* (1721), S. published *Notitia Monastica, or a History of the Religious Houses in England and Wales* (1695; 3d ed. 1787), while after his death appeared the erudite *Bibliotheca Britannico-Hibernica* (1748), giving accounts of all the chief British authors down to the close of the 16th c.

Tannhäus'er was, according to the legend, a *minnesinger*, who, when riding by the Hörselberg, saw a vision of Venus, who kept her court here. Allured by the beauty of the goddess, he entered, as many others had done before him, the recesses of the mountain, and there led a life of mad gaiety and revel for seven years. Unlike his predecessors, T. was destined yet once more to reappear on earth, for at the end of that period, moved by a sudden revulsion of feeling, he tore himself from the arms of Venus, and took his way to Rome, where he besought absolution from the pope, Urban IV. (1261-65). The stern pontiff repelled him at first, till, moved by a miracle, he prepared to grant the required boon. But it was now too late. T. had disappeared, and was never more seen on earth. This legend is but the German form of a far-spread myth. 'There are parallel examples,' says Baring-Gould in his *Curious Myths of the Middle Ages*, 'in modern Greek, Albanian, Neapolitan, French, Danish, Norwegian, Swedish, Icelandic, Scotch, and Welsh.' The German legend has later additions, as that the trusty Eckhart was appointed to warn travellers from the mountain. Tieck (q. v.) has made it the subject of a beautiful story in his *Phantasus*. Wagner has treated it in one of his operas, and Morris and Swinburne, in modern English literature, have embodied the old story in beautiful verse. It is worthy of note that a *minnesinger* named T. lived during the papacy of Urban. He was able and cultured, but wild and dissipated. It is not clear, however, that he is the subject of the old myth. Heine in his *Ueber Deutschland* considers the legend, in its modern form, to represent the struggle between Christianity and Paganism.

Tann'in or **Tann'ic Acid** ($C_{27}H_{22}O_{17}$) constitutes the astringent principle of many vegetable matters, and probably exists in several distinct modifications. The most important of these is that obtained from oak-bark or nut-galls, known as *gallotannic acid*. It is prepared by infusion in water of powdered nut-galls; and by careful evaporation of the resulting solution, a yellowish friable uncrystallised porous mass is left behind, which is very soluble in water, less so in alcohol, and very slightly soluble in ether. A strong solution gives with mineral acids precipitates which are nearly insoluble in acid liquids. With ferric salts, gallotannic acid gives a deep bluish black precipitate, which is the basis of writing ink (see INK). Hence an infusion of T. is a useful test for the presence of iron. With a great variety of organic and especially animal substances, such as albumen, starch, gelatine, skin, muscular fibre, etc., T. forms insoluble compounds which resist putrefaction. Upon this principle the operation of tanning depends. See LEATHER.

Medicinal Properties of T. A.—T. A. is a pure astringent; and, owing to its property of coagulating albumen, it cannot be absorbed into the blood. Before absorption, T. A. is converted into *gallic acid*; so that when the part to be acted on can only be reached through the circulation, the latter is to be preferred. The local action of T. A. is much more powerful than that of gallic acid, and it may be administered to overcome relaxation, as in cases of spongy gums, mercurial sore mouth, chronic sore throat, and hæmorrhoids; and as a styptic to check hæmorrhage when the source can be reached directly, as in epistaxis, hæmatemesis, hæmorrhage from the bowels, &c. T. A. is also employed, locally, to arrest excessive secretions, as in leucorrhœa, diarrhœa, excessive perspiration, chronic ulcers, &c.; and for hardening parts exposed to friction, as sore nipples and tender feet.

Tann'ing. See LEATHER.

Tann'ing Sub'stances. All vegetable substances which contain Tannin (q. v.) or Tannic Acid (q. v.) in applicable quantity may be employed as T. S., and that principle is found most richly in the barks of many trees, and in the husk or shell of various seeds, in leaves, and in various excrescences caused by the puncture of insects. The most important T. S. are barks, and these are enumerated under Barks, Tanning (q. v.). Other substances used in tanning are sumach, which consists of the dried leaves and young twigs of various species of *Rhus* growing on the Mediterranean coasts and in the United States. It contains 12 to 16 per cent. of tannic acid. Divi-divi, the pod of a leguminous tree, *Cæsalpinia coriaria*, said to yield 50 per cent. of tannic acid; algarovilla, the capsules of *Prosopis pallida*, and Bablah pods of *Acacia bablah* are occasionally used as T. S. Valonia, the acorn-cups of *Quercus ægilops*, is a valuable source of tannic acid, yielding as much as 45 per cent. Still more rich are the various kinds of Galls (q. v.), but these are chiefly used for ink manufacture; and several of the other substances above enumerated are more largely employed in dyeing than in tanning.

Catch, gambir, and kino are astringent extracts containing a large percentage of tannic acid, and they are much employed in the quick tanning of leather.

Tan'sy (*Tanacetum*), a genus of *Compositæ*, numbering about 50 species of strong-scented herbs, often shrubby below, with alternate usually much-divided leaves, and solitary or corymbose heads of rayless yellow flowers. The genus is represented in Europe, N. and S. Africa, temperate and cold Asia, and N. America. Common T. (*T. vulgaris*) has long had a reputation as a medicinal herb, causing it to be much grown in gardens in the past. It possesses bitter, tonic, vermifuge, and febrifuge properties. The plant is a native of Northern Europe, Siberia, and N.W. America, and occurs in a wild state in Britain, but as met with along the sides of streams, &c., is often of garden origin. It now holds a place in gardens mainly for the young leaves, which are shredded down and employed to flavour puddings, omelets, and cakes. A variety with leaves doubly curled is generally preferred. T.-tea enjoys a rustic reputation as a stomachic.

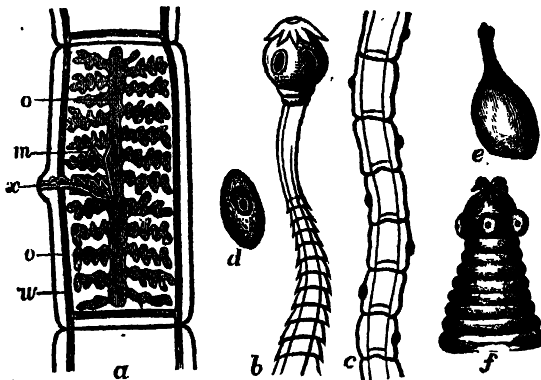
Tan'talum (Ta = 182), a rare metallic element, discovered in 1803 by Ekeberg, in the Swedish minerals tantalite and yttro-tantalite. On the authority of Wollaston, it was long believed to be identical with Columbium or Niobium (q. v.); but their separate identity was established by Rose in 1846.

Tan'talus, a mythical king of Lydia or Phrygia, son of Zeus. Having divulged the secrets of his father, he was doomed in the nether world to stand, tormented by intense thirst, in a lake of water which receded whenever he stooped to drink, and under bunches of grapes which were withdrawn whenever he tried to grasp them. From T.'s name comes the English 'tantalise.'

Tántia Tópi ('the weaver who became an artilleryman'), the most energetic of the rebel ringleaders during the Sepoy Mutiny of 1857. He commenced as a lieutenant of Nana Sahib (q. v.), of whom he is said to have been a relation; but after the latter had fled into Nepaul, he continued the war for several months, retreating with great rapidity through Bundelcund and Central India, but was finally captured, tried, and hanged in April 1859. T. T. was the last armed rebel in the field.

Tántrás (from Sanskrit *tan*, 'to believe'), a body of Sanskrit religious writings, which, though much later in date than the Vedas, and presumably later also than the Puranas (q. v.), have at the present day the greatest influence on Hindu opinions and observances. They all take the form of a dialogue between Siva and his wife Durgah or Parvati, and inculcate mystic and impure ceremonies in honour of the latter goddess.

Tantum Ergo, the hymn sung in the Roman Catholic Church at benediction with the Holy Sacrament.



Taormi'na, a town on the E. coast of Sicily, occupies a hill 900 feet above the sea, 30 miles S. of Messina by rail. The chief buildings are the *Palazzo del Duca di S. Stephano* (14th c.), and the *Badia*, a Gothic building. There is a Greek theatre (357 feet in diameter) in tolerable preservation. The *Castello di T.* (1300 feet above sea-level) dominates the town. There are also tombs, churches, &c., of archæological value. Pop. (1874) 2458. T. (anc. *Tauromenium*), founded by the Siculi in the 4th c. B.C., was long a Roman possession. It was taken by the Saracens in 902 and 962, by the Normans in 1078, by the French in 1676, and in 1849 by the Neapolitans under Filangieri.

Tapa'jos, a river of Brazil, rises in the Serra Diamantina, 20 miles from the headwaters of the Paraguay (q. v.), and after a northerly course of 1100 miles joins the Amazon in 35° W. longitude. The T. is a dark, wide stream, and is navigable throughout most of its length. Steamers ply on its lower course for several hundred miles.

Tap'estry is an elaborate and artistic variety of textile fabric used for the ornamentation of walls, for curtains, screens, and other hangings, and for covering seats and cushions, &c. T. is made by a process intermediate between weaving and embroidery, being worked in a web without any shuttle, the weft threads being inwrought by means of a needle. The endless variety of coloured threads necessary for the weft cannot be carried from one end of the warp to the other as in ordinary figured weaving, since that would not only involve an enormous loss of valuable thread, but would render the texture thick, heavy, and unwieldy. A partial kind of weaving with needles is therefore adopted, short lengths of thread of the special colours required being worked in at the places necessary for the design, and fastened at the back of the texture. The operations are carried on in a kind of loom in which the warp originally was stretched out in a horizontal direction, but in mediæval times a loom with a vertical frame was introduced, which came to be much more used than the low or horizontal frame. The manufacture and use of T. date from exceedingly remote times. There can be little doubt that the curtains of the Tabernacle, 'of fine twined linen, with blue and purple and scarlet, with cherubims of cunning work,' were a kind of T., and throughout ancient history there are frequent references to T. work. In early Christian times T. was extensively used for the decoration of churches and other ecclesiastical edifices, on which account the work was generally executed in connection with monastic establishments; and when in later times it began to be generally used in the houses of nobles and wealthy personages, ladies of high rank practised the art. In the reign of King Dagobert the abbey of St. Denis was hung with tapestries, *brodées d'or et garnies de perles*, and from that time to the present moment T. has continued to be in France a manufacture patronised and fostered by the reigning and governing powers, the Gobelins Factory (q. v.) and the establishment of Beauvais being under the control of the State. As early as the 11th c. English T. was famous throughout Europe, but the art did not develop in this country in the 15th and 16th centuries as it did on the Continent, where it then came more directly under the control of trained artists. T.-weaving was a source of great reputation to the city of Arras in mediæval times, the name arras having become, and even yet continuing (thanks to Shakespeare), synonymous with T. After the 14th c. pictorial backgrounds were introduced into tapestries, and the varieties and shades of colour employed were greatly extended. In the 16th c., Flemish towns, especially Lille and Brussels, became great centres of the manufacture, and it was in Brussels that the famous tapestries in the Vatican, worked from the well-known cartoons of Raphael, were produced. In the second half of the 18th c. the Gobelins work came to the front, and under the direction first of Oudry and subsequently of Boucher, 'a new departure' in T.-weaving was initiated, the object of which was, with endless shades of yarn, to reproduce exactly the effects of ordinary oil-paintings, and such still continues to be the object of the French T. artists. Lately the manufacture of T. has been revived in England, an establishment entitled the 'Royal T. Manufactory' having been erected for the purpose on land granted by the Crown at Old Windsor. Many choice works have already been executed, and the concern gives promise of becoming a grand national one. The term T. is applied to a variety of woven fabrics having a multiplicity of colours in their design, which, however, have no other characteristic in common with true T. Thus a particular kind of carpet woven with a printed warp is called a T. carpet (see CARPET), and the name is also commonly given to elaborately woven coloured curtains.

Tape-Worm (*Tænia*), a well-known genus of parasitic *Scolecida* (q. v.) belonging to the section *Platyelmia*, or that including the so-called 'flat worms.' It stands as the representative of a special division of *Platyelmia* (q. v.), that of the *Tæniada*. In this group the body of the adult consists of flattened joints, which terminate anteriorly in a head armed with minute hooklets and suckers adapted for adhesion to the mucous membrane of the intestine of its host. No mouth or digestive system is developed. The young undergo a curious and complex development, and the adult is hermaphrodite. 'Externally it presents a long, flattened, ribbon-like form, divided throughout its length into segments of oblong shape (fig. *c*), except at the anterior portion of the organism, where a rounded head (fig. *b*), supported on a series of constricted segments forming the neck, is found. The segments of the neck are small and closely set, but the succeeding joints gradually increase in size, those of the posterior extremity forming comparatively large oblong segments, each of which is loosely articulated to the neighbouring joints. The head (*b*), which consists of a small rounded body, is pro-

vided with a series of hooks and suckers, by means of which the animal adheres firmly to the mucous or lining membrane of

MORPHOLOGY AND DEVELOPMENT OF TÆNIADA.

a, Single segment (proglottis) of *Tænia solium*, magnified and enlarged, to show the branched ovary (*o o*), the generative pore (*x*), the male generative organs (*m*), and the water-vascular system (*w*); *b*, Head and neck segments of *Tænia solium* enlarged, showing the booklets and suckers; *c*. Portion of tape-worm (natural size), showing the alternating generative pores. *d*, Free ovum of *Tænia*, with the contained embryo (proscolex); *e*, *Cysticercus cellulosæ*, 'Scolex,' or encysted condition of *Tænia*; *f*, Magnified head of same, showing booklets, suckers, and constricted segments forming the neck (after Wilson).

the intestine. The segments are produced from the anterior extremity by a process of continuous gemmation or budding. Each fresh segment, as produced, occupies a position between the head and the segments previously formed; the older and most mature joints being thus situated at the posterior extremity of the body. The head thus constitutes the true animal, the various segments being regarded as sexual zoöids, or individuals produced by the asexual 'nurse,' formed by the head-segments. The mature and ordinary segments or 'proglottides' (*a*) are devoted solely to the reproduction of the animal, and contain each a complete generative apparatus, capable of producing fertilised ova, male and female elements being found in each segment. Although organically connected with each other, and by each other to the head segment, the last and most mature segments are continually being detached, and are excreted from the animal in whose interior the *Tænia* resides; but fresh and new segments are, as we have seen, being continually formed by the anterior extremity, and these gradually take the place of the segments which have fallen away.

'No trace of a digestive system is seen, the animal living by the imbibition and absorption, through the membranous walls of its body, of the nutritive juices of its host. The water-vascular system (*w*) is represented by a vessel running along each side of the body, communication between the vessels taking place by means of a transverse branch at the articulation of each segment with the neighbouring joint. The nervous system consists of two small anterior ganglia, from which filaments, proceeding to the posterior parts of the organism, are derived. The generative organs therefore occupy the greater part of each joint. The ovary, forming by far the greater bulk of the contained organs, consists of a main trunk or stem from which lateral branches are given off (*o o*). The male organ exists as a small convoluted tube (*m*) terminating in the posterior part of the segment in a minute vesicle. The efferent ducts of the generative organs open by a small pore (the *generative pore*) (*x*), situated on a minute papilla or eminence, placed, in *Tænia solium*, in the centre of the lateral margin of the segment. The position of the generative pore, varying throughout the group, has been used as a means of classifying the various members of the division. The tænia varies in length as the organism has existed for a longer or shorter period; in many instances specimens have measured many yards in length; at all times, however, the segments are produced with great rapidity, new and fresh growths continually taking place as the creature continues to exist in a favourable situation. Each segment being thus capable of producing an immense number of fertilised ova, and the number of segments being also great, it follows that a mature tænia is the receptacle of an almost incalculable progeny. But the history of the reproductive process, and the consideration of the various stages through which the ovum and embryo have to pass before the mature and adult form is attained, indicate a merciful provision of nature in thus limiting their growth, and preventing the otherwise dangerous increase of these animals.

'The stages in the life-circle of a tænia may be conveniently classed under six heads, corresponding to six distinct periods in the process of development. Beginning with the mature and sexually-perfect segments, or 'proglottides,' we find that these are being continually discharged from the alimentary canal of the animal in whose interior the tænia resides. The contained and already fertilised ova (fig. *d*) of the proglottis are liberated by the subsequent destruction and decay of the segment; and for the further development of these ova it is necessary that they should enter the alimentary canal of some warm-blooded vertebrate. Having gained admittance to the digestive system of such an animal, the external envelope of the ovum is dissolved, and the minute contained embryo is set free. Its rounded form is now observed to be armed at one point by six siliceous or flinty hooks, by means of which it bores its way through the tissues of its host until it reaches some organ, such as the liver, which forms a very noted resting-place for these creatures. Or it may take up its abode in the muscular tissues of the animal; but at any rate, and wherever its resting-place is found, the *proscolex*—as the little hooked travelling embryo is called—there develops around itself a cyst or bladder-like structure containing fluid, and constituting what is known as the *Scolex* or *resting-larva* (*e f*) of the tænia. Forms of this description, long known by the name of 'Cystic worms,' are now ascertained to be merely representatives of one of the transitionary stages in the development of tænia. Within the cyst or bladder of the scolex, the head and neck of the future worm are developed in the form of a small process growing from one of the walls of the cyst. The process of development cannot proceed further until the 'scolex' be liberated from the animal in whose tissues it thus lies buried. If, however, the flesh of an animal containing 'scolices' be swallowed by some other warm-blooded vertebrate, the further and final stages in the process of development will continue and be completed. Having thus gained access to the alimentary canal of this second host, the bladder-like cyst is next dissolved by the action of the digestive juices, and the scolex-embryo, now set free, attaches itself to the mucous membrane of the intestine by the already-formed hooks and suckers. The organism next begins to bud and to develop posterior segments, until at length the mature tænia or 'strobila,' with its lengthened train of joints or 'proglottides,' is produced; each joint being sexually mature, and capable of producing ova, which, in the course of their development, will repeat the wondrous cycle through which we have traced their predecessors and progenitors.

'In the case of the *Tænia solium* of man, the life-history of the future organisms has been ascertained with considerable exactitude. The ova liberated from the 'proglottides' may be swallowed by the sheep or pig, in which the 'proscolex' burrows its way through the tissues of either animal, to become the 'scolex.' In the pig the development of the cystic 'scolices' causes the disease peculiar to that animal, and known as 'measles.' No further change can take place in the 'scolex,' unless the pork so affected be eaten by man, in which event the 'scolex,' becoming liberated from the cyst, attaches itself to the intestinal mucous membrane, and develops into the 'strobila,' or mature tænia.

'The cystic forms or 'scolices' of one animal become thus developed into the tænia of another animal. The *Cysticercus fasciolaris*, or cystic worm of the mouse, is in this way developed into the *Tænia crassicolis* of the cat; and, in like manner, the *Cysticercus pisiformis* of the rabbit is the immature *Tænia serrata* of the dog and fox.'—Wilson's *Elements of Zoology*.

The *Tænia solium* whose life-history has just been described, is the common T. W. of man, the 'scolex' of which is obtained by man usually from underdone pork. From underdone beef man obtains another species of T. W. (*Tænia mediocanellata*), whilst another genus of T. W., the Russian T. W. (*Bothriocephalus latus*, distinguished by its larger head and by the generative pore being placed in the middle of the flat surface of the segments), also inhabits the human intestine, but occurs only on the Continent. The disease known as 'hydatids' affecting the human liver is caused by the presence of the 'scolices' of a T. W.

(*T. echinococcus*), which in its mature state infests the intestines of the dog. Thus man may serve as an intermediate or primary host for the 'scolices' of the T. W. of another animal.

The 'scolices' of T. W. are obtained by man, as already remarked, from imperfectly-cooked meat. They may also be obtained, however, from unwashed vegetable matter. The successful *treatment* of T. W. depends on the removal of the entire worm. If the 'head' be left attached to the intestinal mucous membrane, it is capable of producing another tænia by budding; hence the removal of the head is the important aim of the physician. The *remedies* most in vogue are oil of turpentine, santonin, kousso, kamela, and the extract of male fern—the last being most popular with practitioners. The treatment is begun by purgation with castor-oil or aloes, and the diet of the patient is to be kept low. After purgation, the extract of male fern is administered, one or two doses sufficing to remove the parasite. The patient is thereafter to be cautioned to exercise care in his dietary, and to use salt plentifully with his food.

Tapio'ca. See MANIOC.

Ta'pir (*Tapirus*), a genus of *Ungulate* or hoofed quadrupeds, belonging to the family *Tapiridæ*, in which the fore feet have four toes, while only three toes are developed on the hind feet. There is a small proboscis or trunk, and the skull is pyramidal. The nasal bones overhang the nasal cavity. The tail is very short. The skin is thick and hairy. There are six incisor teeth in each jaw, the canines are small, and there are fourteen molars in the upper jaw and twelve below. The American T. (*T. Americanus*), inhabiting S. American forests, has a mane. The colour is blackish brown. A second species (*T. villosa*) inhabits the Andes range. The Malayan T. (*T. Malayanus*) is larger than the preceding species. It wants a mane, and the colour is black, with a white back, rump, and belly. Another genus of *T. elasmognathus*, of which *E. Bairdii* is a familiar species, is found in S. America, and *T. Roulini* and *T. leucogenys* occur in the mountainous regions of Ecuador and the United States of Colombia.

Tapp'ing is an operation for the evacuation of a cavity overdistended with fluid. It is required in cases of ascitis and ovarian dropsy, to relieve the patient from the distress caused by distension. T. is usually performed in the linea alba, about halfway between the umbilicus and pubes, but the site may vary in cases of encysted dropsy, care being taken to avoid the course of the epigastric artery. It is also used in hydatid tumours of the liver, in hydrocele, in pericardial dropsy, in hydrocephalus, and for the relief of empyema and other effusions in the cavity of the pleura. The operation may be performed by the trochar and canula, or, better still, by means of the aspirator. When performed by the aspirator no air is admitted.

Tápti, a river of India, which flows from E. to W. across the centre of the peninsula, S. of the Satpura Mountains. It rises in the native state of Betul, and after a total course of 441 miles, first through the Central Provinces, and then through the Bombay plains of Khandesh and Gujerat, falls into the Bay of Cambay a little S. of Surat. It is only navigable in the lower portion of its course, and there also can it alone be used for artificial irrigation. In the upper portion, its narrow valley, which is naturally very fertile, is shut in between steep hills. Total area of drainage basin, 27,000 sq. miles.

Tar is a product of the destructive distillation of various organic substances; but the tars of commerce are obtained 1st from the distillation of coal, &c. for gas (gas T. or coal T.), and 2d from the distillation of wood (wood T.). Gas or coal T., which was formerly regarded as a troublesome and almost useless bye-product of the gas manufacture, is now a substance of so much value that it is second only in importance to the gas itself. As obtained in gas-works, gas T. is a dark-coloured ill-smelling heavy liquid of extremely complex chemical character, consisting of a mixture of fluid and solid hydrocarbon, acid, and basic substances. Its value in recent times has arisen almost entirely from the fact that it is the source of the wide range of important dyeing substances, which, derived from aniline, phenol, (carbolic acid), and anthracene respectively, may all be classed as T. colours. Coal naphtha obtained by distillation from coal T. is a mixture of several hydrocarbons of different degrees of volatility, the lightest being benzol and toluol, and the earlier part of the distillate is composed of a mixture of these two, and that part is utilised for the preparation of aniline as the basis of the Aniline Colours (q. v.). The material remaining in the retort after the light oils are distilled over constitutes artificial asphalt, but this on further distillation at a higher heat gives off 'heavy oils,' leaving in the retort pitch, a substance which when cold is hard, black, and shining, and breaks with a glassy fracture. The principal constituents of the heavy oil are carbolic acid (phenol), cresylic acid (cresol), and in the later stages of the distillatory process anthracene is obtained. All these substances are industrially important, carbolic acid not only as an antiseptic and disinfectant, but also as the basis of valuable dyes, and anthracene as the source of the now most important dyeing agent, artificial alizarine.

Wood T. is obtained as a bye-product in the destructive distillation of wood for the manufacture of pyroligneous acid (wood vinegar), and methyl alcohol (wood spirit). It is in the same way obtained in Northern Europe in connection with the preparation of wood charcoal, but the greater part of the T. of commerce (Stockholm T., Archangel T., &c.) is obtained by a very rude and wasteful process. A pit about 9 feet deep and 10 feet of surface diameter is prepared, the sides of which are lined with clods, and into this the wood to be distilled is piled. Air is admitted to the pit by channels passing down to its lower end, and in the best constructed pits there is a pipe for conveying away the incondensible gases, and a receptacle in which the T., &c., condense. Fir wood is principally distilled, it yielding from 13 to 14 per cent. of T., while non-resinous wood yields not more than 9 or 10 per cent. The condensed liquid contains wood vinegar and oil of turpentine; and, on re-heating, these more volatile products are driven off. When the second distillation is forced, a solid black resinous residue is obtained, which constitutes common pitch. Wood T. has several constituents in common with coal T.; its most characteristic fluid ingredients being hydrocarbons with methylic acetate, acetone, eupione, and creosote, with solid resinous matters, paraffin, anthracene, chrysene, &c. It possesses valuable antiseptic properties, chiefly owing to the creosote it contains, whence its principal value for most purposes is derived. In addition to its various uses in the arts for coating and preserving timber and iron in exposed situations, and for impregnating ships' ropes and cordage, it has various applications for external use in medicine owing to its antiseptic properties.

Ta'ra, a Tahiti name for *Colocassia macrorrhiza*, a species of *Araceæ* possessing the acrid properties pervading that order, yet supplying one of the principal articles of diet in the Sandwich Islands. This is obtained from the large starchy rootstock of the plant, which by washing and cooking is rendered an innocuous, pleasant, and nutritious food. The name T. is likewise given to the allied *Caladium esculentum*, of which both the tuberous roots and the leaves are similarly utilised (see COCCO).

Ta'ra Fern is *Pteris esculenta*, the rhizome of which, prior to the colonisation of New Zealand and the introduction there of the potato and corn, formed a great part of the food of the native population. The rhizome was collected from rich ground, cut into pieces about 9 inches long, and stacked for future use. When so required it was washed, dried in the sun, and roasted.

Tarana'ki, a county and formerly a province of New Zealand, situated on the W. coast of the N. Island. It has an area of 3495 sq. miles, two-thirds of which is forest, and possesses an amazingly fertile soil, but settlement has been retarded by the lack of a harbour and by hostilities with the Maoris. The coast is lined for many miles by a deposit of titaniferous iron sand, from 2 to 5 feet deep, from which steel of the finest quality has been made. The pop. of the county at the census of 1878 was 9463, and that of New Plymouth, the chief settlement, 2680. The district derives its name from the remarkable extinct volcano called by the Maoris T., and by Europeans Mount Egmont.

Tarann'on Shales, a series of dark-coloured beds, attaining a collective thickness of nearly 2000 feet. They occur in Radnor and Montgomeryshire, occupy an intermediate position between the Llandovery and Wenlock formations, and are almost destitute of fossils.

Tarantell'a, a rapid Neapolitan dance in $\frac{6}{8}$ time, usually accompanied by the tambourine. The word is derived from the *tarantula* spider.

Tar'antism (Lat. *tarantula*, 'a ground-spider') is a peculiar disease which prevailed epidemically during the Middle Ages, the most prominent characteristics being leaping and dancing. T. was first described by Nicholas Perotti in the middle of the 15th c. It was a matter of common belief that T. was caused by the bite of the tarantula, a ground-spider common in Apulia. Those who were bitten generally fell into a state of melancholy, and appeared to be stupefied and scarcely in possession of their senses. This condition was, in many cases, united with so great a sensibility to music, that at the very first tones of their favourite melodies they sprang up, shouting for joy, and danced on without intermission, until they sank to the ground exhausted and almost lifeless. In others, the disease did not take this cheerful turn. They wept constantly, and, as if pining away with some unsatisfied desire, spent their days in the greatest misery and anxiety. Others, again, in morbid fits of love, cast their longing looks on women; and instances of death are recorded, which are said to have occurred under a paroxysm of either laughing or weeping. Perotti describes it not as a new disease, but as one well known in Apulia. T. was at its greatest height in Italy in the 17th c., and it was customary for whole bands of musicians to traverse Italy during the summer months, the cure of T. in the different towns and villages being undertaken on a grand scale. See Hecker's *Epidemics of the Middle Ages* (Lond. 1844; trans. for New Sydenham Society).

Taran'to, a town in the province of Terra d'Otranto, Italy, on the Gulf of T., 72 miles S. of Bari by rail. A large arm of the sea, 6 miles long and 2 broad, runs up N.E. from the Gulf, and T. is built on a rocky oblong islet in the middle of this inlet. The town is closely built, and is intersected lengthwise by three parallel narrow streets. In the centre a long street runs N.W. and S.E. To the N. is the Strada Garibaldi, near the Mare Piccolo, which abounds in fish. This street is inhabited by fishermen, who speak a peculiar dialect which still bears the mark of their Greek origin. On the S. shore the Strada Vittorio Emanuelo forms the newest portion of the town. In the centre of the town is the Cattedrale de San Cataldo, in the S.E. corner the Castello (erected by Karl V.), and on the peninsula to the E. of the modern city are ruins of an ancient circus, ancient villas, &c. Over this ground modern villas are once more extending. The S.E. end of the island on which T. stands was formerly attached to the mainland, with which it still communicates by means of a bridge. At its other or N.W. extremity also a long bridge unites it with the mainland and prevents vessels of any size from taking advantage of the safe anchorage afforded by the *Mare Piccolo*. The trade of T. consists chiefly in the vegetable products of the fertile neighbourhood, and in the fish and oysters which are procured in great quantities from the Mare Piccolo. In 1877, 36 British vessels of 12,139 tons, chiefly engaged in the oil trade, entered and cleared from T. The exportation of oil was 4768 tons, of which 3094 went to Great Britain. The total value of imports (Consular Report for 1878) was £28,000, and of exports £380,000. Pop. (1877) 28,739. T. (Lat. *Tarentum*, Gr. *Taras*) was originally a Greek colony founded by Spartan emigrants under Phalanthus in B.C. 708, and in consequence of its splendid harbour rose to be the greatest city of Magna Græcia. At constant war with their neighbours, the Tarentines gradually extended their territory. They first came into contact with the Romans at the close of the 4th c. B.C., and concluded a treaty with them in 302. This peace, however, was broken in 281, when Pyrrhus (q. v.) came to the aid of the Tarentines, who after a protracted struggle surrendered to Rome in 272. During the Punic Wars Hannibal coveted the city, and it was betrayed to him in 212. In 209, however, it was recaptured and plundered by the Roman general Fabius. After this it sank into insignificant tranquillity. On the fall of the Western Empire it was successively taken by Goths, Lombards, and Saracens, but was occasionally attached to the Eastern Empire. It was united to Naples by Robert Guiscard in 1063.

Taran'tula (*Lycosa tarantula*), a species of Spider (q. v.) inhabiting the S. of Europe, and notable for the supposed effects of its bite on the human organisation in inducing a kind of maniacal excitement and dancing. The name is derived from the town of Taranto in Italy, where this creature is common. The T. belongs to a group of spiders forming the family *Lycosidæ*, or that of the wolf-spiders. The body is covered with a fine down, and the legs are long and hairy.

Tarare, a town of France, department of Rhone, on the Tardine, among the Beaujolais mountains, 21 miles N.W. of Lyon by rail. It has two fine churches of the Madeleine and St. André, and manufactures fine muslins, tarlatans, plush, velvets, and other textures, to the value of 7,000,000 francs yearly. Pop. (1876) 14,569.

Tarascon, a town of France, department of Bouches-du-Rhone, on the Rhone, opposite Beaucaire, 13 miles S.E. of Avignon by rail. It has a church of St. Martha (1187) and an old rock-perched castle, built by King René in the 15th c. There are large industries in linens, woollens, cottons, silks, leather, brandy, oil, and vinegar. The neighbourhood produces teasels, madder, almonds, &c. Pop. (1876) 13,489.

Taraxacum. See DANDELION.

Tarazo'na (the ancient *Turiaso*), an old town of Spain, province of Zaragoza, on the Queiles, an affluent of the Ebro, 12 miles S.S.W. of Tudela. It has a fine cathedral with a spire of brick. Pop. 6400.

Tarbagatai', a town in Chinese Turkestan, near the Russian frontier, situated in a fertile plain 170 miles E. of Lake Balkash. It is the emporium of an extensive commerce between China and Russia. Pop. 3000, besides a garrison of 1000 men.

Tarbes, a town of France, department of Pyrenees-Hautes, on the Adour, 100 miles S.W. of Toulouse by rail. It has a cathedral (12th c.). The castle of the Count of Bigorre is now used as a prison. T. is a central depôt for the French artillery. It is an entrepôt for Spanish trade, and has manufactures of wool, flax, paper, playing-cards, &c. Pop. (1876) 21,293. A bishopric was founded here in 470.

Tare, an obscure word that from a wide application to species of *Lathyrus*, *Ervum*, and *Vicia* growing among corn, is now generally limited in botanical books to the genus or subgenus *Ervum*, and is by the farmer applied to the cultivated Vetch (q. v.). Of *Ervum* the most important species is *E. Lens*, which yields a 'pulse,' used boiled either whole or split, or ground and mixed with flour. The legumes are also eaten as a vegetable. The smooth T. and the hairy T. (*E. tetraspermum* and *E. hirsutum*) are frequently met with in cornfields, about hedges and waste places in Britain. The 'tares' of the New Testament are believed to be Darnel-grass.

Tare and **Tret**, in commerce, are certain deductions made from the gross weight of goods. The former is made by taking into account the weight of the packing, and may be *real* when the true weight of the packing is known, or *average* when it is estimated from similar known cases, or *customary* when a uniform value is deducted. The *tret* is a deduction of 4 lbs. in every 104 lbs.—*i.e.*, $\frac{1}{26}$th of the weight *less the tare*—for the waste which certain kinds of goods are liable to from dust.

Tar'get, a mark set up to be fired at: also a synonym of *targe*, a small shield formerly in use. An archery T. consists of leather or canvas stuffed with straw, and painted with concentric rings of different colours. The centre circle is golden, and surrounding it are rings of red, white (or blue), black, and white again, with a green border. A T. for rifle practice is formed of plate iron. In the British army, an oblong plate, measuring 6 feet high and 2 feet broad is designated a T.; it is only used for skirmishing practice. Two such targets are erected side by side for 'third-class' shooting (distances up to 300 yards); three for 'second-class' (distances 300 to 600 yards); and four for 'first-class' (distances 600 to 800 yards). The divisions on the targets are three in number, viz. 'bull's-eye,' 'centre,' and 'outer.' The first is indicated by a black circle, and the second by a black ring painted on the white ground of the T.: all outside of the 'centre' ring constitutes the 'outer.' The value in marks attached to the 'bull's-eye' is 4, to the 'centre' 3, and to the 'outer' 2. The dimensions of the divisions and the T. for different classes are as follows:—

Name of Division.	Dimensions of Divisions, and T.		
	Third-Class (up to 300 yards).	Second-Class (300 to 600 yards).	First-Class (600 to 800 yards).
Bull's-Eye.	1 foot diameter.	2 feet diameter.	3 feet diameter.
Centre.	3 feet ,,	4 ,, ,,	6 ,, ,,
Outer.	Remainder of T.	Remainder of T.	Remainder of T.
	6 feet by 4 feet.	6 feet square.	6 feet by 8 feet.

Hits are signalled by a 'marker' from an iron mantlet at the side of the targets. Without exposing himself he indicates by means of a disc mounted on a pole the position of the hit. A white disc denotes a 'bull's-eye,' a red disc a 'centre,' and a black disc an 'outer.' Simultaneously with signalling, the marker effaces the bullet-mark with a paint-brush fixed behind the disc. A *ricochet, i.e.*, a shot which strikes the ground before the T., is signalled by waving a red flag horizontally in front of the T., and it is registered as 'R.' The targets adopted by the National Rifle Association at Wimbledon, and by affiliated associations throughout this country, differ from military targets. Wimbledon targets have four divisions, called 'bull's-eye,' 'inner,' 'magpie,' and 'outer,' and the value in marks attached to each is respectively, 5, 4, 3, and 2. The signalling disc for a 'bull's-eye' is coloured white, for an 'inner' red, for a 'magpie' black and white, and for an 'outer' black. The dimensions of the divisions of the Wimbledon targets for 1878 were as follows :—

Designation of Division.	Dimensions of Divisions of Wimbledon Targets (1878).		
	At 200 yards.	At 500 and 600 yds.	At 800 to 1000 yds.
Bull's-Eye.	8 inches in diam.	2 feet in diam.	3 feet in diam.
Inner.	1 foot ,,	3 ,, ,,	4½ ,, ,,
Magpie.	2 feet ,,	4 ,, ,,	6 feet square.
Outer.	Remainder of T. 4 feet square.	Remainder of T. 6 feet square.	Remainder of T. 12 feet by 6 feet.

Targowitz', a small town (pop. 2000) in the government of Kiev, Russia, noted for the T. 'Confederation' or plot formed here (14th May 1792) by five Polish nobles, who were instigated by Catherine II. Its object was the overthrow of the new constitution, and it led to the second partition of Poland (q. v.).

Tar'gums ('translations,' from Aramaic *tirgêm*, 'to translate, explain') are the Chaldee paraphrases and versions of the Old Testament. In the post-exilian times, as Hebrew gradually became unknown to the common people, the public reading of the law was accompanied by an oral paraphrase (*cf.* Nehemiah viii. 8). This custom received a great impulse as the synagogue system gained prevalence, and the T., though long preserved by mere oral transmission, may have begun to be fixed in writing as early as about 50 A.D. None of the extant T. covers the whole Old Testament, but from one and another we have versions of all the books except Ezra and Nehemiah. Onkelos, to whom the oldest of these, a targum on the Pentateuch, is attributed, was, according to the Talmud, a proselyte, the pupil and friend of the Gamaliel who died not long before the destruction of the Temple. His targum, in general plan at least, was probably extant before 50 A.D. Its language resembles the Biblical Chaldee, and is almost quite free from traces of late idiomatic corruptions. As a translation it is faithful, generally very literal, gives often clever explanations, and errs, as a rule, only in obscure passages. Explanatory additions of any length are mostly confined to the poetical portions; and alterations of the text, due to Jewish opinions and theological presuppositions, are mainly mere substitutions for anthropomorphisms and the like, so that this targum may fairly be styled a translation, not a paraphrase, and its author must have possessed a strong exegetical tradition. Jonathan ben Uziel, the reputed author of the targum on the *prophetæ priores et posteriores*, is said to have been a pupil of Hillel. But this targum is certainly much later than that of Onkelos, being far less pure in idiom and much more paraphrastic. Even the historical books are often expounded, and in the prophets the exposition frequently almost passes into an actual Haggada (q. v.). Next we have two T. on the Pentateuch in a Jewish-Aramean dialect which approaches Syriac, and has many foreign elements. One of these, which is complete, is ascribed to Jonathan ben Uziel; the other, in appearance a mere collection of fragments, is styled the 'Jerusalem Targum.' The former rests entirely upon the targum of Onkelos, but is, besides, a compendium of all the Halachas (q. v.) and Haggadas (q. v.) on the text. The theology, angelology, historical allusions—in short, the entire colour and contents—point not to Jonathan's time, but to a date not earlier than 750 A.D. The Jerusalem targum is probably not so much the remnant of a paraphrase earlier than the pseudo-Jonathan, as a Haggadic supplement and collection of marginal glosses and variations upon Onkelos. It is older than the pseudo-Jonathan, and resembles the Mishna (q. v.) in dialect, as the latter does the Talmud (q. v.). As regards the T. on the Hagiographa, traditionally ascribed to Joseph the Blind, Psalms, Proverbs, and Job are probably of the same age and of Syrian origin; that on the five Megilloth (Canticles, Ruth, Lamentations, Ecclesiastes, Esther) is probably by one author who flourished later than the Talmudic epoch, and wrote in a dialect midway between east and west Aramaic. This targum is less a translation than a continuous Haggadic commentary. Of similar Haggadic character and late date is the targum on Chronicles. That on Daniel contains manifest allusions to the Crusades, and belongs probably to the time of the brief Christian rule at Jerusalem in the 12th c. A targum on the apocryphal portions of Esther may merely be mentioned. See article 'Thargumim' in Herzog's *Real-Encyclopädie für Theologie und Kirche*; Emanuel Deutsch, *Literary Remains*; Jost, *Geschichte des Judenthums und seiner Sekten* (1857-59); Grätz, *Geschichte der Juden*.

Tari'fa, a seaport of Spain, province of Seville, the most southerly town of Europe, on the Strait of Gibraltar, at Punta Marroqui, 20 miles S. W. of the town of Gibraltar. It is thoroughly Moorish in aspect, dingy and crowded, girt with embattled walls, and defended by an old castle and a modern fort, the latter situated on the Isleta de T., with which the town is connected by a causeway. The harbour is shallow, but T. has important anchovy and tunny fisheries. Pop. 12,000. The Carthaginian *Josa* and the Roman *Julia Traducta*, the town is said to have been named by the Moors after Tarif Ibn Malik, who landed here before the conquest of Spain to reconnoitre. It was held by the English against a strong French force under Laval and Victor in 1811.

Tar'iff, a table showing the rate of duties, bounties, and drawbacks charged on goods imported or exported from one country to another. The name is derived from the Moorish port of Tarifa (q. v.), where duties were levied on African commerce. Tariffs are regulated according to fluctuations of trade and the relations of international commerce. At present the British T. imposes no export duty, and an import duty on only twenty articles. In the United States the term is exclusively applied to a law of Congress fixing the import duties.

Tar'latan, a light, thin, cotton fabric used for ladies' dresses, &c. It is imported into England from France and Switzerland. Tarare (q. v.), in France, is the principal seat of its production.

Tarn, a department in the S. of France, in the basin of the T., a tributary of the Garonne. Area, 2216 sq. miles; pop. (1876) 359,232. The southern half is occupied by mountains of the Cevennes system, but affords good pasturage and building timber; the northern half is level. T. yields abundant crops of pease, wheat (2,512,000 bushels in 1876), and fruit, and breeds good sheep, swine, and geese. Coal, iron, marble, and gypsum are found in the soil. There is some weaving. The capital, Albi (q. v.), gave name to the Albigenses (q. v.), and 12 per cent. of the population are still Protestants.

Tarn-et-Garonne, a department in the S. of France. Area 1436 sq. miles; pop. (1876) 221,365. It is a level plain crossed by slight hills and watered by the Garonne. The country is fruitful and well tilled, and produces excellent wheat (3,644,000 bushels in 1876) and corn, pease, vegetables, tobacco, flax, and hemp. Horses and cattle are largely reared. Coal, marble, iron, &c., are found. Woollen, cotton, silk-hosiery, and quill-pen manufactures, together with the making of wine and brandy, are the chief industries. Of the population 16 per cent. are Protestant. Montauban (q. v.) is the chief town.

Tarno'pol, a town of Galicia, Austria, on the Sereth, 87 miles S.E. of Lemberg by rail. It has a Roman Catholic and a Greek church, a Jesuit college, upper gymnasium, &c. There is considerable trade in corn and other agricultural products. A great horse-market with horse-races is held annually. The pop., of which one-half are Jews, was (1870) 20,087.

Tarnov', a town of Galicia, Austria-Hungary, 47¾ miles E. of Cracow by rail on the navigable river Dunjec, not far from the mouth of the Vistula. It is the seat of a bishop, and has a town-house and cathedral with curious statues of the princes of Ostrog and T. The chief trade is in corn, linen, leather, and timber. Pop. (1870) 21,779, of which one-third were Jews.

Tarpau'lin, a waterproof covering formed of canvas coated with tar and dried. It is employed to cover hatchways, boats,

&c., on shipboard, and also to protect agricultural produce, roofs in process of construction, goods in transit, and other articles, from the effects of the weather.

Tarpei'an Rock, the western cliff of the Capitol in Rome. Once, when the Sabines besieged Rome, Tarpeia, daughter of the Roman general, offered to show them a secret entrance for what they wore on their left arms—meaning their bracelets. They accepted her offer; but, to punish her perfidy without breaking their promise, crushed her with their shields. The spot was hence called the T. R., and persons accused of aiming at the 'restoration of the monarchy,' *i.e.*, of despotism, were thrown from it. In the garden of the so-called *Casa Tarpeia*, on the Monte Caprino, is still shown a *Rupe Tarpeia*.

Tarquin'ii, The, according to the Roman legend which once passed for history, were a noble Roman family of foreign origin. Its chief members were **Lucius Tarquinius Priscus**, fifth king of Rome, who came from the Etruscan city of Tarquinii. His wealth and ability soon procured him influence in his new home. He became intimate with Ancus Martius, the reigning monarch, and at length succeeded to the throne. He reigned for thirty-eight years, and increased the power of Rome abroad and her splendour at home. He conquered in war the Latins, Sabines, and Etruscans. To him is ascribed the construction of the vast sewers (*cloacæ*), which still remain intact, of the Circus Maximus, the Forum, and the Capitoline Temple. He is also credited with several important changes in the constitution of the state. In the midst of his power he was murdered by the sons of Ancus Martius.—**Lucius Tarquinius Superbus**, seventh and last king of Rome, succeeded to power by violence, and ruled by the same. He disregarded or abrogated popular rights and privileges. He was engaged in frequent wars, and as he was a successful commander he soon made Rome the first of the Latin cities. He took the Volscian city of Suessa Pomatia and the Latin city of Gabii. He was feared abroad and hated at home, and an opportunity for that hatred to manifest itself soon occurred. Sextius, the king's son, conceived a passion for the beautiful and virtuous Lucretia, wife of his cousin Collatinus. He gratified this passion by force and fraud. The outraged wife killed herself, but not till she had made her husband and father aware of the crime of Sextius. Along with Brutus (q. v.), they roused the people by the recital of the disgraceful story, and Tarquinius and all his family were for ever expelled from Rome (510 B.C.). Tarquinius made several attempts to regain his lost kingdom; first with help from the people of Tarquinii and Veii, again with the assistance of Lars Porsena, and for the last time by the aid of the Latin states. All were unsuccessful. Finally Tarquinius retired to Cumæ, where he died.

Tarr'agon. See ARTEMISIA.

Tarrago'na (Phœn. *Tarchon*, Lat. *Tarraco*), a fortified seaport of Spain, and chief city of a province of the same name, on the Mediterranean, at the mouth of the Francoli, 63¼ miles W.S.W. of Barcelona by rail. It consists of an upper and under town; the under protected by a range of bastions fronting the Francoli, the port, and mole, while an inner line of works protects the rise to the upper town, which is built upon a limestone rock 760 feet high, is girdled with ramparts and outworks. T. has a noble Gothic cathedral (1089-1131), and many interesting Roman remains. The harbour is accessible only for small vessels, but there is a large trade in corn, wine, oil, and fruits. Pop. (1877) 19,002. T. was founded by the Phœnicians, and was the capital of the Roman province of Tarraconensis. In 1813 it was plundered by Suchet.

Tarr'ytown, a town of New York, U.S., on the Tappansee, 26 miles N. of New York by rail. It has eleven churches, two banks, and two newspapers. Major André was captured here. T. was the home (Sunnyside) and contains the tomb of Washington Irving. Sleepy Hollow is in the neighbourhood. Pop. (1877) about 5000.

Tar'shish, an important maritime city frequently mentioned in the Old Testament, is commonly identified with the Phœnician colony of Tartessus in the S.W. of Spain. Its name first occurs in Gen. x. 4, in connection with the Grecian races, and we afterwards hear of it as an important part of the Tyrian kingdom, and as exporting silver, iron, tin, lead, and precious stones. 'Ships of Tarshish' were the largest merchant vessels known to the Hebrews, and were so called either as built on the model of the T. ships (compare the English 'East Indiamen'), or if the derivation of T. from the Sanskrit *tarishna*, with the sense of 'sea,' 'ocean,' be correct, as equivalent to 'deep-sea vessels.'

Tar'sia (Ital. *intarsiatura*, 'inlaid work'), a kind of inlaid woodwork, figures and other designs being represented by pieces of differently tinted woods inlaid in panels of walnut or other wood. T. was brought to considerable perfection in Italy during the Renaissance, and was employed in decorating the choirs of churches, &c.

Tarsus, a scientific name used to denote the region popularly known as the ankle, and which in man consists of 7 bones —*os calcis* (heel), *astragalus*, *calcaneum*, *cuboides*, *naviculare*, and three *cuneiform bones*. The astragalus receives the lower extremity of the *tibia* or shin-bone, and thus assists in forming the ankle-joint. The T. of other vertebrates may differ very widely from that of man. There are as many as 9 ossicles in the T. of the salamander, and the number is reduced to 3 in serpents.

Tar'sus, the ancient capital of Cilicia, on the Cydnus, 12 miles above its mouth, and nine hours' journey from Adana. Traditionally founded by Sardanapalus, it is first mentioned by Xenophon as captured by Cyrus. After passing successively under the dominion of the Seleucidæ and Ptolemies, it was made by Pompey the capital of a Roman province (66 B.C.). Here Alexander caught a fever from bathing in the icy Cydnus (333 B.C.), and here Cleopatra was royally received by Antony (41 B.C.), who conferred on T. the Roman franchise. Under the Romans T. rose to be a great seat of philosophy and a place of much commercial importance. It was the birthplace of St. Paul and of seven Stoic philosophers, and here the emperors Tacitus and Maximinus died. Since its capture by the Saracens it has gradually declined, and is now a small dirty town (*Tersus*), with no remains of its former grandeur, and a pop. of 12,500.

Tar'tan (derivation uncertain), a woven cloth having chequered patterns in various colours. It was formerly much worn in Scotland, and certain patterns are still known by the names of the various Highland clans who adopted them. 'Fancy' tartans have of late years somewhat destroyed the individuality of the 'clan' tartans. T. was originally and is still extensively made of wool, but other fibres, such as silk, are now also used. Tillicoultry, Bannockburn, &c., are noted seats of the Scotch T. manufacture.

Tar'tar, Cream of, or **Acid Tar'trate of Po'tash**, is used in medicine as a cathartic, diuretic, and refrigerant in febrile and dropsical affections, and in acute desquamative nephritis. As a refrigerant or diuretic it may be given in doses of from 20 to 60 grains; as an aperient, 60 to 120 grains; and as a cathartic, in doses of from ½ to 1 ounce.

Tartar'ic Acid ($C_4H_6O_6$), the most important of vegetable acids, occurs in many fruits, especially the grape. During fermentation the juice of the grape deposits the substance known in commerce as *tartar* or *ergol*. This substance, essentially the bitartrate of potash, is hardly soluble in cold water, but may be crystallised by cooling from its solution in boiling water. Thus purified it is known as *cream of tartar*, having the composition $KHC_4H_4O_6$. This salt is acid to test-paper, and from it the neutral salt ($K_2C_4H_4O_6$) may be obtained by evaporation of the solution of the bitartrate previously neutralised with potash. The crystallised T. A. resembles this salt in composition, having hydrogen instead of potassium. To prepare it, the impure bitartrate is boiled in water, and carbonate of lime added as long as effervescence continues, indicating the escape of carbonic acid. The action results in the formation of the insoluble tartrate of lime, and the soluble tartrate of potash, and then by the addition of chloride of calcium the potassium is replaced altogether by the lime, chloride of potassium appearing in solution. The lime salt is then strained and boiled with dilute sulphuric acid, when sulphate of lime remains undissolved, and from the filtered solution T. A. may be obtained in transparent prismatic crystals by evaporation. The acid is soluble in about three-fourths of its weight in hot water. When kept, this solution is found to deposit a fungoid growth, acetic acid at the same time appearing in the solution. Crystals of T. A. fuse at 182° C. without loss of weight, but the fused mass is found to consist of a mixture of two new acids which are uncrystallisable. The one, *metatartaric*

acid, has apparently the same formula as T. A., and its salts the metatartrates are more soluble in water than the tartrates, and may be converted into the latter by boiling. The other acid, *isotartaric acid*, has the constitution $HC_4H_5O_6$; and its salts, also much more soluble than the tartrates, may be similarly converted by boiling. At 190° C., T. A. loses water, and is converted into a white insoluble substance known as tartaric anhydride ($C_8H_8O_{10}$). The most important of the salts of T. A. is the double tartrate of antimony and potash, commonly called tartar emetic. It is prepared by digesting cream of tartar with teroxide of antimony, which has been prepared by boiling antimony with sulphuric acid. From the boiled filtered solution octahedral crystals are deposited, having the composition $2(KSbOC_4H_4O_6)$ Aq. The water of crystallisation is expelled at 100° C. At 260° C. an additional molecule of water is lost, but the new salt ($KSbC_4H_2O_6$) may be reconverted into tartar-emetic by dissolving it in water. Compounds analogous to tartar-emetic have been obtained in which antimony is replaced by borax or arsenic, and potassium by silver lead or sodium. Rochelle Salt (q. v.) is a double tartrate of potash and soda, prepared by neutralising cream of tartar with carbonate of soda. By deoxidation T. A. may be converted into malic and succinic acids, which have the compositions $H_2C_4H_4O_5$, and $H_2C_4H_4O_4$ respectively; and these by suitable means may be reconverted in T. A.

Tar'tars or **Ta'tars** (from a Turanian root signifying 'to stretch' or 'to pitch a tent'), the name originally of the Mongolian races, but since the conquests of Chingis-khán (1227) extended to all the tribes under Mongolian sway. Promiscuously applied by mediæval chroniclers to the nomadic bodies that in the 13th c. burst upon Europe from the Asiatic steppes, it owes its rise to a fancied connection with *Tartarus*, the bottomless pit, whose opening, as foretold in the Apocalypse, was now as it seemed fulfilled. '*Tartari, quasi tartarii, exeuntes ad instar dæmonum solutorum a tartaro*,' says Matthew Paris (*Hist. Major*, p. 546). By philologists the term Tartaric is sometimes loosely applied to the entire Turanian family of languages, but usually it is restricted to that class of Turanian Languages (q. v.) of which Turkish stands as the type.

Tar'tarus, according to Hesiod, was the son of Æther and Gæa, and father of the giants Typhœus and Echidna. In the *Iliad*, T. is a place as far beneath Hades as heaven is above the earth—a dark desolate region into which Jews hurled the rebel Titas. Afterwards the name was sometimes used as a synonym of Hades, but more frequently to denote a place of punishment.

Tar'tary, the geographical name of the empire of Chingis-khán and his successors, applied during the Middle Ages to the central parts of Asia and eastern Europe from the Sea of Japan to the Dnieper, but subsequently restricted to Turkestan (q. v.) in Asia, and chiefly to the Crimea (q. v.) in Europe.

Tartuffe', the name of the chief character in what is generally recognised as the finest of Molière's comedies, has come to be synonymous with 'hypocrite' throughout the world, just as 'Pecksniff' is in English-speaking countries. The character of T. was probably suggested by a certain Abbé Roquette, a parasite of the Prince of Conti, and the great 'situation' of the piece (act iii. scene 6) was borrowed from a novel of Scarren's, who again borrowed the idea from a Spanish work. The origin of the name T. is connected by a rather apocryphal anecdote with the Italian word *tartufi*, meaning 'truffles.' The priests, with a fine instinct for 'putting on the cap where it fitted,' considered themselves deeply aggrieved by the character of T.; and though the comedy was written in 1664, it was not till 1669 that Molière obtained permission to perform it publicly and in full. When it was at last produced it ran for three months. An English adaptation of it by Bickerstaff still holds the stage under the title of *The Hypocrite*, 'Dr. Cantwell' being the name given to the English T.

Tashkend, the chief town and military headquarters of Russia in Turkestan (q. v.), situated in a fertile, orchard-covered valley, at the foot of the Alatan and Chatkal mountains, and on the Saralka, a feeder of the Djirhik, which joins the Sir-Daria 165 miles above fort Chulak. The old city, 7 miles in circuit, is girt with a mud wall, pierced by nine gates. It has 270 *maals*, 310 mosques (partly in ruins), 17 colleges, 11 baths, 15 bazaars filled with shops, and two rivulets are distributed through it by many canals, which also serve various mills. The Russian city is regularly built, and has broad, well-lighted streets, lined on both sides with streamlets and rows of shady trees. The Russian citadel, an immense structure, comprises barracks and magazines, and is defended by a bastioned wall. One of the largest cities of Central Asia, T. has long been the centre of an important trade. Here converge roads from Kashgar, Samarcand, Orenburg, and Siberia. The trade is mainly in cotton fabrics, metal wares, and silk, and in the second half of of 1873 the value of foreign goods exchanged amounted to 10,600,000 rubles. A great caravanserai has been recently erected for the wholesale trade. Pop. (1871) 76,072, of whom 46,000 are Sartees, some 3000 Russians, and the rest Kirghis, Usbegs, and Jews, the last occupying a separate quarter. T., the *Shash* of the Middle Ages, was the capital of the Kirghis Cossacks from the 16th c. It was occupied in 1810 by the Khan of Khokan, from whom it was taken by the Russians, 12th September 1867. General Kaufmann has here his residence.

Tas'man, Abel Janssen, a celebrated Dutch navigator, was born probably at Hoorn, about 1600. Commissioned by Van Diemen, the governor of the Dutch Indies, to explore the S. coast of the Australian continent, he left Batavia with two ships, August 14, 1642, passed Mauritius October 8, and on November 24 discovered a coast which he called Van Diemen's Land, but which is now known as Tasmania. He sailed along its S. and E. coasts without being aware of its insular character, and proceeding further E. discovered (December 13) the southern island of New Zealand (January 6), the Fiji Islands, returning to Batavia, June 15, 1643. His account of this voyage was reprinted at Amsterdam in 1722. On the 29th January 1644 he set out on a second voyage to explore the coasts of New Guinea and Australia, from which he never returned.

Tasma'nia, formerly called **Van Diemen's Land**, an island forming a British colony, and lying to the S. of Australia, from which it is separated by Bass Strait (q. v.). It is situated between 40° 33'–43° 33' S. lat. and 144° 30'–148° 30' E. long., is heart-shaped, and its greatest measurements are 210 miles from N. to S. and 190 miles from E. to W. Including fifty-five smaller islands adjoining it and subject to its government, T. has an area of 26,215 sq. miles, or more than four-fifths of that of Ireland. The coast is bold and rocky, and in the S.E. is broken by a number of large bays and inlets, of which the chief are Norfolk, Frederick Henry, and Storm bays, and the estuaries of the Derwent and Huon. Oyster Bay on the E., Ringarooma and Anderson Bays and the estuary of the Tamar on the N., and Macquarie Harbour and Port Davey on the W., are the other principal indentations of the coast-line. The chief islands belonging to T. are the Furneaux (q. v.) group at the eastern entrance to Bass Strait, and Hunter and Robbins Islands at its western entrance, with the very irregularly shaped Bruni Island on the S.E. coast, and Maria Island on the E.

The general aspect of T. is that of a mountainous, wooded, and well-watered country. The mountains may be divided into two systems, occupying respectively the eastern and western portions of the island, and separated by a valley which crosses its centre from N. to S. The mountains, which are usually wooded to a considerable height, abound with bold peaks, deep ravines, and grand basaltic cliffs often hundreds of feet in height. The loftiest summits in the eastern range are those of Ben Lomond (5010 feet) and Mount Barrow (4644 feet). The western mountains consist of a number of ranges diverging from a table-land 3000 feet high, and the highest peaks are Cradle Mountain (5069 feet), Mount Humboldt (5502 feet), Frenchman's Cap (4756 feet), and Ironstone Mount (4736 feet). There are many other mountains from 3000 to 4500 feet high. Geologically the mountain-ridges of T. are chiefly composed of greenstone, while in the S.W. and N.E. districts granite and quartz are found in immense masses. Sandstone, clay-slate, and limestone are abundant on the bases of the mountains and in the valleys. The chain of mountainous islands stretching from T. to Australia seems to indicate a former connection between the two. The central table-land contains several lakes, of which Great Lake, the largest, has an area of 44 sq. miles. From these lakes issue the principal rivers and their tributary streams. The largest of these, and also the largest stream in

the colony, is the Derwent, which flows S.E., as also does the Huon, and both have navigable estuaries. The E. coast has no large river, but on the N. the Forth, Mersey, and Tamar are of considerable size. The last is properly only an estuary, like the Humber in England, being formed below the confluence of the North and South Esk. It is 40 miles long and navigable. The Arthur, Pieman, and Gordon are the largest rivers draining the western slope. The Tasmanian rivers usually run in narrow valleys, have a rapid descent, and are liable to heavy floods.

The climate of T. is one of the mildest and healthiest in the world, free from extremes alike of heat and cold. In summer the hot winds from Australia are tempered by their passage across Bass Strait, while in winter snow rarely falls except on the high lands. At Hobart Town thirty years' observations show the mean temperature during summer to be 62°, during winter 47°, and for the year 54½°. At the same place the mean annual rainfall is 22·71 inches, but for the whole colony it is 35 inches, and on the W. coast it is much heavier, having reached 75 inches.

The fauna of T. resembles that of Australia, the chief indigenous mammals being the kangaroo, wallaby, wombat, and opossum. In the so-called native tiger and devil (see THYLACINE and DASYURE) it also possesses predatory marsupials which in Australia are now found in a fossil state only. The birds number 171 species, of which thirteen are peculiar to T. Insects are very numerous, and the reptiles include thirteen species of snakes, most of which are venomous, tortoises, and lizards. The sea abounds with fine fish, and whales and seals are also found, though less numerous than formerly. Salmon and brown trout have been successfully acclimatised by means of ova brought from Britain. Sheep, cattle, and horses thrive exceedingly, while rabbits have multiplied to such an extent as to become a serious pest.

The flora of T. also closely resembles that of the Australian continent, and among the principal trees which compose its magnificent forests are various kinds of eucalyptus (some specimens 300 feet high, discovered in 1877) and acacia, the Huon pine (*Dacrydium Franklinii*) sassafras (*Athermosperma moschata*), native beech, or 'myrtle,' as the settlers term it (*Fagus Cunninghamii*), and tree-ferns from 20 to 30 feet high. All English crops and fruits grow to perfection, but grapes, oranges, and lemons thrive only in favoured situations. The pastures and hedges of the island are luxuriant, and contribute largely to make T. the most English in aspect of any of the Australian colonies.

The mineral wealth of T. is great, but its development is as yet only in its infancy. For example, coal of good quality is plentiful, yet the colony is chiefly supplied from New South Wales; hæmatite iron is also abundant, and is beginning to be worked; gold to the value of £25,000 was exported in 1877, and ores of silver, platinum, copper, antimony, and bismuth are known to exist within the colony; tin is found in great abundance at Mount Bischoff, in the N.W. district, whence tin to the value of £283,118 was exported in 1877. In 1878 deposits of tin ore, reported to equal in richness those of Mount Bischoff, were discovered at Mount Heemskerk, 35 miles to the S.W. of the former mountain. With the extension of means of communication the mineral riches of the island will be speedily developed. At present the only railway lines in operation are one, 133 miles long, connecting Hobart Town and Launceston, and another running W. from the latter town to Deloraine (45 miles), whence it is being extended to the N. coast at Torquay (30 miles). There is also a tramway connecting the tin mines at Mount Bischoff with the shipping place at Emu Bay.

The total value of the imports into T. during 1877 was £1,297,886, and of the exports £1,437,793. Of the latter the principal items were wool, hides, and skins, tin, gold, cereals, jam and green fruit, timber, bark, and sperm oil. The leading industries, in addition to sheep-farming, agriculture, and mining, are jam-making, flour-milling, and shipbuilding. The public revenue for 1877 amounted to £361,000, of which sum £205,000 were obtained from customs duties. The pop. at the census of 1874 was 104,197. The capital is Hobart Town (q. v.), and the only other town of any size is Launceston (q. v.). The island is divided into 18 counties.

T. was discovered on 24th November 1642 by Tasman, who named it Van Diemen's Land, after the Governor-General of the Dutch E. Indies. The island was visited by many successive explorers, including Cook, Furneaux, Bligh, D'Entrecasteaux, and Bass, and in June 1803 it was taken possession of by Britain for the purpose of forming on it a penal settlement, subsidiary to that of New S. Wales. The early history of the colony was a wretched one, being marked by famine, conflicts with the natives, and the outbreak of bushranging, the last of which continued to be alarmingly prevalent for many years. During the first 20 years tyranny of every kind was rampant, illegal imprisonment, flogging, and even torture to extort confession, being common. In 1824 the colonists petitioned the Home Government for independence of martial law, and the request was granted them in December 1825. The discovery of gold in Australia in 1851 caused a great many of the most valuable settlers to leave T., which thenceforward fell behind in the race of colonial progress, notwithstanding the abolition of transportation in 1853. In compliance with the prayer of the colonists, the name of the colony was altered from Van Diemen's Land to T., the change taking effect on 1st January 1856. The government is now administered by a governor appointed by the Crown, and assisted by a cabinet of four ministers, who are responsible to a Parliament consisting of a Legislative Council of 16 members, and a House of Assembly of 32 members.

The aborigines of T. belonged to a Negrito race, and are pronounced by Professor Huxley to have been 'totally different' from those of Australia. He supposes that they reached T. from New Caledonia by a chain of islands now submerged. They were of a dark-brown colour, approaching black, with naturally twisting hair, while that of the Australian natives is straight. The Tasmanians were also shorter, and more robust than the latter. They wore skin mantles in winter, but went unclothed in summer. Their weapons were spears and clubs, and they were not acquainted with the throwing-stick and boomerang used in Australia. Their numbers in 1803 were estimated at 7000, but were soon reduced by perpetual hostilities with the colonists. At length, in 1830, Governor Arthur attempted to form a cordon, before which the natives should be driven into Tasman Peninsula, which is joined to the mainland by an isthmus only half a mile wide. The enterprise, which occupied 4850 men for six weeks, and cost £27,000, proved a ridiculous failure, its sole fruits being the capture of an old woman and a sick man. Subsequently a bricklayer named Robinson succeeded by moral suasion in inducing the natives to give themselves up gradually, and they were removed to Flinders Island, in Bass Strait, where they were well provided for. Nevertheless, their numbers so rapidly lessened, that in 1838 only 86 were left, and no children had been born during their exile. They were accordingly removed to Port Phillip, and eventually to the vicinity of Hobart Town, but nothing could arrest their decline, and the last representative of the race, an old woman, died on 8th May 1876. See *Daily Life and Origin of the Tasmanians*, by James Bonwick (Lond. 1870); *The Native Tribes of T.*, by J. E. Calder (Hobart Town 1875); *Report* of the Tasmanian Commission to the Philadelphia Exhibition of 1876 (Lond. 1877); *T., Past and Present*, by Sir Charles Du Cane (Colchester 1877); *The Tasmanian Almanac*, and the *Papers and Proceedings* of the Royal Society of T. published annually at Hobart Town.

Tasmann'ia, now united to *Drimys*, is a small genus of *Magnoliaceæ*, was named after the Dutch navigator Tasman, the discoverer of Tasmania or Van Diemen's Land, where *T. aromatica*, a bushy shrub or small tree, is locally abundant from the sea-level to 4000 feet up the mountains; it occurs also in the humid forest-ranges of Victoria, Australia. This species, as also *D. dipetala* of New South Wales, has received the name of 'pepper-shrub' from the colonists, their berries being made use of as a substitute for pepper.

Tassis'udon, the chief town of Bhotan (q. v.), on the right bank of the Godadda, an affluent of the Brahmaputra, has a palace for the two rajahs; the dherma-rajah lives in a high tower with a beautiful idol, the deb-rajah in a square edifice which encloses the tower. The palace is girt with rows of smithies in which the metal images are made.

Tass'o, Bernar'do, an Italian poet, was born at Bergamo in 1493, studied at Padua, and spent a long and restless life as a political agent in the service of several successive patrons, of whom Guido Rangone, Sanseverino, and Gonzaga of Mantua are the chief. He died in 1596 at Ostiglia. In Italian literature T. enjoys a secondary niche as the author of an epic, *Amadigi*, and a new interest has been associated with his name by the discovery of several hundreds of his unpublished letters by the Marchesse

Campori (1869), Portioli, and Panizza; but, after all, his memory is best preserved by the fact that he was the father of Torquato T. See *Fraser's Magazine* (1874), vol. ix.—**Torquato T.**, son of the preceding, and the fourth great poet of Italy, renowned as much by what he learned in suffering as by what he taught in song, was born, 11th March 1544, at Sorrento. While his father Bernardo was moving hither and thither, the bright and precocious boy was allowed to grow up happily in the warm atmosphere of a mother's love; but when at length his father found as he hoped a settlement at Rome, he was obliged to bid what proved to be a last, as it was a sorrowful, farewell to his mother, and make his first trial of a courtier's life. After various vicissitudes, he was sent about 1557 to Padua to prosecute the study of law under Panciroli; but he devoted the larger share of his attention to *Il Rinaldo*, an epic poem, which at length saw the light at Venice in 1562, when he was only 18 years of age. The youthful poet now formally abandoned his legal studies, and devoted himself earnestly to letters, both at Padua and Bologna. Meanwhile his father was attempting to procure him a post under some powerful patron, and at length he learned that the Cardinal Luigi (Lodovico) d'Este was willing to give him an appointment in his household. He was to meet the cardinal at Ferrara; and accordingly, in October 1565, he entered the city which had already been associated with the fortunes of Boiardo and Ariosto, and was destined to be associated with more tragic emphasis with his own. He soon acquired the favour not only of the reigning duke, Alfonso I., but also of his sisters the princesses Lucrezia and Leonora, whose praises he had already celebrated in his *Rinaldo;* and little more was required of him than that he should be what he naturally was, a pleasant companion. In 1571 he was called to accompany the cardinal to France; but he soon returned to the too attractive Ferrara, and in 1573 he formally entered the service of Alfonso. Full leisure was allowed him for his poetic occupations; and under the sunshine of the womanly admiration and encouragement which the princesses bestowed on his task, he gradually developed and completed a great epic, which he had first conceived while a student at Padua, and which was to be a monument to all time of the splendour of the family under whose roof it had been composed. When in 1575 it was brought to a close, he was anxious to submit his poem to the criticism of the principal literati of the day; and for this purpose he went in person to Rome. While there he listened with half consent to the offers of Scipio Gonzaga and Ferdinand de Medici, who were anxious to remove him from the service of Alfonso. But the attractions of Ferrara were again too strong. He returned to the city in 1576, but it soon appeared that he no longer enjoyed the full confidence of his patron. Matters rapidly grew worse; misfortune succeeded misfortune; malicious enemies were evidently at work against him; and their machinations were so underhand that he could find no method of defence. In 1577, partly from fear and partly in anger, he fled from Ferrara, and for a short time he found a sweet asylum with his sister at Sorrento. But it began to be noised abroad that T. was insane, and his proud and sensitive spirit chafed at the insult, and after wandering from city to city seeking rest and finding none, he again made his way to the fatal court of Ferrara. Neglected and insulted on his arrival he broke out into bitter reproaches against the duke; and the duke was, doubtless, only too glad to find him affording such a pretext for his own undoing. In March 1579, by the duke's orders, the high-souled and gentle-hearted poet was imprisoned as a madman in the lunatic asylum of Sta Anna. Of his manifold miseries, his mental agonies and bodily pains, his hallucinations, his hopes, his despairings, his consolations, his pleadings, his protestings, we have ample record in the letters and poems which, even in such circumstances, flowed from his pen; and from time to time some famous visitor to Ferrara—a Montaigne or an Aldus—tells us how he found him. At length in July 1586 Alfonso reluctantly yielded to urgent demands for his release, and the poet was allowed, but under surveillance, to go to Mantua. The Academy of the *Addormentati* or Sleepers offered him the chair of ethics and poetry at Genoa with a salary of 400 crowns, but his heart was set on Rome, and thither he departed in 1587. At first he finds 'the city beautiful and courteous,' but before long he writes that all his many hopes are ending in nothing. He next proceeded to Naples, expecting by a lawsuit to recover his mother's dowry, and there he was fortunate enough to find a true friend and admirer in the Marquis of Manso, who was destined at a later date to extend his hospitality to the youthful Milton. But Rome appeared now to have as fatal a fascination for him as Ferrara had formerly; and wherever he went—to Mantua, to Florence, to Naples—and however attractive his residence was made by his patrons and friends, it was always to Rome that he returned. Thither he was called in the autumn of 1594 by Cardinal Cinthio Aldobrandini; he was to be crowned with laurel in the capitol, even as Petrarch had been crowned, but the ceremony was deferred till spring. During the winter the poet's health gave way, and on 25th April 1595 he breathed his last in the monastery of St. Onofrio, on the Janiculum. A certain mystery still hangs over the relations of T. to the various members of the Este family. The investigations of Rosini render it probable that the poet had made advances to Leonora, which, whether acceptable or not to herself, were treated by the duke as a direct insult to his family. In none of his numerous letters does T. himself make more than covert allusion to the cause of the duke's displeasure, but at the same time he writes as if he were not ignorant of what it really was. Be it what it may, it cannot have been sufficient to justify Alfonso's conduct. As a poet T. takes rank with the greatest of his country. The *Gerusalemme Liberata* is artistically the most perfect epic of modern times; the *Aminta* is the very beau-ideal of a pastoral; the tragedy of *Torrismondo* was one of the best dramatic works in Italian before the appearance of Alfieri; and if all these were lost, some of his lyrical poems would preserve his fame. And besides, he takes no mean position as a master of Italian prose, more especially in the form of dialogue. Familiar with all the literary culture of his time, T. brought to bear on his great work not only the instinctive discernment of the poet but the reasoned decision of the scholar; and for nearly every incident in the complex structure of his principal poem he was perhaps only too ready to furnish a critical why and wherefore. His influence at once made itself powerfully felt in the general current of European literature; and the greatest poets of the succeeding generation were largely affected by his example and precept. The first Englishman who essayed to make his countrymen acquainted with T.'s epic was Richard Carew, but he was prevented from the completion of his task by the appearance of Fairfax's *Godfrey of Bulloigne, or the Recoverie of Jerusalem* (1600), which still has no small claim to be considered the best translation, though others have appeared by Henry Brooke (Lond. 1738), Thomas Hooke (Lond. 1738), John Hoole (Lond. 1762), Hunt (1818), Wiffen (1824-25), Broadhead (1837), C. Lesingham Smith (1851), A. C. Robertson (Edinb. 1853), Bent (Lond. 1856), and Sir J. K. James (2 vols. 1865). Next to the *Gerusalemme* in its popularity stands the *Aminta*, of which there are English translations by Fraunce (1591), John Reynolds (?) (1628), Dancer (1660), Oldmixon (1698), Dubois (1726), Stockdale (1770), and Leigh Hunt (1820). Collected editions of T.'s works have been published at Florence (1724, 6 vols.), at Venice (1722-42, 12 vols.), and at Pisa (33 vols. 1821-32), the last, which is edited by Rosini, being the best and most complete. Among the numerous works which have appeared on T. and his misfortunes, it will be sufficient to mention the following:—Manso, *Compendio della Vita di T. T.* (Naples 1619); J. A. de Charnes, *Vie du T.* (Par. 1690); Serassi, *Vita, &c.* (Rome 1785); G. Compagnoni, *Veglie di T.* (Milan 1810); Stefano Giacomazzi, *Dialoghi sopra gli Amori, &c., di T. T.* (Brescia 1827); Rosini, *Saggio sugli Amori di T. T., &c.* (Pisa 1832); Capponi, *Sulla Causa finora ignota della Aventura di T.* (2 vols. Florence 1840-45); R. H. Wilde, *History of the Madness and Imprisonment of T.* (New York 1841); P. Vimercati Sozzi, *Illustrazioni su Varii Argomenti Relativi a T. T.* (Bergamo 1844); R. Milman, *Life of T. T.* (Lond. 1850); J. H. Wiffen, 'Life of the Author,' in his ed. of the *Jerusalem Delivered*, with a postscript on the Rosini controversy (5th ed. 1854); Cibrario Degli, *Amori e della Prigione di T.* (Turin 1861); G. Voigt, *T. T. am Hofe von Ferrara*, in Sybil's *Historische Zeitschrift*, vol. xx. (Mun. 1868); Cardona, *Studi novi sopra del T. Alienato* (in *Nuova Antologia*, 1873); Cecchi, *T. T. e la Vita Italiana nel Secola XVI.* (Flor. 1877). A really critical life of T. is still a desideratum in English literature.

Tasso'ni, Alessandro, an Italian poet, born at Modena in 1565, studied law at Bologna and Ferrara, became secretary of Cardinal Colonna in 1597, and accompanied him to Spain in 1600. In 1612 he entered the service of Carlo Emanuele of Savoy, for

whom he had a high regard, but he was soon forced by the intrigues of his political enemies to give up his position. In 1626 he obtained the office of secretary to Cardinal Lodovisio, and after the Cardinal's death he was appointed in 1632 chamberlain to Francis I. of Modena. By his hostile *Considerazioni sopra le Rime del Petrarca* (Modena 1609) he acquired the name of *Petrarchomastix*; in his *Pensieri Diversi* (Rome 1612) he made a similar attack on Homer and Aristotle, and maintained that in everything—in literature as well as in science—the moderns had the pre-eminence; and in the *Secchia Rapita* (Paris 1622), a mock-heroic poem ostensibly describing the contest that arose from the rape of a Bolognese bucket by the people of Modena, he treats everything ancient as old-fashioned, and indulges in hilarious but cynical mockery of the general round of human life. His patriotism was severely wounded by the encroachments of the Spanish power, and in his *Filippiche* (Lat. ed. 1878), and his *Manifesto* (Flor. 1855), he laments the decay of Italian independence. T. died at Modena in 1635. The *Secchia Rapita* is his most popular work; it is regularly reprinted from time to time. The last edition was in 1878. A collection of his letters by Gamba appeared at Venice (1827).

Taste, Sense of, is not absolutely confined to the *Tongue* (q. v.) as commonly supposed, but is also exercised by the soft palate, the Tonsils (q. v.), and also the upper part of the pharynx. Like the other senses, it is a modification of the sense of touch. Substances to be tasted are, in other words, brought into direct contact with the sensory surface. For the due exercise of the S. of T. it is necessary that the substances to be tasted be in a state of solution. The saliva and fluids of the mouth thus serve the purpose of dissolving substances, and of bringing their particles into direct contact with the nerves of taste. Insoluble substances are thus usually tasteless, and their contact with the tongue and other parts of the mouth merely gives rise to a sensation of touch. A dry furred tongue, as is well known, is incapable of exercising the S. of T. Abnormal stimulation of the nerves of taste may give rise to altered sensations, as is the case indeed with other nerves of special sense under like conditions. If a current of air be directed upon the tongue, a cool saline taste is produced, analogous to that of saltpetre. A smart tap on the tongue gives rise to a sensation resembling that produced by electricity. The *nerves* of the tongue, palate, and other parts of the mouth which exercise the S. of T., consist of the gastatory branch of the fifth cranial nerve, and of the lingual branch of the *glossopharyngeal nerve*. These nerves also exercise common sensation or touch, whilst a third set supplied to the tongue (namely, the *hypoglossal nerves*) pass to the *muscular substance* of the organ, and endow it with motor power. The S. of T. appears to reside chiefly in the edges and tip of the tongue. The middle of the dorsum, or upper surface of the organ, is but feebly sensitive to taste. The sides and tip are also the seat of acute touch or common sensation.

There can be no doubt that the sense of taste is aided and supplemented by that of smell. In wine-tasting, much of the taste is lost if the nostrils be closed. The delicacy of the S. of T. varies greatly in different persons. A familiar way of stating the general delicacy of this sense is to say that by its aid 1 part of sulphuric acid in 1000 of water can be perceived; the sense of smell, however, being much more delicate still. The exercise of the S. of T. becomes impaired through repetition of a similar or allied taste, as is well seen in the confused sensations resulting from the tasting of two or more kinds of wines. *Subjective sensations* of taste, or those produced by internal causes, are common; most persons having the power to imagine a particular sensation of taste with tolerable vividness.

Tate, Nahum, born in Dublin in 1652, was the son of Dr. Faithful Tate, author of the *Scripture Map of the Wilderness of Sin* (Lond. 1655). Educated at Trinity College, Dublin, he went to London and adopted the profession of literature; and in 1690 succeeded Shadwell as poet-laureate. He died at Southwark, 12th August 1715. T.'s works comprise ten plays, a large number of occasional poems, and a prose collection of *Memorials for the Learned* (Lond. 1686); but he would be almost completely forgotten if he had not written a considerable portion of the second part of *Absalom and Achitophel*, and in conjunction with Dr. Nicholas Brady perpetrated the metre version of the Psalms which appeared in 1696, and ultimately took the place of the version by Sternhold and Hopkins.

Ta'tian, born in Assyria, of a pagan family, in the first half of the 2d c., was an ardent student of the philosophy of his time. Having fallen in with a copy of the Hebrew Scriptures, he was much affected by its contents, and proceeding to Rome, where he met Justin Martyr (q. v.), he made a profession of Christianity, wrote an Apology for it, and was a diligent expounder both of the Old and New Testament. After a time, however, he embraced certain heretical opinions, chiefly three:—(1) He reprobated marriage as on a level with fornication; (2) he held the existence of another God besides the God of all; and (3) he refused to believe that Adam was saved. By later writers he has been erroneously classed with Marcion (q. v.) and Valentinus (q. v.), and regarded as the founder of a school—the Encratites, &c. T. left a large number of writings, of which the most important, and the only one now remaining, is the Apology or Oration to the Greeks. His work, *The Composition of the Four* (Gr. *To dia tessarōn*), is notable as the first attempt to compile a harmony of the four gospels. See Donaldson's *Christian Liter. and Doct.* (vol. iii. Lond. 1866).

Ta'tius, Achill'es. See Achilles Tatius.

Ta'tius, Tit'us, a mythical king of the Sabines contemporary with Romulus. In vengeance for the rape of the Sabine women he advanced against Romulus, who retired to the Palatine Hill. T. posted himself on the Capitoline and Quirinal, and the two kings reigned in friendship over their respective peoples till the death of T., when Romulus was chosen sole king. T. gave name to the Titienses, one of the legendary 'three tribes' into which the Roman people were divided. See Rome.

Tatt'a, a town in the district of Kurrachi, Scinde, British India, 4 miles W. of the Indus, and 60 miles E. of Kurrachi, was formerly a place of great historical importance, but has been devastated by war and malaria. It still has a special manufacture of *lungis*, or scarfs of mixed cotton and silk. The imports are estimated at £40,000; the exports at £4000. T. contains a ruined fort and a handsome mosque, the Jumma Musjid, said to have been built by Shah Jehan. Pop. (1872) 7951.

Tatt'ies (from a Sanskrit word *tat*, 'canvas'), the screen of matted grasswork which is placed before the open doors and windows in most parts of India during the season of the hot winds, and constantly wetted with water to cool the air by evaporation.

Tattoo', a military signal to draw stragglers within the camp. It is given by the drum and bugle.

Tattoo'ing, a mode of personal ornamentation practised by savage peoples, and consisting in cutting or puncturing the skin with various patterns, into which a colouring matter is introduced. The custom appears to have been almost universal, though now disappearing before the spread of civilisation. The prohibition to the Jews (Lev. xix. 28) under the Mosaic law to 'print any marks' upon them, is believed to have reference to T., which is still practised in Arabia. The chief purposes of T., besides that of personal adornment, were to distinguish the rank of the person operated upon, and to mark his entrance on the privileges of manhood. Among the Fijians and Esquimaux a neglect of T. was also believed to prejudice their happiness in the future state. The rudest form of T. is that practised by the Australian blacks and some tribes of Kaffirs. It consists in cutting gashes, arranged in patterns, on the skin, and filling the wounds with clay, so as to form raised scars. In Polynesia the art reached its highest point of perfection. In the Marquesas group, for example, the men were tattooed all over, even to the fingers and toes, and crown of the head, and as each operation lasted from three to six months, a man could scarcely be decorated with an elaborate tattoo before he was thirty years old. In New Zealand the face was the part most tattooed, and tattooed Maori heads were at one time in request for European museums, but they are no longer obtainable in the colony. The T. instruments used in Polynesia consisted of pieces of sharpened bone fastened into a handle, and with their edges cut into teeth. These were dipped into a solution of charcoal, and then struck into the skin with a mallet. The pain produced being intense, female relatives of the patient were commonly employed to drown his cries with their songs. In this country T. was practised by the ancient Britons, and the custom still common among sailors

of printing various devices on their arms, is regarded as a survival of the practice.

Tau, Cross of, or **St. Anthony's Cross**, a heraldic decoration in the form of the letter T, with broadened extremities.

Tauch'nitz, Karl Christoph Traugott, a famous German printer and bookseller, was born at Grosspardau, near Grimma, 29th October 1761; learned the printing trade at Leipzig, where, after serving for some time with Ungar of Berlin, he began business in 1796. He added to printing works a book-store in 1798, a type-foundry in 1800, and the first German stereotype-foundry in 1816. From his establishment, which soon became one of the largest in Europe, issued numerous works equally remarkable for their accuracy, fine typography, and cheapness, and among these perhaps the most notable were editions of Greek and Roman classics, dictionaries, and Bibles. A characteristic specimen of T.'s art is his edition of the Koran of 1834. He died at Leipzig, 14th January 1836.—**Christian Bernhard, Freiherr von T.**, a nephew of the preceding, was born at Schleinitz, near Naumburg, 25th August 1816, and founded the publishing firm of Bernhard T. in Leipzig, which has become universally known through its *Collection of British Authors*, a series comprising 1711 volumes, from 1841 to 1878. The firm is also famed for the publication of many important works in jurisprudence, philology, and classical literature. A series of *German Authors* have issued periodically from its press since 1866. The Duke of Koburg created T. a baron in 1860, and at present (1878) he acts as the British consul-general at Leipzig.

Tau'ler, Johannes, a German mystic and preacher of the 14th c., was born at Strassburg about 1290. In 1308 he joined the Dominicans, and thereafter studied theology for two years at Paris. He soon rose to eminence as a preacher, but in consequence of interviews with a remarkable layman, Nikolaus of Basel, he became so much dissatisfied with himself that he withdrew from the pulpit for two years. On his reappearance he spoke with a power and force that drew crowds to hear him, and at the same time with a recklessness that spared neither powers temporal nor powers spiritual. Accordingly his bishop interdicted him from preaching, and drove him from Strassburg. He went for some time to Köln, but finally returned to end his days in his native town. He died 16th June 1361. His works consist of *Predigten* (new ed. Prag, 1872), and *Nachfolgung des armen Lebens Christi* (Frankf. 1833; ed. by Denifle, Munich 1877). In these works no dogmatic system is regularly expounded, but the chief doctrines of theology are touched upon and expounded in a peculiar mystical manner; but T. united an earnest living faith with these speculations. The deep impressiveness of intense conviction was about everything he said or wrote. He united this with a breadth of view rare in his age and profession, and which well entitled him to the name of 'Doctor Illuminatus,' by which he is distinguished in ecclesiastical biography. See Miss Winkworth, *Life and Times of T.* (Lond. 1857); and K. Schmidt, *Nikolaus von Basel, Bericht von der Bekehrung Taulers* (Strassb. 1875).

Taun'ton ('the town on the Tone'), a town of Somersetshire, on the Tone, 10 miles S.S.E. of Bridgewater by rail, is an important railway centre. Its churches include St. Mary Magdalene, with a noble Perpendicular tower 153 feet high (rebuilt 1858-62), St. James's, with a tower of 116 feet (rebuilt 1875), and St. John's (1863), Second Pointed style, with a spire of 130 feet. Other buildings are a Second Pointed Roman Catholic church (1860), and a Franciscan convent; the Elizabethan Shire Hall (1859), old and new market houses; a masonic hall (1879); the Somerset Hospital (1809); barracks (enlarged 1877, at a cost of £30,000), &c. Besides a free grammar-school (founded 1522; incorporated in 1869 with the Church of England College), there are large Wesleyan (1847) and Independent (1868) colleges. The dismantled Norman castle, in whose great hall Judge Jeffreys held the 'Bloody Assize,' contains now a literary institute and archæological and natural history museum; and there are further monastic remains and a Roman bridge. Formerly one of the great Somerset 'clothier-towns,' T. is now mainly agricultural, yet it has some collar-making, silk-spinning, tanning, paper-making, and iron-working industries. It publishes four newspapers, and returns two members to Parliament. Pop. (1871) 15,466. A wooden fort, founded by Ini of Wessex (688-726), on the banks of the Tone, was the germ of this ancient town, which under the Conqueror was the seat of a mint, in 1497 was seized by Perkin Warbeck, was successfully defended by Blake against 10,000 Royalists (1645), and gave Monmouth a brilliant ovation (1685).

Taun'ton, a town of Massachusetts, U.S., 36 miles S. of Boston by rail. It has 19 churches, 5 banks, a public library, 1 daily and 2 weekly newspapers. The T. river supplies motive power for various industries, which include cotton, machinery, nail, tool, and oil-cloth manufactories, brickworks, engine-works, &c. There is an annual exhibition of mechanical and agricultural implements by the Bristol Agricultural Society. Valuation of town $18,000,000; pop. (1870) 18,629. T. was founded by a colony from T. in England, in 1638, was incorporated as a town in 1639, and as a city in 1864.

Tau'rida, a government in the S.E. of Russia, which includes the peninsula of the Crimea (q. v.), is bounded on the E., S., and S.E. by the Sea of Azov and the Black Sea. Area, 24,537 sq. miles; pop. (1870) 658,549. The greater part of it belongs to the Nogai Steppe, only $\frac{1}{10}$ths being under cultivation, and at least a half unenclosed pasture-land. From the steppe there is a gradual rise through the Isthmus of Perekop to the Crimea, some of whose ranges attain an elevation of 5000 feet. The only river of importance is the Dnieper, which forms the N. W. boundary. Salt lakes abound on the treeless steppes. Vines and orchard-trees are cultivated to a certain extent, but cattle-breeding is the main employment of the inhabitants. The population is very mixed, about one-third of the whole being Little Russians, 100,000 Nogai Tartars, 50,000 German colonists, 22,000 Bulgarians, 15,000 Jews, 14,000 Greeks, and 11,000 Armenians. The chief towns are Simferopol the capital, Sebastopol, Feodosia, and Kertch.

Tau'rine ($C_2H_7NSO_3$), a beautifully crystallisable substance, prepared by boiling dilute hydrochloric acid with taurocholic acid, one of the constituents of Bile (q. v.). It may also be prepared by heating isethionate of ammonia (NH_3, H_2O, C_2H_4, SO_3), which loses its water. This salt not only has a composition apparently made up of the union of ammonia, water, olefiant gas, and sulphuric anhydride, but by a very simple series of operations can be formed by direct synthesis from these.

Tau'rus (Gr. *Tauros*, from N. Semitic *Tûr*, 'a mountain'), the S. border-range of the plateau of Asia Minor, stretching from the Euphrates W. to the Ægean Sea, and forming an unbroken chain, which presents to the S. steep, rocky sides. It rises in terraces to a height of 10,000 feet, and together with the Anti-T. encloses an elevated arid plain, dotted with salt lakes. Across the Kilia Pass and Gülek-Boghas is carried the caravan traffic between Asia Minor and Syria. The rivers Seihun and Dschihan (*Pyramus*) separate the range in the E. from the Akma Dagh (anc. *Amanus*), which forms a connecting-link with the Lebanons of Syria. The Anti-T., continuing in a N.-easterly direction from the main range, joins the system of the Caucasus.

Tautol'ogy (Gr. *tautologia*, from *tauto*, *i.e.*, *to auto*, 'the same,' and *legō*, 'I say') is the unnecessary repetition of the same thought in different words, as in such a sentence as 'The two regiments *simultaneously* attacked the citadel *at the same time*.' If repetition of the thought is needful for greater lucidity or emphasis, it cannot be condemned as tautological; and there are certain phrases such as 'to let and hinder,' in which the T., originating in the epexegetic addition of the second word, is completely sanctioned by usage. Owing to the number of words whose composition and content are only to be distinctly discovered in the foreign language from which they are borrowed, English lends itself to the vice of T. more readily perhaps than most other tongues.

Tautog, a Teleostean fish, the *Tautoga nigra* of naturalists, also named 'Blackfish,' common in N. American seas, and valued for the delicacy of its flesh. Its average weight is from 10 to 14 lbs.; its colour is black, with a whitish belly and sides, and the teeth are numerous and strong. The T. is allied to the Wrasses (q. v.) or *Labridæ*.

Taver'nier, Jean Baptiste, a French traveller, the son of a Flemish engraver, was born at Paris in 1605, and while quite a youth travelled, on the spur of curiosity, through the Netherlands, England, Germany, Hungary, and Italy. He accompanied two French noblemen in a lengthened tour in the East—from Constantinople, through Erzeroum, Tabriz, Ispahan, Bagdad, and Aleppo to Rome—in 1630-33, and from 1638 to 1669 he made five other eastern journeys, crossing Syria and the

Arabian Desert, and proceeding as far as Persia, Hindustan, and Batavia. In these latter journeys he adopted the disguise of dealer in precious stones, and by trading in jewellery amassed a considerable fortune. For promoting French trade in India he was created Baron d'Aubonne by Louis XIV. in 1669. He subsequently squandered his fortune, but settling at Berlin after the Revocation of the Edict of Nantes, was appointed director of an East India company which the Elector of Brandenburg was then founding. While setting out in search of a Russian road to India, he died at Moscow, July 1689. Voltaire said of T. that he *parle plus en marchand qu'en philosophe.* Though an acute, intelligent observer, he was destitute of literary skill, but a report of his six journeys was edited by Chappuzeau and La Chapelle (3 vols. Par. 1676-79; Eng. trans. 1678-84; Dutch, 1682; Ger. 1684; new ed. 7 vols. Par. 1810).

Tavi'ra, a seaport in the S. of Portugal, province of Algarve, on both banks of the Rio Sequa, about equi-distant (20 miles) from Faro on the W. and the Guadina on the E. It has a Moorish castle, two collegiate churches, a richly-endowed hospital, and good sardine and tunny fisheries. Pop. 9000.

Tav'istock, a market-town of Devonshire, 16½ miles N. of Plymouth by rail, lies in a hollow on the right bank of the Tavy, with Dartmoor stretching away from it to the E. The parish church, with a lofty tower standing on piers, was restored (1845), and a new church, Romanesque in style, erected at Fitzford (1867); but of the once famous Benedictine Abbey (founded 961) little remains but a gate-house, a porch, and the refectory, which now are severally used as a public library, dairy, and Unitarian chapel. Other buildings are a Congregational church (1873), with a spire 140 feet high; the guildhall (1848), fronting which is a bronze statue (1864), by Stephens, of the seventh Duke of Bedford, the corn market (1839), and covered markets (1863). These last three structures are all in Late Perpendicular, as also is the Kelly College (1875-76), founded for the sons of deceased naval officers by the late Admiral Kelly with a bequest of £80,000. T. chiefly depends on the neighbouring tin and copper mines, the latter including the Devon Great Consols, which yield almost all the arsenic produced in England, and had paid up to April 1877 £1,195,520 in dividends. In the town itself are engine and machine works, iron foundries, maltings, &c. T. publishes one weekly newspaper, and returns one member to Parliament. Pop. (1871) 7725. The abbey, in which was set up the second English printing press, passed at the Dissolution to the Russells; and its later fame T. owes to its having been the birthplace of Drake (q. v.) and William Browne (q. v.), and the place that Pym represented in the Long Parliament.

Tavoy, the chief town of a district of the same name in British Burmah, 220 miles S. of Moulmein and E. of Bangkok, from which it is separated by a narrow mountain-chain. Pop. (1872) under 5000. It is a seaport, with an export of rice and timber, valued in 1874-75 at £46,517; imports, £54,406.—The *district* of T., a narrow strip along the Bay of Bengal, has an area of 7200 sq. miles; pop. (1872) 71,827.

Taxa'tion of Costs. See Costs.

Tax'es and Taxa'tion are respectively the imposts which the state exacts for its support from its inhabitants, and the manner in which these imposts are levied. In its theoretical aspects the subject forms an important part of the science of political economy, which under this head considers the general effects of taxation on the well-being of the community. The right to tax lies with the *de facto* government for the time being. Such a government performs indispensable functions, and the produce of taxes is required for such performance. The practical problem is how may taxes be best levied. Adam Smith has given the following rules on the subject: 1st, Taxation should be equal—'the subjects of every state ought to contribute to the support of the government as nearly as possible in proportion to their respective abilities.' 2d, The amount to be levied should be clearly and definitely known beforehand by the payers; and, 3d, it should be taken from him at the time and in the manner most convenient for him. 4th, The state should receive as much as possible of the actual amount paid by the taxed. The general truth of these canons is evident. But it is to be observed that absolute fairness of taxation is unattainable, because any one principle on which we might go would not only conflict with others equally good, but would show itself glaringly unjust in many particular cases. An approximate equality is all to which we can attain. Taxes may be general—levied from the community; or particular—from a class or individuals. They are further of two kinds—direct and indirect. The first is taken directly from the taxed, the second is connected with the use of certain articles. The *incidence* (or real payment) of a tax is different in the two cases. In the one the first payer, in the second the consumer of the article, is really the taxed person. Thus a land-tax is really paid by the proprietor of the land, but a tax on commodities, as for instance on bread, though paid to the government by the maker, would cause a rise sufficient to reimburse the payer, and such rise would of course be paid by the consumer. Each of these two systems has its advantages and disadvantages. Direct taxes are probably levied with less expense of collection. They impress upon the taxpayer the exact amount he is paying to government, and thus directly interest him in financial reform, and they are more easily adjusted so as not to press heavily on the poor. But, on the other hand, the payment of large sums of money at once to government creates a disagreeable irritation, and an after dangerous feeling, and the payment of direct taxes is easily evaded to a great extent by the dishonest (*e.g.*, the income-tax). Indirect taxes, on the other hand, are payable at a time and manner most convenient to the consumer. Then, luxuries which either give only a partial benefit (wine, spirits, tobacco), or those which are only luxuries because they are expensive (gold and silver-plate, diamonds, &c.), are peculiarly suited for indirect taxation. But they require an extensive machinery for collection. The excise regulations often interfere with the proper manufacture of commodities, and the custom-house is a barrier to rapid and easy transit from one country to another. They often press unduly on the poor, and though attempts have been made to obviate this by an *ad valorem* rate (*i.e.*, taxing different qualities of an article at different prices), such attempts have not been generally successful. Since, however, taxes are necessary evils, it would seem that a judicious combination of the two systems is best. J. S. Mill enumerates land, legacies, and houses as the best subjects for direct taxation; while indirect taxation should fall —1st, on luxuries; 2d, on necessary articles in an inverse ratio to their necessity; and 3d, on as few articles as possible, in order to lessen the trouble and expense of collection. But no indirect taxation should be so high as to present inducements to smuggling. As to the historical side of the question, T. arose in modern Europe from the decay of the feudal system. Before that the state had sufficient lands in its own possession to defray the expenses of government. But these were afterwards very generally gifted away, and the expenses consequent on the development of governmental functions soon made taxation a necessity. In England the question enters largely into our constitutional history. In early times the king, with the consent of the Witan, raised extraordinary taxes. Under the Norman kings, and on through the later monarchs, the principle 'that there must be no taxation without representation' grew in force, though it was probably the effects of the American War of Independence that raised it to a constitutional axiom. With the unavoidable exception of India, it now prevails through the English empire. Our taxes are divided into Customs, Property, Income, Excise, Assessed, and Stamp. The literature of taxation is peculiarly rich. The following treatises on the subject may be mentioned: Hume's *Essay on Taxation*; M'Culloch on *Taxation* (Lond. 1845); Stansfield, *Direct Outline of Taxation* (Lond. 1849); L. Levi's *Taxation, how Raised* (Lond. 1860); Morton Peto's *Taxation* (Lond. 1863); G. Holloway, *Taxation and Representation* (Lond. 1867); W. P. Urquhart, *Dialogues on Taxation* (Lond. 1867); G. Goschen, *Local Taxation* (Lond. 1873); and R. D. Baxter, *Taxation and Local Government* (Lond. 1874). For the historical aspects of Taxation, see Stephen Dowell's *Sketches of the History of Taxation in England* (vol. i. 1876); and Stubbs's *Constitutional History* (3 vols. Oxf. 1874-78).

Taxicorn'es, a group of *Coleoptera* or beetles, of the *Heteromerous* section of the order. The legs are short and the body somewhat square. The antennæ are also short. The T. are commonly found under the bark of trees.

Tax'idermy (Gr. *taxis*, 'arrangement,' and *derma*, 'a skin') is the art of preparing and preserving the skins of animals, and in a general sense includes the mounting of them for museum purposes. The skin is carefully removed from the animal, the skull and the bones of the limbs only being preserved; it is then

anointed with arsenical soap, of which several kinds are used. The soap cut in thin slices is dissolved with a little water at a gentle heat, salt of tartar and powdered chalk are then added; it is then taken from the fire, the arsenic put in and stirred gently; camphor, with the addition of a little spirits of wine, is pounded in a mortar and the whole mixed together. For the skins of larger animals powdered burnt alum is frequently used. Familiarity with the appearance and form of the animal to be stuffed is essential, and the best and most natural-looking work is produced by preparing an accurate model of the creature, over which the skin is drawn and fastened. The lower animals and the fishes and reptiles, unless when large, are usually preserved in spirits of wine.

Tay, the greatest of Scottish rivers, drains nearly all Perthshire, having a length of 126 miles, and a drainage area of 2500 sq. miles. Its headwater, the Dochart, rises in Ben Lui, to the N. of Loch Lomond, and is joined by the Lochy just before entering Loch T., which is 16 miles long and 2 broad, with an extreme depth of 600 feet. Lying 355 feet above the sea-level, the picturesque lake stretches in a N.-easterly direction along the base of Ben Lawers. After leaving the loch, the river takes a northerly bend, and from the E. and N. receives the Lyon, Tummel, Garry, Bruar, and Isla, and from the W. the Almond, Earn, &c. It passes Dunkeld and Perth, and below the latter place widens into a noble estuary, which attains a breadth of 3 miles, and on the N. side of which is situated Dundee. The navigation of the T. even to Dundee is difficult, owing to the shifting sandbanks, the positions of which are clearly shown in a new chart of the estuary prepared in 1876. The T. has a current of about 5 knots an hour, and is tidal to about 2 miles above Perth, which can be reached by vessels of 100 tons. The salmon-fishing is important, and at Stormontfield, 5 miles above Perth, there are extensive salmon-ponds. The T. fleet of whaling and sealing vessels, with headquarters at Dundee, brought home cargoes to the value of £144,900 in 1877, and £65,800 in 1878.

T. Bridge.—A few miles to the W. of Dundee, the T., at this point about 2 miles wide, is crossed by the great bridge of the North British Railway, the longest structure of its kind in the world. It consists of 85 spans, proceeding from the S. side—13 of 67 feet, 2 of 88, 10 of 130, 13 of 145, 13 of 245, 1 of 162, 11 of 130, 25 of 69, 1 of 170, and 6 of 27. The 13 spans of 245 feet are placed high enough to leave a clear waterway of 88 feet at high water. The superstructure of parallel lattice-girders rests on large malleable-iron caissons and cylinders sunk to a required depth, and partly filled with brickwork, partly with concrete. The six caissons of the central spans are sunk only a few feet into the bottom and then piled, the piles being 60 feet long. The piers were sunk through the clay overlying the bottom rock by the pneumatic process, and the spans raised to position by powerful hydraulic apparatus. The work, designed by Mr. Bouch, and executed by Hopkins, Gilkes, & Co., of Middlesborough, is remarkable not more on account of its size than of the originality of its conception, its great stability, and its comparatively small cost (£509,000). It was begun in June 1871, but operations were little more than experimental till August 1875, from which date rapid progress was made, the last pier being floated out 26th December 1876. In February 1878 it was tested by General Hutchinson, Government Inspector of Railways, who ran five engines of 72 tons each across it, thus bringing to bear 360 tons on each of the 245 feet spans, a pressure far exceeding any that may be reached in ordinary traffic, for which the bridge was opened, June 1, 1878.

Tay Bridge (from Dundee side).

Taylor, Bayard, an American traveller and litterateur, born at Kennett Square, Pennsylvania, 11th January 1825, was apprenticed to a printer in 1842, and made a tour in Europe (1844-45). On his return he published *Views Afoot*, &c. (1846), and in the following year was placed on the editorial staff of the New York *Tribune*, in which most of his subsequent works of travel appeared originally. These works, racy in form and full of keen observation, sufficiently indicate the range of his travels. They comprise a *Journey to Central Africa* (1854), *Visit to India, China, and Japan* (1855), *Pictures of Sweden, Denmark, and Lapland* (1857), *Travels in Greece and Russia* (1859), *At Home and Abroad* (1859; 2d series 1862), *Colorado* (1867), *Central Asia* (1874), and *Egypt and Iceland* (1874). Besides four novels, T. wrote several volumes of spirited musical verse, the last being *Prince Deucalion* (1878), a kind of mystical drama. He made a masterly translation of both parts of Goethe's *Faust*, in the original metres (2 vols. 1870-71), and was engaged from 1872 on biographies of Goethe and Schiller. T. edited a *Handbook of Literature and the Fine Arts* (1852), a *Cyclopedia of Modern Travel* (1856), Frithiof's *Saga*, from the Swedish of Tegner, by Blackley (1867), and the *Illustrated Library of Travel, Exploration, and Adventure* (1872 *et seq.*). He also contributed notes on Loo-Choo and Japan to the *Narrative of Parry's Expedition*, and an introduction to Stoddart's *Life of Humboldt*. His wife, Maria, daughter of Hansen, the astronomer of Gotha, has translated most of his works into German, in which language they find many admirers. In 1862-63 T. was United States secretary of legation and for a while charge-d'affaires at St. Petersburg, and in February 1878 was appointed Ambassador at Berlin, a post he held with honour till his death, on the 19th of December following. A collected edition of his travels appeared in 10 vols. (New York 1869), and his complete poetical works in 1873.

Taylor, Brook, LL.D., F.R.S., an English mathematician, was born at Edmonton, near London, August 18, 1685. He entered St. John's College, Cambridge, in 1701, where he took his bachelor's degree. In 1714 he became secretary to the Royal Society, and in the *Philosophical Transactions* are published his papers on the centre of oscillation and other mathematical subjects. His *Methodus Incrementorum* (1715) contains the famous theorem which goes by his name, and which Lagrange adopted in 1772 as the basis of his calculus of functions. He wrote also the *New Principles of Linear Perspective* (1719), and *Contemplatio Philosophica*, which was left in MS. and published, with a life of T., by his grandson, Sir W. Young, in 1793. T. died in London, December 29, 1731.

Taylor, Sir Henry, an English dramatic author, was born in 1800. He is the only son of George Taylor of Witton Hall, Durham, author of the Memoir of Robert Surtees, prefixed to vol. iv. of the *History of Durham*, and published separately in 1852. Having entered the colonial office in 1823, he rose to be one of the five senior clerks, but retired from service in 1873. In 1862 he received the degree of D.C.L. from Oxford, and in 1869 he was raised to the rank of Knight Commander of the Order of St. Michael and St. George. T.'s most important contributions to literature are his plays, *Isaac Comnenus* (1827), *Philip van Artevelde: a Dramatic Romance* (1834), *Edwin the Fair: an Historical Drama* (1842), and *The Virgin Widow* (1850)—which, though not designed for the stage, are admirable in point of workmanship, and charm the reader at once by the careful discrimination of the characters and the polished

precision and controlled energy of the language. Not a few of the pithy lines have become familiar quotations. T.'s other works are *The Statesman* (1836), *The Eve of the Conquest, and Other Poems* (1847), *Notes from Life, in Six Essays* (1847), *Notes from Books, in Four Essays* (1849). A collected edition of the plays and poems appeared in 1863 (3 vols.); and the first volume of an edition of his whole works in 1877.
